2. The process of preparing the granulated wheat, by first cracking and bolting, and then scouring and fanning the same, substantially as described.

139,601.—*Draftsman's Ruling-Gage.*—AUGUSTUS F. NAGLE, Providence, R. I. Application filed March 27, 1873.

A rule or scale is provided with a small lateral projection at one end, and with an adjustable slide or gage-piece, between which two points a small square or ruling triangle may play over the space allowed by the set of the gage, while being kept, as usual, in contact with the rule. The latter is moved step by step alternately with the triangle as each parallel line is drawn.

Claim.—The combination of the rule with a longitudinally-adjustable slide fitted thereto, so as not to obstruct or affect the straight line on one edge, and the lateral projections or shoulders, substantially as and for the purposes specified.

139,602.—*Combined Step-Cover and Wheel-Fender.*—FRANCIS H. NIEMANN, Cincinnati, Ohio. Application filed August 28, 1872.

When the door is shut the spring presses the cover closely over the step and when the door is open it holds the fender in position in relation to the wheel.

Claim.—1. The spring *a*, in combination with the fender *b*, as a cover for the step *g*, and a fender for the wheel *e*, substantially as set forth.

2. The combination of the spring *a*, the fender *b*, and the door *f*, substantially as set forth, and for the purpose specified.

3. The spring *a*, in combination with the fender *b* and the door *f*, to which it is fastened at the point *d* as a cover for the step *g* and a fender for the wheel *e*, substantially as set forth.

4. The combination of the spring *a*, the knob *c*, and fender *b*, substantially as set forth, and for the purpose mentioned.

139,603.—*Speeder.*—GEORGE W. OLNEY, Lincoln, R. I. Application filed October 16, 1872.

The long bolster is fitted closely within the long bearing, and they effectually maintain the reciprocating spindle, moved by the copping-rail projection with which it is loosely connected, as shown, in a vertical position.

Claim.—The combination, with a vertically-reciprocating live-spindle and a bow-flier, of a copping-rail connection which loosely engages with the spindle and the driven bolster F, which is closely fitted at top and bottom thereof within a long vertical bearing, and which is arranged to actuate the spindle and firmly maintain it in a rigidly-vertical position, substantially as described.

139,604.—*Endless Chain for Animal-Power.*—GEORGE N. PALMER, Greene, N. Y., assignor to H. A. LYON and L. E. ST. JOHN, same place. Application filed March 21, 1873.

The treads are arranged in step form, so as to present level surfaces to the feet of the animal, while the power is inclined.

Claim.—1. The treads A, having formed upon each end the diagonal tenons H, so that while the power is inclined the upper surface of the treads will be held in a level position, substantially as and for the purpose specified.

2. The links F F having shoulders *b b*, in combination with the treads A having diagonal tenons H H, all constructed and arranged for operation as and for the purpose described.

139,605.—*Gas-Retort.*—JOSEPH D. PATTON, Treverton, Pa. Application filed April 26, 1873.

An arrangement for gradually heating the resin or volatile oil in a partially-protected retort previous to its exposure to full heat in a subsequent retort.

Claim.—A retort or retorts for gas-making purposes, protected wholly or in part from the direct heat of the furnace, in combination with one or more retorts wholly exposed to the heat, the said protected retorts being wholly or partly inclosed by the masonry, or partly by the same and partly by other retorts which are partly inclosed by the masonry, all substantially as specified.

139,606.—*Sewing-Machine Caster.*—JOHN H. PLANK, Bloomfield, Iowa. Application filed March 1, 1873.

Two bars upon each side of the machine are adjusted in length by a slot and set-screws near the center, so as to be used for all-sized machines. The four outer ends of these two pairs of bars are furnished with cups or sockets in which the feet of the machine are inserted, and each socket provided with two holes for the pintles of the casters.

Claim.—The device for supporting sewing-machines formed of the slotted bars A A, bolt F, foot-rests B, and casters E E, arranged as specified.

139,607.—*Fire-Proof Roof.*—NIELS POULSON, New York, N. Y. Application filed February 15, 1873.

The external surface is formed of the metallic plates A, the joints of which are covered by the rib B, the ribs and plates being connected by clamping-bolts with the internal wire-gauze on which the plaster is spread.

Claim.—Plates A, having front and rear flanges *a* and *b*, held in connection with ribs B and wire-gauze C by means of lugs *c*, bolts *f*, washer-clamp *g*, and nuts *h*, forming the fire-proof French roof, substantially as described.

139,608.—*Caster for Sewing-Machines.*—GEORGE K. PROCTOR, Salem, Mass. Application filed January 22, 1873.

As an improvement on this party's patent, No. 120,098, October 17, 1871, the lever-bar is hung to and upon the treadle-rod, securing greater steadiness or rigidity of movement, and is so disposed as to turn around a common longitudinal center or axis. This lever-bar is placed in combination with either one or both the operating-levers, when they are interlocked by stop and pin or detached from each other, each of the three levers carrying their respective casters. Additionally, the lever bar is channeled or made concave, to serve as a dripping-pan for drippings of oil from the bearings.

Claim.—1. The lever-bar C, hung as described, in combination with lever F, or lever G, or both, and their respective casters, all substantially as described, for the purpose specified.

2. In combination with the elements of the above claim, the bar C, adapted to serve as a dripping-pan, substantially as described.

139,609.—*Machine for Working Waste, Fibrous Material, &c.*—JOSIAH K. PROCTOR, Philadelphia, Pa., assignor of one-half his right to CHARLES R. LINDSAY, same place. Application filed December 21, 1872.

In advance of the main cylinder is a set of drawing-rolls, the teeth of each pair of which intersect with each other and with those of each preceding pair to hold the stock firmly while being drawn and to clear each other. The described arrangement of the feed-roll teeth is to prevent the stock binding in them, and that of the stripper-teeth to give them a carding as well as a cleaning action. Each group of workers has, progressively, finer teeth to refine the stock as it is advanced. The main cylinder is expansible to securely hold the toothed rings, and a supplemental head is used, which, being filled with toothed rings, is moved endwise into place on the cylinder to pack the rings closely together.

Claim.—1. In a machine for working woolen rags, hard waste, and other similar fibrous substances, a series of toothed drawing-rollers intersecting in pairs, and each succeeding pair so arranged as to clear their predecessors, substantially as and for the purpose described.

2. The arrangement of the feed-rolls, as described, the lower roll having relatively coarse teeth and wide spaces between them, and the upper roll finer teeth and narrower spaces, for the purpose specified.

3. The arrangement of the feed-roll stripper with its teeth pointing in the same direction as the teeth on the feed-roll which it clears and on the cylinder against which it works, substantially as specified.

4. The described arrangement of workers, growing finer as they recede from the feed-rolls, as and for the purpose described.

5. In a machine for working woolen rags, hard waste, and other similar fibrous substances, the arrangement of the workers so that their teeth will intersect for the purpose of clearing, as described.

6. The arrangement of the workers in groups of different grades, for the purpose set forth.

7. The arrangement of the upper feed-roll and its stripper, and of the workers, with their teeth intersecting and pointing in the same direction as those on the main cylinder, so that the feed-roll will clear the stripper and each worker will clear the adjacent one, as described.

8. In combination with the toothed rings and packing, a cylinder having a fixed and a movable head, and so constructed that it may be contracted and expanded, for the purpose specified.

9. In combination with the cylinder sections connected at one end by a joint or hinge to a sized head, the conical block for expanding the cylinder, as described.

10. The supplementary sliding cylinder-head, constructed and arranged as specified.

139,610.—*Grain-Drills.*—GEORGE A. PURSLY, Pittsfield, Ill. Application filed March 8, 1873.

The seed-conducting tubes are slung on the rear of a rectangular carriage-frame, and are connected by drag-rods to a lateral beam in the middle of the frame, above which, standing by means of rods within spiral springs on each drag-rod, is another beam with a pin at each end working in a slot of a plate pivoted to the frame. The slots being eccentric to the pivots, pressure on the drag-bars will regulate the depth of work in the ground.

Claim.—The combination of the pivoted and slotted plates I, pivoted connecting-bar J, and lever K, with the bar E, guide-rods D and F, springs H and G, draft-rods C, hakes B, and frames A, substantially as herein shown and described.

139,611.—*Harvester.*—WILLIAM K. RAIRIGH, Plumville, Pa. Application filed December 7, 1872.

A two-wheeled front-cut side-draft machine has a sliding seat connected to the lifting-lever by an intermediate link, so that the position of the driver is changed when the cutting apparatus is raised or lowered; also, the shaft which drives rotating cutters is formed in sections connected by screws.

Claim.—1. The pinion-shaft D made in three sections, as and for the purpose described.

2. The combination, with the cutter-bar and sliding seat I, of lever K connected with each and arranged as described, so that the seat is thrown rearwardly whenever the cutter-bar is raised.

139,612.—*Harvester.*—WILLIAM K. RAIRIGH, Plumville, Pa. Application filed August 23, 1872.

Claim.—1. The sliding reel-block *m*, the racked and sliding pulley-block P, and the hand crank-shaft Q having pinion and drum thereon combined with cords and pulleys, as and for the purpose specified.

2. A pivoted sliding rake, S, having projection *s*' that is held by rod T and acted upon by spring *t*, substantially as and for the purpose specified.

139,613.—*Dumping Apparatus.*—GEORGE W. REED, Middlesex, Pa. Application filed April 19, 1873.

The platform upon which the car rests is pivoted into the hoisting-frame, and is provided at either end with suitable locking devices for preventing the car from running off during the ascent and descent of the same. To the frame-work around the hoisting-frame is arranged a device for locking such hoisting-frame, so as to prevent the descent of the same during the process of dumping. A device is also arranged for opening and closing the door of the car automatically.

Claim.—1. Slide-lever F, slotted and pivoted to platform E, substantially as set forth.

2. Side rails G having car-stops H, in combination with pivoted lever I and rods *k*, substantially as described.

3. Frame A, having projecting arm *d* to act on lever *m* of car-door for opening the same, as set forth.

4. Car L with door *d*, having pivoted lever *m* and circular piece O, as described.

5. Chute D, having bottom extension *b* to act on car-door for closing the same, as specified.

139,614.—*Hoisting-Machine.*—SAMUEL REYNOLDS, Pierrepont Manor, N. Y. Application filed May 9, 1873.

A small and compact machine especially adapted for use in stores and buildings.

Claim.—1. The combination of the wheels *a d e g i* with the spool or drum, substantially as specified.

2. A hoisting-machine in which the various parts are arranged and combined to operate substantially as shown and described.

139,615.—*Cider-Mill.*—WILLIAM RICE, Fitchburg, Mass. Application filed April 19, 1873.

A wooden wheel with metallic blades or mashers, and a guard pin or bolt so placed that the apple-parings will turn roundit, forming a cushion which clears the blades of pomace and forces it out through aperture beneath; also a concave scroll spring-presser, having a correspondingly-curved bed formed to receive it when pressed back by the material to be crushed.

Claim.—In combination with the wheel D, provided with blades or mashers 1 2 3 4, and the guard-pin E, the concave scroll spring-presser C, extending partly around said wheel and secured at its lower end to the end piece A in front of a correspondingly-curved bed formed in said end piece for its reception, as shown and described.

139,616.—*Machine for Cutting Webbing.*—WILLIAM A. RICE, Bristol, N. H. Application filed September 28, 1872.

The lower blade has serrations to prevent movement of the material being cut, and the edges of the blades are kept pressed together by the elastic washer on the bolt holding the blades.

Claim.—1. The blade E, the nicked blade A D, and the bolt and elastic washer when connected with and operated by the treadle and spring, substantially as and for the purpose specified.

2. Shears for cutting webbing and other substances, with one of the blades provided with nicks D to prevent the substance being cut from slipping, substantially as specified.

139,617.—*Corn-Planter.*—ANDREAS RÖHMER, Newport, Ky. Application filed January 27, 1873.

The share is made with a lance-shaped nose, ridged center, vertical sides, from the bottom of which horizontal flanges are turned inward, and with covering-wings extending obliquely backward from the vertical sides.

Claim.—The share C e D D' E E' *e e'* F F', formed as and for the purpose set forth.

139,618.—*Heating-Stove.*—THOMAS H. SALMON, Brooklyn, N. Y. Application filed January 6, 1873.

A stove having a down-draft through the fuel. A plate forms that side of the hanging grate which is opposite the smoke-pipe.

Claim.—The combination, with an apertured cover, I K, and a combustion-chamber, C, having outlet G, of the hanging grate E having the plate H, arranged as and for the purpose described.

139,619.—*Furniture-Caster.*—CEVEDRA B. SHELDON, New York, N. Y. Application filed May 19, 1873.

The horn of the caster, instead of being cast, is swaged up with its collar or journal from a single piece of sheet metal. The caster-socket which enters the leg of the furniture is also swaged or struck up from a single piece. These two parts of the caster are secured together by an independent wrought-iron pintle, which may be headed down at both ends.

Claim.—1. The socket D and flange G made in one piece of struck-up sheet metal, as and for the purpose specified.

2. The horn A and collar E made in one piece of struck-up sheet metal, as and for the purpose specified.

3. The struck-up sheet-metal socket and flange D G combined with the struck-up sheet-metal horn A with collar E, by means of the wrought-iron pin C, substantially as described.

139,620.—*Corn and Cotton Planter.*—ZACHARIAH B. SIMS, Bonham, Tex. Application filed November 21, 1872.

Claim.—In a seed-planter, the axle J, carrying an adjustable driving-wheel, K, and provided with the cranks M M, in combination with the rods N N, rock-shafts P P', stirrups S S', feeders *z z*, and distributers *d*, all arranged and operating substantially as described, for the purpose set forth.

139,621.—*Sled-Brake.*—JOSEPH SLATER, Sandy Lake, Pa. Application filed April 19, 1873.

The brake-bar is pivoted to a rock-shaft, and so hung to the beams of the sled that when not in use it is supported in a horizontal position beneath the beams.

Claim.—The combination of sliding rod D provided with claw F, and pivoted to arm C of rock-shaft B, the lever G, and keeper E, all constructed and arranged as specified.

139,622.—*Wrench.*—THOMAS J. SMITH and JOHN LEE, St. Louis, Mo., assignors of part interest to JOHN J. RICH and JOHN GALLAGHER, same place. Application filed December 19, 1872.

A lever having cog-teeth is pivoted to the movable jaw; the teeth mesh into corresponding ones on a wedge, which secures the jaw in position.

Claim.—The combination of a rack-wedge and cog-lever with a wrench having a movable jaw, substantially as described and shown.

139,623.—*Corn-Harvester.*—JAMES H. SPEARS, KENNEDY WELLS, and ROBERT WELLS, Piper City, Ill. Application filed April 19, 1873.

A pair of inclined screw-rollers for gathering, two endless aprons for conveying, and a pair of horizontal rollers for husking, are so arranged that the corn is automatically severed from the standing stalks, conveyed to the husking-rollers, and thence delivered into a wagon.

Claim.—The combination of the carrier V, inclined spout W, toothed rollers X, elevator Y, and spout A', with each other and with the guides L and threaded or corrugated rollers J, for removing the husks from the ears and depositing the husked ears in a wagon, substantially as herein shown and described.

139,624.—*Hydraulic Elevator.*—TIMOTHY STEMMS, San Francisco, Cal. Application filed December 4, 1872.

The cylinder lies horizontally in the cellar. Its piston has a flexible piston-rod, which passes through a stuffing-box and then around pulleys to the platform or cage. Water is admitted to the cylinder between the piston and the stuffing-box and forces the piston to the other end of the cylinder to elevate the cage. The weight of the cage causes it to descend by drawing the piston to the front end of the cylinder, if the water is allowed to escape by a waste-pipe.

Claim.—The horizontal cylinder A, in combination with the flexible piston-rod C, attached directly to the piston B, and the large pulleys E and platform, arranged and operated as shown and described.

139,625.—*Evaporating-Pan.*—GEORGE W. STORER, Philadelphia, Pa. Application filed March 10, 1873.

The bottom and sides of the steam-chamber of the pan are surrounded by an air-space and non-conducting material to prevent loss of heat by radiation.

Claim.—The evaporating-vat described, provided with an inner corrugated bottom, B, which is separated from the outer bottom A by means of a steam-space, C, and the whole protected upon its sides and bottom by means of the wooden vat D, non-conducting covering *d*, and air-space E, substantially as and for the purpose specified.

139,626.—*Clasp for Securing the Ends of Leather Straps.*—OLE O. STORLE, Milwaukee, Wisconsin, assignor to himself and WILLIAM JOHNSON, same place. Application filed December 9, 1872.

A metallic loop is constructed with a hook, which forms a bushing for the strap. Both ends of the strap pass into the loop, one end under and the other over the hook or bushing, which has a pin on its outer surface to prevent the strap from being drawn through the loop.

Claim.—The combination of clasp A, pin B, and bushing C; pin B placed on the bushing C outside of the clasp to facilitate the fastening and unfastening the strap.

139,627.—*Spring-Bed.*—STEPHEN STOUT, Tremont, Ill. Application filed May 10, 1873.

The lateral cross-pieces have recesses and grooves for the springs and slats. The springs are continuous with alternating extensions, and are held to the slat by a cord or strap.

Claim.—1. The lateral cross-piece B having alternating recesses *b* and grooves *a* for slats C and springs *c*, substantially as described.

2. The continuous double-acting spring D, with alternating extensions *d* and spiral springs *c*, substantially as specified.

3. The combination of the subject-matter of the foregoing clauses, with cord or strap E, slats C, and frame A, substantially as and for the purposes described.

139,628.—*Skate.*—WENDELL STRASSER, Taylorsville, Ohio, assignor to himself and SAMUEL S. BAUGHMAN. Application filed October 17, 1872.

To fasten the skate quickly and firmly to the sole.

Claim.—The fixed lug G and screw F, in combination with the bar E, a toe-piece or rest, and heel-cap, as set forth.

139,629.—*Drilling-Machine.*—WILLIAM H. THORNE, Philadelphia, Pa. Application filed February 24, 1873.

A horizontally-swinging arm carries a sliding saddle, upon which is the vertical drilling-spindle. The spindle is held up against its feeding-screw by means of a weighted lever. The vertically-sliding table is supported by the adjusting-screw.

Claim.—1. A table, B, having vertical adjustment on the standard, in combination with the horizontally-swinging arm D, the sliding saddle and drill, and the mechanism for rotating said drill, substantially as shown and described.

2. In combination with a radially-swinging arm and adjustable drilling-head and spindle, the weighted lever R, or its equivalent device, when arranged to operate substantially as specified.

3. The combination and arrangement, as herein described and shown, with the base *c* and post A, of the pulleys Y H located on said base, the pulleys F on the post, the swinging arm D, gears K L M, grooved shaft N, saddle I, drill-spindle P, and the gears that communicate power from the shaft to the spindle.

4. The combination, with the spindle P, yoke T, lock-nut W, and feeding-screw, of the collar V, weighted lever R, and fulcrum S, substantially as and for the purposes set forth.

139,630.—*Lamp-Post Attachment for Supporting Electrical Wires.*—JACOB P. TIBBELL, Charlestown, Mass. Application filed January 22, 1873.

A wire frame ascends from the lamp, or from the post below the lamp, converging at top into a sleeve; through this sleeve short rods pass transversely, bearing upon their ends grooved insulating-rollers for the reception of wires intended primarily for lighting the gas by electrical currents.

Claim.—An attachment for lamp-posts, consisting of the frame C, constructed as described, and provided with the tube *b* carrying the studs *d*, substantially as and for the purpose specified.

139,631.—*Governor.*—ELSON TOWNS, Clare, Ill. Application filed March 8, 1873.

To the upper end of the ball-spindle is attached a flat friction-wheel, which, as the ball-arms rise, is moved against another supported by an adjustable forked spring, secured to a curved bar and forming part of the supporting-frame, and counteracts the speed by frictional contact. The bevel-gearing is arranged in a pivoted yoke, connected to a vertical shaft and pitman. The shaft has a forked arm, supporting a weighted lever, fulcrumed in a stand and connected at its outer end to the governor-valve, and regulates the admission of steam.

Claim.—1. The yoke P, pitman S, shaft R, fork T, and lever U, in combination with a governor, substantially as and for the purposes described.

2. The gear-wheels N, Q, and Y, in combination with the yoke P, as and for the purposes described.

3. The improved governor, consisting of the shaft M, gears N Q Y, yoke P, shaft R, pitman S, fork T, lever U, spindle D, ball H, arms G G, friction-wheels E I, spring J, box C, and bed and frame A B B', substantially as and for the purposes described.

139,632.—*Hose-Coupling.*—THOMAS J. TRAPP, Williamsport, Pa. Application filed April 5, 1873.

The tapering ends of the coupling terminate in square shoulders. Equidistant from each is a circumferential rib which acts as a stop to the ends of the hose and provides a surface to be grasped by the hand in applying the coupling.

Claim.—1. In couplings for elastic hydraulic hose, the tube A provided with a tapered or conical end terminating in a right-angled shoulder, as shown and described.

2. The circumferential rib *d*, in combination with the tube A, and a projection, *e*, for engaging with the elastic hose, as specified.

139,633.—*Instrument for Cleaning Gun-Barrels.*—WILL E. TURNER, Fort Snelling, Minn. Application filed March 15, 1873.

An instrument formed of a tube and movable central rod, and an expansible cluster of wire or similar material, the latter being expanded and adjusted to fit barrels of different caliber, or to give more or less friction to barrels of the same caliber, by means of a screw-thread and nut on the rod.

Claim.—An instrument for cleaning and burnishing gun-barrels, consisting of the tube A, wire-cluster C, rod D, head E, screw-nut F, and handle G, when arranged to operate as shown and described.

139,634.—*Steam-Condensing and Water-Heating Tank.*—CHARLES N. TYLER, Buffalo, N. Y. Application filed February 25, 1873.

A vessel with a false bottom, upon which is secured an inner annular water-chamber, through the center of which passes a small cold-water pipe provided at its upper end with an inverted spray-cup for turning the water into the inner chamber. A jet-condenser, partly above and partly below the false bottom, is provided with suitable pipes and cocks for regulating the water, and it condenses the exhaust steam, and any not condensed passes up between the upper chambers, and is there condensed. At the same time the water is heated.

Claim.—1. The combination of the water-chambers F, G', and I, as arranged and constructed for operation in the manner set forth.

2. The combination of the condensing-surfaces E, G, and H, as arranged for the purpose set forth.

3. The combination of the pipes L and S, and their respective stop-cocks, with the chambers F and G, for the purpose set forth.

4. The combination of pipe *d* for the supply of cold water and its overflow *e* with chamber G' and steam-chamber H, the whole being arranged in the manner and for the purposes set forth.

5. The combination of cold-water pipes *d*, *f*, and *g*, and stop-cocks *h*, *i*, and *k*, with chamber F, for the purpose set forth.

6. The spray-condenser J and steam-pipe *o*, in combination with the subject-matter of the fifth claim, for the purpose set forth.

7. The combination of hot-water pipe M and its branches *t*, *u*, and *v*, and their respective stop-cocks, with chambers F, G', and I, for the purposes set forth.

8. The combination of the goose-necks *q* and *w* with the chambers F and I and cold-water-supply pipe *d*, for the purpose set forth.

139,635.—*Railway Switch.*—WILLIAM H. VAN GIESON, Whitewater, Wis. Application filed May 16, 1873.

The switch is shifted to the siding by means of a toggle-lever, which is lifted by a hand-lever and returned to place by a spring. It is retained when shifted by a catch on the end of oscillating lever, which engages with a notch on the slide-bar. This is tripped by the train whenever it approaches on the main line through the cams and rods, which connect with the oscillating lever and disengage the catch. The spring restores the spring to place. The cams are so formed that only the motion of the train toward the switch operates them. A foot-lever is provided which elevates two pins on either side of the slide-bar, one of which engages the notch *b* and retains the switch from replacement, and the other, of wedge-shaped form, prevents the engagement of the catch, which is provided for use only when the switch is to be self-operating.

Claim.—1. The levers or cams *k k* having slots *k' k'*, springs or weights *m m*, and the rods L L^1 or other equivalent connections, the same being combined and arranged in connection with the main rails of the track and a suitable locking device for the switch-rails, substantially as described, as and for the purpose specified.

2. The rails A A, levers or cams *k k* having slots *k' k'*, rods L L^1, lever I having a dog or catch, I', spring or weight M, the same being combined and arranged to operate in connection with the sliding bar of a switch-rail, substantially as described.

3. In combination with the sliding bar D, the toggle-arms or levers E E^2, arranged and connected to operate in the manner described, and which, when the arms are extended to lock the switch-rails in connection with the main rails, leaves the toggle-joint connection E^1 below the pivot-centers *d' e'* of the arms, substantially as set forth and shown, as and for the purpose specified.

4. The sliding plate D of the switch-rails, toggle-arms E E^2, and spring or weight F', the whole being combined and arranged to operate substantially as described, as and for the purpose specified.

5. The lever H, having arms or pins *h h'*, arranged as shown, and secured to operate in connection with the sliding bar D and its automatic locking mechanism, substantially as described.

6. The lever H, having arms or pins *h h'*, arranged as shown, and spring H^2, the whole being combined and arranged to operate in connection with the sliding bar D, substantially as described.

139,636.—*Heel-Burnishing Machine.*—CAROLINE VROOMAN, Boston, Mass., administratrix of HENRY S. VROOMAN, deceased. Application filed March 8, 1873.

The spindle upon which the boot or shoe is supported slides in a screw-threaded tube, and is adjusted by means of a wheel-nut which turns upon the tube. A cam-lever and spring arranged to elevate or depress the beam to which the burnisher is attached.

Claim.—1. The threaded tube E and wheel-nut I combined with the sliding spindle, as and for the purpose described.

2. The cam-lever *t* and spring *g*, arranged to operate in connection with the beam T and burnisher U, as and for the purposes described.

139,637.—*Sole-Channeling Machine.*—CAROLINE VROOMAN, Boston, Mass., administratrix of HENRY S. VROOMAN, deceased. Application filed March 8, 1873.

A pattern-plate, of configuration similar to a shoe-sole, is supported upon the bed of the machine, on the edge of which is a cogged rack which gears with small spur-wheels. The lever, to one end of which the channeling-tool is attached, is pivoted to a movable arm, and has vertical movement independent of, and horizontal movement with, the arm.

Claim.—The combination, in a sole-channeling machine, of the swinging arm M, lever Q, roll U, pattern D, and bed A, as and for the purpose described.

139,638.—*Berth for Vessels.*—BERNHARD WEISKER, New York, N. Y. Application filed March 28, 1873.

A pendulum-frame, guided in a channel or groove to confine its oscillations in one plane, forms the bearings for suspended berths, pivoted so as to swing in a plane at right angles to that of the main frame.

Claim.—The pendulum B combined with a guide-groove, *b*, and forming the bearings for pivots *c*, from which are suspended the berths D, (one or more,) substantially in the manner and for the purpose herein shown and described.

139,639.—*Tipping-Chair.*—HENRY K. WHITE, Chelsea, assignor to PARKER, WHITE & CO., Boston, Mass. Application filed May 6, 1873.

The outer ends of two of the spider-arms are pivoted in bearings fixed to the under side of the seat, and in one side of each ear or plate from which the bearing extends a notch is formed, while from the spider-arm, adjacent to the pivot, extends a shoulder. The pivot is encircled by a coiled spring, with one end held in said notch and the other by said shoulder.

Claim.—The spider-arm pivot *b*, having the shoulder *h*, and the bearing-cylinder *d* encompassed by the spring *k*, and having the notch *i*, the respective ends of the springs being arranged with relation to the shoulder *h* and notch *i*, substantially as shown and described.

139,640.—*Type.*—EDWIN R. WHITNEY, Magog, Canada. Application filed April 3, 1873.

Type cut or molded from glass are mounted upon a backing of wood.

Claim.—A type for printing, made of glass, as herein set forth.

139,641.—*Drip-Conductor.*—JOHN G. WIDMANN, Yonkers, N. Y. Application filed February 19, 1873.

Two matched sections, which are provided, respectively, with an inclined floor, a side guard, and an end guard.

Claim.—A longitudinally-adjustable drip-conductor composed of two matched sections, which are provided, respectively, with an inclined floor, a side guard, and an end guard, substantially as described.

139,642.—*Hanging Millstones.*—ALEXANDER W. WIHALL, Cincinnati, Ohio. Application filed April 9, 1873.

Spindle and running-stone securely connected together by the devices claimed.

Claim.—1. The combination of the bushing A provided with the groove *a'*, and the spindle C provided with the radial key D, substantially as and for the purpose shown.

2. In combination with the bushing A, spindle C, and key D, the key E, substantially as and for the purpose set forth.

3. In combination with the stone B, the bushing A provided with the flanges *a* and groove *a'*, the spindle C, and the key D, the lead filling F, substantially as and for the purpose shown and described.

139,643.—*Railroad Crossing.*—JOSEPH WOOD, Red Bank, N. J. Application filed November 11, 1872.

The rails are laterally notched and fitted together, and are braced by angular splice-bars, one leg of which passes through the web of the intersecting rail. A conical pin takes the wear of the flange at the intersection and eases it over the point where continuity is interrupted.

Claim.—1. A railroad intersection in which some of the rails are laterally notched at and near their ends, to receive the ends of other and intersecting rails, as and for the purpose set forth.

2. A detachable pin, G, inserted at the intersection of the rails, as and for the purpose specified.

3. The combination of the said pin with the angular splicing-bar H.

4. The combination of the within-described angular splicing-bars H, I, J, and K with the main rails of the intersection.

139,644.—*Band-Saw.*—CHARLES A. YOUNG, Providence, assignor of one-half his right to PARDON F. BROWN, Manton, R. I. Application filed May 14, 1873.

A band sawing-machine has its parts so arranged as to be readily changed into a reciprocating scroll-saw when desired.

Claim.—1. In a complex scroll-sawing machine the combination, substantially as described, of the table, the overhanging frame, the saw-driving pulley provided with a link connection, and the carrying-pulleys provided with gig-saw clamps or studs, and with a link connection whereby the same organization of mechanism may be made to operate a band-saw or a reciprocating saw, in the manner substantially as set forth.

2. The combination of the band-saw, the driving-pulley, and the guiding-pulleys, herein described, and their arrangement with relation to the table, as specified, whereby great depth of table can be attained in the direction of the driving-pulley, as set forth.

REISSUE PATENTS.

5,430.—*Fur-Set Box.*—JAMES W. AIKIN, Philadelphia, Pa., and JOHN H. STONE, Hamilton, Canada, assignors, by mesne assignments, to FREDERICK CRANE, Bloomfield, N. J.—Patent No. 70,676, dated November 12, 1867. Application filed May 27, 1873.

A fur-box has within it, attached to its bottom, a tube for containing a muff and sufficient space for cape and collar outside of the tube. Within the muff-tube is a perforated tube for containing camphor. The lid of the box is held air-tight by an elastic band.

Claim.—1. A fur-set box in which is combined a circular muff-case and exterior thereto a receptacle for retaining the cape, collar, or other article of fur, substantially as described.

2. A fur-set box in which is combined a circular muff-case, having an interior perforated central cylinder for holding camphor or other moth-preventive substance, and a receptacle exterior to the muff-case for retaining the cape, collar, or other accompanying article of fur, substantially as described.

3. A fur-set box in which is combined a circular muff-case, having an interior perforated central cylinder for holding camphor or other moth-preventive substance, a receptacle exterior to the muff-case for retaining the cape, collar, or other accompanying article of fur, and an elastic rubber ring applied at the cover, as set forth.

5,431.—*Flexible Lip-Formed Valve.*—EDWARD FIELD, Middlesex, county, England.—Patent No. 127,036, dated May 21, 1872. Application filed April 19, 1873.

Claim.—1. A valve for pumps, consisting of a flexible ring or disk, *a*, retained in the position described, so that its outer edge shall have an annular bearing upon the seat, as set forth.

2. The combination of a holder, constructed substantially as described, and a series of annular lips of flexible material, arranged one above the other in pairs, each pair being in contact at their outer edges, as described.

5,432.—*Grain-Drill.*—BENJAMIN KUHNS, Dayton, Ohio.—Patent No. 116,719, dated July 4, 1871. Application filed January 21, 1873.

Half the drag-bars are hinged to a stationary beam and half to an oscillating beam, which is capable of occupying two positions, in one of which the teeth are in single rank, and in the other they are in double rank, and are held so by a pin.

Claim.—1. In a grain-drill, the combination of an oscillating bar, to which a portion of the drag-bars are attached, and locking bolts or pins, arranged substantially as described, for the purpose of holding the oscillating bars in position, as set forth.

2. In combination with the oscillating bar D, to which the changeable drag-bars are attached, and its arms D^1 D^1, the studs *e e'*, which play through the side beam of the frame, and are retracted and projected by means such as described, or equivalent means, all operating in the manner set forth.

5,433.—*Breech-Loading Fire-Arm.*—JOE V. MEIGS, Lowell, Mass. Patent No. 81,100, dated August 18, 1868; antedated August 5, 1868.—Division A. Application filed March 31, 1873.

Claim.—1. A breech-block moving loosely in a slot transverse to the bore of the gun, and constituting the firing-pin, substantially as set forth.

2. The combination of a breech-block, slotted horizontally and moving transversely to the line of the bore, with a lever vibrating on a pin movable in the slot of the breech-block, to hold the breech securely closed without strain on the lever, substantially as set forth.

3. The combination, substantially as set forth, of an extractor, a guide pin, and a guide-slot in which the pin moves.

4. A cartridge inserting and extracting lever, working on three pivots, all movable, substantially as set forth.

5. The combination of a reciprocating trigger-guard, a slotted breech-block reciprocating transversely to the bore of the gun, and a vibrating lever pivoted to the guard, controlled by a guide-slot on the frame and actuating the breech-block by means of a sliding connection, these instrumentalities being constructed to operate in combination substantially as set forth.

6. An extractor vibrating on a movable fulcrum parallel to the line of the bore to push in the loaded cartridge as the breech closes, and hooking over the flange of the cartridge on one side of its axis to remove the exploded shell as the breech opens, substantially as set forth.

5,434.—*Method of and Means for increasing the Capacity of Oil-Wells.*—EDWARD A. L. ROBERTS, Titusville, Pa.—Patent No. 59,936, dated November 20, 1866; antedated May 30, 1866. Application filed May 24, 1873.

Claim.—1. The method or process of increasing or restoring the productiveness of oil-wells by causing an explosion therein, at or near the oil-bearing point.

2. The method or process of increasing or restoring the productiveness of oil-wells by causing an explosion at or near the oil-bearing point, in connection with superincumbent fluid tamping, substantially as set forth.

3. In combination with a torpedo adapted to deep wells, the employment of a weight and guiding-cord for the purpose of exploding the charge, substantially as described.

4. The means herein described for suspending, adjusting, and exploding torpedoes in oil-wells at any desired or predetermined point, consisting of a wire or cord attached to such torpedo, and through which, as a medium of communicating ignition, the torpedo is exploded.

5,435.—*Reservoir Cooking-Stove.*—EBEN BUSSEY, Troy, N. Y., assignor of three-fourths interest to CHARLES A. MCLEOD, same place.—Patent No. 51,202, dated December 5, 1865; reissue No. 2,319, dated July 24, 1866. Application filed April 24, 1873.

The top plate of the stove is extended beyond the flues and exit-pipe, and in and upon it the water-reservoir is sustained against the back of the stove. A portion of this back is cut away to allow the products of combustion to impinge against the boiler so placed against the stove. The exit-pipe is placed at the rear of the stove, on the prolongation of a line passing between the oven and the reservoir.

Claim.—1. The top plate of a cooking-stove extended beyond the rear flues thereof, and provided with an opening for the reception of a reservoir or boiler, as and for the purposes described.

2. The arrangement of an unceased reservoir at the rear of the stove, with the upper part thereof resting in the opening in the extended top plate, as and for the purposes described.

3. The arrangement of a reservoir at the rear of a stove, with its bottom resting on the back plate thereof, and its upper part above the opening in the extended top plate.

4. The arrangement of a reservoir at the rear of a stove, a portion of the back plate of which has been removed, so that the front plate of the reservoir will form a part of the back plate or outer casing of the vertical flues of the stove, as and for the purposes described.

5. The arrangement, in a cooking-stove, of a culinary boiler and an exit-passage for the gases of combustion, both at one end of the stove, and so that the said boiler forms a part of the lateral casing on the outer side of a fire-flue or fire-flues in the end of the stove below the said exit-passage, in the manner substantially as and for the purposes set forth.

6. The employment and arrangement of the boiler or reservoir A within and upon the rear end of a cooking-stove, and wholly or partly below the top plate thereof, so that one side of such boiler shall form and complete the lateral casing of the rear end vertical flue or flues below the top plate thereof and the bottom of said boiler, in the manner and for the purpose substantially as herein described and set forth.

7. The construction of the rear end and vertical flue or flues of a cooking-stove by means of the boiler or reservoir A and the lower vertical end or boiler-supporting plate *c*, so that the hot air or escaping products of combustion shall come into direct contact with that part or portion of such boiler next adjoining such flue or flues, so as to warm or heat the water or other material in said boiler, in the manner substantially as herein described and set forth.

8. In a stove having a portion of the rear casing of the vertical flues removed and a reservoir placed contiguous thereto, the arrangement of the exit-passage or smoke-pipe upon a vertical line or prolongation of a vertical line passing between the reservoir and the oven, as and for the purposes described.

9. In a cooking-stove having three flues and a portion of the casing of the vertical flues removed and a reservoir placed in the rear thereof, the arrangement of the exit-passage or smoke-pipe over the center ascending vertical flue.

10. In a cooking-stove having ascending and descending flues and a portion of the casing of the vertical flues removed and a reservoir placed in the rear thereof, the arrangement of the exit-passage or smoke-pipe over the vertical ascending flue and between the reservoir and oven.

11. The extension of the flue division-plates under the reservoir, as and for the purposes described.

12. A cooking-stove in which a portion of the casing of the vertical flue or flues has been removed, as and for the purposes described.

5,436.—*Shuttle for Sewing-Machines.*—GEORGE A. EDWARDS and GEORGE SCHNEIDER, Syracuse, N. Y.—Patent No. 136,311, dated February 25, 1873; reissue No. 5,342, dated April 1, 1873. Application filed May 26, 1873.

The bobbin-supporting spindle is hinged to the shuttle-case, and the spring, the pressure of which is governed by the nut, presses the head of the bobbin into the annular depression and thereby regulates the tension of the thread carried by the shuttle.

Claim.—The shuttle provided with the pivoted screw-threaded spindle, thumb-nut, and spring, and with the depression *c*, into which the head of the bobbin may be pressed by the spring and nut, as described.

5,437.—*Smoothing and Fluting Iron.*—JOHN HEWITT, Pittsburg, Pa.—Patent No. 135,335, dated January 28, 1873; reissue No. 5,357, dated April 15, 1873. Application filed May 27, 1873.

The iron is in two sections. When attached it is used as a smoothing-iron; when detached the upper section is used as a fluting-iron, having ribs on the lower surface.

Claim.—An iron with a coniform point, having two ironing-surfaces, one finished as a sad and the other as a fluting iron, the ribs or ridges of the latter, throughout their entire length, projecting below the highest surface of the plane of its plate, substantially as described.

5,438.—*Re-Winnowing Attachment for Thrashers.*—JOHN B. PADON, Troy, Ill.—Patent No. 136,175, dated February 25, 1873. Application filed May 17, 1873.

Attached to rear of thrashing-machine, so that straw may be delivered thereon by straw-carriers and re-winnowed.

Claim.—1. The frame A, perforated bed B, plates *x* and *w*, belts *h h'*, bars *k k'*, &c., fan D, and operating-pulleys, all combined and constructed and arranged as and for the purpose shown and specified.

2. The frame A, perforated bed D, plates *x* and *w*, belts *h h'*, bars *k k'*, &c., fan D, worm E, and operating-pulleys, the several parts being combined, constructed, and arranged as and for the purpose shown and specified.

5,439.—*Curtain-Fixture.*—THE SALEM SHADE-ROLLER MANUFACTURING COMPANY, Salem, Mass., assignee, by mesne assignments, of L. A. TRIPP, deceased.—Patent No. 67,465, dated August 6, 1867. Application filed April 25, 1873.

Within the roller is a spiral spring for automatically winding the shade, and at the end is provided a sliding bolt and ratchet or notched periphery for retaining and holding the spring.

Claim.—The arrangement of the roller B, detent F, and ratchet G, so that the detent shall revolve with the roller and be held from engaging with the ratchet by such revolution, all substantially as described.

INDEX OF INVENTIONS PATENTED JUNE 3, 1873.

[The numbers in parentheses denote the classification of patents.]

Alarm, till, (24,) J. F. Baldwin 139,530
Animal power, endless chain for, (159,) G. N. Palmer 139,604
Bag fastening, mail, (162,) E. X. Blair 139,536
Basket, work, (38,) T. V. Hobbs 139,508
Bed bottom, spring, (62,) C. Gammel 139,567
Bed, spring, (62,) S. Stout 139,627
Bedstead, invalid, (62,) A. Bray 139,493
Bedstead, parlor, (62,) F. E. Coffin 139,454
Billiard cue, (143,) H. Platts 139,519
Bin for preserving sweet potatoes, &c., (59,) H. T. Basye 139,532
Block, building, (143,) S. T. Fowler 139,462
Bobbin, (142,) A. I. Earl 139,558
Bouquet holder, (63,) A. F. Ransom 139,477
Box, fur set, (38,) Aikin and Stone, (reissue) 5,430
Brush, (22,) C. W. Palmer 139,474
Buildings, construction of, (4,) H. H. Bryant 139,451
Burial casket, (39,) Henika and Carder 139,465
Burner, gas, (64,) D. E. Ryan 139,481
Butter worker, (45,) W. N. Golden 139,571
Button hole cutter, (38,) W. C. McGill 139,472
Canceling stamp, hand, (117,) E. H. Thomas 139,486
Car brake, automatic railroad, (122,) G. E. Earl 139,557
Car brake, railway, (122,) J. S. Anderson 139,527
Car, dumping, (31,) Hanford and Wood 139,575
Car pusher, (122,) A. S. Bailey 139,529
Car seat, (121,) F. Farrell 139,561
Car, sleeping, (121,) J. S. and D. R. Leighton 139,587
Car starter, (122,) Field and Steger 139,563
Card and other cylinders, device for traversing, (28,) F. Herboth 139,466
Card case, (146,) Miller and Bennett 139,513
Carriage hook, Landau, (31,) O. S. Osborn 139,515
Carriage top, (31,) G. Bockstaller 139,450
Case for indexes, (146,) C. E. Fellows 139,503
Caster, furniture, (94,) C. B. Sheldon 139,619
Chair, (62,) W. Gardner 139,568
Chair, step ladder, (62,) H. Willgohs 139,488
Chair, tipping, (62,) H. K. White 139,630
Cigar drying mold, (160,) N. W. Palmer 139,517
Clothes washer, (138,) W. R. Brooks 139,494
Clothes wringer, (91,) D. M. Cole 139,545
Coal mining machine, (124,) W. Case 139,541
Cock, stop, (152,) G. W. Eddy 139,559
Condensation of air, forcing water by direct, (118,) J. M. Brooke 139,538
Conductor, drip, (30,) J. G. Wildmann 139,641
Cooling rooms, apparatus for, (83,) A. M. Lesley 139,470
Corn husker, (59,) C. A. Lang 139,586
Corn, preserving, (58,) L. McMurray 139,595
Corn row marker, (133,) Cooke and Cross 139,546
Cultivator, (43,) J. P. Manny 139,471
Cultivator, (43,) Richardson and Behel 139,478
Cultivator teeth, manufacture of, (43,) J. Behel 139,535
Curtain fixture, (62,) L. A. Tripp, (reissue) 5,439
Desk, school, (62,) J. W. Childs 139,543
Drawing board, (146,) A. Hitchcock 139,507
Drier, offal, (48,) M. Anderson 139,528
Drill gage, (100,) A. C. Trafton 139,487
Drill, grain, (133,) B. Kuhns, (reissue) 5,432
Drill, grain, (133,) G. A. Puraly 139,610
Drilling machine, (100,) W. H. Thorne 139,639
Dumping apparatus, (79,) G. W. Reed 139,613
Dyeing fabrics, (11,) F. G. Graupner 139,573
Egg carrier, (116,) A. H. Bryant 139,540
Elevator, hydraulic, (118,) T. Stebins 139,634
Engine, compound steam, (150,) W. W. Crane 139,549
Engine, steam, (156,) Babcock and Wilcox 139,448
Envelope, (146,) Pink and Silverberg 139,475
Explosive compound, (71,) E. Judson 139,468
Exterminator, bed bug, (63,) C. L. Fewell 139,562
Fences, iron post for wire, (52,) D. Kaufman 139,469
Fibrous material, &c., machine for working waste, (32,) J. K. Proctor 139,609
File, paper, (146,) C. Mason 139,592
Fire arm, breech loading, (18,) J. V. Meigs, (reissue) 5,433
Fire arm, revolving, (123,) C. Fuehl 139,461
Fire escape, (30,) J. A. Talpey 139,484
Fire proof roof, (126,) N. Poulson 139,607
Fly protector, (62,) I. Daugherty 139,552
Fruit, apparatus for preserving, (58,) L. R. C. Cooley 139,547
Fruit jar, (58,) A. T. Jones 139,580
Fruit, vegetables, &c., preserving, (58,) Jones and Cooley 139,581
Funnel, measuring, (167,) Cobic and Shartser 139,496
Furnace, blast, (85,) J. V. Woodhouse 139,489
Furnace, boiler, (148,) A. B. Smith 139,582
Furnace, hot air, (154,) W. O. Grover 139,505
Furnace for separating zinc from gold, &c., retort, (99,) E. Balbach, Jr. 139,449
Gage, draftsman's ruling, (97,) A. F. Nagle 139,601
Gas governor and by-pass, (64,) P. Munsinger 139,514
Gas lighting, electrical, (64,) Mueller and Meier 139,599
Gas regulator for vulcanizers, (46,) G. M. Hopkins 139,579
Gas retort, (66,) J. D. Patton 139,605
Governor, (89,) E. Towns 139,631
Gun barrels, instrument for cleaning, (70,) W. E. Turner 139,633
Harvester, (74,) W. K. Miller 139,596
Harvester, (74,) W. K. Miller 139,597
Harvester, (74,) W. K. Rairigh 139,611
Harvester, (74,) W. K. Rairigh 139,612
Harvester, corn, (75,) Spears and Wells 139,623
Heel burnishing machine, (16,) H. S. Vrooman 139,636
Heel plate, (16,) H. L. Drake 139,500
Hinge, sheet metal, (94,) W. H. Hart 139,464
Hoisting machine, (79,) S. Reynolds 139,614
Hook, back band, (72,) J. Straus 139,524
Hoop locks, machine for cutting, (40,) J. McGrew 139,594
Horses, sun bonnet for, (72,) J. Anderson 139,491
Hose coupling, (167,) T. J. Trapp 139,632
Hose coupling, metallic, (167,) E. S. Elmer 139,459
Hose pipe, compound, (167,) M. Cronin 139,550
Ice cream freezer, (58,) H. B. Campbell 139,453
Ice creeper, (16,) A. Heulings 139,506
Kettle, (154,) Evans and Perry 139,502
Lamp bracket, (62,) G. Jones 139,582
Lamp post, (90,) L. A. Gouch 139,504
Latch, coach door, (93,) J. Thielemann 139,485
Leather board, manufacture of, (72,) S. Moore 139,598
Leather, machine for skiving, (16,) J. W. Chandler 139,495
Lock, bag, (93,) H. Ahrend 139,526
Logs, machine for moving, (130,) Hinkley and Rodgers 139,578
Loom stop mechanism, (95,) W. Edson 139,560
Mangling and wringing machine, (91,) Hall and Newton 139,574
Matches, machine for cutting, (174,) Cummings, Smith, and Jordan 139,457
Meat and vegetable cutter, (25,) M. L. Edwards 139,501
Mechanical movement, (67,) J. B. Doolittle 139,499
Mill, cider, (19,) W. Rice 139,615
Mill, flour, (57,) J. Dean 139,553
Mills, ore feeder for grinding and crushing (3,) C. P. Stanford 139,523
Millstones, hanging, (57,) A. W. Winall 139,642
Millstones, leveling, (57,) W. Ring 139,479
Nail assorting apparatus, (103,) J. Coyne 139,548
Nut lock, (14,) Hull and Brown 139,467
Oil wells, increasing the capacity of, (124,) E. A. L. Roberts, (reissue) 5,434
Ore washer, (3,) R. Gidley 139,570
Ores, apparatus for separating, concentrating, and amalgamating, (3,) H. H. Eames 139,556
Organ, reed, (106,) A. J. Sorensen 139,483
Pan, evaporating, (155,) G. W. Storer 139,625
Picks, manufacturing, (40,) D. Collins 139,455
Pipe fittings, machine for tapping, (64,) J. L. Pope 139,476
Pipes, machine for introducing water and gas, (167,) Fritz and Pooley 139,566
Planter, corn, (133,) A. Rohmer 139,617
Planter, corn and cotton, (133,) Z. B. Sime 139,620
Plow truck, (114,) J. Flanagan 139,564
Poudrette, apparatus for drying, (96,) L. Duvall 139,555
Post attachment for supporting electrical wires, lamp, (52,) J. P. Terrell 139,630
Printer's chase, (117,) L. G. Chaput 139,542
Pulley, friction clutch, (87,) J. D. Crocker 139,456
Purifier, middlings, (57,) E. N. Lacroix 139,585
Rack and boot jack combined, towel, (62,) C. Darnstaedt 139,551
Railroad crossing, (120,) J. Wood 139,643
Railroad switch, (120,) J. F. Linthicum 139,589
Railroad switch, (120,) W. H. Van Gieson 139,635
Railroad tie, (120,) Pock and Richmond 139,518
Rivers, removing sand bars in, (82,) A. Garnham 139,569
Sad, fluting and hand iron, (38,) A. S. Mann 139,590
Saw, band, (130,) C. A. Young 139,644
Saws, adjusting circular, (130,) S. W. Clemmens 139,544
Sawing machine, (130,) Detrick and Culver 139,554
Seed dropper, (133,) J. M. Forden 139,565
Sewing machine caster, (134,) J. H. Plank 139,606
Sewing machine caster, (134,) G. K. Proctor 139,608
Sewing machine cutting attachment, (134,) J. E. Wiggin 139,525
Sewing machine, fan attachment, (134,) E. Kempe 139,584
Sewing machine shuttle, (134,) Edwards and Schleder, (reissue) 5,436
Sheet metal, machine for corrugating, (136,) F. Roys 139,480
Skate, (143,) W. Strasser 139,629
Skirt, hoop, (80,) Lockwood and Carter 139,510
Sled brake, (31,) J. Slater 139,621
Smoothing and fluting iron, (91,) J. Hewitt, (reissue) 5,437
Solder, flux for, (136,) C. E. Yager 139,490
Soldering iron, (136,) Blaisse and Brauner 139,537
Soldering machine, (136,) W. D. Brooks 139,539
Sole channeling machine, (16,) H. S. Vrooman 139,637
Sole pressing machine, (16,) C. M. Hayden 139,577
Spark arrester, (94,) T. D. Hendrick 139,509
Speeder, (142,) G. W. Olney 139,603
Spring, door, (24,) D. Dick 139,458
Stamp holder, currency and postage, (146,) S. V. Beckwith 139,498
Staple, blind slat, (30,) C. H. Palmer 139,516
Steam condensing and water heating tank, (148,) C. N. Tyler 139,634
Step cover and wheel fender combined, (31,) F. H. Niemann 139,602
Stereoscope, folding, (157,) J. A. Basin 139,534
Stove grate, (154,) W. J. Keep 139,583
Stove, heating, (154,) T. H. Salmon 139,618
Stove, reservoir cooking, (154,) E. Bussey, (reissue) 5,435
Straps, clasp for securing the ends of leather, (23,) O. O. Storis 139,626
Submarine blasting, charging and tamping platform for, (124,) J. Burson 139,452
Telegraph pole, (59,) McCarver, Athey, and Jennings 139,593
Thrashers, re-winnowing attachment for, (159,) J. B. Padon, (reissue) 5,438
Thread dressing and winding machine, (17,) J. Short 139,641
Toy, (143,) A. R. Batchelder 139,533
Trap, animal, (143,) J. Gould 139,572
Trunk and strap fastener, (162,) J. Fairman 139,460
Turn table, (120,) Macdonald and Fritzsche 139,512
Type, (164,) E. R. Whitney 139,640
Valve, flexible lip-formed, (152,) E. Field, (reissue) 5,431
Valve, piston, (152,) G. H. Gibbs 139,463
Vessels, berth for, (137,) B. Weisker 139,638
Wagon running gear, (31,) A. Lewis 139,588
Washing machine, (91,) P. G. Dahmer 139,497
Washing machine, (91,) J. W. Hannah 139,576
Washing machine, (91,) M. N. Lovell 139,511
Water by direct condensation of air, apparatus for forcing, (118,) J. M. Brooke 139,538
Water closet, portable, (8,) T. Barrett 139,531
Webbing, machine for cutting, (44,) W. A. Rice 139,616
Wheat and process of preparing same, food from, (57,) E. H. Murray 139,600
Wheel quartering machine, (100,) W. Sellers 139,482
Whip socket attachment, (31,) R. Dods 139,498
Windmill, (118,) W. D. Nichols 139,473
Work stand, ladies', (38,) G. S. Manning 139,591
Wrench, (100,) Smith and Lee 139,622
Wrench, pipe, (100,) J. Rigg 139,580

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED JUNE 3, 1873.

Ahrend, H., Bag lock 139,526
Aiken, J. W., and J. H. Stone, Fur set box, (reissue,) 5,430
American Stop Motion Company, assignee 139,560
Anderson, J., Sun bonnet for horses 139,491
Anderson, J. S., Railway car brake 139,527
Anderson, M., Offal drier 139,528
Athey, Jennings, and McCarver 139,568
Atlantic Giant Powder Company, assignee 139,563
Automatic Car Brake Manufacturing Company, assignee 139,468
Babcock, G. H., and S. Wilcox, Steam engine 139,557
Bailey, A. S., Car pusher 139,448
Balbach, E., Jr., Retort furnace for separating zinc from gold, &c 139,589
Baldwin, J. F., Till alarm 139,449
Barmore, B. M., assignee 139,530
Barrett, T., Portable water closet 139,458
Basye, H. T., Bin for preserving sweet potatoes 139,531
Batchelder, A. R., Toy 139,532
Baughman, S. S., assignee 139,533
Bazin, J. A., Folding stereoscope 139,698
Beckwith, S. V., Currency and postage stamp holder 139,534
Beer, C., assignee 139,492
Behel, J., Manufacture of cultivator teeth 139,450
Behel and Richardson 139,535
Bennett and Miller 139,478
Blair, B. X., Mail bag fastening 139,513
Blaisse, G. F., and J. Branner, Soldering iron 139,536
Bockstaller, G., Carriage top 139,537
Branner and Blaisse 139,450
Bray, A., Invalid bedstead 139,537
Brooke, J. M., Apparatus for forcing water by direct condensation of air 139,493
Brooks, W. D., Soldering machine 139,538
Brooks, W. R., Clothes washer 139,539
Brown and Hull 139,494
Brown, P. F., assignee 139,467
Bryant, A. H., Egg carrier 139,644
Bryant, H. H., Construction of buildings 139,540
Burdett Organ Company, assignee 139,451
Burson, J., Charging and tamping platforms for submarine blasting 139,483
Bussey, E., Reservoir cooking stove, (reissue,) 139,452
Campbell, H. B., Ice cream freezer 5,435
Carder and Henika 139,453
Carpenter, C. C., & Co., assignees 139,465
Carpenter, T. B., assignee 139,510
Carter and Lockwood 139,492
Case, W., Coal mining machine 139,510

Chandler, J. W., Machine for skiving leather 139,495
Chaput, L. G., Printer's chase 139,542
Chessman, R., assignee 139,548
Childs, J. W., School desk 139,543
Clark, A. T., assignee 139,555
Clemmens, S. W., Adjusting circular saws 139,544
Coffin, F. E., Parlor bedstead 139,454
Cohic, J. K., and D. H. Shartzer, Measuring funnel 139,496
Cole, D. M., Clothes wringer 139,545
Collins, D., Manufacturing picks 139,453
Cooke, A., and D. W. Cross, Corn row marker 139,546
Cooley and Jones 139,581
Cooley, L. R. C., Apparatus for preserving fruit 139,547
Coyne, J., Assorting nails 139,548
Crane, F., assignee, (reissue,) 5,430
Crane, W. W., Compound steam engine 139,549
Crocker, J. D., Friction clutch pulley 139,456
Cronin, M., Compound hose pipe 139,550
Cross and Cooke 139,546
Culver and Detrick 139,554
Cummings, P. D., M. Smith, and J. C. Jordan, Machine for cutting matches 139,457
Dahmer, P. G., Washing machine 139,497
Darnstaedt, C., Towel rack and boot jack combined 139,551
Daugherty, L., Fly protector 139,552
Dean, J., Flour mill 139,553
Detrick, W., and J. D. Culver, Sawing machine 139,554
Dick, D., Door spring 139,458
Doda, R., Whip socket attachment 139,498
Doolittle, J. B., Mechanical movement 139,499
Drake, H. L., Heel plate 139,500
Duvall, L., Pomdrette 139,555
Eames, H. H., Concentrating and amalgamating ores 139,556
Earl, G. E., Automatic railroad car brake 139,557
Earle, A. I., Bobbin 139,558
Eddy, G. W., Stop cock 139,559
Edson, W., Loom stop mechanism 139,560
Edwards, G. A., and G. Schieder, Sewing machine shuttle, (reissue,) 5,436
Edwards, M. L., Cutter for meats and vegetables 139,501
Elmer, E. S., Metallic hose coupling 139,459
Evans, W. J., and W. Perry, Kettle 139,502
Fairman, J., Trunk and strap fastener 139,460
Farrell, F., Car seat 139,561
Fellows, C. E., Case for containing indexes 139,503
Fewell, C. L., Bed bug exterminator 139,562
Field, E., Flexible lip-formed valve, (reissue,) 5,431
Field, G. W., and J. Steger, Car starter 139,563
Fisher, T. J., assignee 139,582
Flanagan, J., Plow truck 139,564
Foehl, C., revolving fire arm 139,461
Forden, J. M., Seed dropper 139,565
Fowler, S. T., Building block 139,462
Fritz, J., and W. C. Pooley, Machine for introducing water and gas pipes 139,566
Fritzsche and Macdonald 139,512
Gallagher, J., assignee 139,622
Gammel, C., spring bed bottom 139,567
Gardner, W., Chair 139,568
Garnham, A., Removing sand bars in rivers 139,569
Giant Powder Company, assignee 139,463
Gibbs, G. H., Piston valve 139,463
Gidley, R., Ore washer 139,570
Golden, W. N., Butter worker 139,571
Gooch, L. A., Lamp post 139,504
Gould, J., Animal trap 139,572
Graupner, F. G., Dyeing fabrics 139,573
Gross, E. L., assignee 139,563
Grover, W. O., Hot air furnace 139,505
Hall, T., and J. Newton, Mangling or wringing machine 139,574
Hanford, J. M., and J. Wood, Dumping car 139,575
Hannah, J. W., Washing machine 139,576
Hart, W. H., Sheet metal hinge 139,464
Hayden, C. M., Sole pressing machine 139,577
Hendrick, T. D., Spark arrester 139,509
Henika, H., and M. K. Carder, Burial casket 139,465
Hentings, A., Ice creeper 139,506
Herboth, F., Traversing card and other cylinders 139,466
Hewitt, J., Smoothing and fluting iron, (reissue,) 5,437
Hinkley, J. M., and A. Rodgers, Machine for moving legs 139,578
Hitchcock, A., Drawing board 139,507
Hitchcock, J., trustee, assignee 139,464
Hobbs, T. V., Work basket 139,508
Hopkins, G. M., Gas regulator for vulcanizers 139,597
Hoyt, W. R., assignee 139,454
Hull, A. C., and J. S. Brown, Nut lock 139,467
Jennings, McCarver, and Athey 139,583
Johnson, W., assignee 139,626
Jones, A. T., assignee 139,547
Jones, A. T., Fruit jar 139,580
Jones, A. T., and L. R. C. Cooley, Preserving fruit, &c 139,581
Jones, G., Lamp bracket 139,582
Jordan, Cummings, and Smith 139,457
Judson, E., Explosive compound 139,468
Kaufman, D., Iron post for wire fences 139,469
Kaep, W. J., Stove grate 139,583
Kemps, R., Sewing machine fan attachment 139,584
Kuhns, B., Grain drill, (reissue,) 5,432
Lacroix, E. N., Middlings purifier 139,585
Lane, Z. M., assignee 139,577
Lang, C. A., Corn husker 139,586
Lee and Smith 139,622
Leighton, J. T. and D. R., Sleeping car 139,587
Lesley, A. M., Cooling rooms 139,470
Lewis, A., Wagon running gear 139,588
Lindsay, C. R., assignee 139,589
Linthicum, J. F., Railroad switch 139,509
Little, E., assignee 139,590
Lockwood, G. W., and A. Carter, Hoop skirt 139,510
Lockwood, R. B., assignee 139,480
Lovell, M. N., Washing machine 139,511
Lyon, H. A., assignee 139,604
Macdonald, C., and C. O. H. Fritzsche, Turn table 139,512
Mann, A. S., Sad, fluting, and band iron 139,590
Manning, G. S., Lady's work stand 139,591
Manny, J. P., Cultivator 139,471
Mason, C., Paper file 139,592
Mawhinney, H. H., assignee 139,525
McCarver, T. J., J. Athey, and B. Jennings, Telegraph pole 139,593
McGill, W. C., Button hole cutter 139,472
McGrew, J., Machine for cutting hoop locks 139,594
McLeod, C. A., assignee, (reissue) 5,435
McMurray, L., Preserving corn 139,595
Meier and Mueller 139,599
Meiga, J. V., Breech loading fire arm, (reissue) 5,433
Miles Alarm Till Manufacturing Company, assignee 139,530
Miller, H. H., and T. Bennett, Card case 139,513
Miller, W. K., Harvester 139,596
Miller, W. K., Harvester 139,597
Moore, S., Manufacture of leather boards 139,598
Mueller, C. G., and H. Meier, Electrical gas lighting 139,599
Mumford, T. T., assignee 139,538
Manzinger, P., Gas governor and by-pass 139,514
Murray, E. H., Food from wheat and process of preparing same 139,600
Nagle, A. F., Draftsman's ruling gage 139,601
Newton and Hall 139,574
Newton, N. C., assignee 139,584
Nichols, A. J., assignee 139,561
Nichols, W. D., Windmill 139,473
Niemann, F. H., Combined step cover and wheel fender 139,602
Olney, G. W., Speeder 139,603
Osborn, O. S., Landau carriage hook 139,515
Padon, J. B., Rewinnowing attachment for harvesters, (reissue) 5,438
Palmer, C. H., Blind slat staple 139,516
Palmer, C. W., Brush 139,474
Palmer, G. N., Animal power 139,604
Palmer, N. W., Cigar drying mold 139,517
Parker, White & Co., assignees 139,630
Patton, J. D., Gas retort 139,605
Peck, W., and W. C. Richmond, Railroad tie 139,518
Perry and Evans 139,502
Pink, C., and M. Silverberg, Envelope 139,475
Plank, J. H., Sewing machine caster 139,606
Platts, H., Billiard cue 139,519
Pooley and Fritz 139,566
Pope, J. L., Machine for tapping pipe fittings 139,476
Poulson, N., Fire proof roof 139,607
Proctor, G. K., Sewing machine caster 139,608
Proctor, J. K., Machine for working waste fibrous material 139,609
Pursely, G. A., Grain drill 139,610
Rairigh, W. K., Harvester 139,611
Rairigh, W. K., Harvester 139,612
Ransom, A. F., Bouquet holder 139,477
Rayburn, J., assignee 139,565
Reed, G. W., Dumping apparatus 139,613
Reynolds, S., Hoisting machine 139,614
Rice, W., Cider mill 139,615
Rice, W. A., Machine for cutting webbing 139,616
Rich, J. J., assignee 139,622
Richardson, G. R., and J. Behel, Cultivator 139,478
Richmond and Peck 139,518
Rigg, J., Pipe wrench 139,520
Ring, W., Leveling millstones 139,479
Roberts, E. A. L., Increasing the capacity of oil wells, (reissue) 5,434
Rodgers and Hinkley 139,578
Rogers, H., assignee 139,598
Rohmer, A., Corn planter 139,617
Roye, F., Machine for corrugating sheet metal 139,480
Ryan, D. E., Gas burner 139,481
Salem Shade Roller Manufacturing Company, assignee, (reissue) 5,439
Salmon, T. H., Heating stove 139,618
Schieder and Edwards, (reissue) 5,436
Scott, W. A., assignee 139,489
Sellers, W., Wheel quartering machine 139,482
Shartzer and Cohic 139,496
Sheldon, C. B., Furniture caster 139,619
Short, J., Thread dressing and winding machine 139,521
Silverberg and Pink 139,475
Sims, Z. B., Corn and cotton planter 139,620
Slater, J., Sled brake 139,621
Sloan, J. O., assignee 139,565
Smith, A. B., Boiler furnace 139,522
Smith, Jordan, and Cummings 139,457
Smith, T. J., and J. Lee, Wrench 139,622
Sorensen, A. J., Reed organ 139,483
Spears, J. H., and K. and R. Wells, Corn harvester 139,623
Stanford, C. P., Ore feeder for grinding and crushing mills 139,523
Stebins, T., Hydraulic elevator 139,624
Steger and Field 139,563
St. John, L. E., assignee 139,604
Stone and Aikin, (reissue) 5,430
Storer, G. W., Evaporating pan 139,625

Storie, O. O., Clasp for securing the ends of leather straps 139,626
Stout, S., Spring bed 139,627
Strasser, W., Skate 139,628
Straus, J., Back band hook 139,524
Sturgeon, L. H., assignee 139,467
Talpey, J. A., Fire escape 139,484
Thielemann, J., Coach door latch 139,485
Thomas, E. H., Hand canceling stamp 139,486
Thorne, W. H., Drilling machine 139,629
Tirrell, J. P., Lamp post attachment for supporting electrical wires 139,630
Towns, E., Governor 139,631
Trafton, A. C., Drill gage 139,487
Trapp, T. J., Hose coupling 139,632
Tripp, L. A., Curtain fixture, (reissue) 5,439
Turner, W. E., Instrument for cleaning gun barrels 139,633
Tyler, C. N., Steam condensing and water heating tank 139,634
Van Gieson, W. H., Railway switch 139,635
Vrooman, H. S., Heel burnishing machine 139,636
Vrooman, H. S., Sole channeling machine 139,637
Weisker, B., Berth for vessels 139,638
Welter, J. E., assignee 139,585
Wells and Spears 139,623
Whitall, H., assignee 139,452
White, H. K., Tipping chair 139,639
Whitney, E. R., Type 139,640
Widman, J. G., Drip conductor 139,641
Wiggin, J. E., Sewing machine cutting attachment 139,525
Wilcox and Babcock 139,448
Willgohs, H., Step ladder chair 139,488
Winalt, A. W., Hanging millstone 139,642
Wood and Hanford 139,575
Wood, J., Railroad crossing 139,643
Woodhouse, J. V., Blast furnace 139,489
Woodworth, R. N., assignee 139,521
Yager, C. E., Flux for solder 139,490
Young, C. A., Band saw 139,644

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited, and the invention therein described will become public property, as against the applicant therefor, unless he shall make a new application within two years from the date of notice of the original allowance.

The following abbreviated form of the Patent Office classification by subject-matter may be of assistance to persons ordering copies of specifications and drawings by class. Of course the classes vary somewhat in number of patents, and in following a branch of industry it may be necessary to group several classes to secure absolute completeness. These groupings will readily suggest themselves to the inventor or mechanic.

Aërated liquor apparatus 1
Air and gas engines 2
Amalgamators, ore-mills 3
Architecture 4
Artificial limbs, &c 5
Baking 6
Baling-presses 7
Baths, closets, &c 8
Bee-hives 9
Bell and brass founding 10
Bleaching, dyeing, &c 11
Blowers 12
Boats 13
Bolts, nuts, rivets 14
Bookbinding 15
Boots and shoes 16
Braid, thread, &c 17
Breech-loaders 18
Brewing, cider, &c 19
Bricks 20
Bridges 21
Brushes and brooms 22
Buckles, buttons, &c 23
Builders' hardware 24
Butchering 25
Candles, soap, &c 26
Carbureters 27
Carding and roving 28
Carpenters' tools 29
Carpentry 30
Carriages and wagons 31
Cartridges and bullets 32
Casting 33
Casting soft metals 34
Chemical processes 35
Clocks and watches 36
Cloth-dressing, &c 37
Clothes-making 38
Coffins 39
Coopering 40
Cotton 41
Counting and registering 42
Cultivators 43
Cutlery 44
Dairy apparatus 45
Dental instruments 46
Distilling and rectifying 47
Driers 48
Edge tools 49
Electrical apparatus 50
Excavating and grading 51
Fences and gates 52
Files and rasps 53
Fine arts 54
Fire-arms 55
Floor-cloths 56
Flour-mills 57
Food, preservation of 58
Food for stock, preparing 59
Forging 60
Fuel 61
Furniture, &c 62
Garden and orchard tools 63
Gas, distribution of 64
Gas-heaters 65
Gas, manufacture of 66
Gearing 67
Glass 68
Governors 69
Grinding and polishing 70
Gunpowder 71
Harness and saddlery 72
Harrows, rollers, &c 73
Harvesters, A 74
Harvesters, B 75
Hats and felting 76
Hay-tedders, &c 77
Hemp and flax 78
Hoisting machinery 79
Hoop-skirts and corsets 80
Hose and belting 81
Hydraulic engineering 82
Ice-making 83
India rubber 84
Iron and steel 85
Jewelry 86
Journals, bearings, &c 87
Kitchen and table utensils 88
Knitting, netting, &c 89
Lamps and lanterns 90
Laundry apparatus 91
Leather 92
Locks and latches 93
Locomotives 94
Looms 95
Manures 96
Mathematical instruments 97
Medical compounds 98
Metallurgic processes 99
Metal working 100
Meteorological instruments 101
Musical instruments 102
Nails and spikes 103
Needles, pins, &c 104
Ordnance 105
Organs 106
Paints and varnishes 107
Paper-making 108
Paper manufactures 109
Paving 110
Photography 111
Pianos 112
Plating 113
Plows 114
Pottery 115
Poultry, care of 116
Printing 117
Pumps 118
Punching and shearing 119
Railroads, (the "Way") 120
Railroads, (rolling stock,) A 121
Railroads, (rolling stock,) B 122
Revolvers 123
Rock-drilling and blasting 124
Rolling metals 125
Roofing 126
Rope and cordage 127
Safes and vaults 128
Salt 129
Saw-mills 130
Saws 131
Scales and weights 132
Seeders and planters 133
Sewing-machines 134
Sheep, care of 135
Sheet metal working 136
Ship-building, (the hull) 137
Ship-building, (masting, &c) 138
Ships, propulsion of 139
Silk 140
Spades, shovels, &c 141
Spinning 142
Sports 143
Stabling, stalls, &c 144
Starch 145
Stationery 146
Steam-heaters, &c 147
Steam-boilers, (construction) 148
Steam-boilers, (furnaces, &c) 149
Steam-engines 150
Steam-pistons, &c 151
Steam-valves 152
Stone, lime, and cement 153
Stoves and ranges 154
Sugar and molasses 155
Surgical instruments 156
Surveying and optical instruments 157
Telegraphs 158
Thrashing, &c 159
Tobacco 160
Toilet articles 161
Trunks and satchels 162
Tube and wire 163
Type and stereotype 164
Umbrellas, fans, &c 165
Ventilators 166
Water, distribution of 167
Water-wheels 168
Willow and rattan 169
Wire-working 170
Wood-screws 171
Wood-lathes 172
Wood-working, (machine-tools) 173
Wood-working, (special machinery, A) 174
Wood-working, (special machinery, B) 175
Wood-working, (special machinery, C) 176

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 31, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks)..... 6,500
SEWING-MACHINES and attachments..... 2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes..... 4,000
PRINTING; including presses, type, and printers' furniture. 2,500
CARRIAGE-WHEELS; including hubs, spokes, tires, and axles 1,200
FELTING and HATS; including caps, bonnets, flock, &c..... 1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments)..... 1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs..... 1,400
CARRIAGES and WAGONS; (excepting wheels, hubs, and axles) (in progress.)

The specifications of patents have been reprinted back to November 26, 1866; from that date to June 30, 1871, on the larger paper; from July 1, 1871, to the present time, on the smaller paper.

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

BOUND VOLUMES OF PATENTS.

The Office is now prepared to furnish to subscribers the monthly volumes of patents at $125.00 per annum, bound in half-sheep.

In these volumes the specifications are in full, the type of the same size as the printed patents and records; the drawings are in full, but are one-half the size (linear) of those attached to the patents and bound up for record; the illustrations are four on a page, but *fac-similes* of the originals, with the headings and signatures.

The volumes are the same size as the patents and the OFFICIAL GAZETTE, and have an average of 800 pages of specifications, 260 of drawings; total of each volume about 1,060 pages. They commenced with the issue of July 2, 1872, being the successors in this form of the weekly volumes of patents published under the joint resolution of Congress, passed January 11, 1871, which discontinued the publication of the illustrated annual report of the Commissioner of Patents, and provided for the publication in lieu thereof of complete copies of the specifications and drawings of patents issued subsequently to June 30, 1869. Under this resolution the volumes were to be placed for free public inspection in the capital of each State and Territory of the United States, and in the clerk's office of certain of the federal courts. The Commissioner is also authorised by the resolution to "furnish a complete set of such specifications and drawings to any public library which will pay for binding the same into volumes to correspond with those in the Patent Office, and for the transportation of the same, and which shall also provide proper custody for the same, with convenient access for the public thereto, under such regulations as the Commissioner shall deem reasonable."

After filling the requisition as provided above, a surplus remains which the Commissioner now offers at the rate of $125.00 per annum—say, 1,060 pages per month: 9,600 pages of specifications, 3,120 pages of drawings—12,720 pages.

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

COMMISSIONER'S DECISIONS.

VINTON *vs.* PIERCE.—*Interference.*

[*Appeal from the Board of Examiners-in-Chief in the matter of interference between the application of John J. Vinton and the patent of Jonas J. Pierce, granted June 7, 1870, for* IMPROVEMENT IN HOT-BLAST APPARATUS.—*Decided May 26, 1873.*]

Priority will be awarded to the party who originated the invention before his competitor suggested it to him, and who reduced it to actual practice and took out a patent for it, of all which his competitor had full knowledge, but interposed no claim to it, and did not apply for a patent for nearly two years after the other patent was granted, although he originated the invention before the patentee, but did nothing toward perfecting it.

THACHER, *Acting Commissioner:*

This is an interference between a patent issued in 1870 and an application for a patent for the same invention filed nearly two years subsequent to the former grant. The burden of proof, therefore, rests entirely on the applicant, and a second patent ought not to be issued to him except upon conclusive evidence of his right to the same—such, in fact, as would defeat the existing patent in court; for without a strict adherence to this rule the Commissioner will be placed in the awkward position of granting a patent which the courts will not sustain—a result always to be avoided, if possible.

The Examiner of Interferences found in favor of the patentee.

The Examiners-in-Chief reverse this decision, but remark "that, if it be granted that Pierce was an *independent* inventor, priority must be declared in his favor." From an examination of the testimony this appears to be the only question of any importance in the case; for, if both parties were original and independent inventors, Vinton has not the shadow of a right to a patent. It will therefore receive consideration first.

Vinton conceived the idea of the invention in 1868, and made a fugitive sketch of it on a drawing-board the latter part of that year.

He entered the employment of Geddes, Pierce & Co., at Sharpsville, Pennsylvania, in November, 1869, where he also made the acquaintance of Jonas J. Pierce, to whom he claims to have communicated the invention within the first month he was there. This was in connection with a chalk-drawing made on the office-floor at an interview with Geddes, Eagan, and J. J. Pierce. The only affirmative evidence that the invention was described to Pierce at this time is the testimony of Vinton himself. Pierce denies it, and Geddes, called as a witness by Vinton, says the conversation was about another matter. Eagan, the only other person present, was not examined on this point. The weight of evidence is, therefore, against the claim of Vinton in this, the most important, point in his case, so that, if there was no evidence touching the prior invention by Pierce, I should be unwilling to convict him of fraudulently appropriating the invention of another on this testimony alone.

But there is affirmative evidence that Pierce had made the invention some time before this interview, and that, too, without taking into consideration certain testimony going to prove the date of invention as somewhat earlier than sworn to by Pierce in his "preliminary statement," which has been excluded, very properly, both by the examiner and Board. Parties must be held strictly to their "preliminary statements," except on unmistakable evidence to the contrary, such, for instance, as a date of record incorrectly stated from memory.

In this instance, although the new date sought to be established does not antedate the inception of the invention previously fixed by Vinton, which gives the appearance of truthfulness to the testimony, still I do not find good reason for admitting it as evidence in this

case. Pierce gives the time in his "statement" when the idea of the invention first occurred to him—a date which could be known to him alone. The evidence submitted is not conclusive that he was mistaken in this, and there is, therefore, no reason for changing the ruling made in *Allen & Moody* vs. *Gilman*, 2 Official Gazette, 293, and *Hovey* vs. *Hufeland*, 2 Official Gazette, 493.

In his preliminary statement Pierce says the invention originated with him in August or September, 1869. With his testimony he files two exhibits, 1 and 2, which he swears were made about that time, and which illustrate the invention in pencil-sketches. He also states that this improvement was the subject of general conversation during the summer of 1869, which testimony is corroborated by James Pierce and Mr. Kelly. None of this evidence is contradicted, and, standing as it does unimpeached, it proves conclusively that Pierce originated the invention in dispute before he had even seen his competitor, Vinton. I cannot leave this part of the case without remarking that Vinton's conduct appears to me utterly inconsistent with his present claims. From letters filed as exhibits it appears that, as early as February, 1870, he was aware of the fact that Pierce had filed a caveat for the invention in this Office, and was fully advised of the course necessary for him to pursue if he wished to protect rights claimed by him. Yet he stood by while the invention was put into practice by his rival before his very eyes; was himself foreman of the shop where the castings were made; probably also had knowledge of the fact that Pierce obtained a patent in June, 1870, and disposed of rights to others in the vicinity of Sharpsville, and not a protest was made—not even an application for a patent filed, although he was abundantly able, until nearly two years after the issue of the patent to Pierce.

This is not the course of an inventor who sees another stealing and appropriating to his own use a valuable invention, to which he alone has the right. I cannot believe that, upon the evidence now before the Office, any court in the country would annul the patent for fraud in its procurement.

Admitting both Vinton and Pierce to be original inventors, but little remains to be said. Vinton was the first to originate the invention in 1868, but, up to the time of filing his application, April 10, 1872, produced nothing more than fugitive sketches in different places, unless drawings made by Geddes, late in 1869, can be appropriated by him, which is a disputed matter. In the mean time Pierce also originates the invention in 1869, files a caveat in February, 1870, and an application for a patent in May following, and about the same time adopts measures to put the improvement into actual use by contracting, in June, for a new furnace, the castings for which were delivered in October, and which was in full blast in March, 1871. For the delay on the part of Vinton no excuse is offered—not even the poor one of poverty so frequently urged. Under the most liberal construction of Vinton's testimony his conduct does not show reasonable diligence in adapting and perfecting the invention. His *laches* are fatal to the claim he now makes, and, although second in the conception of the improvement, Pierce is the first inventor in the legal sense of the term.

The decision of the Examiners-in-Chief is reversed.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—MAINE DISTRICT.

JOHN W. JONES *et al. vs.* R. K. SEWALL, Administrator.

[*In Equity.—Before Clifford, Judge.—Decision May* 17, 1873.]

Although an inventor has obtained a patent for a process, he may have another for the product.

There cannot be more than one valid patent for an invention, nor can the grantee of a patent sustain an action upon another patent for the same invention issued afterward.

Separate patents for separate and distinct parts of the same invention are nevertheless valid.

A patent is *prima facie* evidence of the patentee's having made the invention when the specification was filed.

If a patentee wishes to show that he made the invention previous to filing his application, he must prove, as against another patent for it, that he had reduced it to practice as an operative machine.

Previous use or knowledge of an invention abroad is no defense against a patent, unless it was described in some printed publication so clearly as to enable others to put it in practice.

The use of an invention by the author for the purposes of experiment, though continued for more than two years, will not prejudice his right to a patent.

Neither will the sale or use of it for two years by others without his consent.

Where an invention has, through the acts of the inventor, gone into public use beyond his control, his right to it is forfeited beyond recall.

The defense that the patentee had allowed his invention to be in public use or on sale for two years before he applied for a patent, is distinct from the defense that he had abandoned it to the public, and should not be blended with it in the same pleading.

Unavoidable delay while an application for a patent is pending is no ground for imputing abandonment.

Mere forbearance to apply for a patent while the inventor is experimenting upon his invention, and perfecting it and testing its value, affords no ground for presuming that he has abandoned it.

A patent for preserving green corn by severing the kernels from the cob so that the juices will be liberated, and then boiling the kernels and juices together in sealed cans, is valid, although a patent has been previously granted abroad for preserving corn by boiling it in vessels, without specifying whether the kernels are to be separated from the cob or whether they are to be broken or whole.

[Wm. Henry Clifford, *Counsel for Complainants.*
R. K. Sewall, Bradbury & Bradbury, A. A. Strout, *Counsel for Respondent.*]

CLIFFORD, *J.:*

Inventions lawfully secured by letters patent are the property of the inventors, and as such the franchise and the patented product are as much entitled to legal protection as any other species of property, real or personal. They are, indeed, property, even before they are patented, and continue to be such, even without that protection, until the inventor abandons the same to the public, unless he suffers the patented product to be in public use or on sale, with his consent and allowance, for more than two years before he files his application for a patent. (5 Stat. at Large, 123; 5 Ibid., 354.)

On the 8th of March, 1853, Isaac Winslow, of Philadelphia, filed in the Patent Office an application for a patent for "a new and improved mode of preserving green corn," in which he stated that he had invented a new and useful improvement for accomplishing that object, and prayed that letters patent might be granted to him for that invention. Certain portions of the invention were not illustrated either by drawing or models, and in consequence of that omission the application, on the 1st of August following, was returned to the inventor, leaving it to his option to supply the omission or to modify his claim. He elected to supply the deficiency, and, on the 26th of October succeeding, he filed in the Patent Office additional drawings and a model of the invention, and samples of the patented product. Information from the Patent Office was communicated to the inventor on the 2d of November, in the same year, that the Office did not regard the operation of cutting the corn from the cob as any part of the process of preserving the product, and requesting him to decide whether the Office should examine the process of preserving or that of removing the corn from the cob, under the fee already paid, evidently showing that the Office required another fee if both were to be examined. Compelled to elect a second time, the applicant decided to strike out his second claim, and consented to take a patent for the process of preserving the patented product. Nothing further was done until the 19th of the same month, when the Patent Office informed the applicant that the Office was of the opinion that his process was substantially the same as that in common use for preserving both vegetable and animal substances. On the 18th of February, 1862, the inventor filed in the Patent Office a new application for a patent, referring to the fact that his prior application, as modified, was rejected, and renewing the prayer that letters patent might be granted to him for the entire improvement. In the meantime the inventor assigned the business over to his brother and the complainant, with the stipulation that he would give the assignees the benefit of any improvement he should make, and of his knowledge of the new process. Before the second application for a patent was made the entire inventions were duly assigned to the complainant, and it is proper to remark that the title of the complainant is admitted.

Four several letters patent were granted for the inventions, and they were all issued in the name of the inventor, but each contains the recital that he had assigned all his right, title, and interest in the invention to the complainant. They are as follows: 1. No. 34,928, dated April 8, 1862, for a new and useful improvement in preserving Indian corn in the green state. 2. No. 35,274, dated May 13, 1862, for a new and useful improvement in preserving green corn. 3. No. 35,346, dated May 20, 1862, for a new and useful improved process of preserving green corn. 4. No. 36,326, dated August 26, 1862, for a new and useful improvement in the process of preserving green corn. Possessed, as he is, of the absolute title to those improvements, the complainant claims the full and exclusive right and liberty of making and using the said improvements, and vending the same to others to be used, and he charges that the respondent named in the bill of complaint, then in full life, from the 13th of September, 1867, to the 19th of November, in the same year, unlawfully and wrongfully used and practiced the described improvements claimed and patented by the complainant. Service was made, and the respondent appeared and filed an answer. Amendments were made to the bill, by consent, admitting new complainants, and also to the answer allowing the respondent to set up new defenses. Reference will only be made to such of the defenses set up in the answer as were pressed in argument at the hearing. Argument to show that the title of the complainant is valid is unnecessary, as that is admitted by the respondent, and the complainant having introduced in evidence the several letters patent described in the bill of complaint, it is conceded that they afford a *prima facie* presumption that the patentee is the original and first inventor of the several improvements therein described and secured to the supposed inventor. Much consideration need not be given to the question of infringement, as the respondent admits that his foreman, though as he alleges without his consent, put up certain parcels of green corn preserved substantially by the same process as that described in the specification of the patentee, and substantially the same as covered by his patents, amounting to seven hundred cans, which have been sold, and the proceeds and profits have been received by the respondent, as stated in the account annexed to the answer. Unless the patent is sustained, the question of infringement is an immaterial issue, and where it is admitted, and the case shows that profits have been received by the respondent to a substantial amount, the question of the extent of the infringement is usually left to be determined by the master. Viewed in the light of these suggestions, it is quite clear that the case depends upon the defenses set up in the answer, as, if no one of them is sustained, the complainants are clearly entitled to a decree.

They are as follows:

1. That the patentee was not the original and first inventor of the improvements, or either of them, as alleged in the bill of complaint.

2. That the several supposed improvements are merely old methods applied to a new use, and that the several improvements, and each of them, were well known and in public use prior to the alleged discovery and invention of the patentee.

3. That the several improvements were in public use and on sale more than two years before the patentee made his application for a patent.

4. That the patentee abandoned his invention to the public before he filed his application for a patent.

Application was made by the inventor, in the first place, for one patent to embrace all the several subject-matters described in the four patents subsequently granted by the Commissioner of Patents. Novelty and utility are both required to constitute a patentable invention within the meaning of the patent law, but where both of those qualities are combined, it is settled law that the right to a patent does not depend upon the "quantity of thought," ingenuity, skill, labor, or experiment, or the amount of money which the inventor may have bestowed or expended upon his production. (Curt. on Pat., sec. 31.)

Defenses involving the validity of a patent cannot be satisfactorily examined, or their sufficiency or insufficiency determined, without first ascertaining what the invention is which is embodied in the patent constituting the subject-matter of the controversy.

I. Undoubtedly the first patent is for the product of the invention, or for the new article of manufacture, to wit, Indian corn preserved green, or Indian corn preserved in the green state. In his first attempt to preserve the corn in the green state, without drying the same, the patentee states that he did not remove the

kernels from the cob, which was not satisfactory, as the article obtained was very bulky, and when used the peculiar sweetness of the corn was lost, the same being absorbed, as the patentee supposes, by the cob. Experiments of various kinds were subsequently made to overcome the difficulties attending the effort to preserve the corn without drying the same, which were also unsuccessful, as the kernels, when preserved, did not retain the milk and other juices of the corn, leaving the product hard, insipid, and unpalatable, and without the full flavor of fresh green corn. All such experiments were abandoned, but he finally succeeded in producing an entirely satisfactory article of manufacture, which is the one described in the specification and claim of his first patent. His description of the method of manufacturing the product is substantially as follows: Select a superior quality of sweet corn, in the green state; remove the kernels from the cob by means of a curved and gaged knife, or other suitable means; pack the kernels in cans, and hermetically seal the latter so as to prevent evaporation under heat or the escape of the aroma of the corn. When packed the cans of corn are to be exposed to steam or boiling heat for an hour and a half, then puncture the cans, and immediately seal the same while hot, and continue the heat for two hours and a half longer. Afterward the cans may be slowly cooled in a room at the temperature of seventy to a hundred degrees Fahrenheit. Indian corn thus packed and treated, the patentee states, may be warranted to keep in any climate. Being preserved in its natural state, as near as possible, it retains the peculiar sweetness and flavor of fresh green corn right from the growing field, and it is only necessary to heat the corn in order to prepare it for the table, as it is fully cooked in the process of preserving. What the patentee claims in that case is—

> The described new article of manufacture, to wit, Indian corn, when preserved in the green state, without drying the same, the kernels being removed from the cob and packed in cans hermetically sealed and treated substantially in the manner and for the purpose set forth in the specification.

II. Attention will next be called to the second patent, which purports to embody an invention for a new and useful improvement in preserving green corn, or, in other words, the patented invention is for the process of manufacturing the new product described and patented in the first-mentioned letters patent. Necessarily the details of the process are somewhat fully given in the specification describing the patented product, but the claim of the first patent does not extend to the process, which shows that the Patent Office committed no error in granting the second patent, as it does not include anything patented in the first patent. (*Goodyear* vs. *Providence Rubber Co.*, 2 Cliff., 371; same case, 9 Wall, 788; *Seymour* vs. *Osborne*, 11 Wall., 559.)

Both parties agree that it is competent for the Commissioner to grant a patent for the product and one for the process, and it is obvious that the patent under consideration is for the process, which is not included in the prior patent. It has long been common, says the patentee, to boil green or unripened corn, and then to dry the same for winter use, but corn thus dried must be boiled again when prepared for the table, and is more or less hard and insipid, as it loses the fine flavor of fresh green corn. Ears of corn, also, are sometimes boiled and then hermetically sealed in cans, but the cob seems to absorb the sweetness of the kernels, or if the kernels are removed from the cob after boiling, and then preserved, still the fine flavor of the natural corn is lost. Many and varied attempts were made by the patentee to preserve green corn on the cob without drying the same, but all those efforts were unsuccessful, as the article was bulky, and the sweetness of the corn was absorbed by the cob. Subsequently he conceived the idea of first removing the corn from the cob, and then boiling or cooking the kernels and preserving them as thus separated from the cob. Some benefit doubtless resulted from that new conception, but a new difficulty arose, as the kernels of corn were broken in being removed from the cob, and the milk and other juices of the corn were dissolved and diluted in the process of boiling, leaving the product insipid and unpalatable. Unable to overcome that difficulty in that mode, he next attempted to cook the corn, without permitting it to come in contact with the water, by exposing the cans containing the corn to boiling water, but he soon found that mode of preserving the corn was unsatisfactory, as a long time was requisite to cook the corn sufficiently for preservation, and it appears that the milk of the corn evaporated and the corn became more or less dried.

Two other patents are set forth in the bill of complaint, but it is clear that the patents are each for the new and useful improvement in the process of preserving green corn, and that they severally embody substantially the same invention as that described in the second patent. Improvements, consisting of separate and distinct parts, may in certain cases be secured by separate and distinct patents, but no more than one patent can legally be granted for the same invention. (5 Stat. at Large, 192; *Sickles* vs. *Falls Co.*, 4 Blatch., 508.)

Inoperative patents, or such as are invalid by reason of a defective or insufficient description or specification, may also in certain cases be surrendered, and the Commissioner, in such cases, is authorized to cause a new patent to be issued to the inventor for the same invention, but the Commissioner does not possess the power to grant a second patent for the same invention, in any case nor under any circumstances, without the surrender of the first one granted to the patentee. (*Suffolk Co.* vs. *Hayden*, 3 Wall., 319; 5 Stat. at Large, 122.)

Apply those principles to the case, and it is certain that the third and fourth patents described in the bill of complaint are void. More than one patent for the same invention cannot be legally issued by the Commissioner, but the irregular issuing of the second patent cannot impair the right of the patentee under the first patent, if it was valid at the time it was granted. Tested by these rules of decision, it is quite clear that the bill of complaint as to the third and fourth patents must be dismissed, but that the complainants are entitled to a decree for an account and for an injunction for the infringement of the first and second patents, unless the defenses, or some one of them set up by the respondent, are sustained.

I. First defense is that the patentee is not the original and first inventor of the respective improvements. Both patents may be considered together, as all the proofs applicable to one apply equally to the other, and the positions taken in argument are the same in both,

without an exception. Before examining that defense, it becomes necessary to refer somewhat more fully to the nature and peculiar characteristics of the respective improvements in question, in order that the evidence adduced may be fully understood and properly applied. Ears of corn may be boiled and hermetically sealed in cans without infringing the inventions of the patentee, but the difficulty with that product and the process which produces it is that the cob absorbs the sweetness of the kernels, and the article becomes insipid and unpalatable, and consequently it is not salable to much extent. So the kernels may be removed from the cob after boiling, and then be preserved in cans hermetically sealed, without any conflict with the improvements embodied in the patents described in the bill of complaint, but the process and the product which it produces are comparatively valueless, as the fine flavor of the green corn cooked in the usual way is lost in the process of manufacture.

Corn may also be preserved, when in a green state, by removing the kernels from the cob and boiling or cooking the same, before the kernels are packed in cans hermetically sealed, without subjecting the manufacturer to the charge of infringing these patents; but the difficulty with that process is that the kernels, in being removed from the cob, are broken, and consequently the milk and other juices of the corn in that state are dissolved out in the process of boiling or cooking, and the natural aroma of the green corn cooked in the usual way for the table is lost, and the product becomes of little or no value as an article of commerce. Attempts were made by the patentee in this case to remedy that difficulty by packing the kernels in cans not sealed, and exposing the cans containing the kernels to boiling water, but the process was unsatisfactory in other respects, as it required a long time to cook the corn, during which the milk and other juices evaporated and the corn became more or less dried. All experiments of such kinds having failed to produce the desired result, the inventor adopted the process of removing the corn from the cob, packing the kernels in cans, hermetically sealing the same, and then boiling the cans until the corn therein became completely cooked; but he states that the cans must be very strong or they may burst; and to prevent that he practiced puncturing them, after they became well heated, to allow the air to escape, immediately re-sealing the same to prevent the evaporation of the juices of the corn or the loss of the natural aroma. Cans, if sufficiently strong, it would seem, may be used to complete the process without the necessity of their being punctured after the boiling is commenced, but, unless the cans are very strong, it is better to puncture them, in order to relieve the internal pressure and to prevent them from bursting. Even if the cans when not punctured, as described, do not burst, the air contained in the cans and the vapor become more or less expanded by the heat, so as to press the heads of the can outward and give the same the appearance of cans which contain the gaseous products of decomposition. Such appearances, even when the corn is perfectly preserved, diminish its value as an article of commerce, which shows that it is better to puncture and re-seal the cans during the process of boiling, unless the cans are very strong.

Taken as a whole, the description in the specification of the respective patents constitutes a full compliance with the requirement of the act of Congress in that behalf, showing that the claim of the patentee in the first patent is the described new article of manufacture, to wit, Indian corn, when preserved in the green state, without drying the same, the kernels being removed from the cob, hermetically sealed, and heated, substantially in the manner and for the purpose set forth, which is well justified by the description of the invention given in the specification.

His claim in the second patent is for the described process of first removing the corn from the cob and then preserving the kernels, substantially in the manner and for the purposes set forth, which is also well supported by the antecedent description contained in the specification, to which it is appended. Viewed in any proper light, it is clear that the purpose of the invention, as evidenced by the language of the description throughout, is to preserve not only the farinaceous elements of the kernels, but also the milk and juices of the same, which give the peculiar aroma or flavor to green corn when cooked for the table in the usual way during the season when the kernel is full grown, or nearly so, but before the milk and juices of the kernel become concrete, as in ripe corn. Beyond all doubt, the patented process, if the directions are properly followed, will accomplish the purpose for which it was invented, and will enable the manufacturer to preserve the kernels of green corn with all the milk and other juices of the same, without any chemical or other change, except what is produced by the cooking, which is effected by putting the sealed cans containing the kernels, with their milk and other juices, just as the same were removed from the cob, into boiling water, and keeping the cans with their contents in the boiling water for the period or periods specified in the descriptive part of the specification. Proof to that effect, of the most satisfactory character, is exhibited in the record, and the patented product, as seen everywhere in daily use, fully attests its accuracy and truth. Sufficient has been remarked to show what the improvements are which give rise to the present controversy, and, having accomplished that purpose, the next inquiry is whether the patentee is the original and first inventor of the respective improvements.

Tested merely by the pleadings, the affirmative of that issue is upon the complainants, but the complainants having introduced the original letters patent under which they claim, the rule is well settled that the burden of proof is changed, and that it is incumbent upon the respondent to show, by satisfactory proof, that the patentee is not the original and first inventor of the respective improvements, as he, the respondent, has alleged in his answer. Evidence was introduced by the complainants, of the most satisfactory character, showing that the patentee, Isaac Winslow, of Philadelphia, discovered the patented process of preserving green corn early in the year 1842, and that he made successful experiments in reducing his invention to practice at Westbrook, in the State of Maine, during the latter part of the summer or in the early part of autumn of that year, leaving no doubt that the process discovered was the same as that described in the second patent, on which the suit is founded, and that the results were satisfactory to a limited extent. All doubt

as to the date of those experiments is removed by the statements of the witnesses as to the attending circumstances, which could hardly fail to impress the memory so as to prevent unintentional mistake, and there is no reason disclosed in the proofs to create any distrust as to the integrity of the deponents. Though a resident of Philadelphia, the patentee sometimes went abroad for temporary periods, and in the spring prior to making these experiments he wrote from France to his brother-in-law, living at Westbrook, in the State of Maine, requesting him to plant a piece of ground with sweet corn, evidently for the purpose of securing the means of making such experiments and testing the utility of the new process which he had invented, and it appears that his brother-in-law complied with his request. Pursuant to that arrangement, he visited his brother-in-law, at Westbrook, toward the close of the summer or early in the fall of that year, and commenced to make experiments to preserve green corn, occupying for that purpose a building situated on the same farm which had previously been used as a cord factory. He worked less than a week that season, and the experiments, to a large extent, were unsatisfactory, as the cans in which the corn was packed were not strong enough to resist the pressure within, occasioned by the boiling. Attempts were made to preserve the corn by cooking it before it was packed in the cans, both by cooking it on the cob and then removing the kernels, and also by first removing the kernels and then boiling the same, but all of those experiments proved to be wholly unsatisfactory, as all or nearly all of the corn in the cans spoiled, and all such as was not spoiled was found to be insipid and comparatively tasteless, and of little or no commercial value. Experiments were also made by cutting the kernels of the freshly-gathered green corn from the cob with a gaged knife, and packing the same, with their milk and other juices, in cans hermetically sealed, just as the kernels came from the cob, and cooking the same by placing the cans with their contents in a large vessel containing boiling water, and most of those experiments, when the cans proved to be strong enough to resist the inward pressure during the process of boiling, without bursting, were generally satisfactory. Few or none of the cans were properly constructed, and many of them burst during the process of boiling, and in consequence of that tendency the patentee found it necessary to take the cans out of the bath before the process of cooking the corn was completed, and to puncture or vent the cans, as described in the specification, immediately resealing and replacing the same in the receptacle of boiling water until the contents of the cans were cooked sufficiently for table use; and the proofs show that when the cans were temporarily vented in that way the experiments were generally successful. Such experiments were repeated the next year for a few days, during the proper season, and from year to year, to the autumn preceding the time when the patentee made his application for letters patent.

Practical experience showed that the process subsequently patented was much the most successful in accomplishing the desired object, but the process required strong cans to prevent them from bursting during the boiling, even when the cans were temporarily vented, as described; and it was a long time before the manufacturer was able to furnish the inventor with an article properly constructed for the purpose, as fully appears from the testimony of the manufacturer of the cans, who was examined as a witness. Application for a patent was filed in the Patent Office by the inventor on the 8th of March, 1853; but the first claim was neither illustrated by drawings nor by a model, nor did the applicant forward to the Patent Office any specimens of green corn preserved by his process, and the specification, on account of those omissions, was returned to the applicant, leaving it at his option to supply the deficiencies or to modify his claim. He elected to supply what had been omitted when the application was filed, and on the 26th of October, in the same year, filed in the Patent Office additional drawings, together with a model of the invention and samples of the preserved green corn, and requested an early examination of the application and claims. Doubtless the proper officers of the Patent Office complied with his request, as they returned the specification on the 2d of November following, informing him that the Office did not regard the operation of cutting the corn from the cob as any part of the process of preserving the same, and requested him to decide which part of the alleged invention the Office should examine, whether the process of preserving the product or that of removing the corn from the cob. Obliged to waive one for a time, he struck out the second claim, which covered the process for removing the corn from the cob, and on the 4th of the same month returned the specification, as amended, expressing the hope that the Office would be enabled to decide favorably on the remaining claim without delay. His hopes, however, were not realized, as the Office, on the 19th of the same month, rejected the amended application, expressing the opinion that the alleged invention was substantially the same as that in common use for preserving meats and vegetable substances. Except an occasional visit of the patentee to the Patent Office for the purpose of consultation with the Commissioner or Examiners, nothing further was done by him to procure a patent until the 18th of February, 1862, when he filed in the Patent Office a second application for a patent, which in substance and effect is the same as the one previously filed by the same party, and which, like the other, seeks to procure letters patent for the entire invention. Before the rejection took place the claim for the product had been stricken out, so that the claim for that part of the invention had never been the subject of decision by the Patent Office. In view of the circumstances, the Commissioner decided to review the whole case, and came to the conclusion that the proofs before him entitled the applicant to letters patent, both for the product and for the process, as shown in the two patents under consideration.

Two other patents were also issued to the same party, but the court is of the opinion that they are invalid, as having been issued for the same invention as that described in the specification of the second patent. Repeated decisions have established the rule that a patent duly issued, when introduced in evidence by the complainant in a suit for infringement, is *prima facie* evidence that the patentee is the original and first inventor of what is therein described as his invention, and when taken in connection with his original application is *prima facie* evidence that the invention was made at the time the application was filed; but when the patentee proposes to show that his invention is of a date prior to the time when he filed his original application, he takes upon himself the burden of proof, and to maintain that theory as against another patented improvement of the same construction and mode of operation he must prove not only that he made his invention at the period claimed, but that he reduced the same to practice as an operative machine. (*Johnson* vs. *Root*, 2 Cliff., 116.)

Suppose that is so, still the respondent cannot invoke that principle with much effect in this case, as he does not preserve green corn under a patent, and the proofs are entirely satisfactory that the patentee made the invention more than ten years before the application for a patent was filed in the Patent Office. Great difficulty was experienced by the patentee throughout the whole period in procuring cans properly constructed for the purpose, and the proofs show that it was that imperfection and difficulty more than any other which prevented him from making an earlier application for a patent. Much examination, in detail, of the parol proofs introduced by the respondent, to show that the patented process was known or used in the United States before the early experiments made by the patentee, may well be omitted, as it is not pretended, nor can it be, that any other person, resident in this country either before or since that time, ever invented such a process; and a careful scrutiny of the evidence given by those witnesses as to what was in fact done by the several deponents will show that no one of them ever preserved any green corn, in the mode of operation circumstantially described in the specifications of the patents, until the witness, in some way and to some extent, became acquainted with the process of the patentee, either from rumor or from some one who had assisted the patentee in making those experiments, and in most cases not until years after the invention was made, and in some cases long after the patentee had filed his application for letters patent in the Patent Office. Careful analysis of the testimony of those witnesses shows that many of them never practiced the patented mode of operation at all, as they cooked the corn before the kernels were packed in the cans, and that all those who ever did practice it in any degree, or ever made any near approximation to it, never commenced to preserve green corn in that way until they had learned something, by rumor or otherwise, concerning the mode of operation which was practiced by the patentee. They do not pretend that they *invented anything of the kind*, but all they claim is that they were successful in learning what the process was which was practiced by the assignor of the complainants. Beyond all doubt, the patentee was the original and first inventor of the process in the United States, and sufficient appears, even in the proofs introduced by the respondent, to convince the court that the first knowledge which those witnesses ever had of the patented process was procured, directly or indirectly—as by report or rumor—from persons residing near the place where the experiments of the patentee were made, or who had at some time been the employees of the inventor and had assisted in his experiments. Suppose it to be true that the patentee was the first person in the United States who had practiced the patented process and preserved green corn in that mode of operation, still it is contended by the respondent that he is not the original and first inventor of the improvement within the meaning of the patent law, as the process had been previously known and used in some foreign country; but the decisive answer to that suggestion is that the mere previous knowledge or use of the thing patented in a foreign country will not defeat a patent issued here to an original inventor, unless it appears that the same invention had been patented in such foreign country or had been described in some public work anterior to the supposed discovery thereof by the patentee, and it is well settled law that patented inventions cannot be superseded by the mere introduction in evidence of a foreign publication, though of a prior date, unless the description or drawings contain or exhibit a substantial representation of the patented improvement in such full, clear, and exact terms as to enable any person skilled in the art or science to which the improvement appertains to make, construct, and practice the invention to the same practical extent as he would be enabled to do if the information was derived from a prior patent. (*Seymour* vs. *Osborne*, 11 Wall., 555.)

Next the respondent insists that the process described in the English patent to Peter Durand supersedes the invention of the assignor of the complainant as a prior discovery and for the same improvement. Vegetable substances intended to be subjected to that process, the specification states, are to be put into the vessels selected for the purpose, in the raw or crude state; but the patentee, in enumerating the articles to be preserved, does not mention green corn, nor does he state whether the kernels are or are not to be removed from the cob, or, if to be removed, whether the removal is to be effected in a manner to leave the kernels *unbroken* or by means of a gaged knife, as in the mode of operation described in the complainant's patent, nor is any mention made of preserving green corn or any other vegetable substance *in the natural juices of the article*, as in the mode of operation set forth in the patent mentioned in the bill of complaint. Instead of packing the kernels in the vessels selected for the purpose, in their crude state, as suggested in the English patent, the process patented by the assignor of the complainant directs that the kernels should be cut from the cob in a way which leaves a large part of the hull on the cob and breaks open the kernels, liberating the juices, to use the language of the patentee, and causing the milk and other juices of the corn to flow out and surround the kernels, as they are packed in the cans in such a mode that the juices form the liquid in which the whole is cooked when the cans are subjected to the bath of boiling water.

Evidently much is due to this feature of the patented mode of operation in preserving the product, and causing it to retain the sweetness, peculiar flavor, and natural aroma of green corn as when fresh gathered in the season and boiled for the table in the ordinary way for family use. Nothing of the kind is suggested in the other specification, and it is quite clear that a careful comparison of the descriptions given of the inventions, in the respective specifications, fully justifies the opinion of the learned expert examined by the complainant, that the two patents are essentially and substantially

unlike, to which it may be added that persons having no other knowledge of the complainant's process than what they derive from perusing the specification of the other patent, would never be able to preserve green corn by that mode of operation. Palpable as these differences in the mode of operation are, they cannot properly be overlooked in determining the issue under consideration, nor are they merely formal, as the proofs are full to the point that the product manufactured by the process of the complainant is far superior to that preserved in any other known mode. Other vegetables, such as beets and carrots, or peas and beans, may be packed in the cans in a crude state, as they retain their juices, and may be well preserved if entirely secluded from the atmosphere, as by packing them in vessels hermetically sealed, but their chemical composition is very different from green corn, which is much more difficult to preserve in its natural freshness without loss of its peculiar flavor and aroma, as accomplished by the complainant's process. When the kernels are cut from the cob they are opened, and the milk and other juices of the same flow out and become a constituent part of the vegetable substance to be preserved, and if exposed to air in that state for any considerable time their chemical relations to each other will soon change, and the whole substance will become sour. Exposure to heat, if seasonable, will remove that tendency, as the relations of the elements of which the substance is composed will become fixed, and the danger of putrefaction or souring will be greatly lessened or entirely averted.

Throughout his experiments the aim of the patentee was to perfect the process of preserving green corn without losing any of the natural juices of the cereal, and to discover the method or means of fixing the elements of the corn in the milky state, so that when packed in vessels to be preserved their chemical relations to each other would never change unless the vessels containing the corn were opened. Obviously he could not accomplish that purpose by putting the corn into cans in the crude state or before it was removed from the cob, as the juices of the kernels would be absorbed by the cob in the cooking, nor could he accomplish his object by cutting the kernels from the cob and boiling them in water before they were packed, or by cooking them in open vessels without water, as in the one case the milk would be washed out of the kernels, and with it all the peculiar flavor of green corn, and in the other case the aroma and juices of the cereal in the green state would be lost by evaporation. Suggestion is made that the kernels may be removed from the cob without cutting, and if packed in cans in that state before being cooked they may be regarded as having been packed in the crude state, which may perhaps be conceded; but two answers are made to that suggestion, either of which is sufficient to show that the suggestion cannot serve to benefit the respondent.

1. Because that process is substantially different from the complainant's process.

2. Because the proofs on both sides show that the product, when the green corn is preserved in that mode of operation, is of a very inferior quality, not much better than the product when the corn is boiled before it is packed.

Viewed in the light of these suggestions and of the expert testimony in the case, which corresponds with the same, I am of the opinion that the patents of the complainants are not superseded by the aforesaid foreign patent introduced by the respondent.

II. Enough has already been remarked to show that the second defense cannot be sustained, as the evidence introduced to show that the patentee is the original and first inventor of the improvements is equally persuasive and convincing to disprove the theory that the inventions are old ones applied to a new use, which is all that need be said upon the subject. Nor is any argument necessary to show that the other defense embraced in the same proposition must be overruled, as there is no evidence in the record to support the theory that the improvements, or either of them, were well known or in public use prior to the alleged discovery and invention of the patentee. Attempts were doubtless made by various persons to preserve green corn prior to the date of the invention in controversy, but it is so manifest to every impartial inquirer that they were of a character substantially different from the process and product patented by the assignor of the complainant, that it would be a work of supererogation to repeat the explanations which demonstrate the truth of that proposition. Such an issue cannot be properly investigated and determined without first ascertaining what the patented invention is, but the moment that preliminary inquiry is solved the whole difficulty disappears, as it at once becomes self-evident that none of the methods previously practiced embraced the mode of operation invented by the patentee.

III. Patents otherwise valid may be avoided in a suit for infringement by proof that the invention was in public use and on sale more than two years, with the consent and allowance of the patentee, before he filed his application for a patent, which is the next defense presented by the respondent. Inventions ceased to be patentable, at one time, if permitted to pass into public use or to be on sale for any time, with the consent and allowance of the patentee, before his application for a patent, but the more recent act of Congress provides that such public use or sale shall not have any such effect, unless it was continued for more than two years prior to such application. (5 Stat. at Large, 123; 5 Ibid., 354.)

Full proof that an invention had been in public use or on sale, *with the consent and allowance* of the inventor, for more than two years before the application for a patent was filed in the Patent Office, is a good defense to such an action if the same is properly alleged in the answer. (*Agawam Co.* vs. *Jordan*, 7 Wall., 607; *McClurg* vs. *Kingsland*, 1 How., 209; *Stimpson* vs. *Railroad*, 4 How., 380; *Shaw* vs. *Cooper*, 7 Pet., 318.)

Nothing short of proof that the invention was on sale or in public use, with the consent and allowance of the inventor, for a period exceeding two years, will support such a defense, as the party charged with infringing the rights of an inventor must bring himself fairly within the words of the act of Congress, which justify the acts charged as an infringement. (*Ryan* vs. *Goodwin*, 3 Sum., 518.)

Such acts, if done without the consent and allowance of the inventor, are plain violations of his rights, and of course will not afford any justification to a subsequent wrong doer. (*Wyeth* vs. *Stone*, 1 Story, 282.)

If the sale or use is without the consent or allowance of the inventor, or if the use is merely experimental, to ascertain the value, utility, or success of the invention by putting it in practice, that is not such a sale or use as will deprive the inventor of his title. (*Ryan* vs. *Goodwin*, 3 Sum., 518; *Pitts* vs. *Hall*, 2 Blatch., 229; *McCormick* vs. *Seymour*, 2 Blatch., 240.)

Such acts of an inventor, it is well held by Judge Story, are to be liberally construed as acts of an experimental character, nor is the inventor to be estopped by allowing a few persons to use his invention to ascertain its utility, or by any such acts of use or indulgence to others to use the same, as are not inconsistent with the clear intention to hold the exclusive privilege, and to secure the same by letters patent. (*Mellus* vs. *Silsbee*, 4 Mason, 111.)

Where the party has subsequently taken out a patent, the court is not authorized to give effect to such a defense to a charge of infringement, except in cases where the proof is clear and cogent. (*Wyeth* vs. *Stone*, 1 Story, 281.)

Tested by those rules, as the case must be, it is quite clear that the defense under consideration must be overruled, as there is no evidence in the record to show that the inventions, or either of them, were in public use or on sale more than two years before the inventor applied for a patent, or for any shorter period, with the consent and allowance of the patentee, or that he had any knowledge of any such sale or public use at the time it was made. On the contrary, the evidence shows that the inventor never gave his consent to any such sales, and that he constantly asserted that he intended to apply for a patent. Sales in some cases were made by his brother, but the evidence shows that the inventor disapproved of the acts, as calculated to produce embarrassment when he presented his application for a patent at the Patent Office. Public use of an invention, unless by the patentee himself, for profit, or by his consent and allowance, will not work a forfeiture of his title, as such forfeiture is not favored unless it clearly appear that the use was solely for profit, and not with a view of further improvements or of ascertaining its defects, or for any other purpose of experiment in reducing the invention to practice. (*Pitts* vs. *Hall*, 2 Blatch., 236.)

Inventors have a right to employ all means necessary and proper to enable them to perfect their inventions and to reduce the same to practice, and it is clear that no such experimental act can justly be viewed as legitimate evidence to support the defense of a prior unauthorized public sale or use of the invention, or a use inconsistent with the right to apply for a patent to secure the exclusive authority to make and use the invention, and to vend it to others to be used, as provided in the patent act. Persons charged with the infringement of letters patent may set up as a defense that the inventor suffered the invention to be in public use and on sale more than two years before he applied for a patent, and they may also set up as a distinct defense, even in the same answer, that the inventor, before he applied for a patent, abandoned the invention to the public, but those two defenses ought not to be blended in the same allegation, as they depend in many respects upon very different principles. Some of the amendments to the answer, however, were filed by consent, and inasmuch as no exception was taken to this part of the answer, the question of abandonment, as pleaded, may be considered as open.

As pleaded, the defense is that the inventor abandoned the invention to the public before he filed his application for a patent. His first application was filed on the 8th of March, 1853, and he filed the second application on the 18th of February, 1862, which it is conceded is substantially the same as the first one, which is still on file in the Patent Office. Evidence of an affirmative character to show that the inventor ever uttered a word or did an act signifying an intention to abandon his invention to the public before he filed his first application for a patent is entirely wanting, nor is is there any circumstance introduced in evidence to support that theory, except the mere lapse of time from the discovery of the invention to the filing of the application, and it is settled law that the mere forbearance to apply for a patent during the progress of experiments, and until the party has perfected his invention and tested its value by actual practice, affords no just grounds for any such presumption. (*Kendall* vs. *Winsor*, 21 How., 328; *Agawam Co.* vs. *Jordan*, 7 Wall., 607.)

Apply that rule to the present case, and it is clear that the proofs furnish no ground for such a presumption before his first application was improperly rejected by the Patent Office. Such an adverse decision operates as a great discouragement to an indigent inventor, as was strikingly illustrated in the case of the inventor of the improved mode of manufacturing wool, who, in consequence of such a decision, was kept out of the enjoyment of the fruits of his genius for forty years. (*Agawam Co.* vs. *Jordan*, 7; Ibid. 604.)

Abandonment or dedication of an invention to the public, being in the nature of a forfeiture of a right, is not favored in law, and Mr. Justice Nelson decided that such a defense could not be sustained, unless the acts of the party invoked for the purpose were corroborated by some declarations manifesting such an intention; but it is not necessary to apply that rule in this case, as the evidence fails to disclose either any act or declaration to support the theory. Argument to show that the inventor was entitled to a patent at the time his first application was rejected is unnecessary, as the proposition stands confessed by the Patent Office. Nothing beyond the decision of the Office reversing their former action would seem to be required to establish that proposition; but if more be needed, it will be found in the reasons which the Office assigned at the time for refusing to issue the patent. Those reasons, it will be recollected, were that the alleged invention was substantially the same as that in common use for preserving meats and vegetable substances, which shows beyond all doubt that the Office never gave the subject a proper examination, or utterly failed to understand the nature of the improvement or to comprehend the mode of operation, as scientifically described in the specification. Truth was crushed for the moment, but, happily for the cause of justice, the reasons given for the erroneous decision remained on file, which enabled the Office, at a later period, to correct the error and to do justice to a meritorious inventor. Construed strictly, the defense of abandonment, as pleaded, has respect only to the period of time which elapsed between the

discovery of the invention and the filing of the first application, which was rejected; but the respondent insists, in argument, that the inquiry under that issue extends also to the facts and circumstances which occurred between the times when the first application was rejected and the filing of the second, which, with some hesitation, is admitted, as it is by no means certain that a second application was necessary. (*Suffolk Co.* vs. *Hayden*, 3 Wall., 319; *Godfrey* vs. *Eames*, 1 Wall., 325.)

Delays in the Patent Office, which an inventor cannot prevent, will not impair his title to his invention, nor can any use of the invention during such delays, if without his consent and allowance, afford any evidence to support the issue that the inventor abandoned the invention to the public. (*Howe* vs. *Williams*, 2 Cliff., 262; *Simpson* vs. *Railroad*, 4 How., 402; *Goodyear* vs. *Day*, Law's Digest, 363; *Morris* vs. *Huntingdon*, 1 Paine, 348.)

Suppose, however, the period between the rejection of the first application and the filing of the second is as much within the issue presented by the answer as the period between the discovery of the invention and the filing of the first application, still I am of the opinion that the defense that the inventor abandoned his invention to the public is not sustained by the evidence exhibited in the record. No one but the inventor is competent to abandon his invention to the public. His acts and declarations, if explicit, are sufficient for the purpose, or he may accomplish the same end by continued acquiescence in the acts of others, of which it appears that he had knowledge; but the proof of knowledge and acquiescence must be beyond all reasonable doubt, as every presumption is the other way. (*McCormick* vs. *Seymour*, 2 Blatch., 255.)

Testimony is introduced by the respondent showing that the brother of the inventor made sale of small quantities of the preserved corn on several occasions, but the record does not contain any evidence that the *inventor* ever sold any of the patented product, or that he ever gave his consent that the product should be sold by his brother or any other person before he filed his application for a patent. Prior to the application for a patent, the better opinion from the evidence is that none of the product of the new process was put upon the market, as the evidence is satisfactory that he knew that sales or public use more than two years before he applied for a patent would defeat his right. Immediately upon filing his application for a patent he gave a license to his brother and the first-named complainant, and received a royalty from them for their manufacture. Small amounts only were manufactured, and few sales only were made subsequent to the rejection of the first application.

When a party practices his invention merely for the purposes of experiment or completion, before he takes out a patent, the inference that he intends to surrender the invention to the public does not arise, and consequently a dedication to the public cannot be proved by evidence that shows only experimental practice by the inventor or his employees, whether in public or private. Such an inference is never favored, nor will it in general be sufficient to prove such a defense, unless it appears that the use, exercise, or practice of the invention was somewhat extensive and for the purpose of gain, evincing an intent on the part of the inventor to secure the exclusive benefits of his invention without applying for the protection of letters patent. (Curtis on P., 3d ed., sec. 389.)

Exceptional cases arise, as where the invention, by acts of the inventor, has gone into general public use and got beyond his control, without any effort on his part to restrain its general use, as in such a case it is held that he cannot resume the ownership dedicated to the public, and that his right to a patent is forfeited. Speaking of such a case, however, Judge Story said in *Mellus* vs. *Silsbee*, (4 Mason, 111,) that the inventor "is not to be estopped by licensing a few persons to use his invention to ascertain its utility, or by any such acts of peculiar indulgence and use as may fairly consist with the clear intention to hold the exclusive privilege." Tested by that rule, it is quite clear that the single license referred to, which was not granted until after the application for a patent was filed, and which was never exercised, except to a very limited extent, is wholly insufficient to support the defense that the inventor abandoned the invention to the public. All must agree that he did not intend to dedicate it to the public, as his application for a patent was then pending in the Patent Office, and the evidence shows that he continued to press it, with confident hopes of success, until the adverse decision was announced. Nor does the record exhibit any evidence to show that the invention got into public use with the consent and allowance of the inventor, or through any negligence or improvidence on his part, as it appears that he visited the Patent Office as often as it was necessary, to ascertain whether the opinion of the Commissioner had undergone any change, and that he presented his second application for a patent as soon as he could obtain any hope of receiving a decision in his favor. No persons, except the two before mentioned, ever had authority from him to practice the invention, and the proofs show that all others who did practice it before the date of the letters patent obtained their information, whether from rumor or otherwise, without the consent and allowance of the patentee.

Separate examination of the other foreign patents introduced by the respondent does not appear to be necessary, as the stress of the argument to show that the patentee in the patent of the complainant was not the original and first inventor of the improvement seems to rest upon the Durand patent, which the principal expert of the complainant says would not succeed with green corn, and he supports that conclusion with reasons which are both persuasive and convincing. Due attention to the nature of the invention in question and to its described mode of operation is all that is necessary to render the reasons given by the witness conclusive, as it is clear that the patent in the other case does not contain a word to indicate that the patentee ever thought of removing the kernels from the cob by means of a gaged knife, for the purpose of liberating the juices of the same, so that the kernels, as packed in the cans, would be cooked in their own juices when the cans are placed in the bath of boiling water. Sweet corn in the green state, as the witness testifies, is a peculiar substance, differing materially from any other cereal, seed fruit, or vegetable used as food. Its composition and structure are such that it is singularly susceptible to fermentative decompositions and changes, more so than any fruit or vegetable that has been successfully preserved in hermetically-closed packages for any considerable length of time. Such liability to rapid change is not due to any one particular constituent, but to the presence together of several substances, such as gluten, sugar, fat, and starch, in such proportions as are best adapted for fermentation and action upon each other. Its peculiar flavor, other than its sweetness, is contained in and associated with the fat or oil present, so that very slight fermentations of the other constituents are sufficient to destroy that peculiar aroma.

Green corn, of the kind mentioned, in common with other cereals, contains more phosphorus or phosphoric acid than fruits or other vegetables. As compared with sweet peas, for instance, the kernels of sweet corn are much more delicate and liable to change, as they contain a much larger proportion of milk, juice, or sap, which itself contains more sugar, starch, and oil than the juice of sweet peas, and the glutinous or nitrogenous constituent, which acts as the ferment or primary cause of change, is much more active in the juice of sweet corn than in that of sweet peas. Equally instructive support to the same view is derived by comparing sweet corn with such fruits as peaches, as the juice of the peach contains no oil, and the kernels of sweet corn contain only one-eighth as much water as the peach, besides other differences of an equally important character, showing that such fruits as peaches are much less liable to ferment than sweet corn, and that they are much more easily packed and preserved. Examined in the light of these suggestions, as the case should be, it is quite clear that the mode of operation described in the specification of the complainants' patent differed widely from anything which preceded it, and that it effects a new and highly useful result, and for these reasons the complainants are entitled to a decree for an account, and for an injunction.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

24,734.—*Machines for Making Paper-Bags.*—Granted to WILLIAM GOODALE, July 12, 1859. Hearing June 25, 1873.

24,748.—*Paint-Cans, &c.*—Granted to JOHN W. MASURY, July 12, 1859. Hearing June 25, 1873.

24,755.—*Method of Operating Windlasses.*—Granted to PETER PHILIP, July 12, 1859; reissued March 4, 1873. Hearing June 25, 1873.

24,772.—*Powder-Kegs.*—Granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., July 12, 1859; reissued January 6, 1863, and December 7, 1869. Hearing June 25, 1873.

24,773.—*Hollow Augers.*—Granted to ARCALOUS WYCKOFF, July 12, 1859; reissued March 13, 1866. Hearing June 25, 1873.

24,819.—*Mode of Heating Drying-Cylinders by Steam.*—Granted to ALBERT P. PITKIN, July 19, 1859. Hearing July 2, 1873.

24,838.—*Pumping-Engines.*—Granted to HENRY R. WORTHINGTON, July 19, 1859. Hearing July 2, 1873.

24,863.—*Sewing-Machines.*—Granted to E. A. GOODES and E. L. MILLER, July 26, 1859; reissued February 9, 1864. Hearing July 9, 1873.

24,905.—*Piano-Fortes.*—Granted to JOHN U. FISCHER, July 26, 1859. Hearing July 9, 1873.

24,915.—*Casting Copper Cylinders.*—Granted to FREEBORN ADAMS, August 2, 1859. Hearing July 16, 1873.

24,923.—*Elevators for Warehouses, Factories, Mines, &c.*—Granted to ALBERT BETTELEY, August 2, 1859. Hearing July 16, 1873.

24,947.—*Journal-Boxes.*—Granted to JOHN A. MONTGOMERY, August 2, 1859. Hearing July 16, 1873.

24,953.—*Meat-Cutters.*—Granted to JOHN G. PERRY, August 2, 1859. Hearing July 16, 1873.

24,963.—*Flour-Packers.*—Granted to SAMUEL TAGGART, August 2, 1859; reissued November 7, 1871. Hearing July 16, 1873.

24,987.—*Fishing-Reels.*—Granted to WILLIAM BILLINGHURST, August 9, 1859. Hearing July 23, 1873.

25,005.—*Governor-Valves.*—Granted to BENAIAH FITTS, August 9, 1859. Hearing July 23, 1873.

25,014.—*Machines for Cutting Out Wooden Ware.*—Granted to GEORGE R. HAY, August 9, 1859. Hearing July 23, 1873.

25,015.—*Wood-Saw Frames.*—Granted to JAMES HAYNES, August 9, 1859; reissued August 25, 1863. Hearing July 23, 1873.

25,017.—*Steam-Boilers.*—Granted to ROBERT HOOPER, August 9, 1859. Hearing July 23, 1873.

25,036.—*Post-Marking Stamps.*—Granted to MARCUS P. NORTON, August 9, 1859. Hearing July 23, 1873.

25,061.—*Elevator or Hoisting Apparatus for Hotels, &c.*—Granted to OLIS TUFTS, August 9, 1859. Hearing July 23, 1873.

25,071.—*Roof for Railroad Cars.*—Granted to A. P. WINSLOW, August 9, 1859; reissued August 8, 1865. Hearing July 23, 1873.

25,115.—*Self-Acting Wagon-Brake.*—Granted to BENJAMIN S. HEALY, August 16, 1859. Hearing July 30, 1873.

25,148.—*Weighing-Scales.*—Granted to FRANCIS M. STRONG and THOMAS ROSS, August 16, 1859. Hearing July 30, 1873.

25,149.—*Blanks for Shoe-Pegging Machines.*—Granted to BENJAMIN F. STURTEVANT, August 16, 1859; reissued June 12, 1866. Hearing July 30, 1873.

25,153.—*Carding-Engines.*—Granted to SAMUEL WETHERED, August 16, 1859. Hearing July 30, 1873.

25,166.—*Iron Fences.*—Granted to JOHN B. WICKERSHAM and HENRY JENKINS, August 16, 1859. Hearing July 30, 1873.

25,167.—*Mode of Lighting Gas by Electricity.*—Granted to ARCHELAUS WILSON, August 16, 1859. Hearing July 30, 1873.

25,183.—*Nail-Machines.*—Granted to DANIEL DODGE, August 23, 1859. Application filed May 23, 1873. Hearing August 6, 1873.

25,191.—*Machines for Making Paper-Bags.*—Granted to WILLIAM GOODALE, August 23, 1859. Hearing August 6, 1873.

25,199.—*Feeding Paper to Printing-Presses.*—Granted to RICHARD M. HOE, August 23, 1859; reissued June 30, 1871. Hearing August 6, 1873.

25,235.—*Manufacture of Iron.*—Granted to BERNARD LAUTH, August 23, 1859. Application filed May 22, 1873. Hearing August 6, 1873.

25,237.—*Horizontal Wheels.*—Granted to ABRAHAM ANDREWS and HARRISON KALBACH, August 30, 1859. Application filed May 28, 1873. Hearing August 13, 1873.

25,239.—*Elastic Hose Tubing*, granted to JOHN C. BOYD, August 30, 1859. Application filed May 29, 1873. Hearing August 13, 1873.

25,309.—*Nail Machines*, granted to DANIEL DODGE, August 30, 1859. Application filed May 31, 1873. Hearing, August 13, 1873.

25,343.—*Stoves.*—Granted to EDWARD M. MANIGLE, September 6, 1859. Application filed June 5, 1873. Hearing August 20, 1873.

25,344.—*Machines for Wiring the Joints of Clothes Pins*, granted to ALVIN C. MASON, September 6, 1859. Application filed May 31, 1873. Hearing, August 20, 1873.

25,364.—*Watches.*—Granted to CHARLES E. JACOT, September 6, 1859. Hearing August 20, 1873.

25,373.—*Machines for Making Paper Boxes.*—Granted to SILAS B. TERRY, September 6, 1859; reissued May 17, 1870. Application filed June 5, 1873. Hearing August 20, 1873.

25,395.—*Heels for Boots and Shoes.*—Granted to SIMEON DODGE, Jr., and BENJAMIN POTTER, Jr., September 13, 1859. Application filed June 13, 1873. Hearing August 27, 1873.

25,434.—*Cotton-Scrapers.*—Granted to JONATHAN H. MITCHELL, September 13, 1859. Application filed June 10, 1873. Hearing August 27, 1873.

25,442.—*Boilers and Steamers.*—Granted to DANIEL R. PRINDLE, September 13, 1859. Application filed June 13, 1873. Hearing August 27, 1873.

25,443.—*Seeding-Machines.*—Granted to SILAS G. RANDALL, September 13, 1859; reissued May 25, 1869. Application filed June 11, 1873. Hearing August 27, 1873.

25,747.—*Method of Combining Emery with Caoutchouc.*—Granted to THOMAS J. MAYALL, October 11, 1859. Application filed June 16, 1873. Hearing September 24, 1873.

25,473.—*Scales*, granted to ANDREW TURNBULL, September 13, 1859. Application filed May 31, 1873. Hearing, August 27, 1873.

25,484.—*Grain-Separators.*—Granted to JONATHAN L. BOOTH, September 20, 1859; reissued September 25, 1860, and November 29, 1864. Application filed June 14, 1873. Hearing September 3, 1873.

25,499.—*Railroad-Car Seat.*—Granted to ELI WHEELER, September 20, 1859. Application filed June 17, 1873. Hearing September, 3, 1873.

25,506.—*Lamps.*—Granted to HALVOR HALVORSON, September 20, 1859; reissued June 6 and December 5, 1871. Application filed June 6, 1873. Hearing September 3, 1873.

25,544.—*Try-Cocks for Steam-Boilers.*—Granted to JOHN F. COOK, September 20, 1859. Application filed June 10, 1873. Hearing September 3, 1873.

25,570.—*Mode of Arranging Couches in Railroad Cars*, granted to EDWARD C. KNIGHT, September 27, 1859. Application filed May 31, 1873. Hearing, September 10, 1873.

26,243.—*Water-Closet Basins.*—Granted to WILLIAM BOCH, Sr., November 29, 1859. Application filed June 10, 1873. Hearing November 12, 1873.

30,201.—*Apparatus for Freezing Liquids.*—Granted to FERDINAND PHILIPPE EDOUARD CARRÉ, October 2, 1860; reissued in two divisions February 18, 1873. Patented in France August 24, 1859. Application filed May 17, 1873. Hearing August 13, 1873.

EXTENSIONS GRANTED.

24,367.—*Improved Ore-Separator*, granted to WILLIAM OLAND BOURNE, June 14, 1859.

Claim.—1. A sieve-bed in which the openings or perforations for the passage of the air or water through it are so contracted as to enforce a uniform action of the air or water through the entire surface of the sieve-bed, which may be made of sheet metal, or of any textile material, either separately or in combination, or of their equivalent, as above set forth.

2. The application of a vibrating and shaking motion to a sieve-bed, in combination with a blast or current of air or water, in the manner and for the purpose above described.

3. The above-described adjustable blades for agitating the substance on the sieve-bed, and for regulating the discharge of the refuse substances over the front edge of the table, as above described.

4. The separation of metals or other heavy substances from ores or other materials, when fed upon a sieve-bed, by the gravitation of the lighter substances toward and over the front or waste edge, when acted upon by a current of air or water through a sieve-bed, in the manner and for the purpose above set forth.

24,402.—*Improved Steam-Pressure Regulators*, granted to ALBERT P. PITKIN, June 14, 1859.

Claim.—1. The forming a connection with the reduced pressure pipe or chamber A and diaphragm spring or piston B, (or their equivalents,) for the purpose of opening and closing a passage, C, between the high and reduced pressure pipes or chambers A and D, as and for the purpose described.

2. The combination of passage C, piston or valve E, rod I, lever F, diaphragm spring or piston B, and safety-valve H, arranged to operate in relation to each other, as and for the purpose described.

24,428.—*Improvement in Trip-Hammers*, granted to BENNET HOTCHKISS, June 14, 1859.

Claim.—1. The improved means of operating the hammer—that is, by an air-spring cylinder, substantially as described, (or its equivalent,) applied to the piston, and combined with mechanism by which a rapid reciprocating rectilinear motion may be imparted to such cylinder, essentially in manner and so as to operate the piston and hammer, as specified.

2. In combination with the piston trip-hammer, the air-spring cylinder and the mechanism for imparting to the latter reciprocating rectilinear motions, as described, mechanism, substantially as specified, for varying the altitude of the path of movement of the cylinder under circumstances as explained, such mechanism, as above described, consisting of an eccentric bearing-shaft, H, applied in boxes I I and to the crank-shaft G of the cylinder B, substantially as specified.

24,432.—*Improvement in Rolling Metal for Jewelry*, granted to JOHN S. PALMER, June 14, 1859.

Claim.—The employment of a tapering die, A, in combination with the pressing-roller, substantially as and for the purpose specified.

24,436.—*Improvement in Railroad Bars*, granted to HENRY WEBB, June 14, 1859.

Claim.—The angular rail hereinabove described, when constructed so as to be convertible and present a new surface after the first surface has been worn out, in the manner and for the purposes above specified.

DISCLAIMERS FILED.

24,367.—WILLIAM OLAND BOURNE, New York, N. Y.—*Improved Ore-Separator*, dated June 14, 1859. Disclaims:

"That part of the claims in said specification which is in the following words, to wit:

'*Claim.*—1. A sieve-bed in which the openings or perforations for the passage of the air or water through it are so contracted as to enforce a uniform action of the air or water through the entire surface of the sieve-bed, which may be made of sheet metal or of any textile material, either separately or in combination, or of their equivalent, as above set forth.

'4. The separation of metals or other heavy substances from ores or other materials, when fed upon a sieve-bed, by the gravitation of the lighter substances toward and over the front or waste edge, when acted upon by a current of air or water through a sieve-bed, in the manner and for the purposes above set forth.'"

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date June 10, 1873.]

6,699.—*Ale-Pump.*—STEPHEN LANE, Jr., Englewood, N. J.—Case A. Application filed May 16, 1873.

6,700.—*Ale-Pump.*—STEPHEN LANE, Jr., Englewood, N. J.—Case B. Application filed May 16, 1873.

6,701.—*Cooking-Stove.*—GARRETTSON SMITH and HENRY BROWN, Philadelphia, assignors to ENOS S. SHANTZ and OLIVER B. KEELEY, Spring City, Pa. Application filed May 17, 1873.

6,702.—*Cape.*—MARTIN LANDENBERGER, Philadelphia, Pa. Application filed May 8, 1873.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date June 10, 1873.]

1,299.—*Druggists' Goods.*—ARNOLD & MCNARY, New York, N. Y. Application filed June 2, 1873.

1,300.—*Whisky.*—J. BUMGARDNER & SONS, Staunton, Va. Application filed April 3, 1873.

1,301.—*Hog Products.*—G. CASSARD & SON, Baltimore, Md. Application filed May 27, 1873.

1,302.—*Medicines.*—SARAH DE GRATH, Jersey City, N. J. Application filed May 24, 1873.

1,303.—*Stoves, Heaters, and Ranges.*—HICKS & WOLFE, Troy, N. Y. Application filed May 19, 1873.

1,304.—*Silicias, and Goods of Like Character.*—LESHER, WHITMAN & CO., New York, N. Y. Application filed May 24, 1873.

1,305.—*Cured or Smoked Fish.*—HENRY MAYO & CO., Boston, Mass. Application filed May 31, 1873.

1,306.—*Flavoring Extracts, &c.*—STEELE & PRICE, Chicago, Ill. Application filed April 8, 1873.

1,307.—*Fruit-Jars.*—THE CONSOLIDATED FRUIT-JAR COMPANY, New York, N. Y., and New Brunswick, N. J. Application filed May 31, 1873.

1,308.—*Fruit-Jars.*—THE CONSOLIDATED FRUIT-JAR COMPANY, New York, N. Y., and New Brunswick, N. J. Application filed May 31, 1873.

1,309.—*Books.*—DWIGHT C. CUTLER, Carthage, Ill. Application filed May 24, 1873.

1,310.—*Raisins.*—FREDERICK C. LEWIS, Trenton, N. J. Application filed May 31, 1873.

1,311.—*Plug Chewing-Tobacco.*—LIGGETT & MYERS, St. Louis, Mo. Application filed May 13, 1873.

1,312.—*Cod-Liver Oil.*—HERBERT M. ROGERS & Co., New York. N. Y. Application filed May 31, 1873.

1,313.—*Medical Compound.*—E. M. TUBBS & Co., Manchester, N. H. Application filed May 31, 1873.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date June 10, 1873.]

ORIGINAL PATENTS.

139,645.—*Coffee-Steeper.*—JOSEPH D. ADNEY, Chicago, Ill. Application filed March 26, 1873.

Near the the top of the vessel, on the inside, is a detachable annulus or annular diaphragm depressed toward the center, and in the central openings are downwardly-bent demilunes cut from and of the size of said openings.

Claim.—The construction and arrangement of the vessel A provided with a perforated bottom, and an inclined diaphragm, B, provided with the two pendent demilunes *b*, substantially as and for the purpose set forth.

139,646.—*Process of Reducing Wood-Fiber to Pulp.*—THOMAS B. ARMITAGE, New York, N. Y. Application filed March 16, 1872.

Claim.—The above process of disintegrating woody fiber, wherein the woody matter in a revolving vessel is subjected to heat in the form of free steam without pressure, substantially as described.

139,647.—*Flush-Bolt for Doors.*—STEPHEN D. ARNOLD, New Britain, Conn., assignor to P. & F. CORBIN, same place. Application filed May 2, 1873.

The thumb-piece of a flush-bolt is hinged to the bolt proper, and a spring applied within the shank near the joint, between the thumb-piece and the bolt. There is also a hook at the end of the thumb-piece, which catches either at one side or the other of a lug or block formed on the back of the bolt. By this construction the hinged thumb-piece must be pressed back before it can be moved vertically, and the hook engaging on either side of the lug holds the bolt either in projected or retracted position.

Claim.—The thumb-piece *f*, with the hook *s* at the end thereof, in combination with the spring *u* within the bolt-shank *e*, and the block *r* at the back of the plate *a*, in which plate *a* is an opening for the rib *o* of the thumb-piece *f*, as set forth.

139,648.—*Spring-Clip for Carriages.*—DAVID W. BAIRD, Geneva, N. Y. Application filed January 9, 1872.

A spring-clip having a socket for the reception of the front end of the reach.

Claim.—The clip A having a socket for the perch, substantially as shown.

139,649.—*Manufacture of Spiegeleisen.*—EDWARD BAKER, Millstone, N. J. Application filed April 30, 1873.

Seven parts of the residuum (left from manufacture of oxide zinc from Sussex county, New Jersey, ore) are added to one part iron ore, (magnetite,) and the whole worked in a blast-furnace. Former processes have yielded spiegeleisen in proportion of twenty-seven per cent. of the residuum treated. By the present process thirty-five per cent. is obtained.

Claim.—The process for obtaining spiegeleisen by smelting the residuum of the zinc or like ores which contain Franklinite iron in admixture with ordinary iron ore, substantially as described.

139,650.—*Double-Acting Pump.*—PHILANDER M. BARKER, Grand Haven, Mich. Application filed March 8, 1873.

Above the piston is placed a stationary diaphragm, through a central opening in which passes the hollow piston-rod. The diaphragm consists of two parts, having an annular space between them, divided into two chambers. The chamber on one side connects with numerous perforations in the cylinder, and communicates with the space between the diaphragm and piston through a segmental valve opening downward. The other chamber controls the communication between the space just referred to and the upper part of the cylinder by means of a segmental valve opening upward.

Claim.—The construction and arrangement, with relation to the cylinder A and check-valve B, of the piston C provided with the valve D and hollow piston-rod E, and the diaphragm-plug G G', provided with the partitions *c c*, passages *d d' d''*, and valves H H', arranged, with relation to the apertures *e* in the cylinder, as and for the purpose set forth.

139,651.—*Tap and Die.*—ALBRECHT E. BARTHEL, Detroit, Mich., assignor to himself and ALEXANDER B. BARY, same place. Application filed February 18, 1873.

A shallow groove is turned in the bottom of all the threads save those near the head, which are left for a distance equal to the thickness of the nut to be tapped. The fin that is left by these grooves in cutting a nut is finally removed by the ordinary threads near the head. Near the point of the tap every alternate projection or thread is reduced to lessen the friction when in use.

Claim.—1. A tap having the grooves *a* cut or turned in the bases of its threads, substantially as herein described and shown, and for the purpose set forth.

2. A tap having the alternating cutting-segments *b* near its points reduced in diameter, substantially as and for the purposes herein shown and specified.

3. A screw-cutting die having a groove, *a*, cut in the bases of its threads, substantially as and for the purpose set forth.

139,652.—*Quill-Bobbin for Spinning-Machines.*—DAVID RASS, Jr., Woonsocket, R. I. Application filed May 16, 1873.

The plugs, besides forming bushings against which the spindle bears, also prevents the ends of the bobbin being indented, roughened, or split from rough usage.

Claim.—A quill-bobbin provided with a thin tubular body, and at either or each end thereof with a protection crown-bushing, of horn or other proper hard material, so applied to the body as to extend into it and project over and upon and cover the end thereof, all substantially as described and represented.

139,653.—*Paper-File Box.*—JOHN H. BENTLEY, Cambridge, Mass. Application filed April 21, 1873.

One end is hinged to the bottom and provided with supplemental inner sides. Its outward motion is arrested by a wire that encircles it, the ends of which terminate in stops loosely incased in the sides of the box.

Claim.—In combination with the paper-file box A, with hinged end B, wing pieces D D', the bent wire E, its ends terminating in curved arms H H' with catches P P', and operating in conjunction with cases T T, when constructed, combined, and arranged to operate substantially in the manner described, as and for the purposes set forth.

139,654.—*Apparatus for Testing Hydrocarbon-Oils.*—JOHN B. BLAIR, Philadelphia, Pa. Application filed November 21, 1872.

Two reservoirs having vertical tubes are employed. One is filled with standard oil and the tube closed at 215° Fahrenheit, forming a thermometer. The other tube is left open and filled with the oil to be tested to the same height as the thermometer. The reservoirs are immersed in boiling water. Based on the theory that oils of different gravities expand unequally.

Claim.—The testing apparatus, consisting of the bottle A with closed tube E, as described, and the bottle B with open tube F, in connection with the graduated support B, all arranged, adapted, and operating as herein set forth.

139,655.—*Railroad-Car Axle-Box.*—RUSSELL BREWER, New York, N. Y. Application filed May 18, 1872.

The axle-box is provided with journals upon its sides; also a concave top, a concave seat being secured to the sill. Anti-friction rollers are arranged about the journal. The inner sides of the box are so formed that it will afford a large surface between the rollers and the box to retain oil to lubricate the journal. A roller, its journals revolving in spring-boxes, conveys oil from the lower part of the box to the journal.

Claim.—1. The axle-box C, provided with the journals *b b*, arranged at right angles with the car-wheel journal, and having the convex bearing-seats *c* and convex rib *e*, substantially as specified.

2. The journal bearing-block G, having concave bearing-faces *z*, recess *w*, and slot *v*, in combination with a journal-box, substantially as specified.

3. The combination of the upper section E, lower section or oil-reservoir B, and journal bearing-block G, arranged as specified.

4. The combination of the axle-box C, having the concave lubricating-faces *t*, rotating oil-cylinder D, anti-friction rollers *c*, all of the same diameter, and arranged and operating in the manner set forth.

139,656.—*Device for Steaming Oil-Wells.*—THOMAS B. CAROTHERS, Oil City, Pa. Application filed August 27, 1872.

The supplemental pipe through which steam is forced extends below the tubing, and is perforated from near the top of the sand-rock down to within about three feet of the bottom of the well.

Claim.—The steam-pipe D having perforations *a a a a*, in combination with the casing-head A, casing B, and tubing C, all constructed and arranged to operate substantially in the manner set forth.

139,657.—*Platter for Sewing-Machines.*—ORANGE M. CHAMBERLAIN, New York, N. Y., assignor to himself and WILLIAM B. CARRINGTON, same place. Application filed September 13, 1872.

Attachment is capable of forming plaits inclined or at right angles to the length of the material, and has its slide-bearings and screws so constructed that the position of the blade may be varied at will without detaching the parts from the sewing-machine.

Claim.—1. The slide-bearings *i* sustaining the plaiting-blade in an inclined position to the line of the sewing-machine feed, in combination with the mechanism, substantially as set forth, for reciprocating the said bearings and blade, as set forth.

2. The screws *5*, entering cavities in the bearings *i i*, in combination with the plaiting-blade, substantially as set forth, so as to vary the position of that plaiting-blade.

3. The presser-foot *w*, connected to the socket *s* by a slot and screw, in combination with the adjustable plaiting-blade, so as to vary the position of the presser-foot to suit that of the blade, as set forth.

4. The long roller *r*, having a roughened surface and sustained upon the presser-foot *w*, in combination with the plaiting-blade to compress the fold of the plaited goods and move the same along with uniformity, as set forth.

139,658.—*Reciprocating Churn.*—GEORGE P. COAN, Wyandotte, Mich. Application filed March 8, 1873.

Within the main churn-body, vertically arranged, is a hollow and perforated smaller cylinder, concentrically held by end flanges, the upper flange proceeding from a central descending collar sliding telescopically upon the smaller cylinder, thus adapting it to outer cylinders or churn-bodies of different lengths, a disk dasher working vertically in the inner cylinder, through the perforations of which the cream passes in and out.

Claim.—In churns, the perforated and adjustable cylinder B, provided with flange *a* and cap *d*, the latter being also provided with flange *h*, as described, and for the purposes set forth.

139,659.—*Spark-Arrester.*—ALONZO W. CRAM, Litchfield, Ill. Application filed October 30, 1872.

Claim.—1. In combination with the smoke-stack A, the air-funnel F and central air-flue H *h*, arranged substantially as and for the purpose set forth.

2. The combination of the smoke-stack A, chambers A^2 and G, air-funnel F, and central air-flue H *h*, substantially as and for the purpose set forth.

3. The combination of the smoke-stack A, dust-receiver B, deflector C, gauze diaphragm D, funnel F, chambers A^2 and G, and central air-pipe H *h*, all arranged substantially as set forth.

4. The combination, in a locomotive smoke-stack, of the pivoted deflecting-plates I, connected by the rod *i'* and arms *i*, and arranged to operate automatically by means of a vane, J, substantially as set forth.

139,660.—*Railroad-Rail Joint.*—WILLIAM CRANDELL, Westfield, N. Y. Application filed December 19, 1872.

Claim.—The sides of a web of a railroad rail provided at each end with the series of V-shaped threads or serrations *b b b*, in combination with fish-plates having corresponding threads or serrations *a a a*, as herein shown, for the purpose specified.

139,661.—*Wheel for Vehicles.*—GEORGE J. CROSS, Greenwich, England. Application filed April 8, 1873.

The segments are cast with screw-bolts projecting therefrom, by which they are secured to the rim or felly.

Claim.—The segments *s* of metal, bolted to the felly or rim *n* of the metallic wheel *l m n*, as and for the purposes specified.

139,662.—*Wood Block for Flooring.*—FRANK DOUBRAVA and JOHN STAIB, Hartford, Conn. Application filed April 18, 1872.

Claim.—As a new article of manufacture, a flooring-block composed of the two cross-pieces *a a* mortised together, and the

four V-shaped pieces *b b b b*, the whole tongued and grooved together, substantially as described.

139,663.—*Carriage-Curtain Fastener.*—HOWARD DRAKE, Attleborough, Mass. Application filed October 26, 1872.

A pivoted button having a catch-lug is used in connection with a pair of connected disks, slotted to receive said button.

Claim.—1. The pivoted carriage-button A having the lug B, in combination with a metallic disk or disks, C, having the eye *d* and slot *d'*, substantially as specified.

2. The carriage-button A with the flat base *a*, and provided with the lug B projecting at the outer end, as described.

139,664.—*Apparatus for Treating Ores, Sulphurets, Animal Matter, Paints, &c.*—HENRY H. EAMES and CHARLES J. EAMES, New York, N. Y. Application filed May 31, 1873.

By subjecting a continuous stream of the material to be treated in thin stratums upon descending alternate diaphragms, with an ascending current of heated air or superheated steam, condensing the material eliminated in any suitable manner.

Claim.—1. The apparatus herein described for treating ores, animal matter, white lead, and other precipitated pigments, the same consisting of an outward vertical case, having within it a series of shelves and rakes or stirrers, so as to agitate the material and move it from the upper to the lower shelves, as and for the purpose set forth.

2. The combination of the vertical case, having alternate shelves and stirrers, with the exhaust-fan and condensing apparatus.

3. The combination of the furnace arranged so as to inclose the treating-case, and transmit the products of combustion through it, with the draft or blast apparatus, and the condensing apparatus, all substantially as specified.

139,665.—*Feed-Water Heater.*—CHARLES E. FRAZIER, Baltimore, Md. Application filed February 6, 1873.

The exhaust steam passes through a branch pipe which enters the bottom of the heater, and up a central pipe perforated at its upper end. The condensing-water enters through the top of the case and passes through perforated or grated plates and condenses the steam, at the same time heating the feed-water, which is withdrawn at the bottom. Any uncondensed steam passes through a branch pipe at the top connecting with the main pipe.

Claim.—The heater A, having the plates E E', surrounding the perforated pipe D, in combination with the main exhaust pipe B, branch exhaust-pipes C and F, deflectors H, and feed-pipes G and G', substantially as and for the purpose herein set forth and described.

139,666.—*Reed-Organ.*—LEVI K. FULLER, Brattleborough, Vt., assignor to J. ESTEY & COMPANY, same place. Application filed March 3, 1873.

A single movement of the lever throws the bellows-pedals out of action when the auxiliary bellows-handle is to be operated. There is also special construction of the pedal and manual coupler connections.

Claim.—1. In a reed-organ provided with blow-pedals *b b*, the lever A, applied to the blowing apparatus, in combination with stop mechanism by which it may be thrown into or out of action, substantially as set forth.

2. The bar F, links C C, and block B, in combination with the lever A, substantially as and for the purpose herein set forth.

3. The levers E E', in combination with the rods *t u* and keys *h i*, substantially as described.

4. The reeds J, arranged below the foundation-board, in combination with the projecting valves *v* and rods *u*, substantially as herein set forth.

5. The combination of the levers *m*, tracker-pins *s s'*, and pivoted bar D, arranged and operating substantially as described.

139,667.—*Bit-Stock.*—ALBERT D. GOODELL, Miller's Falls, Mass., assignor to MILLER'S FALLS COMPANY, same place. Application filed April 30, 1873.

The bit holder is swiveled on a square notched ratchet. The pawl is correspondingly square, with one side beveled, and is made to rotate, and by its position will carry the stock in either direction, or it may be permanent therewith to operate the tool, as in ordinary holders.

Claim.—The combination, with a tool-holder, of a series of ratchets or recesses, *a c*, and a pawl or latch, *b*, so constructed that the tool can be rotated in either direction and locked stationary to the handle by the same pawl or latch, substantially in the manner and for the purposes described.

139,668.—*Riding-Saddle.*—ROBERT C. HAMIL, Harrisville, Tex. Application filed October 8, 1872.

Claim.—A saddle-tree constructed with a longitudinal arched handle, B, in the center and on top of the front tree, and the vertically-arched handles C C in the front of the front tree, either worked out of the solid wood of the tree or made separately and afterward attached to the saddle-tree, as and for the purpose described.

139,669.—*Road-Scraper.*—DANIEL S. HAMILTON, Elmira, N. Y. Application filed February 10, 1873.

The scraper is suspended by chains directly from the axle, and is elevated by clutching the wheels to the axle so that both turn together. A ratchet and pawl retain the load in a raised position, and when it is desired to lower the scraper the detent is released.

Claim.—1. A road-scraper suspended directly from the axle of a two-wheel carriage, and elevated or lowered by winding or unwinding chains or ropes, that are attached directly to the carriage-axle.

2. A road-scraper constructed with two half-bottoms, each hinged a little off its center, so that the contents thereof may be emptied without overturning the scraper, substantially as herein described.

3. The combination of the spring-lever D with the clutch *a*, ratchet *b*, and the axle C, for elevating the scraper by winding the chains by which it is suspended directly upon the axle of the carriage, substantially as described.

4. The releasing mechanism herein described, consisting of the combination of a spring-lever catch with a fixed ratchet-wheel upon the axle of the carriage, so that when the catch is lifted out of the wheel the scraper may descend by its gravity to the ground.

139,670.—*Composition for Filling the Grains of Wood.*—WILLIAM HARDING, Brooklyn, N. Y. Application filed January 8, 1873.

Whiting, twenty-one ounces; turpentine, six fluid-ounces; linseed-oil, one fluid-ounce; Japan goldsize, two fluid-ounces.

Claim.—The composition herein described for filling the grains of wood preparatory to applying color to the same.

139,671.—*Boot-Stretcher.*—DAVID HARRIS, Litchfield, Ill., assignor to himself and JOHN TREMLETT, St. Louis, Mo. Application filed February 12, 1873.

The stretcher is provided with a pivoted bottom plate for stretching the instep, a "hump" projecting up through the body of the stretcher, operated by a wedge-shaped lever for stretching any part from instep to toe. Also, a heel-plate adjusted by means of screw and lever. All of which may act jointly or separately.

Claim.—1. The bottom plate B, follower C, and hand-screw C', arranged and constructed to operate, in combination with body A of stretcher, substantially as and for the purpose set forth.

2. The bottom plate B, hump D, wedge-acting lever E, follower F, and hand-screw F', arranged and constructed to operate, in combination with body A of stretcher, as and for the purpose set forth.

3. The heel-plate G, hand-screw G', follower H, lever I, and side links I', in combination with bottom plate B and body A of stretcher, as and for the purpose set forth.

4. The combination and arrangement of bottom plate B, follower C, hand-screw C', hump D, wedge-shaped lever E, follower F, hand-screw F', heel-plate G, hand-screw G', follower H, connecting-lever I, side links I', and body A, all constructed to operate as and for the purpose set forth.

139,672.—*Corn-Planter.*—GEORGE HAYES, Lawrenceburg, Ind. Application filed December 5, 1872.

A single wheel is mounted in a frame like a wheelbarrow, and the seed-box is mounted upon the frame to which it is hinged, a lever extending backward to the handles so that the feed-wheel in the bottom of the box can be thrown out of gear.

Claim.—The combination of the seed-box C, provided with a conical dropping-plate, *k*, with the tilting-lever *e*, standard F, and clamp *c*, substantially as and for the purpose specified.

139,673.—*Folding Table.*—FREDERICK W. HEUBLEIN, Hartford, Conn. Application filed September 16, 1872.

The two side rails and the two end rails are hinged to the four corner-posts. The table top is provided with cleats at each end, and these cleats have notches in them to receive the outer parts of the top of the corner-posts.

Claim.—The combination of the four corner-posts *a a¹ a² a³*, the two side pieces *b b'*, the two end pieces *c c'*, and the top *f*, having the cleats *f¹*, notched at *f²*, the whole constructed, arranged, and designed for use substantially as described, for the purpose set forth.

139,674.—*Cap Setting and Extracting Device.*—EZRA S. HOLMES, Grand Rapids, Mich. Application filed March 24, 1873.

Claim.—The bent handle or lever I I I and the movable guide-plug W, in combination with the hinged handle or lever I' and the extracting-point S, forming a portable cap-setting and cap-extracting pinchers, for the purpose and substantially in the manner described.

139,675.—*Bale-Tie.*—EDWARD P. JONES, Shell Mound, Miss. Application filed May 24, 1873.

Claim.—1. The bale-tie A, having a continuous and uncut wall, slots or openings B B', and the tongue C, having its outer section turned down so as to leave a shoulder or flange bearing, *c*, and an opening, *c'*, either with or without the wall A^4 being bulged, the whole being so constructed and relatively arranged that the tongue shall extend on such a plane with the side walls A^3 A^5 of the tie that the lateral slipping of the band off the tongue shall be prevented by said walls, and without any sections of the same being cut away so as to provide bearing-flanges for that purpose, substantially as described.

2. The bale-tie A having slots or openings B B', and the tongue C having shoulders or projections *c b*, either with or without the wall A^4 being bulged, the whole being so constructed, combined, and arranged as to permit of the fastening and retention of the band, substantially as described.

3. The bale-tie A, having a projection, *a'*, on its wall, as shown, slots or openings B B', and the tongue C, having shoulders or projections *c b*, either with or without the wall A^4 being bulged, the whole being so constructed, combined, and arranged as to operate substantially as described, as and for the purpose specified.

139,676.—*Curtain-Hook.*—HUBERT L. JUDD, Brooklyn, N. Y. Application filed May 14, 1873.

The lower end of the hook is constructed with a lip to set below the offset upon the plate, and with a teat to enter a recess in the plate; the parts are then united by a rivet. The ornament at the upper end of the hook is inclosed in a metallic frame having on its back a cylindrical teat, which passes through a hole in the hook and is spread out as an open rivet.

Claim.—1. The lip *e* and teat *i* upon the arm *d* in combination with the plate *a*, offset *c*, and rivet *l*, as and for the purposes set forth.

2. The curtain arm, hook, or band, made with an ornamental head attached by the sheet-metal back *r* and cylinder or tent *s*, as and for the purposes set forth.

139,677.—*Lady's Dress.*—HARRIET JUDSON and EMILY S. JUDSON, Brooklyn, N. Y. Application filed April 10, 1873.

The skirt is shortened or lengthened by tightening or loosening the draw-string around the edge of the yoke.

Claim.—A dress formed with the yoke A and gathering-strings *d d*, in combination with the skirt C C, substantially as and for the purposes set forth.

139,678.—*Manufacture of Springs for Watches and other Time-Pieces of Aluminium Compounds.*—FRED. ADOLPH LANGE, Glashutte, Saxony. Application filed October 25, 1872.

After the wire has been handled in the usual way by drawing and rolling, I submit it to the action of a peculiar kind of plane, and then, by stoning it, reduce it to any required size. The wire thus reduced is wound and pressed and heated until the steel is of a light blue color.

Claim.—1. The alloys of aluminium herein described, forming hair-springs for watches and other time-pieces.

2. The new manufacture herein described—that is to say, springs suitable for watches and other time-pieces made of compounds of aluminium tempered, annealed, and treated substantially as described.

139,679.—*Milking-Pail.*—GEORGE T. LINCOLN, Leominster, Mass. Application filed April 11, 1873.

The pail has a dishing cover, with a concave recess to receive the milk and an inlet for cleansing purposes; also, a strainer leading into the spout beneath another strainer located within the spout, so that the milk is strained twice. The pail is perfectly protected against dust, and the milk is not liable to spill when the pail is upset.

Claim.—1. In the milking-pail, the two strainers *s f*, the discharging-spout, and the dished cover B, combined and arranged as specified.

2. The dished cover B, made with the inlet or opening *h* and the milk-receiving recess or concavity *g*, arranged together, and with the strainer *e*, as set forth.

3. The milk-pail provided with the stationary cap B, the two strainers *s f*, the inlet *h*, and the milk-receiving cavity *g*, all arranged, with the pail body and spout, substantially as explained and represented.

139,680.—*Railroad Car.*—ISAIAH G. MACFARLANE, Wilkinsburg, Pa. Application filed April 12, 1873.

Improvement on patents of ISAIAH G. MACFARLANE, granted April 23, 1872, and September 17, 1872. An improved construction of the center brace and end passage of the car.

Claim.—1. The braces *z*, extending from the side rails *e* to the opposite bottom rail *a*, and mortised or let into each other, substantially as and for the purposes described.

2. The upper end rails *s*, extending from the sides of the car to and terminating at the sides of the through passage-way A^3, substantially as and for the purposes set forth.

3. The longitudinal truss-rods *k*, fastened to and in combination with the cross-rods *l*, substantially as and for the purposes described.

139,681.—*Machine for Beading Sheet-Metal Ware.*—CHARLES E. MARCHAND, Alliance, Ohio, assignor of one-half his right to THOMAS R. MORGAN, same place. Application filed April 11, 1872.

The cutters are adjusted for operating by the eccentric post which supports the plate to which they are attached.

Claim.—1. The combination of the eccentric post *h q* with the plate *m*.

2. The combination of the levers *a* and *c*, the rollers *e*, *d*, *v*, and *s*, the parts *o* and *w*, and the parts *i* and *e'*, for the purpose herein set forth.

139,682.—*Horse-Power.*—HENRY I. MARNETTE, Chicago, Ill. Application filed April 10, 1873.

Upon the bed-plate is bolted the hollow metallic column having enlarged base, within which is stepped a vertical spindle carrying a pinion at its lower end within the enlarged base, and a pulley at its top. The short vertical shaft is stepped in the bed-plate and carries a triple-cone gear. The spur-wheel, with a long sleeve slipped over the column with sweeps attached to its upper end.

Claim.—The construction and arrangement of the bed-plate A, column B, spindle C, pinion D, pulley E, shaft F, geared cone G, spur-wheel H, sweep I, spider J, platform K, internal gear L, and supporting-rollers *a*, substantially as and for the purpose set forth.

139,683.—*Reverberatory Furnace.*—HUGH MCDONALD, Pittsburg, Pa. Application filed February 27, 1873.

A series of coking-chambers are placed in front of the combustion-chamber. At the upper part of the coking-chamber jets of steam or water are admitted into the line of draft through perforated pipes, and pass with the gases evolved by a flue to a storage-chamber, and from thence to a perforated bridge, from whence they enter the combustion-chamber, mingling with cross-jets of air from a separate chamber in the bridge. Air is admitted into the storage-chamber to mingle with the gas, and air and steam into the rear and sides of the combustion-chamber to facilitate combustion.

Claim.—1. In combination with the coking-chamber or furnace, a steam or water pipe suitably arranged therein for supplying moisture to the smoke and gases evolved in the operation of coking, substantially as set forth.

2. In combination with a series of chambers, B^1 B^2, two or more in number, a pipe, *r'*, arranged transversely across the chamber B^2 at a suitable point for supplying air or steam to the smoke and gases of combustion at or near the point of their entrance into the said chamber, substantially as set forth.

3. In combination with a fuel-coking chamber, B, of a furnace of the class indicated, a smoke-flue or smoke-flues, *f'*, suitably arranged for conveying any desired portion of the smoke and gases from the coking-chamber out of the line of the draft, and causing them to re-enter again the line of the draft in a separate combustion-chamber, B^2, and at or near the fire-bridge, either directly or through an intermediate gas-holder, *g*, substantially as set forth.

4. The combination of case *k*, pipe or pipes k^1, and chambered fire-bridge, with openings thence into the combustion-chamber B^2, substantially as and for the purposes set forth.

5. The combination of the air-openings from the pipe *n'*, and the smoke-openings from the fire-bridge, arranged to discharge in close contiguity into the path of the flame from the combustion-chamber to the working-chamber, substantially as set forth.

6. The steam-pipe *i* and smoke-flues *f'* uniting and leading to the chambered fire-bridge, so as to discharge the smoke and gases of combustion intermingled with steam into the combustion-chamber, the combination being substantially as set forth.

7. The openings c^1 in the upper part of the chamber B^2, and registers c^2 for supplying air laterally to the fire in the chamber, substantially as set forth.

139,684.—*Stationary Wash-Tub.*—BERNARD MORAHAN, Brooklyn, assignor to himself, FRANK TEFFT, and GEORGE G. KELLOGG, New York, N. Y. Application filed November 8, 1870.

A tub is made of cast-iron of the ordinary form of stationary tubs. Within the front inclined side of the tub is placed a metallic corrugated wash-board, which is detachable and can be held in place by cleats.

Claim.—The removable wash-board B in combination with a stationary wash-tub, and with cleats *a* or their equivalents for sustaining the same firmly and allowing it to be introduced and replaced, as herein specified.

139,685.—*Stationary Wash-Tub.*—BERNARD MORAHAN, Brooklyn, assignor to himself, FRANK TEFFT, and GEORGE G. KELLOGG, New York, N. Y. Application filed January 16, 1873.

The tubs are made of earthenware, and set and held in frames of wood and metal with cement between them.

Claim.—1. In combination with the tubs A, the wooden or elastic top framing E, matched upon the edges of said tubs, as herein specified.

2. In combination with the tubs A with suitable top edgings, the supporting-frames B B', applied at or near the base of the tubs, and extending to or near the top edge of the tubs and to the floor at front and back, for the purpose herein specified.

3. In combination with the tubs A and supporting-frames B B, the longitudinal bolts or braces G, and the up and down bolts H and I, binding the parts firmly together, as specified.

139,686.—*Electric Fuse.*—GEORGE M. MOWBRAY, North Adams, Mass. Application filed March 19, 1873.

A copper thimble surrounded with a gutta-percha covering has a chambered gutta-percha plug or cap, which carries the terminals of the insulated wires, and the explosive compound to be ignited by the spark, the whole being securely cemented together.

Claim.—1. The plug D with its priming-chamber and flange, substantially as described.

2. The insulated copper shell A B, substantially as described.

3. The combination of insulated wires C with the molded plug D, substantially as described.

4. The combination of the insulated wires C, the plug D, and the insulated copper shell, substantially as described.

139,687.—*Bell-Pull.*—WALLACE T. MUNGER, New Britain, Conn., assignor to P. & F. CORBIN, same place. Application filed April 12, 1873.

The bell-pull, by acting on an intermediate swinging segment-lever, at a point near its pivot or fulcrum, increases the range or throw of the bell-cord.

Claim.—1. The segmental pulley *m*, connected by the link *l* with the pull-lever *f*, and acting upon the chain *n* with an accelerated motion, substantially as and for the purposes set forth.

2. The side plates *b b*, with the gudgeons *a i* introduced within the mortise in the plate *a*, and receiving between them the pull-lever *f* and segmental chain-pulley, substantially as set forth.

139,688.—*Box for Spices, &c.*—EDWIN NORTON, Chicago, Ill. Application filed July 23, 1872.

The body of the box is a tube consisting of two or more thicknesses, formed by winding and cementing a continuous strip of paper or wood, and the ends are made of sheet metal pressed into the proper shape.

Claim.—The box herein described, consisting of a tube, A, of two or more thicknesses, formed by winding and cementing a continuous strip of paper or wood, in combination with the ends B, substantially as and for the purposes specified.

139,689.—*Extension-Ladder.*—JOSEPH PINE, Brooklyn, N. Y., assignor to EDWARD B. LEVERICH, same place. Application filed April 4, 1873.

The elevating-rope passes over a pulley, which is adjustable by means of nuts and a screw in order to keep the rope always taut under varying atmospheric conditions. The winding-barrel

is made with grooved fusees, and one barrel tapers slightly so that the slack of the wire rope may be fully taken up as the ladder is elevated. The cranks are mounted in hollow axles so as to push in and be concealed in recesses in the sides of the ladder and be out of the way when the ladder is handled.

Claim.—1. In combination with the wire-rope and extension-ladder, as described, the adjustable extension-rod G, cross-head H, and carrying-pulley F, substantially as described.

2. In combination with the wire-rope of an extension-ladder, the right-and-left-grooved barrel or fusee J and K, when made as described, and for the purposes hereinbefore set forth.

3. The method of securing the cranks N to the right-and-left-grooved barrel or fusee, by means of a slotted hollow axis and detent-pin, all made and operating substantially as described.

4. The recesses and holes S in the lower ends of the main ladder, in combination with the cranks N and slotted hollow axis, all arranged and operating for the purposes hereinbefore set forth.

139,690.—*Printing and Dial Telegraph and Circuit Therefor.*—HIRAM D. ROGERS, Cincinnati, Ohio. Application filed May 24, 1873.

Places Morse sounder and a printing or dial telegraph in same circuit and on same line. Printing-circuit thrown on automatically when in use, cut out when instrument not in use. Combines Morse key and letter-transmitter in one circuit-breaker.

Claim.—1. The arrangement, in one main-line circuit and upon one base, of the dial or printing telegraph instrument, a Morse receiving-instrument, and a circuit-breaking device, substantially as herein set forth.

2. The combination, with the flexible arm of the transmitter, of an anvil, so arranged that the transmitter serves either as a dial or printing transmitter, or as a Morse key, substantially as set forth.

3. In combination with a printing-telegraph, a circuit-breaker, operating the printing-circuit, arranged to keep such circuit broken at a designated point, substantially as set forth.

4. The combination, with the printing-magnet of a telegraph instrument, of the posts *q r*, spring *s*, and wheel *p*, substantially as set forth.

5. The circuit-breaking wheel *p*, having the point *x*, substantially as and for the purposes set forth.

6. The type-wheel having the numerals arranged upon its face below and in the relation to the letters thereon, substantially as set forth.

7. The method of constructing the type-wheel, substantially as set forth, by first forming the characters upon a flexible strip, which is then affixed to the type-wheel frame, as herein described.

8. A type-wheel formed by the union of a lettered strip of metal or other material and a frame, substantially as set forth.

139,691.—*Hub for Vehicles.*—GEORGE L. ROUSE, Cincinnati, Ohio. Application filed January 24, 1873.

The outer rim can be driven far enough under the flange to present an even surface on the end of the hub.

Claim.—The combination of the rim D and flange C, or their equivalents, when the latter overlaps the former, substantially as and for the purpose set forth.

139,692.—*Electrical Gas-Lighting Apparatus.*—JOHN VANSANT, San Francisco, Cal. Application filed February 3, 1873.

The gas-valve at the burner is operated directly by an electro-magnet whose helix is also employed in exciting a secondary induction-coil for igniting the gas by a spark. A permanent magnet is employed with the electro-magnet, so as to obtain both attraction and repulsion; and to preserve the permanent magnet from deterioration it is surrounded by a coil whose direction of current is never reversed. The apparatus, including the gas-burner, is insulated from the gas-pipe by an interposed tubular section of non-conducting material. By the use of a peculiar circuit-breaker and switch the battery-power is successively transferred to several series or districts of street-lamps.

Claim.—1. An electro-magnetic displacing-weight, g^8, combined with a catch for sustaining the raised weight, and an electro-magnet, g^{12}, for releasing it when desired, substantially as specified.

2. In combination with the helix surrounding an electro-magnet that opens by its immediate attraction, a mercury-valve or a slide-valve, substantially as shown, for admitting gas to a burner, a secondary induction-coil, arranged substantially as specified, for lighting the escaping gas.

3. The slide-valve f^5 with its armatures, combined with the poses f^9 f^{10}, constructed and operated substantially as specified.

4. The combination of an electric helix around a permanent steel magnet to prevent its demagnetization with an electro-magnet to produce motion by repulsion.

5. The combination of a gas-valve with an electro-magnet and a helix surrounding a permanent magnet, in such a manner that an electric current sent in a constant direction through the helix around the permanent magnet, and another current sent simultaneously through the coil of the electro-magnet, shall produce motion that will open or close the valve, according to the direction of the latter current.

6. In combination with an electric machine placed near a gas-burner to admit or exclude the gas, the use of an electrical insulator to prevent metallic connection between said machine and the gas-supply pipe, or any other non-insulated support.

7. In combination with an insulated electro gas-lamp, the use of an independent metallic connector to bring the said lamp into electric communication with the ground when required, substantially as specified.

8. In combination with one or more induction-coils, an electrotome having a permanent or electro-magnetic core, movable automatically within a fixed or adjustable electric coil, substantially as specified.

9. The headed pin e^4, attached to the axial bar e^3 and moving in the slot of the connecting-spring e^5, for rupturing the circuit, in the manner specified.

10. The combination of a source of dynamic electricity with an electrotome, an electrical switch, C, and two or more series of connected electric machines at street-lamps, for lighting or extinguishing the gas.

139,693.—*Valve or Cut-Off for Cupola and other Furnaces.*—WILLIAM H. WARD, Auburn, N. Y. Application filed November 7, 1872.

A cut-off valve of fire-clay in an iron frame is attached by bolts and screws to the outside of cupola and melting furnaces, so as to draw the metal in the same manner that molasses or other liquid is drawn from a cask.

Claim.—1. The combination, with the discharge-orifice of a melting-furnace or separate receiver, of a sliding cut-off gate, consisting of a composition or burned fire-clay valve or plug, L, and a metallic holding and operating frame, H, therefor, as herein set forth.

2. The adjustable fire-clay plug or valve L and receiving-frame H, combined with a spring, K, as and for the purpose set forth.

3. The independent or detachable receiving-frame A B, adapted for the reception of a composition or burned fire-clay bed-piece or discharge-tube, F G, and an adjustable fire-clay valve L, as described.

4. The bed-piece F G G′, secured within the openings in the plates A B by means of the beveled seats of the latter, constituting a clamping device, as set forth.

5. In a cut-off device for melting-furnaces, a removable fire-clay plug, valve, or stopper having a constant pressing adjustment upon its bed at right angles to its opening and closing movement upon the latter.

6. In such a cut-off device, the combination of a removable fire-brick clay plug or valve with a removable fire-brick clay bed, to effect the replacement of one or both when required.

7. An attachable cut-off device or gate for furnaces or furnace-ladles, as a new article of manufacture and trade.

139,694.—*Throttle-Valve for Locomotive and other Engines.*—HENRY WATKEYS, Syracuse, N. Y. Application filed March 28, 1873.

A throttle-valve, consisting of a main and adjustable supplemental valve, is arranged in a vertical branch of the dry-pipe, and is operated by a toggle-jointed lever connecting by a bell-crank lever with the valve, and by a rod projecting through the front of the boiler with the starting-lever.

Claim.—1. The combination of a throttle-valve, consisting of a main valve and an adjustable auxiliary or supplemental valve, with the dry-pipe of a boiler, constructed substantantially as specified.

2. The combination of a toggle-jointed lever with the main and auxiliary valves of a throttle-valve, when constructed and operating substantially as herein described.

139,695.—*Harvester-Cutter.*—SAMUEL H. WELLINGS and SIMON SOULES, Bridgeville, Mich., assignors to themselves and EDWARD Y. KELLEY, same place. Application filed July 15, 1872.

An endless chain cutter, composed of irregular triangular-shaped cutter-sections riveted to links which clasp the base of the triangle and which meet between the extremities of the base, so that the joint between the links and the cutter-sections shall not coincide.

Claim.—The herein-described endless-chain harvester-sickle, composed of the sickles A, constructed specifically as described, and link-bars A′, pivoted together as shown and set forth.

139,696.—*Nut and Washer Machine.*—WILLIAM R. WILBUR, Cleveland, Ohio. Application filed March 8, 1873.

The punch and cutter are operated alternately by means of levers worked by cams that are provided with side stubs for returning the punch and cutter to their original positions at the proper time. A finger is reciprocated across the dies to clean them from chips after each operation.

Claim.—1. The shaft *b*, cam *u*, spring-bar *w*, and cleaning device *y*, substantially as shown and described.

2. The shaft *b*, levers *c d*, cams *g*, studs *h*, and arms *i*, when combined with the slides *l*, and punches *n o*, substantially as specified.

139,697.—*Wheel for Vehicles.*—JACOB WOODBURN, St. Louis, Mo., assignor to WOODBURN SARVEN WHEEL COMPANY, Indianapolis, Ind. Application filed December 14, 1872.

The wedges prevent the spokes from being withdrawn and permit the spokes to be made of smaller pieces of timber than otherwise.

Claim.—The combination of the spokes, the flanged rings, and the transverse wedges, constructed independently of the flanges, substantially as and for the purpose described.

139,698.—*Molasses-Pitcher.*—HOMER WRIGHT, Pittsburg, Pa., assignor of two-thirds of his right to HENRY H. COLLINS and BENJAMIN F. COLLINS, same place. Application filed March 3, 1873.

The lid is connected with the top of the pitcher by a double hinge, so as to have a forward and backward, as well as well as an up and down, motion, and has a scraper attached to its front edge so as to draw the liquid left on the lip back into the vessel.

Claim.—1. A jug-top having a lid capable of a forward and backward, as well as an up and down, motion, substantially as and for the purpose described.

2. The compound hinge D and stop S, in combination with the lid and scraper, as and for the purpose described.

139,699.—*Water-Wheel.*—THOMAS J. ALCOTT, Mount Holly, N. J. Application filed February 19, 1873.

The walls of the casing are adjustable. The hub is made sectional and its lower portion forms the supporting-foot. The gate-ring has issues of differential series to admit of full-packed issues of water, whether using partial or entire capacity of the wheel.

Claim.—1. The walls, consisting of the shells F and adjustable plates F′, substantially as and for the purpose set forth.

2. The cast metallic hub, the lugs or rim P, rim L, and shaft S, combined and operating as herein set forth.

3. The concave rim, buckets, and encircling rim cast in one, in combination with the sectional hub, substantially as and for the purpose set forth.

4. The inner gate-ring E formed with issues H, constructed of differential series, respectively, H′ H″ H‴, in connection with the walls with chutes D′, equal to one issue of the series of the ring E, substantially as and for the purpose set forth.

139,700.—*Presser-Foot for Sewing-Machines.*—GEORGE W. ALLERTON and ZENAS M. POWERS, Robinson, Ill. Application filed May 5, 1873.

This presser allows the material to be turned easily in any direction about the needle.

Claim.—A rotating presser, whether of glass or other substance, connected with its supporting-arm by a hollow pivot, through which the needle works, substantially as specified.

139,701.—*Manufacture of Zinc-White.*—NATHAN BARTLETT, Bayonne city, assignor to himself and SAMUEL C. WEST, Elizabeth, N. J. Application filed April 19, 1873.

The batches being successively moved toward the chimney renders the working of the furnace continuous, and prevents the loss of heat which occurs when the furnace is stopped or the whole batch of spent ore removed at once. The shape of the furnace concentrates the heat the nearer it approaches the chimney.

Claim.—1. The chamber H, made widest at the mouth and tapering to the escape, as and for the purpose described.

2. The mode of working zinc-oxide furnaces by supplying the ore at the front from time to time, and shifting that contained in the furnace along toward the rear and removing the residuum thereat, as described.

139,702.—*Gas-Purifier Tray or Grating.*—JOHN L. CHEESMAN, New York, N. Y. Application filed May 23, 1873.

Insert transverse pieces of hard wood through the body of the tray.

Claim.—The improved tray described, composed of the grated board A *a*, with the transverse pieces B inserted through holes in the body of the same, and with the incorrodible pegs or nails C, arranged as herein set forth.

139,703.—*Glove-Fastening.*—DUNCAN A. COOPER, Worcester, England. Application filed April 22, 1873.

The clasp consists of a hollow body or shell having on the back part a stud at one end and a slot at the other. Two articles or two parts of one article may be united by passing the stud through a button-hole in one of them and engaging the slot with a hook or projection on the other.

Claim.—The improved solitaire glove clasp or fastening, comprising the back plate and front plate, formed, as described, with the hole *a b* in the back plate for engaging the button on one side of the slit, and the stud *d* for attaching it to the glove on the other side of the slit, substantially as specified.

139,704.—*Friction Attachment for Securing Pulleys to Shafts, &c.*—HENRY COX, Peterborough, Canada. Application filed April 5, 1873.

Claim.—The eccentrics D, applied in connection with the pulley B, to secure the pulley on the shaft or prevent its retrograde motion, substantially in the manner described.

139,705.—*Printing and Dyeing Fabrics.*—THOMAS CROSSLEY, Bridgeport, Conn. Application filed February 4, 1873.

Makes a solution of the gum and boiling alone, adding a cold solution of pipe-clay, and uses the mixture without further boiling, as specified.

Claim.—The process for preparing and compounding the base and colors used in printing woven and felted fabrics by mixing a cold solution of pipe-clay with solutions of gum and colors without boiling the compound before using, substantially as set forth.

139,706.—*Printed Pile Carpet.*—THOMAS CROSSLEY, Bridgeport, Conn. Application filed February 4, 1873.

The carpet is printed with colors having a friable base, made by boiling the gum solution and afterward adding cold pipe-clay solution in the proportion of twenty per cent. gum solution to eighty per cent pipe-clay, steamed in the ordinary way, and finally cleaned by whipping and brushing.

Claim.—The mode of manufacturing printed carpets by first applying the colors with a friable base, and then, after steaming, cleaning mechanically, substantially as set forth, so as to dispense with the necessity of washing.

139,707.—*Medical Compound for Liver Diseases.*—JOSEPH M. CUNNINGHAM, Mount Morris, Ill. Application filed May 17, 1873.

Socatrine aloes, five ounces; gentian, one-half ounce; quassia, one-half ounce; golden seal, one-half ounce; saffron, one-half ounce; capsicum, one-half ounce; gamboge, one dram; rhubarb, one-half ounce; alcohol, one quart; water, one quart; oil of sassafras, one dram; sugar, two pounds.

Claim.—The compound for the cure of liver and kindred diseases, consisting of the parts and in the quantities stated, and prepared substantially as specified.

139,708.—*Die for Pressing Hats.*—JASON DEMPER, Barre, Mass. Application filed April 25, 1873.

The hollow die is heated by steam passing through a pipe, around which the die is cast.

Claim.—A hat-die formed by casting the metal around a steam-pipe arranged in the mold, substantially as shown and described.

139,709.—*Potato-Digger.*—HENRY M. DOWD, Saratoga Springs, and WILLIS W. DOWD, Jr., North Granville, N. Y. Application filed April 19, 1873.

Claim.—The scraper combined with an evener and draft-bar suspended from the tongue, as and for the purpose described.

139,710.—*Match-Plane.*—JAMES EDWARDS, New York, N. Y. Application filed March 15, 1873.

The plane-stock has two adjustable fences and an adjustable plane-bit for varying tongues.

Claim.—The adjustable guide H, in combination with the piece E and iron C, as and for the purposes described.

139,711.—*Traction-Wheel.*—JOHN G. GALLET, St. Augustine, Ill. Application filed March 8, 1873.

The bolts by which the tread-plates are secured upon the elastic tire are hinged to the under side of the plates to allow of lateral movement.

Claim.—The combination, on a solid plate, A, of two rims, *a b*, the plates C, hinged bolts *d*, elastic washers *e*, and pins *f*, to hold the sectional rubber blocks of a wheel-tire, in the manner described.

139,712.—*Automatic Gate.*—CYRUS E. GILLESPIE, Edwardsville, Ill. Application filed March 22, 1873.

To the hinge-post, near the ground, is attached a plate having near its front end a stud, to the upper end of which is pivoted a short arm, through the middle of which passes a pin having a small pivoted wheel at its lower end. The upper end of this pin receives the eye of the lower hinge-strap. To the inner end of the pivoted short arm is a pin to receive the eyes on the inner ends of the operating-rods. A lever is hinged to the latch-lever and parallel thereto, and has a projecting pin, which, when inserted to the rear of a stop in the gate, prevents the latter from being opened by stock.

Claim.—1. The plate E, stud F, pivoted arm G, pin H, roller I, and pin K, in combination with the strap or bolt J of the gate, and with the post C and rods L, substantially as and for the purpose described.

2. The combination of the hinged lever S, pin T, and stop-piece V, with the pivoted levers P Q, weighted arm R, latches M N, and gate A, substantially as herein shown and described, and for the purpose specified.

139,713.—*Shoe-Lacing.*—JONES HARDING, Galesburg, Ill. Application filed October 15, 1872.

A wire is continuously curved and formed into alternate hooks and bases. The hooks are used for lacings, and the bases are secured to both sides of the slit of a shoe by means of elastic cords or bands.

Claim.—The continuous wire D when formed into a series of hooks, as described, and secured to the shoe by means of the elastic cords or bands I, in the manner and for the purpose specified.

139,714.—*Peach-Cutter.*—WILLIAM J. HILL, Fayetteville, Tenn. Application filed April 19, 1873.

The invention consists in the construction of a block on legs or uprights, to which is attached a sliding loop with a cap, and connected to a lever at its lower end pivoted to one upright, by which motion is given to force the peach upon tapering semi-tubes, which divide it, and the pit is forced through the tube and the peach, in parts, into the spout.

Claim.—The combination of the block G, sliding loop F, lever H, cutters C *c′*, spout E, and table A B, with each other, substantially as herein shown and described.

139,715.—*Relisher and Wedge-Cutter.*—WESLEY J. HOSKINS and AMOS D. ROWE, Essex, N. Y. Application filed May 17, 1873.

Two sets of circular saws are arranged in connection with a vibrating table in such manner that a forward movement of the table causes one set of the saws to cut the inner sides of the tenon, after which a vertical motion brings the other set of saws into operation, cuts the wedges, and, by bringing the material into contact with a stationary cutter, removes them, leaving the double-tenon complete.

Claim.—1. The combination of the gangs of saws D I, oscillating table F, and stationary cutters L, substantially in the manner described.

2. The swinging saw-frame E and oscillating table F, connected by arm H and rod G, substantially as specified.

3. The combination of rod O, treadle N, spring U, and pawl Z′, substantially as herein described.

139,716.—*Railroad Crossing.*—ROBERT J. HUGHES, Rynear, Ind. Application filed April 5, 1873.

In this class of crossings the crossing-rails are placed on a higher level than the main rails to avoid cutting the latter. A bearing-plate supports the wheel, which runs upon its flange in making the crossing. In this device the rail B⁹ is held against the main rail by a spring, except when pressed out by the flanges of a train upon the main line, said spring-rail being held in place by a pin attached to a support, which enters a horizontal perforation in the rail. The ties are notched to accommodate the main rails to a lower level than that of the crossing.

Claim.—1. The raised crossing-rails B, allowing the car-wheels to pass above main rails, in connection with the spring-rails B^2, flange-plate D, and guide-rail E, substantially as described.

2. The spring-rail B^2, having perforations, in connection with the pin *a*, and support *d*, as set forth.

3. The cross-ties C, formed with notches for keeping the main rails on the level of the track, as set forth.

139,717.—*Machine for Crimping Leather for Boots and Shoes.*—SAMUEL W. JAMESON, Newark, N. J., assignor to himself and WILLIAM J. DUDLEY, same place. Application filed May 20, 1873.

The crimping-jaws are formed with projecting beaks or points at their lower extremity, which are inwardly beveled, each jaw being provided with upwardly-curved corrugations upon their inner faces. A set of smoothing-jaws are arranged immediately above the crimping-jaws so as to receive the stock and remove the wrinkles which remain after the crimping process.

Claim.—1. The crimping-jaws, each formed with a projecting beak or point, and inwardly beveled on each side thereof, substantially as shown and described, so that when the jaws descend the material when first acted on shall hug the beaks or points only of the jaws without clinging to the beveled sides.

2. In a machine or apparatus for crimping leather for boot and shoe fronts, a crimping-jaw the acting face of which is provided between the toe and leg portions, and at the point where it crimps the leather over the bend in the tree or form, with upwardly-curved corrugations, arranged substantially as described, to concentrate or crowd the leather toward the heel or lower rear point of the boot-front during the descent of the jaw, substantially as herein shown and set forth.

3. A crimping-jaw for crimping boot and shoe fronts, formed with a projecting beak or point, and inwardly beveled on each side thereof, and provided with central upwardly-curved corrugations, with or without toe and leg corrugations, substantially as herein shown and described.

4. A crimping-jaw constructed with toe and leg portions, and with a central part provided with upwardly-curved corrugations, substantially as described, the said central part being of such relative dimensions to the toe and leg portions that, during the descent of the jaw, it will have traversed only about one-half the boot or shoe front when the toe and leg portions of the jaw are about to release or quit the same.

5. In a crimping-jaw for crimping boot and shoe fronts, the combination of the central upwardly-curved corrugations with toe and leg corrugations, formed substantially as shown and described, so as to divert from the heel or lower point of the front the material on each side of said central corrugations, for the purposes set forth.

6. In a crimping-machine, the combination, with the crimping-jaws, of finishing-jaws following said crimping-jaws and acting on the crimped front as it leaves the latter set of jaws, substantially as shown and described.

7. The finishing-jaws having such a contour as to fit or come in contact simultaneously at all points of their lower edges with the tree, or the crimped front thereon, and arranged immediately above the crimping-jaws to take hold of the crimped front before it is entirely released by the crimping-jaws, substantially as shown and set forth.

8. The finishing-jaws formed substantially as described, with toe and leg portions, which may be adjusted or set out more or less to conform to irregularities in the thickness of the crimped front.

9. In combination with the crimping-jaws and finishing-jaws, the hinged independent ways upon which said sets of jaws respectively slide, and the independent and separate systems of levers, connecting-rods, and weights, for drawing together said ways, substantially as shown and described.

10. The combination, with the finishing-jaws, of mechanism, substantially as described, for setting them at different distances apart, to accommodate different thicknesses of leather, and for maintaining their parallelism when thus adjusted.

11. The combination, with the crimping-jaws and their hinged ways, of independent hinged ways and finishing-jaws sliding thereon, the said crimping-jaws and finishing-jaws being so connected that while moving together up and down the jaws of either set may move laterally apart, independently of and without interference with the other set.

12. In combination with the finishing-jaws, jointed at their lower ends to their supporting brackets, the devices herein described for connecting the upper ends of said jaws to their brackets, and the levers whereby said devices may be operated to tilt the said jaws toward or away from each other as desired, substantially as and for the purposes shown and set forth.

139,718.—*Tobacco-Hanger.*—ELEAZER KENYSHALL, New Britain, Conn. Application filed March 24, 1873.

A strip or lath is provided with a series of clasps alternating on each side, by which the stalks of tobacco are held firmly without piercing the stem.

Claim.—The improved tobacco-hanger herein described, consisting of the strip C, in combination with a series of clasps, A, each of which is provided with arms *a a*, which pass each side of the stalk to hold it, and the tang or staple B, by which said clasps are secured to the strip C, all substantially as specified.

139,719.—*Curtain-Fixture.*—ALMON E. LAZELL, West Meriden, Conn. Application filed May 13, 1873.

The frame has an inclined plane or inclined slots, with which is combined a roller; between said roller and the frame the cord is held. A spring is also attached to the frame and presses the cord against the roller.

Claim.—1. In a curtain-holder, the roller 3 working in the inclined planes or slots of a suitable holding-frame, when arranged to operate substantially as shown and described.

2. The spring 5, arranged in a suitable frame, and combined with a roller working in an inclined plane or slot, substantially as set forth.

3. The frame 1, having the inclined slots 2 and legs 4, when constructed as specified, in combination with the roller 3, substantially as shown.

139,720.—*Reservoir Cooking-Stove.*—DENNIS G. LITTLEFIELD, Albany, N. Y. Application filed February 19, 1873.

The products of combustion can be directed into the upper part of the chamber containing the water-reservoir, whence they escape into the stove-flues about the oven, or they can be diverted entirely away from said reservoir-chamber.

Claim.—The auxiliary chamber A containing the reservoir B, when combined with the descending flue or flues G of a cooking-stove, in such a manner as to discharge the heated gases from the base of said chamber into the said flue or flues, and controlling the admission or exclusion of such gases to and from said chamber while operating the oven, by the dampers E E, substantially in the manner herein described.

139,721.—*Car-Starter.*—GEORGE LOWDEN, Brooklyn, N. Y. Application filed December 9, 1871.

The self-acting pawl, which is in combination with the loaded drum, engages with a ratchet secured to the car-axle.

Claim.—A car-starter capable of being used as a brake, by means of a draft bar or rod, E, provided with a hook, H, and controlled by the flexible band or rope C', pin *d*, lever *n*, when operated by the handle or crank F, in combination with the chain C, forming a part of the rod E, operating through loops S'' S''' loaded drum D, self-adjusting pawl P, and ratchet R, all located and operated below the bottom frame-work of the car for the double purpose, substantially in the manner as above set forth.

139,722.—*Box for Holding and Transporting Bottles.*—JOHN MATTHEWS, New York, N. Y. Application filed May 16, 1873.

Between the upper and lower side pieces spaces are left so as to expose the bottles to view and to give the transverse pieces, which receive the necks of the bottles and support the fluted bottle-receptacles, a firm support; these transverse pieces are in turn supported by a center-piece, which serves also to protect the necks of the bottles.

Claim.—1. The two series of partitions *e* and *d d*, arranged at right angles within the box, and bored or fluted, as described, so as to form receptacles for the bottles, as set forth.

2. The box-frame, composed of end pieces, four side pieces, B B and C C, with space *x* between, and the transverse stripe *f f*, all combined and arranged substantially as described.

3. The center-bar *p*, secured to the ends of the box and arranged so as to support the cross-pieces *f f* and protect the necks of the bottles, substantially as set forth.

139,723.—*Butter-Worker.*—JAMES MCBRIDE, Ithaca, N. Y. Application filed March 11, 1873.

A circular dish upon the table inclines to one end of said table for the escape of the water which passes from openings near the base of the dish. A rack on the periphery of said dish is operated to revolve the dish by a clutch, which is operated by connecting-arms from a rock-shaft, which is itself the pivot upon which is moved the arm, upon the center of which the peculiar presser is fixed, said presser having a divided and a solid end to be used alternately by reversing the arm in its socket end.

Claim.—1. The double-headed presser *a*, with divisions *s*, in combination with the lever *p* socketed in and oscillating the shaft *c*, substantially as set forth.

2. The double-headed presser *a*, with one head, *a'*, solid, and the other head, *a''*, with a longitudinal division, *s*, and two transverse apertures, *s'*, one through each division of the head *a''*, as set forth.

3. The lever *b*, shaft *c*, arm *f*, rod *g*, lever *h*, and click *i*, in combination with the pan *p*, pivoted and attached to the slope *o*, and secured to the bed-piece or table *a*, substantially as set forth.

139,724.—*Sectional Steam-Boiler.*—THOMAS E. MCNEILL, New York, N. Y. Application filed March 30, 1872.

The tubes are large near the fire in order to prevent too rapid formation of steam, and burning. The water first enters the smaller tubes in the upper part. Provision is made for circulation of water and for unequal expansion and contraction of parts.

Claim.—1. A sectional boiler consisting of two sets of communicating tubes, one above the other, and the lower being of larger diameter than the other, all substantially as specified.

2. The combination, substantially as described, of the partitioned drums L and M with the upper tubes B of the boiler.

3. The combination, substantially as described, of the upper tubes B, and their connecting-drums, forming a feed-water heater, with the distributing-drum F.

4. The combination, with the tubes A, of feed-pipes E, communicating with the upper ends of the said tubes, and of supplemental feed-pipes J, of smaller diameter than the pipes E, communicating with the lower ends of the said tubes, all substantially as and for the purpose specified.

5. The combination, with the said tubes A, of yielding or elastic feed-pipes J, substantially as described.

6. The combination, with the tubes A and pipes J, of caps D, cast in two sections, adapted to each other and to the said tubes and pipes, substantially as described.

7. The combination of the tubes A, connecting-pipes J, and drum H communicating with the pipes J, substantially as described.

8. The pipes E, each cast in one piece, with a return-pipe, E', of smaller diameter.

9. The combination of the drum-section F with the pipe E and return-pipe E', substantially as and for the purpose described.

139,725.—*Horse-Power.*—JOSEPH MILDOURN, Millport, Ohio. Application filed April 12, 1873.

Adjustable extension-levers attached to ordinary levers by means of bands and a screw or bolt, there being a series of holes on the ordinary levers by which the extension-levers may be adjusted at any required length. Also, outside stay-rods attached to holes in the ends of the extension-levers, and draft-rods attached to eyes in the stay-rods and to staples at the ends of the ordinary levers.

Claim.—1. In combination with the levers B, the extension-levers D, stay-rods E, and draft-rods F, arranged substantially as and for the purposes described.

2. The eye J, staple K, bands G G, and bolt H, in combination with the lever B, the extension-lever D, and draft-rods F, as and for the purposes described.

139,726.—*Scaffold.*—DANIEL Y. MILLER, Huntsville, Ill. Application filed March 29, 1873.

The short legs of the standards are made readily detachable by having their upper ends beveled to form a wedge-shaped socket, in connection with the iron band which surrounds them. They co-operate with the beveled end of the standard-piece and its band *c*. The rising platform is supported by iron bails attached to transverse pieces having fender-rollers K, and a slotted plate *l*, which passes over a pin in the wall to keep the platform steady and level.

Claim.—1. In combination with the standard A, formed of the short bars *a a* beveled at their upper ends and pivoted to the band D, the bars or pieces B, and band *c*, as described, whereby said parts A B are adapted to be connected, as set forth.

2. The platform F, having lateral pieces *h* with guide-rollers K, and plate *l* for guard-pin, as described.

139,727.—*Propelling Canal-Boats.*—WILLIAM F. MILLER, East Walpole, Mass. Application filed April 12, 1873.

Frame carrying traction-wheel slides freely up and down in a well in the boat, and is raised at will by spur-pinions, which are thrown into and out of gear with the frame by a rock-shaft; said pinions being operated by a worm and a wheel having a ratchet-and-pawl connection with their shaft—the object being to allow the frame to be forced upward whether the pinions are in or out of gear.

Claim.—1. The combination of a fixed gear, H', and vertical sliding shaft E, the same having a spline connection, with the gears G' E', and a propelling-wheel mounted in a vertically-sliding frame, substantially as shown and described.

2. In combination with the vertically-sliding frame C and the propelling-wheel, the pinions L' L, movable shaft D, crank rock-shaft Q, worm F, spur-gear G, ratchet-wheel H, and pawl I, all as shown and described.

139,728.—*Cooking-Range.*—JAMES H. MITCHELL, San Francisco, Cal. Application filed February 24, 1873.

The ovens are removable with the front plate. The upper inside edges of the plate at the back and those at ends of the range are beveled so as to afford a space under the top plate for the water-pipe, which connects the coil in the fire-chamber with the reservoir.

Claim.—1. The range-front A with its attached ovens B B, in combination with a range having the supporting-ledge C, substantially as and for the purpose above described.

2. The beveled edges *d* of the back and side plates, in combination with the water-pipe *f* and rim-plates or frame E, substantially as and for the purpose above described.

139,729.—*Paint-Compound.*—HORATIO NELSON, New York, N. Y. Application filed April 26, 1873.

Adhesiveness is enhanced by the use of clay.

Claim.—A paint composed of plumbago, clay, silicate of potash or soda, and oil, in about the proportions specified.

139,730.—*Steel or Chair.*—HENRY OCORR, Milwaukee, Wis. Application filed May 31, 1873.

The rim is made of metal cast in one piece, and has sockets to receive the legs, and a perforated flange or ledge for the attachment of the cane or upholstered seat.

Claim.—A cast-metal rim for a stool or chair, formed in one piece, as herein described, with sockets to receive the legs, and a perforated flange or ledge for attachment of the upholstered or cane seat, as shown and described.

139,731.—*Knapsack.*—GEORGE H. PALMER, Monmouth, Ill. Application filed January 6, 1873.

Claim.—1. The knapsack-frame of flexible wood sticks X, canvas corner-pieces *b*, leather stiffeners *a a*, connecting-straps Z, and ties a^3, combined substantially as specified.

2. The combination, with a knapsack-frame constructed as described, of cover A' B' detachably attached to said frame, substantially as specified.

3. The coat-straps *a*, blanket-straps *d*, suspending-straps *b*, and loops *c' c'*, combined and arranged in detachable and adjustable connection with the knapsack, substantially as specified.

4. The combination of the back-pad, double shoulder-straps and waist-brace *m*, substantially as represented in Fig. 3.

5. The combination of the waist-belt *p* with the waist-brace *m* and shoulder-straps, substantially as specified.

6. The combination of the saber and carbine slings, substantially as specified.

7. The combination of the saber and carbine slings with the back-pad and shoulder-braces, substantially as specified.

8. The detachable fastening-loop D' and toggle-piece E, in combination with the knapsack and the straps attached thereto, substantially as specified.

139,732.—*Cotton-Planter.*—GEORGE PATERSON, Waynesborough, Ga. Application filed February 21, 1873.

A narrow rectangular frame is mounted on one wheel therein, the axle-tree of which is extended beyond the frame for the support of a rolling seed-drum on each side, having on their peripheries conducting-spouts, each of which, on reaching the ground, becomes filled and discharges its contents. In front of the drums are guano-hoppers with spring-valves at their outlets, which are struck by projections on the spouts. There is a partially-rotating lateral shaft in front of the machine and another in the rear, each with downward arms, the one having openers, the other coverers.

Claim.—The vertical pocket-slide N, arranged to reciprocate up and down in a guano-dropper, as and for the purpose described.

139,733.—*Sad-Iron Holder and Lid-Lifter.*—CHARLES B. PETTENGILL, Hebron, Me. Application filed May 23, 1873.

Has two arms, the ends of which are constructed with projections over which are forked openings to receive the bail of a kettle, &c., and when brought together furnish a hook for lifting stove-covers. The two arms are connected with two half-circular frames, hinged at their center by a rod, on which there is a spiral spring. The half-circular frames are constructed with supporting-bars running through their length to form a round handle, which is covered with material to protect the hand, to be used as a sad-iron holder.

Claim.—The combination of the arms *b c*, frames *e f*, rod *i*, prongs *o p*, spiral spring *j*, and the leather or cloth covering *n*, substantially in the manner herein set forth.

139,734.—*Soda-Water Fountain.*—ALVIN D. PUFFER, Boston, Mass. Application filed April 8, 1873.

The heads are chamfered off to prevent the lining from being injured at the corners, and are secured to the jacket by a tubular rod attached to each end of the cylinder. Plaster of Paris is applied to the interior of the lining to prevent fusing while soldering.

Claim.—1. The employment of plaster of Paris, or an equivalent substance, applied to the interior of the lining or shell A to retain it in proper shape should fusion take place, substantially as and for purposes stated.

2. The combination, with the lining or shell A, of external metallic jacket B, and heads *b c*, the latter being provided with chamfered edges inserted within the part B, substantially as shown and set forth.

3. In combination with the lining or shell A, metallic jacket B, and heads *b c*, the tubular rod or stay D, (with or without pipe *j*,) plug *g*, and thimble *d*, said parts being arranged together, substantially in the manner and for the purposes shown and set forth.

139,735.—*Stem Winding and Setting Watch.*—GEORGE P. REED, Malden, Mass. Application filed March 14, 1873.

An oscillating plate, carrying two engaged wheels in constant gear with the crown-wheel of the pendent stem, is so arranged that when not latched by a detent in engagement with the center or hand wheel it is held entirely free from the movement by a delicate spring, while the act of turning the stem in the proper direction automatically throws the gear into connection with the winding-barrel.

Claim.—1. In stem-winding and hand-setting mechanism for watches, a swinging plate carrying two gears or toothed wheels, meshing permanently into each other and pivoted to it, one at times meshing into and driving a toothed wheel fixed upon the winding-arbor, to wind up the mainspring, and the other at times taking into a toothed wheel fixed upon the hands-arbor, to set the hands, the plate being swung toward the winding-arbor and the latter wheels engaged by the rotation of a crown-pinion pivoted to the main plate of the watch and rotated by the pendant-knob, substantially as and for purposes stated.

2. In combination with the swinging carrier-plate and its two wheels, arranged with relation to the hands-arbor and the winding-arbor, and operated to move toward the latter by the crown-pinion *c*, as described, the spring *t*, arranged and operating substantially as shown and set forth.

3. In combination with the swinging carrier-plate and its two wheels, arranged relatively to the hands-arbor and the winding-arbor, and operated to move toward the latter by the crown-pinion *c*, as described, the spring *t*, shipper *l*, slider *q*, and spring-latch *s*, said parts being arranged together for joint operation, as shown and set forth.

139,736.—*Washing-Machine.*—NATHAN F. REED, North Wolcott, Vt. Application filed May 5, 1873.

The box in ordinary form, with a rubbing-surface of rolls extending its entire length, with a rubber over it of diminished length to allow motion, over which is a platform to which, by staples, the levers are connected to give it motion, and its tension regulated by a roll connected to levers, the tension of which is regulated by a hook-and-ratchet connection from the extreme end of it and the bottom of the box.

Claim.—1. The arrangement of the staples H, hook connecting-bars I, and levers K, in connection with the roller-platform E F G, roller-bottom C D, and box A, substantially as herein shown and described.

2. The combination of the levers L, cross-bar M, arms N, roller O, and hook ratchet-bar Q, with the movable roller-platform E F G, roller-bottom C D, and box A, substantially as herein shown and described.

139,737.—*Spinning-Mule.*—THOMAS H. RUSHTON and ROBERT TOUGH, Bolton, England. Application filed February 27, 1873.

For giving reduced speed to the carriage during the after-stretch; for starting the rolls quickly or slowly, as desired, when spinning fine or coarse yarn; and for unlocking the long lever to disengage the running-out mechanism at the end of the stretch.

Claim.—1. The combination of the bevel-gears b^1 b^2 a^1 *l* with the spur-gears a^4 l^2 m^1 m^2, the clutches a^2 a^3 a^5, the ratchet *P*, and the plate l^3 having the sliding catches l^4, as and for the purpose described.

2. The combination of the roller-shaft *a* with the disk a^6, having snugs placed at unequal distances apart, and the sliding clutch a^5 having a pin for engaging said snugs, as and for the purpose set forth.

3. The combination of the faller-leg *o*, having the shoulder *o'*, with the tumbler-lever *p* and the adjustable finger p^1, as and for the purpose specified.

139,738.—*Explosive Compound.*—TALIAFERRO P. SHAFFNER, Louisville, Ky. Application filed May 28, 1873.

Claim.—The combination of gun-cotton or other nitrated fibrous substances, as described herein, with nitrated water, or liquids, or paraffine, or bees-wax, or its equivalent, substantially as herein described.

139,739.—*Waste-Trap.*—WILLIAM A. SHAW and CHRISTOPHER C. TRACY, New York, N. Y., assignors to themselves and CHARLES F. HERVÉ, same place. Application filed May 6, 1873.

In an S-shaped trap, the part forming the bend is made perpendicular, and provided with ribs which guide the ball-valve and prevent it from jamming in the outlet-orifice.

Claim.—A plumbers' waste-trap, provided, in the bend between the two branches, with a ball-valve held and guided between vertical ribs formed on the interior surface of the bend between the valve-seat and the top of the bend, said parts being constructed and arranged for operation substantially as and for the purposes herein shown and set forth.

139,740.—*Mode of Attaching Stove-Doors to their Frames.*—SAMUEL SMITH, Philadelphia, Pa. Application filed April 14, 1873.

The door is attached to the frame by the pivot in the lower edge, so that it will swing downward when the catch is opened. The openings for the pivot and the catch are cast in the same frame. By this means the operation of molding is facilitated, and less iron is required for the bosses of the hinges and the catches.

Claim.—The swinging door A and frame B, when the same are constructed and secured together substantially in the manner and for the purpose hereinbefore described and set forth.

139,741.—*Lawn-Mower.*—THEODOR SOETBEER, Irvington, N. Y. Application filed April 12, 1873.

A frame having a supporting (which is also the driving) wheel extends from the operator's hand to the ground, where is affixed, at a proper angle, a stationary blade, against which is operated a shearing-blade, which clips the grass as the machine is propelled.

Claim.—The combination of the slotted standard A, stationary blade B, movable blade C, pivoted connecting-rod D, crank E, shaft F, frame G, pulley H, band I, pulley J, wheel K, and bolt L with each other, substantially as herein shown and described.

139,742.—*Tobacco-Finisher.*—ALLEN P. SOUTHARD, St. Louis, Mo. Application filed March 22, 1873.

A hollow cylinder, made in longitudinal sections hinged together, is provided with several doors, which may be closed successively as the tobacco is packed upward from the bottom, after which pressure may be applied. After the pressing is completed the doors are opened, the sections separated, and the tobacco removed in mass.

Claim.—The series of independently-hinged doors D and their fastenings E G, in combination with the sections B and C, as shown and described, to operate as specified.

139,743.—*Process of Preparing Corn for Grinding.*—WILLIAM STANDING, Du Quoin, Ill. Application filed February 8, 1873.

Expels oil from and dries corn, preparatory to grinding it, by subjecting it to action of steam under pressure.

Claim.—The process of drying Indian maize, preparatory to grinding the same, by steam applied under pressure, in the manner and for the purpose described.

139,744.—*Leather-Splitting Machine.*—AARON F. STOWE, Worcester, Mass. Application filed April 12, 1873.

Claim.—1. The movable lever S, as applied to support the springs of the lower roll of a leather-splitting machine, to allow them to be relieved of tension when the machine is not at work.

2. The combination, with a knife having an oblong recess and shelf therein, of bolts X having oblong heads, and bed C vertically and horizontally slotted, to enable the knife to be readily taken out without removing the bolts, and the latter to be loosened from the front of bed instead of from the bottom thereof.

139,745.—*Sewing-Machine.*—JOSEPH T. TOBEY, Haverhill, Mass. Application filed May 7, 1873.

Designed for "overstitching." The material is held by the presser about a ridge-like piece on the bed-plate provided with a notch for the passage of the needle. The thread is in short pieces; is fastened at one end to the material. The needle enters and its point leaves the material at the same side; the hooked finger lays the thread in the hook of the needle; the latter retreats, draws the thread with it, the loop-seizer catches the loop so drawn, draws the free end of the thread entirely through the material and leaves it held between the jaws of the lazy-tongs ready for a new stitch.

Claim.—The combination of the curved and hooked needle I, the hooked finger N, the furcated presser L, the loop-seizer P, and the lazy-tongs T, all arranged and operated substantially as specified.

139,746.—*Explosive Compound.*—THOMAS VARNEY, San Francisco, Cal., assignor to THE GIANT POWDER COMPANY and THE ATLANTIC GIANT POWDER COMPANY, same place. Application filed June 4, 1873.

Claim.—The process of granulating or pulverizing dynamite and similar compounds of nitro-glycerine with absorbent matter, by treating them while freezing in the manner substantially as hereinbefore set forth, whereby such compounds are rendered more easy of explosion and more efficient in use.

139,747.—*Box for Packing and Preserving Tobacco.*—LEOPOLD WERTHEIMER, New York, N. Y. Application filed May 6, 1873.

One side of the box is hinged so as to open and fold outward and downward, thus exposing only the top of the tobacco. The cover, at first secured in position by cleats on the inner side of the top of the box, descends as the tobacco is drawn from beneath it, and thus affords constant protection.

Claim.—1. A packing-box for tobacco and other articles, provided with a sliding top capable of moving up and down within the box, and arranged for operation substantially as and for the purposes set forth.

2. In a packing-box of otherwise ordinary or suitable construction for tobacco and other articles, a sectional side, composed of two or more sections hinged together and arranged so that the sections may be successively opened or dropped, to expose only so much of the tobacco or other article as may be needed for the time, keeping the remainder tightly sealed and covered, substantially as shown and set forth.

3. In a packing-box, the combination of a sliding top capable of moving up and down in the box, and a sectional front composed of two or more sections hinged together, under the arrangement and for operation as shown and set forth.

139,748.—*Implement.*—HENRY B. WHITEHEAD, Holly Springs, Miss. Application filed February 1, 1873.

This implement may be used as pliers, wrench, wire-cutter, calipers, and compasses.

Claim.—The combination, with the casing A, of the jaws D D, toothed shanks or bars C C perpendicular thereto, the handles B toothed at *b* and provided with the slots *s s*, and the bolt E, substantially as shown and described.

139,749.—*Apparatus for Treating Grain for Distillation.*—ADOLPH WOOLNER, Louisville, Ky. Application filed May 24, 1873.

Boils the grain in an air-tight vessel under an increased pressure, so as to expose the starch-globules more to a greater degree of heat.

Claim.—In an apparatus for treating grain for distillation, the boiler, perforated steam-pipe *i*, discharge-pipe *o*, and stirrer *l*, when combined for operation, substantially as shown and described.

139,750.—*Cotton-Cultivator.*—CHARLES ZOCHER, Augusta, Ga. Application filed March 29, 1873.

A series of notches or offsets, inclined backward and upward, are formed upon the sweep so that it may clear itself of trash.

Claim.—The sweep B, having its cutting-edge notched and the portion of said edge between the offsets b^1 inclined, as specified, for the purpose of enabling the sweep to clear itself of obstructions, as set forth.

139,751.—*Manufacture of Steel.*—JOHN ABSTERDAM, New York, N. Y. Application filed May 31, 1873.

Claim.—1. A bar, plate, sheet, or slab of semi-steel of cementation, produced by subjecting the crude unrefined iron to a process of cementation, and then refining the converted crude iron by heating and welding the same under the hammer or by the action of rolls, substantially as herein described.

2. A railway bar, made of wrought-iron and semi-steel of cementation, produced by subjecting the crude unrefined iron to a process of cementation, and finishing the metal after cementation, substantially as set forth.

139,752.—*Draft-Hook for Cultivators.*—AUGUSTUS ADAMS, Sandwich, Ill. Application filed January 4, 1873.

The hook is cast with a ring to fit upon the end of the double-tree, with one or more hooks above and below.

Claim.—A draft-hook for cultivators adapted for attachment directly to the end of the evener or double-tree, and cast with a number of draft-hooks, one or more above and one or more below the evener, substantially as described, for the purposes specified.

139,753.—*Coach or Carriage.*—JOHN ALLGAIER, Philadelphia, Pa. Application filed December 17, 1872.

The front portion of the bed of the carriage is hollowed out for the reception of the side lights when not in use.

Claim.—The front bed portion B, constructed with a pocket, G, for the reception of the removable side lights or sashes E E of the front top part C, essentially as described.

139,754.—*Cotton-Bale Tie.*—AUGUSTUS S. ARMSTRONG, New Orleans, La. Application filed May 13, 1873.

A cutting of the metallic band confining the bale, about a foot in length, folded as shown in the drawings.

Claim—The buckle or bale-tie herein shown and described, for the purposes specified.

139,755.—*Spinning-Machine.*—HENRY ASHWORTH, Walsden, England. Application filed October 26, 1872.

For regulating the "drag" on the bobbin in accordance with the velocity of its rotation.

Claim.—The combination, with a rotating spindle and bobbin, of a flange, *g*, and a dished washer higher at the center than at the outer edge, on which the bobbin bears, and arranged so that by the action of centrifugal force it may approach a horizontal position, raising the bobbin, all as specified.

139,756.—*Saw-Handle.*—ELIAS C. ATKINS, Indianapolis, Ind. Application filed September 16, 1871.

A conical bearing-plate rests upon the saw and is provided with a groove upon its upper surface in which the lower end of the ferrule is inserted.

Claim.—The open-ended ferrule *b* projecting beyond the end of the handle, the notched frustum-shaped washer C fitted to the end of the ferrule, entering its projecting end and thus forming a support for the shank, in combination with the handle *a*, slotted bolt *n*, and nut *f*, substantially as and for the purpose set forth.

139,757.—*Manufacture of Wine.*—JOHN C. BAXTER, Washington, D. C. Application filed February 3, 1873.

The fruit is boiled or steamed in a kettle surrounded by water placed in an outer vessel and heated by a furnace. Instead of the kettle a closed vertical cylinder having a perforated coil for the admission of steam may be used.

Claim.—A wine made from oranges, limes, or lemons, or fruits of that class of which they are the representatives, in the manner described, to wit, by first boiling or otherwise digesting the fruit with steam and then adding saccharine matter to the liquid obtained therefrom, and afterward subjecting the must thus prepared to vinous fermentation, as specified.

139,758.—*Hulling-Machine.*—ANDREW BENTELSON, West Salem, Wis. Application filed April 24, 1873.

The vertical edges of the grooves in the bottom side of the stone are lined with metallic plates to prevent wearing away of the stone along these edges.

Claim.—1. A hulling-stone, A, of the character described, having in its bottom side grooves C, the vertical edges *e* of which are lined with detachable metal bars D, substantially as specified.

2. The combination of the hulling-stone A, having grooves C *e* in its bottom side, metal bars D, and eye-bolts E *e*, substantially as and for the purpose specified.

139,759.—*Apparatus for Treating Offal.*—JOSEPH N. B. BOND, New York, N. Y. Application filed May 24, 1873.

Claim.—1. The combination of a drum, A, containing an agitator, E, with a heating-chamber, B, and furnace D communicating with said heating-chamber by means of a pipe, C, containing a cold-air gate, *b*, substantially as shown and described.

2. The combination of a drum, A, containing an agitator, E, with a steam-boiler, F, communicating with the drum by a superheated steam-pipe, *c*, and a wet-steam pipe, *c*, substantially as set forth.

3. The combination of a drum, A, containing an agitator, E, with a furnace, D, and with a cold-water pipe, *f*, substantially as and for the purpose described.

4. The combination of a drum, A, containing an agitator, E, with a heating-chamber, B, a steam-boiler, F, and a cold-water pipe, *f*, substantially as set forth.

139,760.—*Portable Cooking-Stove.*—NATHAN O. BOND, Fairfax Court-House, Va. Application filed April 8, 1873.

The stove is close-bottomed and sets upon the top of the main stove. It is supported at the rear by its exit-pipe connection. The damper-rod, passing through the sleeve sustaining and holding the exit-pipe, unites the sleeve and the collar projecting from the main pipe.

Claim.—1. The summer furnace, constructed substantially as herein described, with a close bottom, independent draft, and horizontal discharge-flue, for the purposes set forth.

2. The removable pipe-collar, consisting of the flanged tubes J K, combined as described, and secured together by means of a damper-rod, M.

139,761.—*Earth-Boring Machine.*—WILLIAM H. BOUSER, Paris, Ill. Application filed April 5, 1873.

The auger-shaft is kept in a vertical position by means of guide-bearings at the top and bottom of the frame, the lower bearing being secured to a hinged portion of the frame, so that it can be thrown back out of the way of the auger when it is raised to be emptied. The hoisting-rope passes over a guide-pulley to a windlass operated by a crank-shaft having changeable gears of different sizes to regulate the speed of the windlass. The auger is provided with the usual serrated cutting-lips and valves, and with reamers having inwardly-projecting flanges to guide the earth into the bucket.

Claim.—1. The ground-frame, consisting of the bed-blocks and the hinged platform having the journal-seat secured to its front edge, substantially as specified.

2. The combination, with well-boring mechanism, of the windlass, crank-shaft, and the adjustable gearing arranged at each end of said crank-shaft to increase the power or speed at will, substantially as specified.

3. The combination, with the well-boring mechanism, of the windlass, the forked supporting arms, the removable transverse bar, and the traveling-pulley, substantially as specified.

4. The reamers, having their cutting-edges serrated and inclined outward and downward, and having the extensions bent rearward and inward to guide the soil to the center, substantially as specified.

5. The auger, consisting of the stem, the L-shaped arms, the upper reamers, the lower blades, and the loose bucket, substantially as specified.

139,762.—*Automatic Boiler-Feed Regulator.*—BURT BRETT, Geneva, Ohio. Application filed June 17, 1872.

Through the rising and falling of the float in the chamber the peculiarly-shaped valve is operated to control the flow of steam to supplying-pump.

Claim.—1. The construction and combination of the valve C with the float A, substantially as and for the purposes hereinbefore set forth.

2. The combination of the valve C, float A, chamber B, and the upper transverse section of Weston and Brett's safety-boiler, above mentioned, substantially as and for the purposes hereinbefore set forth.

139,763.—*Soldering-Machine.*—WILLIAM D. BROOKS, Baltimore, Md., assignor to MARY C. BROOKS and GEORGE D. BROOKS, same place. Application filed May 20, 1873.

The burners are arranged in a circle just above the soldering-tool for the purpose of melting the solder in the gutter at the top, which, when melted flows down through perforations in the tool to the groove in the top of the can. The lower face of the tool is made to slant obliquely upward, so that the solder will not follow its surface and be wasted on the side of the can.

Claim.—1. A soldering-tool having the pin *d* and loosely surrounding the revolving tube *b*, combined, as described, with a feet collar, E, having the slot *e*, to enable the said tool to have end play and yet to revolve with the tube.

2. The combination, with one or more blow-pipe burners, C, of a rotary soldering-tool having trough d^1 and perforations d^2, as and for the purpose set forth.

3. The flange d^4, applied to the bottom edge of a soldering-tool to prevent the ingress of too much air before the melted solder has been properly distributed.

4. A soldering-tool having the oblique face d^3 in connection with the perforations d^2, as and for the purposes set forth.

5. The bolt J, having a disk, J', with flanges *j j* that enable the sections to be coupled together in the manner described.

6. A soldering-tool, C c c^1, having the inner flange c^2, and applicable in the manner and for the purpose described.

7. The gas and air chambers G H, formed in two parts, I I' and K K', as and for the purpose set forth.

139,764.—*Combined Label and Seal for Locks.*—EDWARD J. BROOKS, New York, N. Y. Application filed December 27, 1872.

Claim.—The label-seal herein described, formed with an aperture for applying it to a lock or other object to be secured and printed, or otherwise marked with numbers or other characters to indicate, by the use of a punch, the date of application and the destination or direction of transit of the property protected.

139,765.—*Ditching-Machine.*—CHARLES M. BROWN, Baltimore, Md. Application filed April 11, 1873.

The earth included between the projecting parts of the lower portion of the casing is dug by the scraper-blade and divided by spring cutter-blades projected radially from the periphery of the rotating wheel by a fixed cam, E, as they pass it. Said blades also carry up the earth in the passage formed by the sides and circumference of the casing, and discharge it by the transverse chute.

Claim.—1. The combination of the series of spring-cutters *b* with the rolling-wheel A and cam E, the wheel being loose and the cam fixed upon the axle *a*, substantially as and for the purpose specified.

2. The combination of the rolling-wheel A, spring-cutters *b*, and cam E with the casing C, ditching-blade D, and spout *d*, substantially as and for the purposes specified.

139,766.—*End-Gate for Wagons.*—JESSE D. CAREY, Monica, Ill. Application filed February 17, 1873.

The end-gate is hung to the wagon-body so as to swing out therefrom, in the operation of dumping, without being separated at its pivotal point.

Claim.—The end-gate C having straps *n n*, with eyes *o o* to receive the hooks *r r* of the straps attached to the sides of the wagon-body, upon which the gate swings, substantially in the manner and for the purpose set forth.

139,767.—*Bolt.*—JAMES F. CARLIN, Alexandria, Va. Application filed May 24, 1873.

The tail-piece of a sliding bolt is turned back at right angles, and perforated, or formed into a ring. There is also, on one of the guide-staples, or as an attachment to the bed-plate, a corresponding arm, with the like eye or ring, and these two parallel arms are so arranged in relation to each other that when the bolt is projected a padlock may be conveniently attached through the two eyes or rings, thus securely locking it in position.

Claim.—The slide-bolt B, when provided with a hasp or arm, *d*, having an opening or eye, *e*, and used in connection with a hasp or arm, *f*, having an opening or eye, *g*, formed on or otherwise secured to one of the guide-staples *a*, *b*, or *r*, or to the bed-plate A of the bolt, as described and shown, for the purpose set forth.

139,768.—*Stop-Mechanism for Twisting and Doubling Machines.*—JAMES A. H. CARROLL, Baltimore, Md. Application filed April 29, 1873.

When a strand breaks its weighted cord falls upon and turns the platform so that its near end is elevated and engaged by a pin in the reciprocating bar which in its movement oscillates the platform horizontally which turns the T-bar on its pivot, thereby raising the hook piece, removing the belt from the whorl, and raising the front top roll, thus stopping the further delivery of the strands. The back top roll is loose, and turns only when the front top roll turns.

Claim.—1. The combination, with band C and the shaft of the roll E, of the hook piece D d d^1, the slotted T-bar G *g*, the platform-bar H *h h'*, the bar I *i*, the reciprocating bar J *j j*, and the weighted cords K hung to the threads, as and for the purpose described.

2. The rolls L L', the top one of which is loose to hold the threads, applied in connection with the separable feed-rolls E F, as and for the purpose specified.

139,769.—*Ice Auger.*—WILLIAM A. CLARK, New Haven, Conn. Application filed April 17, 1873.

Claim.—A bit or tool for boring in ice, provided with a point, C, having cutting-lips *c* on its end, and a screw-thread on its sides, with the cutting-lips B, or their equivalents, substantially as described.

139,770.—*Button-Hole Sewing-Machines.*—SHERMAN CLEMINSHAW, Troy, N. Y. Application filed December 7, 1872.

Improvement on patent No. 128,363. The tip or cylindrical arm, and levers which hold the cloth are rotated so as to present the material to the needle which projects from a shuttle-like block supplied with thread by means of the devices enumerated in the fourth and fifth clauses. When a button-hole is completed, the holder is drawn toward the operator, the stirrup enters the fork of the curved arm, the geared dog engages the teeth of a rack on the under side of such arm, and the jaws or levers are opened to permit the removal of the cloth. The beater forces the thread or stitch over the edge. The devices of the last clause elevate the shuttle-like block at the proper time from its bearing in order to allow the loop formed by its attached needle to pass over it.

Claim.—1. The curved arm C, having its outer end forked or cut open, and provided on the concave side with a rack, *a*, substantially as and for the purposes herein set forth.

2. In combination with the cloth-holder, the loose stirrup E, with pin *f*, and the cogged or geared dog D, constructed and operating substantially as and for the purposes herein set forth.

3. In combination with the geared dog D, arranged and operating as described, the catch J, and spring *i*, substantially as and for the purposes herein set forth.

4. The combination, with the swinging cloth-holder, of the rotating worm L, and the gear-wheel K for the purpose of rotating the same, substantially as herein set forth.

5. The combination of the feed-bar M, slotted driver N, adjustable pin *m*, slotted bar O, spring-pawl *n*, and the ratchet-wheel *p*, upon the shaft *k*, for rotating the worm L, substantially as and for the purposes herein set forth.

6. The beater-bar R, connected with the sliding plate S and provided with the wedge *s*, in combination with the adjustable roller *t*, all constructed and arranged substantially as and for the purposes herein set farth.

7. The pivoted gage T, provided with slots *a'*, and operating in combination with the spring *x* and pins *y* and *z*, substantially as and for the purposes herein set forth.

8. The combination of the pivoted lever *v* with pin *b'*, spring *c'* and cam A', all constructed as described, and arranged on the head V of the machine, substantially as and for the purposes herein set forth.

139,771.—*Indicator for Railroad Cars.*—CHARLES H. COFFIN, Boston, Mass., assignor of one-third his right to JAMES W. MORRISON, same place. Application filed April 23, 1873.

A box contains two drums, to which are attached the ends of an indicating-apron, said drums being alternately rotated when geared with the movable pulley-shaft, which is actuated by a belt, receiving motion from the axle.

Claim.—The combination of the worm-gear N M, shaft L, and pulley H with the belt K, shifting-gear E, drums B and B', and show or display belt C, substantially as described, and for the purpose set forth.

139,772.—*Process of Grinding Journal Boxes or Bearings.*—J. WENDELL COLE, Brooklyn, N. Y., assignor to "THE TANITE COMPANY," Stroudsburg, Pa. Application filed December 7, 1872.

Claim.—The process, substantially as herein described, of manufacturing journal boxes or brasses by grinding them longitudinally in relation with their axis, substantially as specified.

139,773.—*Machine for Forming, Shaping, and Dressing Journal-Boxes.*—J. WENDELL COLE, Brooklyn, N. Y., assignor to "THE TANITE COMPANY," Stroudsburg, Pa. Application filed December 7, 1872.

Claim.—The combination of the revolving emery or grinding wheel B, of transverse curvature on its periphery, with the journal-box clamping-carriage E, arranged for operation and adjustable in relation with each other, substantially as and for the purpose herein set forth.

139,774.—*Machine for Dressing Wheels, &c.*—J. WENDELL COLE, Brooklyn, N. Y., assignor to "THE TANITE COMPANY," Stroudsburg, Pa. Application filed December 7, 1872.

A revolving shaft or carrier of the wheel or body to be dressed is combined with a diamond or other cutter, carried by a swinging ball-like holder, arranged over or outside of the periphery of the wheel, and with its axis of motion in a plane which corresponds with that of the wheel's rotation, whereby a wheel or other circular body of transverse curvature on its periphery may be ground or dressed true and of any desired curvature.

Claim.—1. The combination, with the revolving shaft or carrier B by which the wheel or body to be dressed is rotated, of the cutter E and its swinging ball-like holder F, arranged in relation with the shaft or carrier B and with the wheel or body to be dressed, substantially as and for the purpose specified.

2. The diamond or other cutter E, adjustable in a radial direction within its ball-like holder F, in combination with the adjustable bed D and revolving shaft or carrier B, having its axis in a plane which intersects the axial line of the cutter-holder, essentially as described.

139,775.—*Machine for Shaping or Dressing Wheels, &c.*—J. WENDELL COLE, Brooklyn, N. Y., assignor to "THE TANITE COMPANY," Stroudsburg, Pa. Application filed December 7, 1872.

A revolving shaft or carrier of the wheel or body to be dressed is combined with a diamond or other cutter made capable of motion in a transverse relation to the rim or periphery of the wheel, the cutter being directed by a curvilinear guide or pattern corresponding with the shape of the body to be turned.

Claim.—In combination with the emery or other grinding wheel C, the curved guide or pattern D adjustable up or down and about the axis of the swivel-pin *c*, the sliding block F, and the diamond or other cutter E, adjustable through said block, substantially as specified.

139,776.—*Folding-Chair.*—ADAM COLLIGNON, CLAUDIUS O. COLLIGNON, and NICHOLAS COLLIGNON, Closter, N. J. Application filed April 14, 1873.

The back is pivoted to the front legs, just above the junction of the front and rear legs, and rests on the rear legs.

Claim.—In a folding-chair, the back thereof pivoted to the front legs and bearing upon the rear legs, substantially in the manner described.

139,777.—*Cotton-Bale Tie.*—FREDERIC COOK, New Orleans, La. Application filed November 5, 1872.

Claim.—1. The buckle having a single mortise and open slot, when surrounded by an outer rim, E, for the purpose specified, forming therewith a new and improved buckle.

2. The buckle having, in combination, the fingers D D split off and pressed out from its body, with the single central mortise A, the open slot C, the stops or lips G, and the outer rim-plate E with the looped ends of metallic bands, substantially as described.

139,778.—*Manufacture of Steel.*—WILLIAM DOUGHERTY, Philadelphia, Pa. Application filed March 18, 1873.

Claim.—The method of casting steel in wrought-iron or other metallic cases when the latter is of such thickness as to admit of the heat of the melted steel completely welding the case to it, substantially as and for the purpose above set forth.

139,779.—*Watch-Case.*—JOHN C. DUEBER, Cincinnati, Ohio. Application filed November 23, 1872.

The bezel is formed by soldering into the dished portion of a struck-up flat back, and flush with its edge, a ring triangular in section (forming the "snap-ring" for either side) and also by soldering at the angle of the dish, when used for the front or crystal side, another ring square, or rhombold in section, which forms when the flat portion is cut out, the support for the crystal.

Claim.—The bezel, consisting of the three distinct members, to wit, the snap-ring A, the square ring B, and flange *c*, when constructed and adapted to be employed in the manner herein explained.

139,780.—*Conductor's Check-Box.*—JAMES F. GAUNT, Newark, N. J., assignor of one half his right to EDWIN B. KNOTT, same place. Application filed December 5, 1872.

Upon moving the lever, a check is carried by a slide having a slot in one end corresponding in size to a check, from the reservoir to and over the entrance to the drawer. The lever is carried back by a spring and at the same time a hammer, attached to the slide, strikes the bell. A vertical tube forms the reservoir. A bolt is placed upon the checks and follows them down. When the last check has been deposited, the bolt drops into the slot in the slide and prevents further action. A horizontal plate through which an eyelet protrudes, covers the top of the reservoir. A vertical extension from this plate fastens the drawer in place. A padlock fastened in the eyelet locks up reservoir and drawer.

Claim.—1. The combination of case A, knob and lever H and F, spring J, check-distributing slide E, hammer C, bell B, reservoir K, receptacle N, lock R and R', as and for the purposes substantially as herein set forth.

2. The combination of case A, lever F, spring J, slide E, reservoir K, drawer N, lock-bolt R and R', substantially as herein described and for the purpose set forth.

3. The combination of case A, lever F, spring J, check-depositing slide E, hammer C, bell B, reservoir K, follower-bolt W, drawer N, substantially as herein described and for the purposes set forth.

4. The combination and arrangement of all the above-named parts together, as and for the purposes herein described and shown.

5. In combination with a reservoir and check-depositor E, with its actuating devices and receptacle N, the checks, as and for the purpose hereinbefore described.

139,781.—*Stucco Ornament.*—A. DÉSIRÉ GODARD, Chicago, Ill. Application filed April 2, 1873.

Claim.—1. Fire-proof stucco ornaments, composed of a compound of plaster of Paris and glue in layers, and an interposed textile webbing, substantially as specified.

2. Fire-proof stucco ornaments, composed of a textile webbing embedded in layers of a compound prepared by mixing in water plaster of Paris, glue, phosphate of soda, borax, alum, and rock-salt, substantially as and for the purpose specified.

139,782.—*Separator for Iron and other Ores.*—ALEXANDER GOODHART, Newville, Pa. Application filed November 14, 1872.

The freshly-dug ore is fed into an oven, from whence, after being properly dried, it is discharged into a hopper, falls upon rotating disks and is thrown against the sides of a crib, is disintegrated, falling upon a shaking-screen, where the dirt and ore are separated.

Claim.—1. A supply feed-hopper, C, rotary heads H H', cribs I I', and screen L, combined and arranged as and for the purpose described.

2. The combination, with feed-hopper, of oven having pan B discharging thereinto, as and for the purpose described.

3. The described method of cleaning ore by drying it as it comes from the earth and then separating the soil therefrom, thereby dispensing altogether with the washing operation.

139,783.—*Toy.*—MICHAEL GREBNER, New York, N. Y. Application filed November 29, 1872.

The traveling-platform on the top surface has carriers for engaging with and holding toys, and the bottom surface of the toy turn-table has a rack, into which a gear-wheel meshes for the purpose of propelling said platform; it, the platform, being arranged and supported in a guide-way formed in the rigid platform, in the center of which is formed a socket for receiving a Christmas-tree.

Claim.—The stationary platform A provided with the socket C to receive a Christmas-tree, and with the guide-way *a* to receive the traveling-ring *b*, carrying carriers *g* and the rack *e*, into which meshes the spur-wheel *d* driven by the shaft *c*, the whole constructed and arranged as herein shown and set forth.

139,784.—*Wire-Cage.*—MICHAEL GREBNER, New York, N. Y. Application filed January 31, 1873.

Claim.—A cage, the cross-bands of which are provided with eyes for the reception of loops formed on the filling-wires said cross-bands and filling-wires being held together by a locking-bar passing through the loops of the filling-wires, substantially in the manner herein shown and described.

139,785.—*Hand Seed-Sower.*—GEORGE HALL, Morgantown, W. Va. Application filed April 26, 1873.

Claim.—The seed-bar D, beveled at each end and formed with a longitudinal rib, *b*, in its center, and with recesses *d d*, and grooves *i i*, in combination with the seed-box, and the lever for operating said bar, as and for the purpose set forth.

139,786.—*Seal-Lock.*—FRED. C. HAMILTON, New York, N. Y., assignor to EDWARD J. BROOKS, same place. Application filed December 27, 1872.

A hasp is pivoted within a mortise in the shank of the lock, so that its upper or bent arm extends across the bow of the hook. The said hasp is prevented from being retracted by means of a spring-catch, and is held from a forward movement by a seal, which must be broken before the hasp can be released and the lock unlocked.

Claim.—The seal-lock herein described, constructed with a hooked body, A B, and a hinged or pivoted hasp, C, passing through a mortise or opening therein and extending across the bow of the hook B, the said hasp being adapted to be held from forward movement by a seal, S, of suitable form, and secured against retraction by a spring-catch, E.

139,787.—*Harvester.*—WILLIAM HARRISON, Linneus, Mo., assignor of one-half his right to HENRY C. PERWITT, same place. Application filed March 31, 1873.

Two sets of guard-fingers are attached to the same finger-bar, with cutter-sections projecting to the front and rear, and a pitman on each side of the finger-bar receiving motion from a cam in the supporting-wheel, so as to cut back and forth on the same side of the standing grain.

Claim.—The driving-wheel A provided with the cam-way B B^1 B^2, the frame C, the upright E, the rocking-levers N N' constructed as described, the pitmen N M', the scythe-bars L L', the movable knives K K^1 K^2 K^3, the finger-bar F, and slotted fingers G G', &c., and H H', &c., all in combination, as and for the purpose shown.

139,788.—*Puddling-Furnace.*—JOHN HEATLEY, Harrisburg, Pa. Application filed April 17, 1873.

Iron is charged into the raised central chamber, called the stove, and as it becomes melted flows out into the annular chamber, where it is worked by stirrers carried around by the rotating furnace-cover. The dependent fan-blades of the cover create an equable diffusion of the hot air and gas coming from the furnace. Over the rotary cover, and moving with it, is a bar having slotted ends to guide the stirrers. Motion across the annular chamber is imparted to the stirrers by vibrating regulators fixed on a shaft having a hand-crank.

Claim.—1. The stove E placed in the center of melting-chamber B and provided with inlet and outlet openings thereinto and therefrom, as and for the purpose described.

2. The cover I of a melting chamber, B, arranged to rotate thereover, and thus to carry around therewith the stirrers, as a new and convenient means of applying said stirrers.

3. The bar K vertically movable on shaft and provided with arc-slots at each end, in which the stirrers are moved as described, so as to give the double adjustment intended.

4. The combination, with the stirrer-bar K, of the collar M that surrounds shaft, the swiveled disk N, lift-levers O O, and slotted cross-bar P, as and for the purpose set forth.

5. The combination, with screw U, of cords, pulleys, and counter-balance weights, arranged as and for the purpose specified.

6. The bar K, made in two or more pieces, clamped together on shafts and journals of stirrer-blocks, as and for the purpose described.

7. The metallic facings *j j'* applied to the slots i^2 i^3 of the top I of melting-chamber, as and for the purpose described.

8. The combination, with rod *z*, of cams Y Y having the arms *y y*, and operated as and for the purpose described.

9. The revolving cover I having the series of pendent fan-blades I', as and for the purpose specified.

10. The vibratory regulators J' J' applied to the stirrers, as and for the purpose specified.

139,789.—*Iron Ship-Building.*—SAMUEL HOLMES and WILLIAM M. BOWRON, Philadelphia, Pa. Application filed March 27, 1873.

Claim.—As a new structure, a vessel having longitudinal ribs composed of the united flanges of plates which form the skin of the vessel.

139,790.—*Washing-Machine.*—JOSEPH HOOVER, Lancaster, Pa. Application filed May 6, 1873.

The washing-machine has a box or tub of ordinary form, with two beaters connected by levers, by which they are brought in contact by the aid of an upright lever or shaft, which is connected to a cross-bar or shaft attached by a pivot-block to the uprights of the frame, and from which extends downward a connecting lever or rod to the horizontal rod connecting with the beaters by cross-bar.

Claim.—The combination, in a washing-machine, of the lever L on its cross-bar D, rod E, pivot-bar *e*, rubbers F G and I K, all arranged and jointly operating in the manner and for the purpose set forth and shown.

139,791.—*Attachment to Car-Axle Boxes.*—DAVID A. HOPKINS, Jersey City, N. J. Application filed June 1, 1872.

A sleeve projects from the journal-box around the axle into an annular chamber in the hub, and a leather packing bears against the sleeve, the whole uniting to prevent the entrance of dust or dirt.

Claim.—The railroad car wheel and axle, having an intervening annular chamber for the reception of a projecting sleeve from the journal-box, as set forth.

139,792.—*Fire and Burglar Proof Safe.*—BENJAMIN HOWARD, St. Clair, Pa., assignor to himself and THOMAS WATKINS, same place. Application filed March 24, 1873.

The safe is moved into and out of the counting-room by hydraulic power, and it is held in the elevated position by means of a spring-catch that engages in the notch of a rod attached to the under side of the safe. A sliding door is arranged so as to close automatically when the safe is lowered into the receptacle below.

Claim.—1. The rod R, combined with the safe A, and hydraulic press, and with the spring-catch *c*, substantially as specified.

2. The combination of the shaft P, levers O O, and valve-stem N, with the projection *f*, and spring-catch *c*, for operation as described.

3. The door T connected with the beam S with the movable safe A, substantially as and for the purpose specified.

139,793.—*Slide-Valve for Steam-Engines.*—NELSON JOHNSON, Jasper, N. Y. Application filed February 5, 1873.

Provides the extreme ends of a slide-valve with small perforations, with plugs in them to allow enough steam to pass into the cylinder to cushion the piston.

Claim.—The holes *d d*, with the plugs *e e* or their equivalents, arranged in the ends of a slide-valve, B, substantially as and for the purposes herein set forth.

139,794.—*Window-Screen.*—DANIEL C. KELLAM, Detroit, Mich. Application filed May 16, 1873.

Claim.—In combination with a roller and screen of a window-frame, the plates I I with inward-projecting flanges *d d*, constructed and arranged as described, for the purpose of utilizing the expansion of the screen to balance the window-sash, as set forth.

139,795.—*Combined Furnace and Steam-Generator.*—OLIVER W. KETCHUM, Toronto, Canada. Application filed December 17, 1872.

The heated products of combustion are forced into the boiler through perforated pipes, above which deflectors are arranged to direct the water toward the center. Deflectors are also arranged in the steam-dome to prevent foaming.

Claim.—1. A vertically self-feeding furnace, a flame-chamber and a boiler, all made air-tight and combined with air-forcing apparatus, in the manner and for the purpose described.

2. The pipes *c c'* arranged and combined with the flame and water chambers, in the manner and for the purpose specified.

3. The deflectors *a' a'* arranged over the pipes *c'*, as and for the purpose described.

4. The steam-dome *a* provided with a series of superposed deflectors J, applied as and for the purpose set forth.

139,796.—*Refining Butter.*—GEORGE W. KIRCHHÖFFER, Chicago, Ill. Application filed December 20, 1870.

Claim.—1. The herein-described process of suddenly cooling or congealing melted butter, which has been cleaned by injecting the same into a vessel containing milk, buttermilk, or other suitable liquid, substantially as and for the purpose specified.

2. The apparatus, consisting of the reservoir A, congealer B, cooler C, pipe D with stop-cock and perforated end, supply-pipe E, outlet F, pressure-inlet G, filter-frame I, and pan K, substantially as and for the purpose described.

139,797.—*Shirt-Bosom Support.*—ISRAEL L. LANDIS, Lancaster, Pa. Application filed April 26, 1873.

A wire frame for supporting and expanding a shirt-bosom.

Claim.—The oval A, in combination with the ovals C C and B, which latter are provided with loops, the several parts being constructed as and for the purpose set forth.

139,798.—*Casting Chilled Rolls.*—GEORGE G. LONDELL, Wilmington, Del., assignor to himself and WILLIAM STUART, same place. Application filed January 21, 1873.

A sand-lined sleeve is adapted to the interior of the chill and made adjustable vertically so as to cast rolls of different lengths. The sleeve, being free to slide, descends with the roll when shrinking, and thereby prevents a separation of the same at the neck.

Claim.—1. The sand-lined sleeve D, applied to the mold so as to be movable and adjustable therein, as set forth.

2. The sand-lined sleeve, suspended in the chill by rods *m m*, or their equivalent, as specified.

3. The combination of the perforated sleeve D with the perforated box B and its prepared lining.

139,799.—*Ejector.*—WILLIAM B. MACK, Boston, Mass. Application filed March 11, 1873.

The solid spindle, by means of which is regulated the amount of steam issuing from the steam-cone, is formed with a concave tapering lower end. By reason of this peculiar shape the annular jet of steam is guided to the center of the delivery-pipe, forming a more perfect vacuum.

Claim.—In an injector or ejector, a solid stem or spindle, *n*, arranged to operate back and forth within a steam cone or tube, A, and formed with a concave curved tapering termination, n^1, substantially as and for the purposes specified.

139,800.—*Animal-Trap.*—ADONIRAM J. MATTHEWS, Hartwell, Ga. Application filed May 3, 1873.

A slightly-tilting platform connects with and operates two horizontally-vibrating half-gates, one before and the other behind said platform. The outer gate, or the one in the rear of the entering animal, closes as the inner one opens. There is also connected to the platform a locking device.

Claim.—1. The rising-and-falling platform H, counter-balance *g*, the swinging gates F and G, in combination with the stationary gates E E and passage-way D, all arranged substantially as described, and for the purpose set forth.

2. The combination of the rod or arm *i* on the platform H with the lever I, notched at one end, and the rod *r* on the post of the gate G, substantially as and for the purpose specified.

139,801.—*Spring for Vehicles.*—JACOB MAYER, Elmer, N. Y. Application filed April 21, 1873.

Combined torsional and elliptic spring.

Claim.—The combined elliptic and torsional spring C, composed of two halves, each consisting of two torsion-arms, *c c*, and elliptic arms *d d*, constructed to operate substantially as herein-before set forth.

139,802.—*Baker's Oven.*—DUNCAN MCKENZIE, Brooklyn, N. Y. Application filed April 9, 1873.

The products of combustion may pass either upwardly through the oven to the chimney D or laterally and downwardly to the chimney G.

Claim.—1. The combination, with the perforated oven-bottom C, the baking-chamber A, and smoke outlet or chimney D, of the flue or flues H, and chimney G in communication with the fire place or places from below, and an air-inlet, E, to the baking-chamber above the fire-places, substantially as and for the purposes herein set forth.

2. The closed bread-holders K of the revolving reel I, provided with the lids *f* for operation in concert with a stop to automatically open the same in relation with the opening E through which the bread is received and discharged, essentially as described.

139,803.—*Device for Detaching Horses from Vehicles.*—JOHN MCNEILL, Wells, Minn. Application filed April 23, 1873.

Working in a groove in the whiffletree is a rod forked at each end. The trace-hook is passed over one of the projections of each of the forks, and the draft holds the other projection against the cock-eye hook. A lever, E, is attached to the rod C at its center. This lever is bent around the whiffletree until its free end comes in front of it. At this point a strap is attached, which passes up to the driver. When the strap is pulled it turns the rods so that the trace-hooks slip off and the horse is released.

Claim.—1. The whiffletree B, rod C having forked arms or prongs *c c* and *c' c'*, ferrules D D having hook-guards *d d*, and lever E, the whole so combined and arranged as to operate substantially as described.

2. The ferrules F', having hold-backs F and flanges G, in combination with the springs H, substantially as described.

139,804.—*Machine for Granulating Cocoa-Nuts.*—THOMAS MILLS and GEORGE M. MILLS, Philadelphia, Pa. Application filed May 8, 1873.

The frame is made in two parts, the upper part bearing a grooved roller, and the lower part a toothed cylinder and an inclined grooved plate. A series of adjustable elastic wires are arranged at one end of the machine, the free ends thereof engaging in the notches of the toothed cylinder. The upper and lower portions are bolted together at one end by rigid bolts, and at the other end by a hinged bolt working in slots in both portions of the frame.

Claim.—1. The combination of the toothed cylinder H, the inclined grooved plate I, and the toothed roller E, the latter being arranged to revolve at a slower rate of speed than the said cylinder, and the whole being constructed and operating substantially in the manner described.

2. The combination, with the toothed cylinder H, of a series of elastic wires, arranged in respect to the axis of the roller substantially as set forth.

3. The elastic wires *p* clamped to blocks *m* and *n*, which are adjustable on the frame of the machine, as specified.

4. The beveled projections *y* of the upper portion of the frame, adapted to corresponding recesses in the lower portion, in combination with a bolt, K, hinged to the lower portion and having a nut bearing against the upper portion in the manner described.

139,805.—*Sewing-Machine Table.*—THOMAS W. MORRISON, New Brunswick, N. J. Application filed April 17, 1873.

A table constructed with a hollow standard and top with a hinged center, to which is attached the machine, and is hinged at one end to the table and secured by a spring-bolt, which, by withdrawing the center with the machine, may be reversed or turned within the table and the opening covered by a leaf or flap hinged to the edge of it. Within the hollow standard is journaled the fly-wheel to the sides of it, by which, with its crank and cord, motion is imparted to the machine.

Claim.—1. The combination of the sewing-machine, pivoted centrally within a hole in its table, as described, so as to be capable of revolving or swinging upside down below the table, and the bolts for retaining it in position, substantially as and for the purpose herein set forth.

2. The combination, with the bed-plate of the machine thus pivoted, of the flap or leaf E hinged thereto, as specified, essentially as and for the purpose described.

3. The combination, with the machine, pivoted at the middle, as described, of a stand having a central stem or column containing the fly-wheel, whereby the downward strain produced by the driving-belt is brought into a line parallel with the supporting-trunnions, substantially as specified.

139,806.—*Combination Mill-Pick.*—JAMES W. NANCE and DAVID LILLARD, Cornersville, Tenn. Application filed May 7, 1873.

Claim.—The combination of the socket or holder A, bits or points B B, set-screw *a*, plate *b*, handle C, and set-nut D, all substantially as and for the purposes herein set forth.

139,807.—*Rotary Engine.*—SAMUEL P. OCHILTREE, Orange, Ind., assignor of one-half of his right to GEORGE H. PUNTENNEY. Application filed April 23, 1873.

A double-cylinder engine with one central shaft, upon which are two side drums having cam-grooves in them for operating the valves which form the abutments when the revolving cylinder passes.

Claim.—The combination of the cylinders A A' with wheels D and pistons E E', the shaft G with central drum N, and side drums M M' having cam-grooves O O', the steam-chests E R, and the sliding abutments H H' with pins L L', all the parts constructed and arranged substantially as and for the purposes herein set forth.

139,808.—*Button-Fastening.*—MARCUS ORMSBEE, Brooklyn, N. Y. Application filed April 5, 1873.

Claim.—The button-fastener herein described, constructed with a flat head and an elastic tongue fitted to spring into the eye of the button, and having a shouldered loop to project through a hole in the shoe or other garment, as specified and shown.

139,809.—*Spring for Vehicles.*—PETER PENN, Cleveland, Ohio. Application filed October 8, 1872.

The clip embraces the leaves of the spring, and is held in place by a stud entering a recess in one of the leaves.

Claim.—The combination, with an elliptic spring, of a clip, B B', having a stud, *b*, for the purpose of holding the leaves of the spring in place without the usual beads and slots, all as set forth.

139,810.—*Knit Fringe or Border.*—JAMES PHIPPS, Philadelphia, Pa., assignor to MARTIN LANDENBERGER AND COMPANY, same place. Application filed April 4, 1873.

An imitation of the ordinary hand-made "peg-work," but produced on a knitting-machine, the crossings being secured by knitted loops.

Claim.—A knitted fringe or border consisting of body or surface threads *a* and *b*, crossing each other, one or both in zigzag lines, and bound together by chains of needle-thread *d*, extending longitudinally over the back of the fabric, substantially as herein described.

139,811.—*Lighting Gas by Electricity.*—WILLIAM A. PITT, New York, N. Y. Application filed February 5, 1873.

A pivoted conducting-wire, attached by an insulated support to a gas-burner and in electrical connection with one pole of a battery, (the burner being in connection with the other,) is so connected, by a silk cord, with a swinging crank on the gas-cock that, when the latter is turned to let the gas flow, the said pivoted wire is brought near enough to the gas-jet to transmit a spark and is immediately retracted by a spring.

Claim.—1. The method of lighting gas by means of an electric circuit closing and breaking device, arranged in proper relation to the burner, and combined with a stop-cock for enabling the circuit to be closed for igniting the gas by the opening movement of said cock, as herein shown and described.

2. The combination of the stop-cock attachment C^1, and the insulating-string I, with bent wire or igniting-finger F, spring H, and insulater E, for the purpose herein set forth.

3. The disk C^1 provided with crank-arms $C^2 C^3$, and with studs S S, combined with a stop-cock and circuit-closing device, for operation in the manner set forth.

139,812.—*Heating-Furnace.*—JOHN G. PORTER, New York, N. Y., and ELIJAH DAVIS, Jersey City, N. J. Application filed March 24, 1873.

Between the zigzag passages for the currents of incoming and outgoing air are zigzag passages for the products of combustion.

Claim.—The arrangement, substantially as herein described, of the fire-chamber A, the opening *c d* of different relative area, as specified, the upper and lower sets D D' of reverse or return flues *e f*, and the cold-air-circulating horizontal passages *i* with their inlets A, for operation in relation with each other, essentially as herein set forth.

139,813.—*Fire-Place.*—FREDERICK PROUDFOOT, Toronto, Canada. Application filed January 25, 1873.

The fire-basket is adjustable vertically upon the hollow post D. Through this post steam or vapor is supplied to the fire from the boiler. A hinged plate attached to a detachable fire-back may be used to deflect the heat. Doors may be opened to enlarge the fuel-space.

Claim.—1. The fire-basket or grate E, provided with a tubular shank, D', adjustable on the hollow post D, and combined with suitable fastening devices for retaining it at any desired elevation, as and for the purpose set forth.

2. The fire-basket or grate E suspended by chains carrying counter-balance weights, and combined with the tubular shank D' and post D, as and for the purpose specified.

3. In a fire-place constructed as described the water-tank or steam-boiler B, and the pipes C G, suitably arranged to convey the steam to the fire-basket and to the smoke-flue or chimney, as and for the purpose set forth.

4. In a double-front fire-place the detachable back or shield Y, provided with a hinged plate, Y', susceptible of being thrown at an angle to the fire for deflecting the heat into the room, as shown and described.

5. In a fire-place constructed as described the hinged door or doors N, arranged in relation to the fire chamber and lateral chambers of the fire-place in the manner shown, and for the purpose specified.

139,814.—*Rotary Harrow.*—ROLAND RAKESTRAW, Wyoming, Ill. Application filed April 1, 1873.

A harrow-hub made with radial arms and concentric flanges provided with vertical pins, over which V-shaped harrow sections are placed and passed into triangular recesses under the upper flange. The outer ends of the sections are adjustably secured by clevises and pins.

Claim.—The box or hub D made with radial arms *e* and concentric rims or flanges *f g*, concentric rim *f* being provided with vertical pins *b*, in combination with the harrow made in triangular sections A, hinged or hooked together, substantially as and for the purpose set forth.

139,815.—*Washing-Machine.*—LEMUEL REED, Allegheny, Pa. Application filed May 14, 1873.

The rubbing-cylinder is formed with triangular-formed rubbers of wood secured to rings at their ends by a flange upon the lower side and lugs upon the face, and with crossed arms, to the center of which the main shaft is secured and passes through it.

Claim.—The combination of the shaft A, heads B B with flanges *a* and lugs *b*, and the rubbers C C, all substantially as and for the purposes herein set forth.

139,816.—*Scraper.*—ALBAN H. REID, Brandywine Manor, Pa. Application filed March 27, 1873.

The scoop is drawn forward on the ways by the rope. When it reaches the cross-bar the handles are depressed by the attendant and the scoop elevated. After the scoop has passed the cross-bar the front edge of it may rest on the diagonal bars until it reaches the rear end of the cart, when it is tilted and contents emptied into the cart. The scoop is drawn back for another load by the return-rope.

Claim.—1. The combination of the handled scoop A, suitable hauling appliances, and the frame B adapted to the cart, all substantially as set forth.

2. The frame B composed of the parallel trussed bars *d d'*, cross-bars *e* and *f*, and diagonal bars *h h*, all constructed and arranged as and for the purpose set forth.

3. The handled scoop A, its wheels *x x*, the bail *m* connected to the axle of the scoop, and the within-described hauling appliances or their equivalents.

139,817.—*Harvester.*—BUSHROD W. S. RESSLER and CARTHON H. RESSLER, Tipton, assignors to themselves and RICHARD C. CREESMAN, Hagerstown, Indiana. Application filed February 27, 1873.

A hinged lever or secondary seat is connected by cords or chains and springs to clutch-pins, so that when the driver is thrown from his seat the supporting-wheels are locked and the cutting apparatus stopped.

Claim.—The combination of the seat-piece E, the bolts I connected therewith by cords or chains, the notches or recesses in the hubs of the running-wheels G, and the springs J, substantially as and for the purpose specified.

139,818.—*Speaking-Tube Annunciator.*—DAVID ROUSSEAU, New York, N. Y. Application filed October 8, 1872.

A folding tag or door is hinged at its lower edge so as to stand up against the mouth of a speaking-tube. By blowing through said tube the tag is thrown down, exposing a number on its outer fold, and simultaneously an arm attached to the tag releases a clock-work alarm. A device for resetting the tag, or a number of them, at the same time rewinds the clock-work alarm.

Claim.—1. The combination, with a drop-tag at or near the delivery-end of the speaking-tube, of a tag-setting device or mechanism for replacing the tag after it has been exposed, and a power-storing device operated by the tag-setting mechanism, and serving to actuate the call, substantially as specified.

2. The combination of the crank C, the spring *g*, the lifter *i*, the shaft D, the arms *h i*, and the weighted tag-lever *f*, essentially as described.

3. The combination, with the winding-lever K of the power-storing device used to sound the call, of a free lever, L, for operation by the crank C, substantially as specified.

4. The combination of an escapement, F, with the hand *q* of the swinging rod *m*, the stirrup *o*, and the weighted tag-lever *f*, essentially as described.

5. The folding drop-tag *c d*, constructed and arranged for operation in relation with the speaking-tube, substantially as specified.

139,819.—*Electro-Medical Bath-Tub.*—SAMUEL RUSSELL, Jr. New York, N. Y. Application filed March 17, 1873.

An inclined insulated diaphragm provided with a central opening, and a sliding gate is arranged in the bath-tub for the support of the back of the patient. A removable insulating foot-rest is also arranged to be used, if desired.

Claim.—1. In an electro-medical bath-tub the diaphragm D, provided with an opening, K, substantially as and for the purpose herein set forth.

2. In combination with the opening K, the cushion E or its equivalent, and gate F, substantially as set forth.

3. In combination with the diaphragm D, the packing-strips J J, substantially as shown and described.

4. In combination with the diaphragm D, the electrodes B C, arranged at opposite ends of the bath-tub, as set forth.

5. In an electro-medical bath-tub the hinged plate C', substantially as shown and described.

6. In combination with the diaphragm D the removable foot-rest G, substantially as set forth.

139,820.—*Cotton-Gin.*—PETER C. SAWYER, Macon, Ga. Application filed March 26, 1873.

The cotton-box is adjustably hinged at top to the front of the gin-frame and its inner surface is so formed that the revolving cotton will be compressed when presented to the saws, while the opposite side of the roll is expanded. The cotton-box is provided with a swinging front which is adjustable at top and bottom and which has ribs on its inner surface curving in opposite directions.

Claim.—1. The cotton-box G, having its end walls inclined inward from front to rear, as shown and described, whereby the cotton, after being fed through the top opening, will be acted upon by the saws, carried around, and be expanded in the front of the box, as and for the purposes set forth.

2. The cotton-box G, hinged at its top to the serrated bar E, which is slotted and secured by bolts for the forward and backward adjustment of the top of the box, said box being adjusted outward and inward at its bottom by the slotted block or blocks A A, all substantially as and for the purposes set forth.

3. The swinging front H, hinged at its upper end, and both the upper and lower ends made adjustable, substantially in the manner and for the purposes herein set forth.

4. The ribs *p p*, curved in opposite directions and attached to the swinging front H of the cotton-box, as and for the purposes set forth.

139,821.—*Adjustable Try-Square.*—CHARLES A. SCHAEFER, Chicago, Ill. Application filed April 12, 1873.

Two eccentric pins or screws, passing through the stock on a line with the inner edge of the blade, serve mutually to adjust the same, the blade being supported and secured by a permanent screw through the upper end of the stock.

Claim.—The blade B, hung upon the pin *b* as a permanent center, and adjusted by the two eccentric pins C C, as set forth.

139,822.—*Horse-Collar.*—JOHN N. SCHMITZ, Kilbourn City, Wis. Application filed March 1, 1873.

Claim.—1. In the construction of horse-collars the wooden blank A, having notch c^2 cut from its inner side near the lower end, and adapted to be closed when said blank is steamed and bent, in the manner shown and described.

2. The fastening device, consisting of the hooked bar H, having the loop *i* and socket-plates K provided with a series of holes, arranged and operating substantially as shown and described.

139,823.—*Wheelbarrow.*—JOHN B. SCHNEIDER, Kankakee, Ill. Application filed April 10, 1873.

The box or receptacle has pivoted bottoms, which, when not burdened, are held in place by springs; but, when the box is loaded, bars are inserted beneath the bottoms, and removed when the load is to be dumped.

Claim.—In combination with the side bars A and hopper B the doors B' B' hinged to the side bars, bolts D D, rod E, lever E' link *d*, and springs *b b c c*, substantially as and for the purpose set forth.

139,824.—*Coffee-Mill.*—LUI SCHULZ, Cincinnati, Ohio. Application filed April 5, 1873.

Receiving-vessel easily detached from the mill when required. Feather-edged ribs prevent the coffee-berries from clogging in the hopper.

Claim.—1. In a coffee-mill, the combination of the receiving-vessel C having a slot, *c*, enlarged at *c'*, frame A, and hopper B, connected together by pin a^1, substantially as set forth.

2. In a coffee-mill, the curved and feathered-edged ribs b^3 in combination with the hopper B and journal b^2, substantially as set forth.

139,825.—*Sash-Holder.*—WILLIAM SENK, Syracuse, N. Y. Application filed April 8, 1873.

An ornamental weighted lever, pivoted to a plate on the side of the sash, has its short arm expanded into a dovetailed recess, clasping a piece of rubber, and just below this rubber is formed a hook. The rubber serves as a frictional holder only until it drops into a recessed catch-plate. And below this first recess is a catch, with which, for greater security, the hook likewise engages as a positive fastener.

Claim.—The catch composed of the rubber *a* and the hook *b*, constructed as herein set forth, in combination with a catch-plate, E, having a recess, *d*, and catch *c*, as above specified.

139,826.—*Electric Annunciator.*—GEORGE W. SHAWK, Cleveland, Ohio, assignor of three-fourths his right to CHARLES F. UHL, ALBERT STORER, and J. GIBBEN, of same place. Application filed April 11, 1873.

Number is on an arm attached to armature, and is exposed by being lifted before an opening when armature is attracted.

Claim.—The armature C, bar D, yoke E, arm F, arm H, plate G, crank-shaft K with its arm L, and the electro-magnet B, combined, arranged, and operating substantially as shown and described, and for the purpose set forth.

139,827.—*Railroad Switch.*—CHRISTOPHER C. SHELBY, Spring Valley, N. Y. Application filed April 11, 1873.

The swing-rail D is pivoted at *d'*, and is connected by the links *a d e* to the switch-rails. When the switch is set for the siding, the short point rail A is brought into line with the main track, and, in connection with the guard-rail, guides a train approaching on the main track, in the direction of the arrow, safely to the main rail, the rail F' yielding sufficiently by its elasticity to allow the flange to pass.

Claim.—The combination, with a railway, of the switch-rails F F', connecting-rail A, supporting-rail D, and links *a d e*, substantially as and for the purpose specified.

139,828.—*Gas-Burner.*—ISAAC SIMMONS, Baltimore, Md. Application filed March 3, 1873.

This chimney is composed of a metallic base of small diameter, and a glass globe or supplemental chimney above. When placed on the burner the base affords a passage to supply air to the burner.

Claim.—The chimney herein described—that is to say, the metallic jacket E, combined with the glass F—constructed and adapted to operate as set forth.

139,829.—*Crib Attachment for Bedsteads.*—BENJAMIN SNYDER, Philadelphia, Pa., assignor to SARAH D. SNYDER and AUGUSTUS C. LEIDY, same place. Application filed April 18, 1873.

The bottom and side are hinged together, and the ends are hinged to the side. The side has legs to rest on the floor when the crib is drawn out. The bottom is connected by pins to two bell-crank levers, each of which has a roller resting and sliding on the flange of a rail, of which there are two, which extend across the bedstead, and are secured to the under side of the side rails of the bedstead. The front part of the bottom is also provided with two upright arms or links that have projecting pins that slide on the rails when the crib is in a folded position under the bedstead.

Claim.—1. The combination, with a bedstead, of guide-rails H, and a folding crib consisting of a bottom, B, and hinged side and ends, connected as described, so that the crib may be attached to the side rail of the bed and supported by the side A, or folded up and supported by the rails H beneath the bed.

2. The combination, with the rails H, side A, and bottom B, of the levers G, rods I, and links *y*, substantially as set forth.

139,830.—*Wheel for Vehicles.*—SYLVESTER T. F. STERICK, Georgetown, D. C. Application filed January 28, 1873.

The sockets are secured firmly by bands, and rest in a groove, and each may be detached without removing the others.

Claim.—1. A metallic spoke-confining and supporting-socket, B, applied to the spoke and hub of a carriage-wheel, in the manner herein shown and set forth, for the purpose specified.

2. The spoke-confining and supporting-socket B, formed with the flange D, and with internal walls corresponding to the external surface of the shoulder of the spoke, and applied to the spoke and hub in the manner herein described, for the object set forth.

3. A metallic rim for encircling a wooden hub, the rim being made of a series of separate metallic sockets and rigidly connected with the hub and spokes, in the manner and for the purpose specified.

139,831.—*Ear-Cover.*—MELVIN STONE, Vermillion, Ohio. Application filed March 22, 1873.

The spring forms a clamp for clasping the ear-muffs to the head.

Claim.—The spring-clamp ear-protector, constructed as described, consisting of the bent spring c, of suitable shape to be passed over the head, and having its looped ends *b* covered with cloth or fur, held full to form bags or ponches for the ears, as shown and described.

139,832.—*Fire-Tongs.*—CHARLES SWETT, Copiah county, Miss., assignor to CHARLES SWETT, and WILLIAM PALFEY, New Orleans, La. Application filed December 3, 1872.

Claim.—As a new article of manufacture, the tongs, consisting of the legs A A' and tube B, when the same are constructed, combined, and arranged so as to operate substantially as described.

139,833.—*Letter-Box Alarm.*—ALFRED TAYLOR, Brooklyn, N. Y. Application filed March 13, 1873.

A metallic arm rigidly attached to the door-plate, and passing through the door, carries a spring-lid for covering the letter-opening, a bell-trip operated by the lid, and a bell.

Claim.—The combination, in one apparatus, of a door-plate, a door, A', hinged to the plate, an arm, D, fixed to or forming part of the plate, a bell, H, secured to the arm, a hammer, *d*, and mechanism whereby the door, on being opened, is caused to operate the hammer, all as set forth.

139,834.—*Metallurgic Gas-Furnace.*—JOHN THOMAS, Middlesbrough, England. Application filed April 25, 1873.

Additional coal is fed upon the hot coke in or near the throat connecting the gas-generator with the dust-trap, through a suitably located hopper. Girder-shaped iron bars are laid upon the bottom of the gas-main, so as to leave a clear space through the length of the bottom opposite the end or clearing-door, through which dust or other foreign matter can be removed, said matter being eliminated from the gas by bricks with which the chamber above the bars is filled.

Claim.—1. The bricks *g*, in combination with the gas main or chamber O, substantially as and for the purpose herein set forth.

2. In combination with the gas-main O, provided with the bricks *g g*, the door-ways N and doors, arranged substantially as and for the purpose herein set forth.

3. The hopper L or equivalent, arranged over the throat of the gas-main for introducing coals or other carbonaceous material thereto, substantially as set forth.

139,835.—*Connecting and Disconnecting Car-Bodies and Trucks.*—CHARLES D. TISDALE, Boston, Mass., assignor to himself and SAMUEL SHACKELL, same place. Application filed March 15, 1873.

The car to which different-g⁹ged trucks are to be applied is run upon a transfer-truck which runs upon a supplementary track. A section of the main track is constructed with a sufficient incline to allow the trucks to be detached from the body as the car is carried over the inclined section when trucks of different gage are run under the body and secured thereto.

Claim.—1. The transfer-track *k* and the auxillary track, in combination with the main track, substantially as described.

2. In combination with the transfer-track *k*, the swinging jack-blocks *m*, substantially as shown and described.

139,836.—*Pigeon-Trap.*—NATHAN B. TYLER, Warren, Ohio. Application filed April 17, 1873.

Four triangular flaps hinged to the four edges of a square platform, when closed, form a hollow pyramid. Inside, and pivoted to the center of said platform, is a smaller one which, by an attached string, is partly and suddenly rotated at pleasure from a distance. The corners of the upper board press open the hinged flaps, and the bird thereupon escapes for the marksman.

Claim.—1. In combination with the main body of a trap, an auxillary movable bottom which partially revolves, as and for the purposes herein set forth.

2. In combination with the two bottoms A and C, the sides B, connected and operated as and for the purposes set forth.

3. The lever D and pin d for stationing the bottom C to the bottom A, as and for the purpose set forth.

139,837.—*Fruit-Parer.*—ANDREW TURNBULL and RODOLPHUS L. WEBB, New Britain, Conn., assignors to LANDERS, FRARY & CLARK, same place. Application filed June 6, 1873.

The shaft, bearing the holding-fork, is connected by two pinions with the driving-wheel. To the shaft of the driving-wheel is attached a pinion, which engages with cogs on the under side of the revolving table that carries the paring-knife. Above the frame of the forked shaft is a slide to throw off the apple when pared, which is operated by a projection on the revolving table working against a corresponding arm on a shaft, upon which shaft a pinion works in a corresponding rack in said slide.

Claim.—1. A paring-machine, composed of the forked shaft *a*, its operative-gears F P R, whereby the revolution of the said forked shaft is in the same direction as the driving-wheel, the frame A with its arm C supporting the table H, the said table caused to revolve by a pinion upon the driving-shaft and working in a gear beneath the table upon the side toward the driving-wheel, the said table carrying the knife-lever, all substantially as set forth.

2. The slide *t*, moving in a parallel line with the forked shaft *a* and actuated from the revolving table by the projection W thereon working against the corresponding arm *t* on the shaft *r*, upon which shaft a pinion works in a corresponding rack in said slide, substantially as and for the purpose specified.

139,838.—*Automatic Cradle.*—WILLIAM V. VAN DERVORT and ROBERT B. WALKER, New Antioch, Ohio. Application filed May 3, 1873.

The cradle is constructed with a circular toothed sector upon its rocker and a rack connected with the frame into which it works, and is held in place by arm having a guide-pin which slides in a cycloidal groove attached to the rack.

Claim.—The combination, with a cradle-rocker, of the rack *a*, arm C, pin *c*, toothed sector *b*, cycloidal groove *c'*, substantially as specified.

139,839.—*Illuminated Clock.*—EZEKIEL WADE, Elizabeth, N. J. Application filed January 30, 1873.

On the top of a common clock is mounted a globe or vase-dial in gear with the clock-movement so as to furnish an illuminated clock for night use, combined with the more precise time-dial for use by day.

Claim.—The combination, with an ordinary clock, having the dial B, the hour-hand C, and the minute-hand D, of the supplementary illuminated dial, vase, or shade E, the index G, and the spindle *b*, and gears *c d*, for operation by the mechanism which drives the hour-hand of the clock, and so that the illuminated dial revolves in unison with said hand, the whole being arranged essentially as and for the purposes herein set forth.

139,840.—*Pump and Fire-Engine.*—SAMUEL WETRICK and HENRY LATHROPE, Warsaw, Ind. Application filed March 30, 1872.

To a stationary circular chamber are secured radial pump-barrels, the pistons of which are operated by a ring and a cam on the driving-shaft.

Claim.—The fire-engine pump herein described, constructed with an immovable circular chamber, B, discharge-pipe C, radial pump-barrels E, rigidly attached, the valves D, together with the valved and pivoted pistons F operated by a ring, H, and a cam on the driving-shaft, as and for the purpose specified.

139,841.—*Coupling Tubular Lightning-Rods.*—JAMES H. WESTON, Cincinnati, Ohio. Application filed March 1, 1873.

The lower end of each section of tube is sufficiently enlarged to receive the upper end of the section below it, and it is provided with a small transverse slot, through which a split section or tongue of the entering portion protrudes, and this being bent outward serves to lock the sections together.

Claim.—The tubular lightning-rod herein described, having the lower portion A of each section sufficiently enlarged to admit the upper end B, of the next section, the sections being connected and secured together by means of the orifice C and tongue D, all as herein shown and described.

139,842.—*Driving-Rein Support and Protector.*—WILLIAM N. C. WILSON, Summit Point, W. Va. Application filed May 19, 1873.

The rein-support is adjustable in socket-stands, which are secured to the pole or shafts.

Claim.—A driving-rein support, consisting of the bent rod B *b*, socket-stand A *a'*, and clamp or set-screw *s*, all combined and applied to the pole or shafts, as set forth.

139,843.—*Middlings-Purifier.*—JOSEPH W. WILSON, Pawtucket, R. I., assignor of one-half his right to JOHN W. VOSE, same place. Application filed January 11, 1873.

Middlings fed from an adjustable feed-hopper into a reciprocating bolt having a cloth of such fineness that the middlings cannot pass therethrough, and subjected, while on such cloth, to currents of air from a blast and a suction fan.

Claim.—1. In a middlings-purifier, the combination, with a sieve placed in an air-tight chamber, and of such fineness as not to permit the middlings to pass through, of the fans I J, substantially as and for the purpose described.

2. The air-tight chambers A B, hopper C, spout D, fine screen-cloth E, and coarser cloth H, combined with the fans I J, arranged as and for the purpose described.

3. The combination, with hopper C, of the cut-off plate O, rod P, and cam-wheel Q, as and for the purpose described.

139,844.—*Bedstead-Fastening.*—CALMAN WOLF, Rochester, N. Y. Application filed May 9, 1873.

A cam is provided with cam-faces and shoulder-offsets, by which an end and a vertical movement is produced. The cam is turned by a key to engage or release the hooks from the fastening.

Claim.—The combination of the cam E with the fastening D, when said cam and the eye of the fastening are provided with the cam-faces *g d* for producing an end movement, and with the shoulders or offsets *h f* for producing a vertical movement, substantially as and for the purpose specified.

139,845.—*Cotton-Press.*—DAVID H. WOOLDRIDGE, Humboldt, Tenn. Application filed March 3, 1873.

Claim.—The bale-box A, provided with followers B and C C and door D, in combination with the levers E and G G, with their arms I and rollers *d*, and the guide-beam J, all constructed and arranged substantially as and for the purposes herein set forth.

139,846.—*Cartridge-Box.*—SAMUEL MCKENVER, United States Army, stationed at Mobile, Ala. Application filed May 17, 1873.

To open the box the outer section is raised until the cap clears the other, when it is free to fall outward and downward, exposing the cartridges for use.

Claim.—1. A cartridge-box made in two separate parts, connected by pivot-joints or hinges at the bottom, substantially as described.

2. A two-part cartridge-box, having a cover, b^2, and slotted at b^1 b^1 to slide as well as turn upon the pivot-bolts *b b*, as described, to allow the ordinary flap-cover to be dispensed with.

3. The pockets E attached by a pliable fabric, F, to the body of cartridge-box, as set forth, to allow the cartridges to be turned with their heads outward, and into an oblique position where they may be conveniently seized by the soldier.

139,847.—*Cartridge-Box.*—SAMUEL MCKENVER, United States Army, stationed at Mobile, Ala. Application filed June 2, 1873.

The cartridge-box is made in two parts hinged together, one part being longer than the other so as to fold over at the top, where it is fastened by a flap and button. When the flap is detached the outer half of the box opens downward and the contents of the box are exposed and ready for use.

Claim.—1. A cartridge-box formed of two parts hinged together, one made higher than the other so as to fold over it at top and allow it to be latched in the manner described.

2. The flexible connection *a* combined with the rod or pivot B arranged across the middle thereof, as and for the purpose set forth.

3. The flap C and button D applied at the top of a two-part cartridge-box, as and for the purpose specified.

REISSUE PATENTS.

5,440.—*Pump.*—ROBERT M. LAFFERTY, Toledo, Ohio, assignor to himself and E. P. SMITH.—Patent No. 104,604, dated June 21, 1870; reissue No. 4,678, dated December 19, 1871.—Division A. Application filed January 21, 1873.

The ends of the sheet of metal of which the lining is made are so secured that the lining may contract or expand with the pump-stock. The lining is secured to the stock by forcing the flanges of the former into the walls of the latter, or grooves may be previously made for their reception.

Claim.—A flexible or expansible metallic lining, B, in combination with a pump-cylinder, substantially as and for the purpose set forth.

5,441.—*Pump.*—ROBERT M. LAFFERTY, Toledo, Ohio, assignor to himself and E. P. SMITH.—Patent No. 104,604, dated June 21, 1870; reissue No. 4,678, dated December 19, 1871.—Division B. Application filed February 8, 1873.

The openings are curved from near the middle of the piston, leaving the lower part of the piston solid, thus lessening the liability to split. The upper part of the foot-plug is cup-shaped, and the disk-valves are radially and concentrically grooved.

Claim.—1. The piston C, provided with the curved opening *d* and with the cup-leather, or equivalent, and valve D, when each of the parts is constructed and arranged to operate substantially as and for the purposes specified.

2. The piston C and valve D, in combination with the plug E with concave upper face, as described, openings *f*, and cup-leathers or equivalents, all constructed and arranged to operate as and for the purpose set forth.

3. The arrangement of the barrel A, lining B, piston C, plug E, and valves D D', when the parts are constructed and combined substantially in the manner and for the purposes set forth.

5,442.—*Reservoir Cooking-Stove.*—GURDON G. WOLFE, Troy, N. Y.—Patent No. 76,292, dated March 31, 1868. Application filed July 24, 1871.

The water-tank fits into the rear end and forms part of the top plate of the stove, while a portion of this tank rests over the end flues of the stove and a portion extends downward and against the rear vertical end plate of the stove. Over the suitable openings in the said rear plate a damper is placed to regulate the flow of the products of combustion about the front of the tank. The exit-pipe may pass through the front part of the tank.

Claim.—1. The reservoir or water-tank A constructed with an upper bottom, F', and lower bottom A', and intermediate plate K, substantially as described.

2. The reservoir A constructed with an upper bottom, F', and lower bottom A', and intermediate plate K, in combination with the flue E, substantially as herein described.

3. The combination of the reservoir or water-tank A, constructed substantially as herein described, with a cooking-stove having a part or portion of the rear end of the top thereof removed, substantially as shown at Fig. 2 of accompanying drawings, so as to receive and contain the upper part or bottom F' of said reservoir, in the manner and for the purposes substantially as herein described and set forth.

4. The employment of the damper C', in the upper part of the rear and vertical end plate of the cooking-stove, in combination with the vertical flues in the rear end of the stove and with that part or portion of said reservoir extending below the top plate of said cooking-stove, as seen at Fig. 1 of accompanying drawings, and in the manner and for the purposes substantially as herein described and set forth.

5. The employment and arrangement of a reservoir or water-tank with a cooking-stove, so that a part of such reservoir shall be above the top of the stove and over the vertical flue or flues in the rear end thereof, and a part below such top plate, in the manner substantially as shown at Fig. 1 of the accompanying drawings.

5,443.—*Lining for Horse-Collar Caps and Harness.*—DEXTER CURTIS, Sun Prairie, Wis., assignor of one-half interest to GEORGE H. RICHARDS and HENRY GILMAN.—Patent No. 105,017, dated August 2, 1870; reissue No. 5,251, dated January 21, 1873. Application filed May 21, 1873.

The zinc is said to possess medicinal and healing qualities. The aperture for ventilation keeps the metal surface cool.

Claim.—The horse collar cap, consisting of the curved metal plates A B, secured together substantially as described, so as to leave an air-passage between them, for the purposes specified.

2. A horse-collar cap or pad constructed with an upper supporting-plate of iron or other suitable material, and an under surface or lining of zinc, said zinc surface or lining being adapted to the shape of the horse at the parts where it is to be applied, and being secured to the upper plate in any suitable manner.

3. A horse-collar cap having an upper supporting-plate of iron or other suitable material, and an under surface or lining of zinc, said zinc surface or lining not being in immediate contact with the upper plate, except at the places where it is necessary to secure the under plate to the upper one for support, for the purposes herein set forth.

4. In a harness a zinc bearing-surface shaped to the part of the horse with which it is to come in contact, substantially as and for the purposes specified.

5,444.—*Mold for Casting Knobs.*—CHRISTIAN REBSTOCK and JOSEPH OTTNER, Bridgeport, Conn., assignors, by mesne assignments, to THE BRIDGEPORT ELECTRO-CASTING COMPANY.—Patent No. 134,931, dated January 14, 1873.—Division A. Application filed March 22, 1873.

The mold is adapted for the reception of the outer shell of the knob and a spindle projecting from the inner shell. The inner shell forms the core and the fused metal is cast between them. A hard-metal tube is placed around the spindle, for bushing the spindle-hole and a hard-metal eyelet is inserted for bushing the shank screw-hole.

Claim.—1. A mold for casting knobs adapted for the reception of an outer shell, D, and of a spindle, K, projecting from the inner shell E, substantially as described.

2. A mold for casting knobs, so constructed that a bushing-tube around the spindle and an eyelet for bushing the fastening screw-hole may be set, substantially as shown and described.

3. In combination with a mold for casting knobs, the adjustable ring E, substantially as and for the purpose described.

5,445.—*Door-Knob.*—CHRISTIAN REBSTOCK and JOSEPH OTTNER, Bridgeport, Conn, assignors, by mesne assignments, to THE BRIDGEPORT ELECTRO-CASTING COMPANY.—Patent No. 134,-931, dated January 14, 1873.—Division B. Application filed March 22, 1873.

The knob is constructed of an interior and an exterior sheet-metal shell, the space between them being filled with metal.

Claim.—1. The metallic knob and shank, consisting of an exterior and interior shell, and the eyelet for the fastening-screw, the space between the shells being filled with metal, substantially as and for the purpose herein described.

2. The inner shell provided with projections or teats, substantially as and for the purpose described.

INDEX OF INVENTIONS PATENTED JUNE 10, 1873.

	Class No.	Whole No.
Alarm, letter box, A. Taylor	24	139,833
Annunciator, electric, G. W. Shawk	50	139,856
Annunciator, speaking tube, D. Rousseau	24	139,818
Bale tie, E. P. Jones	7	139,675
Bale tie, cotton, A. S. Armstrong	7	139,754
Bale tie, cotton, F. Cook	7	139,777
Bath tub, electro medical, S. Russell, Jr	50	139,819
Bedstead crib attachment, B. Snyder	62	139,829
Bedstead fastening, C. Wolf	62	139,844
Bell pull, W. T. Munger	24	139,687
Bit stock, A. D. Goodell	29	139,667
Boiler feed regulator, automatic, B. Brett	148	139,762
Boiler, sectional steam, T. E. McNeill	148	139,724
Bolt, J. F. Carlin	24	139,767
Bolt for doors, flush, S. D. Arnold	24	139,647
Boot stretcher, D. Harris	16	139,671
Boots and shoes, machine for crimping leather for, S. W. Jamison	16	139,717
Boring machine, earth, W. H. Bouser	51	139,761
Bottles, box for holding and transporting, J. Matthews	1	139,722
Box for spices, &c., E. Norton	88	139,688
Burner, gas, L. Simmons	64	139,828
Butter, refining, G. W. Kirchhoffer	45	139,796
Butter worker, J. McBride	45	139,723
Button fastening, M. Ormsbee	16	139,808
Canal boats, propelling, W. F. Miller	139	139,727
Cap setting and extracting device, E. S. Holmes	53	139,674
Car axle box attachment, D. A. Hopkins	122	139,791
Car axle box, railroad, R. Brewer	122	139,655
Car bodies and trucks, connecting and disconnecting, C. D. Tisdale	122	139,835
Car indicator, railroad, C. H. Coffin	121	139,771
Car, railroad, I. G. Macfarlane	121	139,680
Car starter, G. Lowden	122	139,721
Carpet, printed piled, T. Crossley	11	139,706
Carriage curtain fastener, H. Drake	62	139,663
Carriage spring clip, D. W. Baird	31	139,648
Cartridge box, S. McKeever	102	139,846
Cartridge box, S. McKeever	102	139,847
Casting chilled rolls, G. G. Lobdell	33	139,798
Chair, folding, A. C. O., and N. Collignon	62	139,776
Churn, reciprocating, G. P. Coan	45	139,658
Clock, illuminated, E. Wade	36	139,839
Coach or carriage, J. Allgaier	31	139,753
Coffee mill, L. Schuls	88	139,824
Coffee steeper, J. D. Adney	136	139,645
Conductor's check box, J. F. Gaunt	121	139,780
Corn for grinding, preparing, W. Standing	57	139,743
Cotton gin, P. C. Bawyer	41	139,820
Cradle, automatic, Van Dervort and Walker	62	139,838
Cultivator, cotton, C. Zocher	43	139,750
Cultivators, draft hook for, A. Adams	43	139,752
Curtain fixture, A. E. Lazell	62	139,719
Curtain hook, H. L. Judd	62	139,676
Cutter, peach, W. J. Hill	88	139,714
Digger, potato, H. M. and W. W. Dowd	114	139,709
Distillation, treating grain for, A. Woolner	47	139,749
Ditching machine, C. M. Brown	114	139,765
Dress, lady's, H. and E. S. Judson	38	139,677
Ear cover, M. Seane	38	139,831
Ejector, W. B. Mack	118	139,799
Engine, rotary, S. P. Ochiltree	150	139,807
Engine slide valve, steam, N. Johnson	150	139,793
Explosive compound, T. P. Shaffner	71	139,738
Explosive compound, T. Varney	71	139,746
Fire place, F. Proedfoot	154	139,813
Fire tongs, C. Sweet	154	139,832
Flooring, wood blocks for, Doubrava and Staib	30	139,672
Fringe or border, knit, J. Phipps	89	139,810
Fruit parer, Turnbull and Webb	88	139,837
Furnace and steam generator, combined, O. W. Ketchum	149	139,795
Furnace, heating, Porter and Davis	154	139,812
Furnace, metallurgic gas, J. Thomas	99	139,834
Furnace, puddling, J. Heatley	85	139,778
Furnace, reverberatory, H. McDonald	85	139,683

BOUND VOLUMES OF PATENTS.

The Office is now prepared to furnish to subscribers the monthly volumes of patents at $125.00 per annum, bound in half-sheep.

In these volumes the specifications are in full, the type of the same size as the printed patents and records; the drawings are in full, but are one-half the size (linear) of those attached to the patents and bound up for record; the illustrations are four on a page, but *fac-similes* of the originals, with the headings and signatures.

The volumes are the same size as the patents and the OFFICIAL GAZETTE, and have an average of 800 pages of specifications, 260 of drawings; total of each volume about 1,060 pages. They commenced with the issue of July 2, 1872, being the successors in this form of the weekly volumes of patents published under the joint resolution of Congress, passed January 11, 1871, which discontinued the publication of the illustrated annual report of the Commissioner of Patents, and provided for the publication in lieu thereof of complete copies of the specifications and drawings of patents issued subsequently to June 30, 1869. Under this resolution the volumes were to be placed for free public inspection in the capital of each State and Territory of the United States, and in the clerk's office of certain of the federal courts. The Commissioner is also authorised by the resolution to "furnish a complete set of such specifications and drawings to any public library which will pay for binding the same into volumes to correspond with those in the Patent Office, and for the transportation of the same, and which shall also provide proper custody for the same, with convenient access for the public thereto, under such regulations as the Commissioner shall deem reasonable."

After filling the requisition as provided above, a surplus remains which the Commissioner now offers at the rate of $125.00 per annum—say, 1,060 pages per month: 2,600 pages of specifications, 3,120 pages of drawings—12,720 pages.

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited, and the invention therein described will become public property, as against the applicant therefor, unless he shall make a new application within two years from the date of notice of the original allowance.

COMMISSIONER'S DECISIONS.

MURRAY AND WUTERICH.—*Appeal.*

[*Appeal from the decision of the Primary Examiner in the matter of the application of Murray and Wuterich for a patent for* MACHINE FOR MAKING BIAS BOX-PLAITED TRIMMING.—*Decided June 13, 1873.*]

A claim for a machine and a claim for the product of the machine will not be allowed in the same application. Each must be presented in a separate application for a distinct patent.

LEGGETT, *Commissioner:*

The question in this case is whether the machine and its product shall be permitted to be examined in the same application. The Examiner holds, upon reasons which are of weight, that they ought not to be. He asserts that such practice is not the rule, but the exception, in the Office; and argues that, if it were to be established as the rule, "apart from the question of revenue rightfully due the Government for the examination of each distinct subject of invention, it would lead to a subversion of the present system of classification, * * * greatly increase the labor of examination, * * and result, beyond doubt, in the multiplication of gross errors and the commission, inadvertently, of great injustice, both to inventors and the general public."

The practice has undoubtedly come into vogue, to some extent, of allowing a machine and its product to be claimed in the same application and go out in the same patent. I am not sure such a practice was ever wisely or, in strictness, legally admitted in any instance. Defects in the issue of a patent may be cured in court by force of the presumption that public officers have done their duty, and by the rule that a patent once granted is to be construed liberally in favor of its validity. An oath may have been omitted, and yet in such a case it has been held the patent would be sustained. (*Whittemore* vs. *Cutter*, 1 Gol., 433; *Crompton* vs. *Belknap Mills*, 3 Fish., 536.) However, as Commissioner Fisher remarked in *ex parte Linus Yale*, (Decisions, 1869, p. 110:) "It by no means follows because a patent has been sustained, notwithstanding certain informalities in the issue, that every succeeding patent is to exhibit the same informalities."

The division of inventions preliminary to the issue of patents, under the general rule that separate and distinct subjects of invention cannot be embraced in the same patent, is unquestionably a matter for the discretion of the Commissioner. (*Linus Yale*, ibid; Phil. on Pat., p. 218.) This fact was tacitly recognized, and the general rule and the "exception" to it were stated by the Supreme Court of the United States, in *Hogg* vs. *Emerson*, (6 How., 483,) which has often been referred to in connection with the subject of dividing applications. The Court said: "The public officers have generally declined to issue letters for more than one patent (invention) described in them. (Renouard, 293; Phillips on Pat., 218.) The courts have been disposed to acquiesce in the practice, as conducive to clearness and certainty; and if letters otherwise issue inadvertently, to hold them, as a general rule, null. *But it is a well-established exception* that patents (inventions) may be united, if two or more included in one set of letters relate to a like subject, or are in their nature or operation connected together. (Phillips on Pat., 218; *Barrett* vs. *Hall*, 1 Mason, C. C., 447; *Moody* vs. *Fiske*, 2 Mason, C. C., 112; *Wyeth* vs. *Stone*, 1 Story, 273.)" Under this "exception" the Court sustained the patent before them, the inventions "being all connected with the use of the improvements in the steam-engine, as applied to propel carriages or vessels." The claim covered only different parts of the same engine. In *Wyeth* vs. *Stone* Judge Story said: "A patent under the general patent act cannot embrace various distinct improvements or inventions, but in such case the party must take out separate patents." In *Goodyear* vs. *Providence Rubber Company* Judge Clifford said: "No doubt can be entertained that a new product or manufacture, and a new process or method of producing the new article, are the proper subjects of separate and distinct claims in an original patent." This dictum was uttered upon the consideration

of a patent reissued in divisions, covering, respectively, a process and article.

These and other authoritative cases establish the general rule, but they do not reach the precise question in hand, and, in the short time I have been able to devote to the subject, I have not found any authoritative ruling upon it. I have not even found a case in which the Commissioner has recorded his opinion in favor of joining a machine and its product in the same patent. All the cases of this character I have examined have been allowed by the Primary Examiners—possibly, however, upon sufficient authority, even if not upon sufficient reason. In general, applicants voluntarily make separate applications for their processes, machines, and products, to which no objection can be made. It is desirable that there should be as much uniformity as possible in the Office practice. If the applicant has a right to demand a patent for a machine and another for its product, where he is the inventor of both, as he unquestionably has, then it would be better that separate patents should be taken in all such cases. It is very doubtful whether the practice of granting both in one patent comes within the exception laid down by the Supreme Court in the case above quoted.

A machine is a distinct subject of invention, and its product, or the article which it is employed to make, is another distinct subject of invention, if new in itself. They are classified separately in the portfolios of the Office, and require separate examinations, and to grant both in the same patent complicates and increases the work of Examiners and greatly augments the danger of making mistakes and improperly duplicating patents. One chief object of claiming the article, when novel, is that it may perhaps be made by various machines or by hand. If it could not be, the patent for the machine would fully protect it in the hands of the inventor—except, possibly, against importations. The same is true of a process and the article produced by it. The two are entirely independent. The process may be new and the product old, or both may be new, and yet the product be capable of being produced by other processes.

It might be supposed, because the inception and perfection of a process and the product to be treated and improved by it, or of a machine and its product, are often conjoined in the mind of the inventor, that in this is to be found a reason why the two ought to be regarded as constituting one subject of invention to be embraced in a single patent. But this is not the proper criterion by which to judge of them. The inventions are to be contemplated when completed, and if they are then distinct, it is immaterial how intimately they may have been blended in their production.

Notwithstanding the precedents which exist, and admitting that such a practice as they indicate, if not strictly correct, is not fatal to the validity of patents, I think the time has come when—leaving out of consideration the perspicuity of the patents themselves, and the revenue to be derived under the law for examinations—a proper classification in the Office, so as to facilitate examinations and prevent mistakes in the issue of patents requires that processes, machines, and their products be presented for patent in separate applications.

The decision of the Examiner is sustained.

FREVERT *vs.* GAHR.—*Interference.*

[Appeal from the decision of the Board of Examiners-in-Chief in the matter of the interference between the application of H. F. A. Frevert and the patent of Conrad Gahr for the Manufacture of Harness-Pads.—Decided June 3, 1873.]

Where it is shown that a caveator failed to receive the notice sent him by the Office of a conflicting application, and he consequently filed no counter application, and a patent was granted to his competitor without an interference, he is not to be prejudiced thereby, but will be treated as if both parties were applicants.

The party who first reduced an invention to practice and forthwith obtained a patent for it, will be held the prior inventor, although his opponent had conceived it before, and had described it, but took no measures toward reducing it to practice, (except that he had assisted the other in doing so,) nor toward obtaining a patent till long afterward, and especially if he had made no claim to the invention meanwhile, but when challenged with claiming it had denied it.

THACHER, *Acting Commissioner:*

The invention in controversy is a machine or press for making harness-pads, by which the leather is stamped into form and the filling compressed within it. Gahr filed his application May 13, and obtained his patent November 28, 1871. Frevert filed his application for patent February 14, 1872. On May 10, 1871, however, he filed a caveat covering the invention. Although, as appears from the Office records, due notice was sent to Frevert, according to the usual practice in cases of interference of an application with a caveat, he and his attorney swear that such notice was not received. No response having come from Frevert, Gahr's patent was granted soon after the expiration of the three months for which his case had been suspended to await the filing of Frevert's application. Failing to receive notice, it may be questioned whether Frevert should be prejudiced by the grant of a patent to Gahr. The requirements of the law were all complied with, and in strictness it might seem that such advantage as results to Gahr from the possession of his patent ought to be recognized. The law, however, not only contemplates that notice shall be duly sent, but that it shall be received by the caveator; that he shall have the benefit of his caveat for which he has paid, which he cannot have if he does not receive notice of an interfering application. I do not mean to assert that the Office is bound to insure him notice, further than it does in ordinary cases, by duly mailing the notice and suspending the interfering application, as was done in this instance. But when it appears in proof as a matter of fact that the notice, through no fault of his, did not reach the caveator, then it follows that the patentee has obtained his patent without the proceedings in interference which the law contemplates shall be had in all cases of this nature. Whereas, if the notice had not failed to reach its destination, the parties would, in all probability, have come before the Office as applicants upon equal footing, as the law intends in such cases; now, by the fault of neither party nor the Office, the patentee, as such, has, upon the record, acquired an advantage. It cannot be ignored that his apparent advantage in this instance comes through a mere accident, and that if allowed its ordinary value the spirit of the law would obviously be subverted. Therefore I am not disposed to consider Gahr in any better position than he would have been had the interference been declared pending his application.

Frevert sets forth in his preliminary statement that he explained his invention to his brother July 4, 1870, and to others after that date, and that he filed his caveat May 10, 1871. Gahr, in his preliminary statement, dates the conception of his invention the "first part of the year 1871," and says that about the latter part of March or the first of April of that year he began work upon it, and by the middle of April he had completed an operative machine, which has been in use ever since. Soon after the completion of his machine he took steps to procure a patent. His application was forwarded to the Patent Office May 3, 1871. His testimony corresponds with this statement. Frevert, who was a workman in the shop of which Gahr was foreman, swears that he communicated the idea of the invention to Gahr. This is denied by Gahr, and it is proved that soon after Gahr finished his machine, upon being told that Frevert claimed to have made the invention, he questioned him about it in the presence of some of the men who had heard him claim it, when he denied ever having made the claim. No attempt is made to impeach the veracity of Gahr, while some of Frevert's associates swear that he likes "to talk," "to blow," and "to lie." Gahr appears to be the more credible witness, and, therefore, it must be held, as the Board have held, that he is an original inventor. This being established, there is nothing in Frevert's testimony to show that, in contemplation of law, he was the prior inventor. Admitting that he was the first to conceive the invention, (although there is some doubt as to whether it was precisely this invention that he conceived,) and that he explained it to his brother on the 4th of July, 1870, and to Spear, Bender, and Kunsendorf in February, 1871, who all corroborate him in these statements, he stood by and saw Gahr make and use the invention, and was hired and paid to assist him in doing it, knowing that Gahr claimed it as his own. He took no steps to reduce the invention to practice until long afterward, when it had been tested and patented by Gahr, and when accused of claiming it he denied it in the presence of several witnesses. His course under the circumstances, as has been held by the Examiner and the Board, does not show reasonable diligence in adapting and perfecting his invention, even admitting that he actually made it, so far as to originally conceive and explain it, which may be reasonably doubted. There is no evidence in his behalf that might not readily have been trumped up after the machine was made by Gahr. The only sketches he produces actually were made after the date of Gahr's invention. The entire support of his case is of a dubious character, as compared with that of Gahr, which is consistent, indubitable, and of the highest order. Gahr made his device, worked it, claimed it openly and uniformly, and sought a patent without delay.

I have no doubt, upon the proof, that the patentee should be held the prior inventor, and the decision of the Board is, therefore, affirmed.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

24,819.—*Mode of Heating Drying-Cylinders by Steam.*—Granted to ALBERT P. PITKIN, July 19, 1859. Hearing July 2, 1873.

24,838.—*Pumping-Engines.*—Granted to HENRY R. WORTHINGTON, July 19, 1859. Hearing July 2, 1873.

24,863.—*Sewing-Machines.*—Granted to E. A. GOODES and E. L. MILLER, July 26, 1859; reissued February 9, 1864. Hearing July 9, 1873.

24,905.—*Piano-Fortes.*—Granted to JOHN U. FISCHER, July 26, 1859. Hearing July 9, 1873.

24,915.—*Casting Copper Cylinders.*—Granted to FREEBORN ADAMS, August 2, 1859. Hearing July 16, 1873.

24,923.—*Elevators for Warehouses, Factories, Mines, &c.*—Granted to ALBERT BETTELEY, August 2, 1859. Hearing July 16, 1873.

24,947.—*Journal-Boxes.*—Granted to JOHN A. MONTGOMERY August 2, 1859. Hearing July 16, 1873.

24,953.—*Meat-Cutters.*—Granted to JOHN G. PERRY, August 2, 1859. Hearing July 16, 1873.

24,963.—*Flour-Packers.*—Granted to SAMUEL TAGGART, August 2, 1859; reissued November 7, 1871. Hearing July 16, 1873.

24,987.—*Fishing-Reels.*—Granted to WILLIAM BILLINGHURST, August 9, 1859. Hearing July 23, 1873.

25,005.—*Governor-Valves.*—Granted to BENAIAH FITTS, August 9, 1859. Hearing July 23, 1873.

25,014.—*Machines for Cutting Out Wooden Ware.*—Granted to GEORGE R. HAY, August 9, 1859. Hearing July 23, 1873.

25,015.—*Wood-Saw Frames.*—Granted to JAMES HAYNES, August 9, 1859; reissued August 25, 1863. Hearing July 23, 1873.

25,017.—*Steam-Boilers.*—Granted to ROBERT HOOPER, August 9, 1859. Hearing July 23, 1873.

25,036.—*Post-Marking Stamps.*—Granted to MARCUS P. NORTON, August 9, 1859. Hearing July 23, 1873.

25,061.—*Elevator or Hoisting Apparatus for Hotels, &c.*—Granted to ORIN TUFTS, August 9, 1859. Hearing July 23, 1873.

25,071.—*Roof for Railroad Cars.*—Granted to A. P. WINSLOW, August 9, 1859; reissued August 8, 1865. Hearing July 23, 1873.

25,115.—*Self-Acting Wagon-Brakes.*—Granted to BENJAMIN S. HEALY, August 16, 1859. Hearing July 30, 1873.

25,148.—*Weighing-Scales.*—Granted to FRANCIS M. STRONG and THOMAS ROSS, August 16, 1859. Hearing July 30, 1873.

25,149.—*Blanks for Shoe-Pegging Machines.*—Granted to BENJAMIN F. STURTEVANT, August 16, 1859; reissued June 12, 1866. Hearing July 30, 1873.

25,153.—*Carding-Engines.*—Granted to SAMUEL WETHERED, August 16, 1859. Hearing July 30, 1873.

25,166.—*Iron Fences.*—Granted to JOHN B. WICKERSHAM and HENRY JENKINS, August 16, 1859. Hearing July 30, 1873.

25,167.—*Mode of Lighting Gas by Electricity.*—Granted to ARCHELAUS WILSON, August 16, 1859. Hearing July 30, 1873.

25,183.—*Nail-Machines.*—Granted to DANIEL DODGE, August 23, 1859. Application filed May 23, 1873. Hearing August 6, 1873.

25,191.—*Machines for Making Paper-Bags.*—Granted to WILLIAM GOODALE, August 23, 1859. Hearing August 6, 1873.

25,199.—*Feeding Paper to Printing-Presses.*—Granted to RICHARD M. HOE, August 23, 1859; reissued June 20, 1871. Hearing August 6, 1873.

25,235.—*Manufacture of Iron.*—Granted to BERNARD LAUTH, August 23, 1859. Application filed May 22, 1873. Hearing August 6, 1873.

25,237.—*Horizontal Wheels.*—Granted to ABRAHAM ANDREWS and HARRISON KALBACH, August 30, 1859. Application filed May 28, 1873. Hearing August 13, 1873.

25,239.—*Elastic Hose Tubing*, granted to JOHN C. BOYD, August 30, 1859. Application filed May 29, 1873. Hearing August 13, 1873.

25,309.—*Nail Machines*, granted to DANIEL DODGE, August 30, 1859. Application filed May 31, 1873. Hearing, August 13, 1873.

25,342.—*Stoves.*—Granted to EDWARD M. MANIGLE, September 6, 1859. Application filed June 5, 1873. Hearing August 20, 1873.

25,344.—*Machines for Wiring the Joints of Clothes Pins*, granted to ALVIN C. MASON, September 6, 1859. Application filed May 31, 1873. Hearing, August 20, 1873.

25,364.—*Watches.*—Granted to CHARLES E. JACOT, September 6, 1859. Hearing August 20, 1873.

25,373.—*Machines for Making Paper Boxes.*—Granted to SILAS B. TERRY, September 6, 1859; reissued May 17, 1870. Application filed June 5, 1873. Hearing August 20, 1873.

25,395.—*Heels for Boots and Shoes.*—Granted to SIMEON DODGE, Jr., and BENJAMIN POTTER, Jr., September 13, 1859. Application filed June 13, 1873. Hearing August 27, 1873.

25,434.—*Cotton-Scrapers.*—Granted to JONATHAN H. MITCHELL, September 13, 1859. Application filed June 10, 1873. Hearing August 27, 1873.

25,442.—*Boilers and Steamers.*—Granted to DANIEL B. PRINDLE, September 13, 1859. Application filed June 13, 1873. Hearing August 27, 1873.

25,443.—*Seeding-Machines.*—Granted to SILAS G. RANDALL, September 13, 1859; reissued May 25, 1869. Application filed June 11, 1873. Hearing August 27, 1873.

25,472.—*Scales.*—Granted to ANDREW TURNBULL, September 13, 1859. Application filed May 31, 1873. Hearing, August 27, 1873.

25,484.—*Grain-Separators.*—Granted to JONATHAN L. BOOTH, September 20, 1859; reissued September 25, 1860, and November 20, 1864. Application filed June 14, 1873. Hearing September 3, 1873.

25,488.—*Hydraulic Presses.*—Granted to M. H. CLARK, September 20, 1859. Application filed June 20, 1873. Hearing September 3, 1873.

25,499.—*Railroad-Car Seat.*—Granted to ELI WHEELER, September 20, 1859. Application filed June 17, 1873. Hearing September, 3, 1873.

25,500.—*Lamps.*—Granted to HALVOR HALVORSON, September 20, 1859; reissued June 6 and December 5, 1871. Application filed June 6, 1873. Hearing September 3, 1873.

25,508.—*Tailors' Shears.*—Granted to ROCHUS HEINISCH, September 20, 1859. Application filed June 20, 1873. Hearing September 3, 1873.

25,512.—*Bung-Hole Borer and Reamer.*—Granted to JOSIAH KIRBY, September 20, 1859. Application filed June 19, 1873. Hearing September 3, 1873.

25,544.—*Try-Cocks for Steam-Boilers.*—Granted to JOHN F. COOK, September 20, 1859. Application filed June 10, 1873. Hearing September 3, 1873.

25,570.—*Mode of Arranging Couches in Railroad Cars.*—Granted to EDWARD C. KNIGHT, September 27, 1859. Application filed May 31, 1873. Hearing, September 10, 1873.

25,662.—*Construction of Prisons.*—Granted to EDWIN MAY, October 4, 1859. Application filed June 23, 1873. Hearing September 17, 1873.

25,747.—*Method of Combining Emery with Caoutchouc.*—Granted to THOMAS J. MAYALL, October 11, 1859. Application filed June 16, 1873. Hearing September 24, 1873.

26,243.—*Water-Closet Basins.*—Granted to WILLIAM BOCH, Sr., November 29, 1859. Application filed June 10, 1873. Hearing November 12, 1873.

30,201.—*Apparatus for Freezing Liquids.*—Granted to FERDINAND PHILIPPE EDOUARD CARRÉ, October 2, 1860; reissued in two divisions February 18, 1873. Patented in France August 24, 1859. Application filed May 17, 1873. Hearing August 13, 1873.

EXTENSIONS GRANTED.

24,493.—*Improved Door-Frame for Furnaces*, granted to PAUL A. SABBATON, June 21, 1859.

Claim.—The combination, with the mouth of the furnace, of the door-frame A and door B, when the said door-frame is provided with an opening larger than the door, into which the door shuts so as to close against the furnace or against a shield or false frame C, as and for the purposes herein set forth and described.

24,478.—*Improvement in Machines for Sawing Stone*, granted to ANDREWS T. MERRIMAN, June 21, 1859.

Claim.—The lowering the saw-frame by means of the long screws *s s*, acting on the sliding bars *f f*, and the stiff connecting-rods *r r*, hung with hinge-joints at the saw-frame, and the sliding bars *f f*, (instead of chains or rope,) for the purpose of holding the saw-frame steady and prevent any jumping motion, all in the manner described.

24,456.—*Improvement in Apparatus for Heating Buildings by Steam*, granted to SAMUEL F. GOLD, June 21, 1859; reissued February 6, 1872.

Claim.—1. A steam generator or boiler composed of a series of cast-metal sections each complete in itself, said internal sections being constructed substantially as described, to form the sides and top of the fire-chamber or combustion-chamber, and said end sections being constructed, substantially as described, to form the ends thereof, and the sections united substantially as hereinbefore set forth, by which construction the capacity of the generator and furnace is made capable of being increased or diminished by the addition or removal of internal sections.

2. Constructing the sections of the generator with raised rims *a* upon the edges thereof, by which construction the chambers E, rising above the water-line and out of the draft, are formed when the sections are united together.

3. The steam chamber or radiator P, made up of cast-metal sections, or sectional chambers G, substantially as hereinbefore set forth.

4. The combination of one or more of the radiators P, composed of cast-metal sections or sectional chambers G, with a steam-generator, substantially as hereinbefore set forth.

5. The flat steam-chamber G adapted to the radiation of heat, and cast in a single piece, substantially as hereinbefore set forth.

24,446.—*Improvement in Straw-Cutters*, granted to REUBEN DAVIS, June 21, 1859.

Claim.—1. The combination, with the roller D, of the convex teeth *d*, having the major diameter of their bases arranged parallel with the axis of the roller D, as and for the purpose herein shown and described.

2. The arrangement and combination of the roller D, cutter C, and cylinders E E', substantially as and for the purpose herein shown and described.

24,512.—*Improvement in Body-Bolsters for Railway Cars*, granted to AMBROSE WARD, June 21, 1859.

Claim.—1. The arrangement and combination of the trusses F, center plate D, sills G, and tension-rods I, substantially as and for the purposes herein shown and described.

2. Providing the center plate D with lugs K, protecting flange or cap *b*, lateral bearing-flange *e* at the center, fitting into cap in plate B, the vertical bearing-flange *d'*, fitting into the cap or groove in plate B, the whole combined and arranged as and for the purposes herein shown and described.

24,451.—*Improvement in Metallic Ears for Attaching Handles to Pails and like Vessels*, granted to THOMAS EVANS, June 21, 1859; reissued August 4, 1868.

Claim.—1. Metallic ears for attaching the handles to pails and other vessels formed with concentric annular corrugations surrounding the bail-orifice, subtantially as and for the purposes set forth.

2. I also claim so arranging the hooked ends of the bail as to give them an additional bearing against one or more of said corrugations, subtantially as set forth.

3. I further claim the drip opening or passage, formed by the downward continuation of the outer corrugation, for draining the interior cavity, as shown and described.

4. I also claim a bail-ear, formed with the portion surrounding the eye raised to receive the hooked end of the bail, when the marginal portion or portions thereof are formed on the plane of the part to which they are to be attached, subtantially as set forth.

24,484.—*Improvement in the Preparation of Straw for Paper-Pulp*, granted to JOSEPH B. PALSER and GARDNER HOWLAND, June 21, 1859; reissued July 3, 1860, numbered 997; and again reissued December 15, 1863, numbered 1,590.

Claim.—The process of subjecting straw or similar stalks to the simultaneous action of an alkaline liquid, agitation, and a high temperature such as is produced by contact with a surface heated by a fire-heat, whereby such a change is effected in the organization of the glutinous or resinous matters contained in the material that the fibrous material can be separated from them by washing.

24,484.—*Improvement in Apparatus for the Manufacture of Paper-Pulp*, granted to JOSEPH B. PALSER and GARDNER HOWLAND, June 21, 1859; reissued July 3, 1860, numbered 996; and again reissued August 13, 1867, numbered 2,730.

Claim.—1. The employment of two boilers in the reduction of paper "stock," so arranged in respect to each other that the steam-heat remaining in one after the boiling process has been completed may be transferred to the other boiler in which the boiling process is being commenced, in combination with the pipes or other means by which such steam-heat is thus transferred, substantially in the manner and for the purpose above described.

2. We claim the transferring of the steam-heat from a boiler in which paper stock has been boiled, immediately after such boiling has been completed, to another boiler charged with paper stock, for the purpose of utilizing the heat remaining in the first boiler after the completion of the boiling process therein, substantially in the manner and for the purpose above described.

3. We claim the arrangement and combination of the boilers, the furnace A, and the doors D D', E E', and F F', so as to apply the furnace-heat to either or both the boilers at pleasure, substantially in the manner and for the purpose above described.

24,484.—*Improvement in the Manufacture of Paper-Pulp*, granted to JOSEPH B. PALSER and GARDNER HOWLAND, June 21, 1859; reissued July 3, 1860, numbered 996; and again reissued August 13, 1867, numbered 2,731.

Claim.—1. We claim an internal division of the pipe *b*, which passes through the hollow journal of the rotary boilers by means of a partition, so that the steam from the upper portion of the boiler may find exit through one compartment of the pipe, and the liquid contents of the boiler may find an exit through the other compartment thereof, in the manner and for the purpose described.

2. We claim the employment of the perforated diaphragm *p p'*, when arranged substantially as described, to protect the pipes *A A' e e*, and to strain the liquid from the stock, as and for the purpose above described.

26,415.—*Improvement in Machines for Winding Thread on Spools*, granted to HEZEKIAH CONANT, December 13, 1859; antedated June 22, 1859.

Claim.—1. The combination, substantially in the manner hereinbefore set forth, of a traverse changer with right and left hand screws and with nuts which are alternately in gear with such screws, the combination operating as a whole substantially in the manner and for the purpose herein described.

2. A traverse changer provided with successive steps or teeth, substantially such as is before described, and acting upon lips, as hereinbefore set forth.

3. A stop-motion, substantially such as is described herein, for causing the machine to come to rest when a spool is filled, in combination with automatic apparatus, substantially such as set forth, for regulating the length of motion and change of direction of motion of a guide through which thread is delivered onto a bobbin or spool.

4. The adjustable lips, substantially such as set forth, in combination with a traverse changer, whereby spools of different lengths may be wound by the use of the same traverse changer.

5. Mounting the presser and thread-guide directly upon, or attaching it firmly to, the traverse-rod, as hereinbefore described, whereby the machine is cheapened, and performs its work more accurately.

6. In combination with apparatus, substantially such as described, for governing automatically the motions of a thread-guide, I claim a tension apparatus and stop-motion which arrests the motion of a machine when the thread breaks, substantially by the mode of operation set forth.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date June 17, 1873.]

6,703.—*Lath-Machine Bed.*—WALTER F. BURTON, Chippewa Falls, Wis. Application filed June 5, 1873.

6,704.—*Heating-Stove.*—JOHN V. B. CARTER, Detroit, Mich., assignor to DETROIT STOVE WORKS, same place. Application filed May 17, 1873.

6,705.—*Carpet.*—JOHN FISHER, Philadelphia, Pa. Application filed June 5, 1873.

6,706.—*Carpet.*—JOHN FISHER, Philadelphia, Pa. Application filed June 5, 1873.

6,707.—*Carpet.*—JOHN FISHER, Philadelphia, Pa. Application filed June 5, 1873.

6,708.—*Carpet.*—JOHN FISHER, Philadelphia, Pa. Application filed June 5, 1873.

6,709.—*Flower-Vase.*—JACOB MERSEREAU, Port Chester, N. Y. Application filed May 24, 1873.

6,710.—*Nubia.*—JAMES PHIPPS, Philadelphia, Pa., assignor to MARTIN LANDENBERGER & Co., same place. Application filed May 17, 1873.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date June 17, 1873.]

1,314.—*Chewing-Tobacco.*—ALLEN & ELLIS, Cincinnati, Ohio. Application filed June 7, 1873.

1,315.—*Chewing-Tobacco.*—ALLEN & ELLIS, Cincinnati, Ohio. Application filed June 7, 1873.

1,316.—*Chewing-Tobacco.*—ALLEN & ELLIS, Cincinnati, Ohio. Application filed June 7, 1873.

1,317.—*Chewing-Tobacco.*—ALLEN & ELLIS, Cincinnati, Ohio, Application filed June 7, 1873.

1,318.—*Chewing-Tobacco.*—ALLEN & ELLIS, Cincinnati, Ohio. Application filed June 7, 1873.

1,319.—*Boots and Shoes.*—HORACE H. BIGELOW, Worcester, Mass. Application filed June 6, 1873.

1,320.—*Tobacco and Snuff.*—G. W. GAIL & AX, Baltimore, Md. Application filed April 21, 1873.

1,321.—*Whisky.*—HASTINGS & BERLIN, St. Louis, Mo. Application filed May 29, 1873.

1,322.—*Revolving Pistols.*—MERWIN, HULBERT & Co., New York, N. Y. Application filed May 24, 1873.

1,323.—*Revolving Pistols.*—MERWIN, HULBERT & Co., New York, N. Y. Application filed May 24, 1873.

1,324.—*Oils.*—MATTHEW, THOMAS D., and SAMUEL HODKINSON, Marietta, Ohio, and Louisville, Ky. Application filed May 20, 1873.

1,325.—*Blackberry Brandy.*—JAMES A. JACKSON & Co., St. Louis, Mo. Application filed May 28, 1873.

1,326.—*Insect-Powder.*—PETER REYNARD, St. Louis, Mo., and Louisville, Ky. Application filed June 9, 1873.

1,327.—*Lager Beer.*—THEODORE REMMENEY, Williamsburg, N. Y. Application filed May 31, 1873.

1,328.—*Axes and other Tools.*—THE COLLINS COMPANY, Collinsville, Conn. Application filed December 30, 1872.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date June 17, 1873.]

ORIGINAL PATENTS.

139,848.—*Composition Pavement.*—NATHAN B. ABBOTT, Brooklyn, N. Y. Application filed September 24, 1872.

The bituminous material of the surface is heated and spread evenly, and the quarts-gravel, which forms the wearing-surface, is spread upon this and rolled in, being first heated. The bituminous material forms the matrix or setting, and is not liable to come to the surface and form dust.

Claim.—The surface for composition pavements, composed of the bituminous material and grit, prepared and laid substantially as specified.

139,849.—*Baling-Press.*—JAMES M. ALBERTSON, New London, Conn. Application filed May 5, 1873.

Bolts connecting the cap-plate and base-plate of the pedestal inclosed in hollow columns, the whole passing within the revolving nut, and also serving to transfer the strain of pressing below this nut.

Claim.—1. The base-plate C and cap-plate D of the pedestal surrounding the screw A, connected together by means of two or more bolts passing from one to the other through the inside of the revolving nut B, substantially as described.

2. The bolts E E provided with the collar F; the portion below the collar connecting the parts of the pedestal together; the portion above the collar serving to connect the press-box to the pedestal; and the whole bolt as a means of transferring the strain of pressing below the nut B, substantially as described.

3. The columns H H within the nut B, when made with bolt-holes suited to the reception and passage through them of the bolts E E, connecting together the plates C and D, substantially as described.

139,850.—*Car-Coupling.*—OTTO ALBRECHT, Philadelphia, Pa. Application filed September 10, 1870.

Claim.—The socket-tube having an internal opening expanding toward each end, in combination with the bar C having a washer or nut adapted to the rounded face of the rear end of the tube, as specified.

139,851.—*Dinner-Can.*—ALBERT A. ARNOLD, Clyde, Ohio. Application filed March 10, 1873.

An outer covering composed of four pans or plates pivoted at their edges and held in position by springs. This outer covering serves to inclose within it vessels for coffee, pastry, salt, sugar, and other necessary dishes required to hold and protect a dinner, &c.

Claim.—1. The plates A with hinges, constructed so as to form a can when folded, or a table when spread out, as specified.

2. The combination of the plates A and coffee-can B, pastry-can C, vegetable and meat can E E, sauce-cup F, drinking-cup G, the bail and ears H H, as and for the purpose hereinbefore described.

139,852.—*Cooper's Croze.*—JAMES BAILEY, Springport, Ind. Application filed September 7, 1872.

Two cutting and one clearing tool are held in the stock by a single clamp.

Claim.—The bits D E F, in combination with the blocks O C and loop B, said loop having its edges chamfered and turned slightly downward to press upon the front and rear ends of the bits and hold them fastly upon the block and prevent clogging, substantially as described.

139,853.—*Pile-Driver.*—STEPHEN E. BAKER, Chicago, Ill. Application filed December 16, 1872.

The slip-lock can be adjusted at any height, so as to discharge the hammer when desirable, for light or heavy blows. The arms are hinged to enable them to be pressed outward against the frame, and thus hold themselves in place by friction when the lock-levers press against them.

Claim.—1. The adjustable slip-lock D C B E arranged and combined with the guides and hoisting-lock of a pile-driver, as described and shown.

2. The adjustable slip-lock D C B, in combination with pivoted arms E for holding the parts in place to unlock the levers I, as set forth.

139,854.—*Means for Creating Artificial Currents.*—EDWARD BANTZ, Baltimore, Md. Application filed October 31, 1872.

The apparatus is designed to create an artificial current in outlets of basins, docks, &c., where the water inclines to stagnate.

Claim.—The tunnel or sewer A with the branches B B, in combination with the shaft D with wheels E E, substantially as and for the purposes herein set forth.

139,855.—*Clip King-Bolt and Plate.*—HENRY M. BEECHER, Plantsville, assignor to BEECHER MANUFACTURING COMPANY, West Meriden, Conn. Application filed March 8, 1873.

The king-bolt and its clip are so combined that the latter can not work out of place.

Claim.—1. The concave metal king-bolt clip B, provided with the projection *c*, or its equivalent, to prevent the clip from working longitudinally out of place, substantially as shown and described.

2. The combination of the plate B, having the projections *c*, with the king-bolt A, having the recess *a*, substantially as and for the purpose described.

139,856.—*Instrument for Administering Balls to Animals.*—THOMAS H. BEX, Syracuse, N. Y. Application filed February 5, 1873.

A chambered rod is furnished with a spring-plunger, which is held retracted by an angular slot. The end of the rod where it passes between the teeth of the animal is provided with a rubber ring. The ball of medicine is shot down the throat of the animal.

Claim.—The combination of the rod chambered at C, furnished with rubber at B, and with the spring plunger-rod, and securing-slot, all arranged as shown and described, and for the purposes set forth.

139,857.—*Thrashing-Machine.*—LEWIS C. BICKINGS, Norristown, Pa. Application filed May 3, 1873.

Toothless flexible concave, permitting the projecting portion to be bent to retain the grain in closer proximity to the cylinder.

Claim.—The flexible concave A in combination with the thrashing-cylinder D, arranged and operating substantially in the manner and for the purpose herein shown and described.

139,858.—*Mold for Making Suppositories.*—LYMAN R. BLACKMAN, Newport, R. I. Application filed June 4, 1873.

The lower disk has a flange within which the upper disk fits, the openings in the two disks being caused to register by means of pins in the lower disk and grooves in the upper. The conical chambers are filled with the melted suppository mass, and as soon as the suppositories have chilled, the upper plate is lifted, freeing the tips, after which the plate is reversed and tapped to discharge the suppositories.

Claim.—1. A suppository-mold, consisting of an upper perforated plate, and a detachable base-plate having depressions to form the tips of the suppositories, substantially as set forth.

2. The combination of the plates A and B, provided with devices whereby the openings *a b* are caused to register, substantially as and for the purpose specified.

139,859.—*Apparatus for Manufacturing Boot and Shoe Heels.*—JOHN BLAKEY, Leeds, England. Application filed May 6, 1871.

Waste scraps are cut into proper shape by the machine designed for that purpose, built up with cement in a matrix with a retreating bottom, and under a plunger subjected, while still in the tube or matrix, to powerful pressure until the mass becomes set; then from the roll or body so formed suitable lifts are cut, and pierced with nail-holes in a machine which is provided with means for automatically ejecting the lifts when the awls are withdrawn.

Claim.—1. The described method or process of forming heels or heel-lifts for boots and shoes, by first cutting from waste scraps of leather small pieces, of appropriate size and shape; next, compacting and solidifying such pieces into a solid bar, with or without a wooden core, by means of adhesive material and pressure; next, drying the same; and then cutting or sawing the same into heel-lifts of the desired thickness.

2. The combination, with an endless traveling lattice-sheet or table, of a series of simultaneously operating cutting-dies of different sizes and shapes, adapted each for acting on separate bits of leather placed therein according to size and an appropriate stationary bed beneath the lattice or table to sustain the thrust of the series of cutting-dies, substantially as and for the purpose set forth.

3. The described combination of the hinged mold or box A, rammer B operating as described, and a friction-plug within the mold, or their mechanical equivalents.

4. The described apparatus for squeezing and solidifying the cemented rolls while in the mold A, the same consisting in the rams I and J, entering the opposite sides of the mold, and operated by the screw-spindle M', to force both rams toward each other, to compress the roll in the manner described.

5. In combination with an apparatus for pricking holes into the lifts, the described devices for automatically throwing the lifts, when pricked, out of the recess in the bed, the same consisting of the catch W', lever W, spring Z, and eccentric Y, or their equivalents.

139,860.—*Grain-Drill.*—GEORGE G. BLUNT, Bath, Ill., assignor to himself and J. L. ASHURST, same place. Application filed November 29, 1872.

A rectangular frame is mounted upon two wheels. The forward end of this frame carries a pair of opening runners, and upon the openers is mounted a box for containing the seed. Upon one end of the box is an adjustable slotted stop, which rests upon the main frame, and by the adjustment of this stop the depth of the openers are regulated.

Claim.—The combination of the adjusting standards or slides P with the seed-box B, draft-frame C, and main frame A, the standards being adapted to regulate the position of the draft-frame and seed-box relative to the main frame, as described.

139,861.—*Machine for Swaging Screw-Threads on Bolts and Screw-Blanks.*—REINHOLD BORKLEN, New York, N. Y. Application filed October 2, 1872.

A cylindrical blank-carrier and die, located between two concave dies, and a yielding guide having two pockets on its opposite sides, into which blanks are alternately fed with their points resting between the screw-threading dies. The oscillating mate-die carries with it the yielding-guide which supports the screw while the thread is being made.

Claim.—1. The stationary die or dies C C, and vibrating die D, provided with the guide L, the die D being operated by a crank movement directly from the rod G, substantially as and for the purpose herein specified.

2. The guide L and annular flanges *c e*, in combination with the springs J, hopper H, and dies D C C, substantially as and for the purpose set forth.

3. The annular guide L, with pockets *a*, in combination with the hopper H, when constructed as described and for the purpose specified.

139,862.—*Car-Spring.*—ALBERT BRIDGES, Westfield, N. J. Application filed March 24, 1873.

The rubber springs are incased by flat metal springs, which restore the rubber springs to their normal shape after pressure.

Claim.—A rubber spring, at the sides of which are flat metallic plates that are supported at their ends and bent by the action of the rubber as it presses against such plates, substantially as set forth.

139,863.—*Machine for Seaming Sheet Metal.*—CHARLES BROMBACHER, Tarrytown, N. Y. Application filed November 19, 1872.

In bringing the clamping-jaws together the flanges are not only grasped, but the metal is at the same time pressed down to its position on the roof.

Claim.—The standard *h*, joint *k*, arm *l*, jaws *a m*, toggle *n*, and handle *o*, in combination with the turning and folding jaw *c*, as and for the purposes set forth.

139,864.—*Composition Dressing for Roofs.*—HIRAM O. BROWN, Castleton, Vt. Application filed September 30, 1872.

Composition: Powered slate, fifty parts; sand, fifty parts; magnesian cement, fifteen parts.

Claim.—The non-conducting composition dressing for surfaces of wood, composed of the above-named ingredients, mixed and proportioned and applied in the manner substantially as set forth, for the purposes specified.

139,865.—*Magic-Lantern.*—ALBERT G. BUZBY, Philadelphia, Pa. Application filed February 21, 1873.

The outer wooden case of the instrument is separated by an air-space from the inner sheet-metal lantern-chamber. The top of the lamp fits against the base-plate of the inner chamber, which is provided with a suitable elongated opening for the blaze, air being admitted on either side of the wick or wicks. Transparent tinting-plates are hinged to a collar fitted to slip on the object-tube.

Claim.—1. A magic-lantern apparatus in which a combustion-chamber, A, of metal is surrounded, or partially surrounded, by an outer casing, D, of wood or other non-conducting material, substantially as herein described.

2. A magic-lantern apparatus in which the combustion-chamber A is covered at the top by a roof, D^1, lined with polished metal, or other reflecting material, for the purpose specified.

3. The combination, substantially as described, with the base-plate of the combustion-chamber, of a lamp having a dome arranged to fit snugly against the under side of the said base-plate.

4. The combination, substantially as described, with the outer lens-tube P of the lantern, of tinting-plates hinged to a detachable band M.

139,866.—*Thrashing-Machine.*—MONROE G. CARLETON, Indianola, Iowa. Application filed April 14, 1873.

Two revolving shafts carrying knives for cutting the straw into short lengths, the operative device being inclosed in a hopper or casing.

Claim.—1. In combination with a thrashing-machine, I claim the employment of one or more revolving shafts armed with cutters or knives for cutting the straw into short lengths, as and for the purpose specified.

2. The combination, with a thrashing-machine feeding-hopper, of a reciprocating band-cutter and revolving cutter-shafts, as and for the purpose specified.

139,867.—*Miter-Box.*—CHARLES CATON, Coshocton, Ohio. Application filed April 7, 1873.

An adjustable removable index-ring, *d*, with a graduated plate, E, is employed to give the proper angle of the miter. The graduated arc C is used for the beveled angle when the miter is to be in two planes.

Claim.—1. The combination of the saw-guide and a removable clamping index-ring, substantially as described.

2. The combination of the saw-guides having the clamping-ring with index-finger, and the socket-iron having the marked surfaces, and the arc C, as described.

139,868.—*Metal Can for Paint, &c.*—GEORGE H. CHINNOCK, Brooklyn, N. Y.—Case A. Application filed January 30, 1873.

The end of strip C, constituting loop *g*, is made tapering so as to be out of the way in soldering the remainder of the strip to the can, and is attached at its tip end to the can by a drop of solder.

Claim.—1. The slant or bevel *a* at the top of the body A, arranged to receive the flange *a'* of the cover B, while the strip C attached to the said cover is extended downward to the rib *f*, substantially as and for the purpose specified.

2. The loop *g* of the strip C, fastened at its overlapping extremity, and arranged with reference to the cover B and body A, substantially as and for the purpose specified.

3. The loop *g*, tapered as described, in combination with the strip C, arranged with reference to the cover B and body A substantially as and for the purpose specified.

139,869.—*Metal Can for Paint, &c.*—GEORGE H. CHINNOCK, Brooklyn, N. Y.—Case B. Application filed January 30, 1873.

The pocket F attached to the side of the can is for holding water and the paint-brush, when not in use, so as to keep it moist and pliable.

Claim.—1. The combination, with the flat inwardly-turned fold *a* at the top of the body A, of the external rib *b*, formed in the said body below the fold, substantially as and for the purpose specified.

2. The combination, with the body A, of the rigid transverse brace *d*, the said brace being arranged nearly or quite in line with the points of attachment of the bale B, whereby the inward strain upon the body A, when suspended by or from the bale, is counteracted, substantially as and for the purpose specified.

3. The combination, with a tubular transverse brace arranged in the upper part of the body A, of the inwardly-turned ends of the bale B, substantially as and for the purpose specified.

4. The combination, with the cover C attached to the body A by the soldered strip D, of an orifice *m*, provided either in the cover of the body, and, when the can is filled, closed by the soldered cap or disk *g*, substantially as and for the purpose specified.

5. The combination, with the body A, of the pocket F, substantially as and for the purpose specified.

139,870.—*Paper Bag.*—GEORGE H. CHINNOCK, Brooklyn, N. Y. Case A. Application filed April 2, 1873.

A strip of paper wide enough to form the front and back and an overlap, is perforated with oblong holes, a bag length apart, through which the sheet or tube is severed. When folded and pasted at the side and bottom, the portion cut out provides an opening lip.

Claim.—As a new article of manufacture, the paper bag formed from the blank represented in Fig. 1, and folded and pasted at one edge and at bottom, specifically as herein set forth.

139,871.—*Shoe-Lacing Fastening.*—BENJAMIN B. CHOAT, Springfield, Vt. Application filed April 16, 1873.

The device is made of a continuous piece of wire bent in serpentine form first in one direction and then in the other, and having shanks with eyes at their extremities to secure it to the shoe.

Claim.—The new manufacture or shoe-lacing fastener, substantially as described, constructed of wire bent, as set forth, so as to have the arched recess *a*, the elastic wings or jaws A, A, and the shanks *e e* provided with eyes *f f*, all arranged essentially as represented.

139,872.—*Windlass and Capstan.*—DAVID N. B. COFFIN, Jr., Boston, Mass. Application filed December 8, 1871.

Claim.—1. In a windlass, the combination, with a single shaft, of two or more fast friction-wheels, a corresponding number of correlative loose chain-wheels, and suitable means for locking the chain-wheels severally to their respective friction-wheels or to the shaft, substantially as and for the purposes specified.

2. The combination of the fast friction-wheel *a*, loose heaving-gear *f*, loose chain-wheel *g*, and lock-bolts *h*, or their equivalents, operating substantially in the manner and for the purpose specified.

3. The heaving-gear, friction-wheel, and chain-wheel, as arranged with relation to one another, when the flanges of the gear-wheel and the chain-wheel are constructed as described so as to form local openings or annular openings for a partial exposure of the lock-bolts *h* in the friction-wheel upon both sides thereof, substantially as and for the purpose specified.

4. In a windlass, the combination of two or more loose chain-wheels, *g*, and a corresponding number of independent riding-pawls 17 acting upon the chain-lugs 21, substantially as and for the purposes specified.

5. The independent riding-pawl 17, constructed at its free end, as shown at *x y*, to set upon the loose chain-wheel in the manner and for the purpose specified.

6. The combination of the friction-wheel *a*, friction-strap *l*, and spring *z*, substantially as and for the purposes specified.

7. The gear-wheel *v* upon the capstan-shaft, in combination with the shiftable gear-wheel 10, having a flange, 14', and the clasp 13, substantially as and for the purpose specified.

8. The capstan-pawls having lateral lugs, or their equivalents, formed upon them, in combination with the fixed catches upon the capstan-barrel, all substantially as shown in Fig. 9, and for the purpose specified.

9. The spindle, barrel, and head of the capstan, in combination with the inclined and inverted taper-gears 13 14 15, gear-carrier *m*, and lock-bolts *p* and *n*, or their equivalents, all arranged and operating substantially as and for the purpose specified.

10. The inclined and inverted taper-gears 13 14 15, and gear-carrier *m*, in combination with the sliding lock-bolts *n*, substantially as and for the purpose specified.

11. The center-bearing, constructed substantially as shown and described, whereby it is made to support the main shaft *b*, and at the same time hold the end of the capstan-shaft in position, and prevent it from being carried upward by the action of the wheels into which its gear-wheel meshes.

139,873.—*Manufacture of Funnel.*—LEVI R. COMSTOCK, Baltimore, Md. Application filed January 18, 1873.

Claim.—The perforated nozzle-blank for funnels, provided with the extension B in the same piece of metal to cover in the air-channel, as specified.

139,874.—*Reed-Organ.*—SAMUEL J. CROCKETT, Boston, Mass. Application filed March 29, 1873.

Involves swell-valve connections to draw-stop.

Claim.—1. The arm C or C', the bent lever E or E', the radial arm G, the inclined plane *d*, the cam *e*, and the slide-rod K for depressing each of the valves A or A', combined and arranged as explained, the radial arm being provided with a spring for moving it upward.

2. The slide-rod K, the inclined plane *d*, and the radial arm G, applied to the cap so as to be movable therewith, as described in combination with the lever E and the arm C, arranged together, and applied to the key-frame and the valve A, as set forth.

139,875.—*Heddle-Eye Opener.*—JOHN H. CROWELL, Providence, R. I., assignor, by mesne assignment, to JOHN KENDRICK, JOSEPH H. KENDRICK, and JOHN H. CROWELL, same place. Application filed May 5, 1873.

Two vibrating arms with their free ends bent toward each other and rigidly attached to the opposite sides of a common axis carry each a transverse bar, on which are set, in a straight line, pointed spurs or eye-openers. These arms vibrate within the slots of two fixed plates between which the heddle is slowly carried, and at each vibration one plate serves as a support for the heddle as one series of spurs enters the eyes, while the other plate serves as a stripper to clear the eyes from the opposite series of spurs. To allow the spurs to have a slight lateral movement in case their points strike upon a knot, they are attached to a small blade-spring, and the shank is set in a short transverse slot in the supporting-plate.

Claim.—1. The combination of one or more vibrating eye-openers, L, a holder or support, J', while the eyes are being opened, and a stripper, J, to remove the eyes from the openers, substantially as described.

2. A machine for picking open the eyes of weavers' harnesses, composed of the dual vibrating arms G G^1, armed with spur-points or eye-openers L L', and the devices J J', acting alternately as supports and strippers, all in combination, substantially as described.

3. The combination of the eye-openers L L^1 with their supporting-plates K K', and springs N N', or other yielding device, substantially as described.

139,876.—*Bit-Stock.*—AUSTIN P. DABOLL, New London, Conn. Application filed March 29, 1873.

The head C is retained upon the neck A by a ring D, confined by the screw-sleeve B.

Claim.—In the bit brace or stock, the split-ring D, arranged in the circular groove *a*, and with the lower end of the head C and within the screw-cap B applied to such head C, as set forth.

139,877.—*Flange-Union.*—AUGUST A. DAHL, Titusville, Pa. Application filed April 18, 1873.

The hollow half of the union is cast with an annular seat around its tapped eye, the seat being of suitable depth to receive an annular gasket. The entering half is made with an annular washer around the tapped eye, which, when the two parts are put together and secured by bolts and nuts, will bear against the gasket and make a tight joint. To prevent the two parts of the coupling from turning on each other, they are bound by dowel pins.

Claim.—1. An improved flange-union, consisting of the female and male blocks, *d g*, each having a tapped eye, *f*, and exterior bolt-holes *h'*, the female part *d* being provided with a depressed gasket-seat *d'*, and the male part *g* with a raised washer, *g'*, substantially as set forth.

2. The arrangement of interlocking uneven surfaces outside the recess-gasket and washer in a flange-union, substantially as set forth.

139,878.—*Combined Stop and Check Valve.*—AUGUSTUS A. DAHL, Titusville, Pa. Application filed March 13, 1873.

A side opening in the plug leads to the center and top where it is closed by a flap-valve held down by a spring. The plug may be locked open or shut by a bolt and key.

Claim.—1. The combination of the hollow plug or stop-cock *a*, a check-valve opening outward seated on its open end, and the chamber *b'*, arranged for the through flow of fluids, substantially as set forth.

2. The arrangement, in a line of pipe, of a stop-cock with its head projecting downward, and its open discharging end upward, in combination with a check-vale seated on such open upper end, substantially as set forth.

3. The combination of a hollow plug or stop-cock, a check valve opening outward seated on its outer open end, and a spring for pressing it to its seat, either wholly or in connection with the back pressure of the fluid, substantially as set forth.

4. The arrangement of a locking-bolt relatively to the stop-cock and its case, substantially as set forth, whereby the stop-cock is locked either open or shut.

139,879.—*Stove-Polish.*—JACOB I. DANFORTH, Newburyport, Mass. Application filed April 9, 1873.

One pound of powdered copperas is dissolved in one gallon of cold water. Two ounces of ground logwood and one quart of water are boiled down to one pint. It is then strained and mixed with the dissolved copperas. The mixture is then used as a dissolvent for the ordinary stove-blacking.

Claim.—As a dissolvent for stove-polishes, the within-described liquid composition, formed of the ingredients herein specified, in about the proportions and for the purpose set forth.

139,880.—*Pipe-Stem.*—JONATHAN DAVIS, St. Paul, Minn. Application filed October 16, 1872.

The outer shell of the stem incloses a tube having an ascending and a descending spiral groove on its periphery. The smoke rising in one groove returns in the other and enters the interior of the tube, through which it is conveyed to the mouth.

Claim.—The outer stem A, in combination with the tube B having ascending spiral groove *a* and descending spiral groove *b*, on its periphery, substantially as and for the purpose described.

139,881.—*Fumigator Bee-Hive.*—ABRAHAM R. DENLINGER, Gordonville, Pa. Application filed May 9, 1873.

A tube of sufficient size to hold the burning substance has a perforate plate at each end, beyond which a conic extension at its small end receives a tube. At one end this tube expands to form a mouth-piece; at the other it narrows to a point for the emission of smoke. The diaphragm on the mouth-piece side is removable with that of the conoid piece for the introduction of the fire.

Claim.—The cylinder A and top C, each provided with a perforated diaphragm, *a b*, and tube or tubes D E F, with the mouth piece *c*, and conic end *f*, substantially as shown and described, for the purpose specified.

139,882.—*Apparatus for Forcing Beer and other Liquids from Barrels.*—JOHN DEVLIN, Brooklyn, N. Y. Application filed March 27, 1873.

Mounted on a reservoir is an air-pump, the piston-rod of which is hollow and is provided with a check-valve. The air is conducted to the reservoir through a pipe provided near the pump with a check-valve, and near the reservoir with a two-way cock, by means of which the air may be either admitted to the reser-

veir or transferred to the air-pipe connected to the two-way supply-cock. The supply-cock is so arranged that it opens the passages for supplying air to and liquid from the barrel, or closes the passages simultaneously.

Claim.—1. The combined air force-pump and reservoir A A', provided with the hollow piston-rod *a*, screw-plug *c*, check-valves a^2 a^3, intermediate pipe a^4, two-way cock a^5, and lever B, arranged substantially in the manner described, in combination with the system of air and liquid supply-pipes, arranged substantially as described, for the purpose specified.

2. The two-way liquid-supply cock D, constructing and operating as described, in combination with the air-pipes *d* d^1, and d^2, and liquid-supply pipe *e*, for the purpose herein specified.

139,883.—*Ruffler for Sewing-Machines.*—GEORGE E. DOLTON, Monee, Ill. Application filed October 16, 1872.

The ruffle-former, consisting of a ruffled notched plate, which receives the strip to be ruffled, is reciprocated between the upper and lower plates projecting from the presser-frame. The ruffle may be formed and attached above or below a plain strip, or between two strips.

Claim.—The frame A, having the upper plate *c* and lower arm or plate a^1, the guide-finger P, guide *s*, opening a^2, and bearing B, in combination with the ruffle-former E, sliding between the upper and lower plate, the lever C, and the spring J, substantially as and for the purpose described.

139,884.—*Loom-Temple.*—WARREN W. DUTCHER, Hopedale, Mass. Application filed May 9, 1873.

Claim.—1. In the loom-temple, the roller-cap D, provided with the lip E and the abutment-receiving recess *e*, arranged as set forth.

2. The cap D provided with the lip E, and held in place on the abutment F by the roller-spindle C going through the said lip and being screwed into the trough or its abutment, as explained.

139,885.—*Cartridge-Box.*—WILLIAM H. ELLIOTT, Ilion, N. Y. Application filed May 1, 1873.

Claim.—The combination, with the frame or outer case, of a circular revolving cartridge-holder formed of two radially-corrugated plates, whereby radial receptacles are provided for the cartridges and great strength is imparted thereto, substantially as described.

2. A rotatory cartridge-box in which the radial cartridge-receptacles are inclined to the plane of their revolution, substantially as described and for the purposes specified.

3. A frame or outer case of a revolving-cartridge receptacle, in which the mouth is constructed substantially as shown and described, and having combined with it a stop-pawl and guard, whereby the successive cartridges are covered and secured within the case, while ready means of withdrawal is afforded by a rotary and radial movement as described.

4. The adjustable guard *d*, in combination with the outer case or frame A, having a mouth as described, so that the successive cartridges may be covered and secured in the case and ready means of charging the receptacle is provided, as set forth.

5. The stop-pawl *s*, combined with an adjustable guard *d*, by which it is drawn out of the way of the cartridges when the guard is drawn back for the purpose of charging the cartridge-box, substantially as specified.

6. The connecting-strap T, in combination with hook B, neck or shoulder strap S, and belt N, whereby the cartridge-box is allowed to move back and forth between its two points of attachment without being detached from the person of the soldier, substantially as and for the purpose specified.

139,886.—*Attaching Cork-Retaining Balls to Bottles.*—LUCIEN B. FLANDERS, Philadelphia, Pa. Application filed October 29, 1872.

A cork-retaining ball having enlarged ends, and connected to the neck of the bottle by being embedded therein during the formation of the bottle.

Claim.—The combination, with a bottle, of a cork-retaining ball having enlarged ends embeded in the glass, as specified.

139,887.—*Paint-Brush.*—JAMES J. GORMAN, Cincinnati, Ohio. Application filed November 4, 1872.

A bread brush is constructed in parts, so that they may be separated into smaller ones and used singly when desired.

Claim.—1. Handle S, constructed of two or more pieces, substantially as and for the purposes specified.

2. A brush composed of smaller brushes combined and attached together by the bread hooks *a a* and additional head or cap H, or its equivalent, substantially as and for the purposes specified.

3. As a new article of manufacture, a convertible brush, constructed of smaller brushes so secured together that they may be separated and used singly, when desired.

139,888.—*Bracelet.*—SANFORD W. GRANT, Providence, R. I., assignor to ALBERT O. BAKER, same place. Application filed February 19, 1873.

Provides supports struck up from sheet metal, so that the abutting ends of the face-plates at the spring-hinge joint shall be firm and kept in close contact at all times.

Claim.—In a spring-joint bracelet, the field-piece *b*, substantially as and for the purposes specified.

139,889.—*Washing-Machine.*—ALLEN GREGG, Springborough, Ohio. Application filed March 19, 1873.

A wash-board and rubber pivoted at one end of the lever to an adjustable-detent or holder, with a coiled spring to govern its tension. The lever attached to the rubber by screw and working in a V-shaped slot to limit its action. To the rubber-board is attached projecting-arms, and to the block to which the lever is attached is a pointed screw to support and hold the device in position in the tub when in use.

Claim.—The combination of short arms *c* and thumb-screw I with the table A for centering and retaining the machine within a wash-tub, in the manner and for the purpose described.

2. The arrangement of the socketed balls *f* in the face of table A to operate in combination with the corrugated rubber D and table A, in the manner and for the purpose described.

139,890.—*Hydrant and Fire-Plug.*—JAMES L. HEALEY, Brooklyn, N. Y. Application filed April 25, 1873.

The stand-pipe is divided into two chambers, each provided with its own valve and valve-rod, the pipe and partition being cast in one piece.

Claim.—The stand-pipe *a*, divided by the partition *e* into two chambers, the pipe and partition being cast in one solid piece, substantially as shown and described.

139,891.—*Blast and Cupola Furnace.*—DAVID W. HENDRICKSON, Red Bank, N. J. Application filed April 2, 1873.

An inverted funnel, which can be lowered by means of weights and pulleys to deposit the charge, forms the bottom of the feed-hopper and a chimney for the furnace. A steam-jet, located centrally of the funnel, causes an upward draft. The coils passing through the superheating-stoves terminate in the tuyeres, forming injectors, which carry the gas generated in the stoves to the hearth of the furnace.

Claim.—1. The combination of the furnace A, adjustable and combined stack Q and bell C, as a feeder, with hopper F, steam-pipes H H, nozzle L, tuyeres F F' F'' F''' F'''', stoves D D' D'' D''', cocks I I' I'', pipes E E', coil N, chimney G' G, damper K, and boiler or tank B, substantially as and for the purpose hereinbefore set forth.

2. The stack Q and perforated bell C, combined for the feeding of furnaces, substantially as and for the purpose hereinbefore set forth.

3. The combination of tuyeres F F' F'' F''' F'''' and injector-pipe E with stove D, substantially as and for the purposes hereinbefore set forth.

139,892.—*Tanning Apparatus.*—CONSTANT HERVEUX, Liverpool Road, Islington, England. Application filed January 16, 1873.

Two rectangular frames of wood are constructed to lie one upon the other. Upon the inner face of the one, and near the outer surface, a thin strip of metal is inserted, its edge projecting a little above the surface of the frame. Upon the corresponding inner face of the other frame a groove is formed that the projecting surface of the metal may fit into. The raw-hide is doubled, placed between the frames, and, as they are screwed together, its edges are tightly compressed by means of the metal and groove. The tanning-liquor is then forced into the bag of hide, and by means of hydrostatic pressure the liquor is slowly filtered through the pores.

Claim.—1. The apparatus, shown and described, adapted to clamp the sides of a double hide for the purpose of forming a bag, as set forth.

2. The combination of the frames A A' with the movable pieces B, substantially as and for the purpose set forth.

139,893.—*Animal-Poke.*—CURTIS HINMAN, Akron, Ohio. Application filed March 8, 1873.

Claim.—The above-described poke, consisting of the fork A, provided with the cross-bar D and the spikes F, and pivoted to the spear B, in combination with the guard G, plate-spring I, and yoke E, all arranged substantially as set forth.

139,894.—*Brick-Machine.*—GEORGE O. HOUCK and CHARLES E. SAWYER, Springfield, Ohio. Application filed September 11, 1872.

The raw clay is dumped into hoppers on the opposite sides of the machine, where it is subjected to the operation of horizontal reciprocating plungers, whereby the clay is forced through a set of knives into tempering-chambers, from which the clay is again forced by other plungers into the molds, held closely thereto by supporting-racks, from whence the bricks are removed.

Claim.—1. The combination of the hoppers A A, stationary vertical grates or sets of knives C C, and tempering-chamber D, substantially as and for the purpose herein specified.

2. The combination of the reciprocating trough or receptacle C, hoppers A A, and tempering-chamber D, substantially as and for the purpose herein specified.

3. The eccentric-wheels M O, provided respectively with friction-rings *b b* around their peripheries, substantially as and for the purpose herein specified.

4. The covered oil-cups or cavities *c c*, located respectively in the eccentric-wheels M O for lubricating the peripheries thereof, substantially as herein specified.

5. The frames S S of wires arranged so as to have the curved vibratory movement endwise, and upward and downward, substantially as herein specified.

6. The combination of the spring-catch *m* attached to each bow or projection *n* of the frame, the rock-shaft *o*, and projection *p*, the wire-frame S, and projection *r* thereon, or its equivalent, substantially as herein specified.

7. The counter-weights T T located in the posts *s s* of the frame, in combination with the racks or shelves L L, substantially as and for the purpose herein specified.

8. The molds K K enlarged at the bottom, constructed in two parts, with beveled or notched adjacent edges, and provided with handles U U on cam-shafts *v v*, and cam-bearings V V, all substantially as and for the purpose herein specified.

9. The combination, in a brick-machine, of substantially the following devices: A hopper or hoppers A A to receive the clay, a reciprocating trough or receptacle, B, to transfer the clay between the knives or grates C C into a tempering-chamber, D, chambers I I to receive the tempered clay from the tempering-chamber ready to fill into the molds, a reciprocating plunger, J, to force the clay into movable molds K K, all substantially as herein specified.

139,895.—*Fastening for the Meeting-Rails of Sashes.*—MORTON JUDD, Wallingford, Conn. Application filed May 2, 1873.

A swinging lever with curved end that carries the knob and turns at side into a box, clear of the meeting-rail, has a projection and notch to guard against moving by knife or thin instrument inserted between the sashes. The box containing the fulcrum of the lever is cast upon a bottom plate and combined with a separate cap-plate, the whole being secured together by a single rivet or screw, which otherwise constitutes the pivot of the lever.

Claim.—1. The sash-fastening lever *a*, made with the projection *b* at one side, in combination with the spring *h*, and bearing at the eye of the lever to hold the same in a position diagonal to the meeting-rails of the sash, for the purposes set forth.

2. The box *f* cast upon the plate *c*, in combination with the cap-plate *d* and rivet or screw *b* that secures said cap-plate and forms a pivot for the lever *a*, as set forth.

139,896.—*Elevator for Buildings, &c.*—EPHRAIM KRECH, Poughkeepsie, N. Y. Application filed March 6, 1872.

Claim.—A flat band or strap passing over a pulley, and connecting the elevator car or platform to a piston moving in a cylinder, in combination with a packing-gland through which such flat band passes so as to allow the liquid or fluid under pressure to act between the piston and gland, as set forth.

139,897.—*Platform-Scale.*—JOHN F. KEELER, Pittsburg, Pa. Application filed September 7, 1871.

The longitudinal timbers of the platform are secured above the transverse beams, and are protected by a cover extending along the sides of the platform and over the lateral weighing-levers. A weighted or pendulum lever is also used for automatic indication.

Claim.—1. The longitudinal stringers *t' t'*, when placed chiefly or wholly above the cross-beams *t t*, and firmly fastened thereto, in combination with the main weighing-levers *c* arranged along the side of the platform and above the level thereof, thereby reducing the depth of the pit, when the levers are covered by protecting-boxes *t*, t^1, t^2, and *k*, substantially as described and set forth.

2. The improved weighted lever *f*, constructed and used substantially as described.

3. The swinging platform *t' t' t'* suspended from one or more intermediate platforms, substantially as described.

139,898.—*Hanger for Pulleys.*—JOHN KENT, New York, N. Y. Application filed March 18, 1873.

The hangers can be adjusted both vertically and horizontally, so that the pulleys can be set at any angle that may be desired.

Claim.—An adjustable hanger for pulleys, constructed as herein shown and described, for the purposes set forth.

139,899.—*Inside Blind.*—DAMON Y. KILGORE, Philadelphia, Pa. Application filed May 14, 1873.

Metallic bands are hinged to the connecting-web on each side. Through these bands are passed the slats that form the blinds. The slats and the bands are both slotted for the passage of the elevating-cords.

Claim.—The bands B and hinges C, in combination with the web A and slats D, the webs being hinged to the bands, substantially in the manner and for the purpose set forth.

139,900.—*Harvester.*—GEORGE W. LEISHER, New Wilmington, assignor of one-half his right to BARTON A. LEISHER, Renovo, Pa. Application filed June 24, 1871.

The frame of a reciprocating toothed elevator is hinged to the frame of an endless-apron platform so as to be folded thereon for transportation.

Claim.—1. The elevating apparatus, hinged on the axis of the double crank C C, consisting of the frame H H, the pronged elevators E E, the cranks C C and C_1 C_2, the pulleys P_2 and P_3, with their bands B_2, and the clearer, with its prongs attached to the receiving-trough T_2, constructed substantially as herein described, for the purpose of elevating grain from the bands B B running across the platform of a harvester to the receiving-trough T_1.

2. The combination of bands B B, double cranks C C and C_1 C_2, pulleys R R and P P, pronged elevators E E, receiving-trough T_1, and tables T_2 and T_3, in connection with the cutting apparatus and gearing-frame of a harvester, constructed substantially as described, and used for the purpose of allowing grain, as it is cut, to be bound on the machine, and of preventing all loss of grain.

139,901.—*Boring-Machine.*—HARLIN LONGWELL, Mansfield, Pa. Application filed May 10, 1873.

The device which carries the boring and tenoning tool is made vertically-adjustable, as is also the rest for steadying the spoke.

Claim.—1. The combination of the mortised bar D, ratchet-bar E, with tube H for holding the working parts, the pawl G and spring *e*, all substantially as and for the purposes herein set forth.

2. The socket P with adjustable slide O, and adjustable felly-holder N, for the purposes herein set forth.

139,902.—*Composite Beam.*—WILLIAM W. LUMMUS, Lynn, Mass. Application filed January 23, 1873.

Claim.—A beam composed of metal plates C C, curved widthwise and provided with flanges F F at their edges, and locked together by the plates A and B, and strengthened by vertical plates D, of wood or iron, and the remaining space filled with mortar or incombustible material, substantially as described.

139,903.—*Beam for Floors.*—WILLIAM W. LUMMUS, Lynn, Mass. Application filed November 18, 1872.

Claim.—A wooden beam having its vertical sides slightly hollowed or concave, and strengthened and protected by metal plates arched or curved to correspond with the sides of the beam, and connected by bolts or rivets through the beam, substantially as described.

139,904.—*Beam for Floors.*—WILLIAM W. LUMMUS, Lynn, Mass. Application filed November 19, 1872.

The beam is constructed of a single plate of iron, having its edges slit at intervals, and bent alternately in opposite directions to afford a lodgment for the wooden strengthening pieces B', which also serve to nail to.

Claim.—1. An iron beam, consisting of a single plate of iron, with its edges slit or cut, and bent to hold nailing-strips for floors, ceiling, furring, or lathe.

2. The slits in the edges of the iron beam cut or made on either edge opposite the middle of the spaces on the opposite edge, substantially as described.

139,905.—*Bottle.*—VIRGIL H. LYON, Indianapolis, Ind. Application filed February 7, 1873.

The neck of the bottle forms a receptacle for a compound, which, by means of a stopper, may be kept separate from the contents in the body of the bottle until required to be mixed for use.

Claim.—The corks C D and string E, in combination with the neck or upper portion of the bottle, constructed as and for the purpose set forth.

139,906.—*Fire-Extinguisher.*—HUGH L. MCAVOY, Baltimore, Md. Application filed May 21, 1873.

The acid-chamber is arranged outside of the tank, connecting with it by means of a tube passing through a sleeve, said tube having perforations on one side near the end. The acid-chamber serves as a handle by which it is inverted and the acid discharged.

Claim.—1. An acid-chamber placed at the outside of the extinguisher, and adapted to be moved as a handle upon a hollow stem extending within the generator, the said stem being perforated to admit of the flow of the acid from the chamber into the generator when the said chamber is inverted, as set forth.

2. The equalizing-pipe *e*, in combination with the acid-chamber B, stem *b'*, and opening b''', as and for the purpose specified.

139,907.—*Safe-Vault.*—MORTIMER MCCALL and ROSTO O. WOOD, Buffalo, N. Y. Application filed June 17, 1872.

A vault for protecting safes from fire, &c. The casing is provided with spring-catches for securely fastening the cover to the casing, the spring-catches being automatically released from the cover by the safe while being raised. A screw is used for raising and lowering the safe.

Claim.—1. The cap provided with sockets, in combination with spring-catches attached to the casing, to be automatically operated by the safe while being raised, as shown and described.

2. The combination of the safe B, screw *p*, operated by proper mechanism, vertical casing A provided with spring-catches *z*, and cap C, all operating together as and for the purposes described.

139,908.—*Feed-Water Heater and Condenser.*—THOMAS E. MCNEILL and RUFUS N. PRATT, New York, N. Y. Application filed September 21, 1872.

Claim.—The heater, comprising the water-chamber A, steam-conduit chamber B provided with the outlet *d*, bent tubes C, and steam-inlet chamber D, the whole constructed and arranged for operation substantially as and for the purpose specified.

139,909.—*Temple for Spectacles.*—GEORGE W. MEIGS, Hartford, Conn. Application filed January 24, 1873.

The side bows or temples of a spectacle-frame, made of steel wire, are secured to a separate hinge-piece and have a ball or knob attached to the outer ends.

Claim.—A temple made in parts, and having the half-joint and the ball, either or both, fastened to the body, substantially as described, and for the purposes set forth.

139,910.—*Manufacture of Illuminating-Gas.*—THOMAS N. MILLER, Pittsburg, Pa. Application filed January 25, 1872.

Take the slack as thrown from the mines and agitate in a fine screen or sieve, and wash in water; after which spread upon a platform for the purpose of drying. It is then charged into a retort and the process of distillation conducted in the usual manner.

Claim.—The three specified successive processes, as a preparatory step in the manufacture of illuminating-gas from bituminous coal-slack.

139,911.—*Machine for Grinding Hay.*—WARREN P. MILLER, New York, N. Y. Application filed April 29, 1873.

Spirally-grooved rollers engage with, and impart motion to, each other, the grooves being formed also to grind the hay. A hopper returns the ground hay through the second set of rollers. A pair of screw-bolts and spring-collars serve to produce adjustability in the rollers.

Claim.—The grooved rollers *c d*, and C, working together in the manner described, in combination with the boxes *f*, screw-bolts G, spring-collars *k*, and hoppers P and Q, all substantially as and for the purpose set forth.

139,912.—*Organ-Reed.*—MILES C. MORGAN, Boston, Mass. Application filed April 23, 1873.

Instead of a sliding clamp to move up and down the reed, the reed-block itself is moved between two clamp-jaws which hold the reed fast, and are adjustable to different points thereon.

Claim.—In combination with the plate *c*, having a projecting lip, *h*, attached thereto, the stationary clamp *i*, screw *k*, or its equivalent, and the movable reed-block *d*, for the purpose as herein shown and described.

139,913.—*Reed-Organ.*—CHARLES W. PALMER, Cleveland, Ohio. Application filed April 23, 1873.

The valves are without springs, being closed by the suction of the air. All the reed-sets are vertical, and the reed-valves are operated by the long arm of the lever connecting them with the keys.

Claim.—1. The combination, in reed-organs, of the reed-boards B B, connected by partitions D D, forming valve-chambers, as shown, and the swell-box J provided with openings K and lid M, with the sounding-board A, substantially as described, and for the purpose set forth.

2. The valves E, beveled openings F, rod G, and lever H, in combination with the keys I and board A, and tube-boards B B, substantially as and for the purpose set forth.

139,914.—*Type-Writing Machine.*—JAY READ PEMBER, Randolph, Vt. Application filed January 31, 1873.

Upon depressing the treadle the arms are raised to present the types at their outer extremities. The arms may be held in position, to present any given letter, by pins in the standing frame.

Claim.—1. The combination of two or more sets of type-presenting means, B C, with controlling keys M N, and connecting mechanism, so that the two or more types shall be presented simultaneously in proper order to the paper at the will of the operator, substantially as herein specified.

2. The key-boards A^3 A^2, pins M N, and levers B C, with means D for moving the same in one direction at will, combined and arranged for joint operation, as and for the purposes herein set forth.

3. In combination with the type-presenting means B C, operating-keys M N, and the connecting mechanism, the duplicate sets of keys X Y, and corresponding type-presenting means R S, and their connecting mechanism, arranged as shown and adapted to be operated simultaneously therewith, as herein specified.

4. In combination with the lever B, its segment end, and series of keys M for arresting its motion at different points in its sweep, the type-segment I *i*, operated by the lever as and for the purposes herein specified.

5. In combination with the series of movable keys M, and lever B sweeping across the motion thereof, and suitable printing devices carried by the said lever, the hinged flap *b*, with its spring b^1 serving therewith, as herein specified.

6. In a type-printing machine having a lever, B, arrested in different positions by keys or pins M, the collar *m* on the said arresting means adapted to engage with and to hold the lever, substantially as and for the purposes herein specified.

139,915.—*Cooler for Wine, &c.*—FRANCIS M. PIPER, Chicago, Ill. Application filed April 12, 1873.

Perforated tray suitable for receiving broken ice, with inverted cups open at the bottom, and, preferably, approximating the form of inverted wine-bottles.

Claim.—The perforated tray A, provided with the inverted cups B B, open at the bottom and arranged tightly in or around the perforations in the tray, in combination with a suitable support or case, substantially as and for the purposes specified.

139,916.—*Fire-Proof Vault.*—GRANVILLE W. PITTMAN, Keokuk, Iowa. Application filed March 18, 1872.

The safe is arranged in a vault with an arched top, an air space being left all around it, and a flue for cold air opening into the bottom. A chimney carries off the air as heated, and maintains a constant circulation to cool the contents of the vault.

Claim.—1. The combination of the fire-proof vault A, the receptacle B in a permanent position, the air-passages C C′ around the contents, and the passages F G for introducing cool air and forcibly carrying off hot air, all substantially as set forth.

2. The combination of the fire-proof vault A, the air-passages F G for introducing cool air and carrying off hot air, and the arched top having the circular holder H, substantially as set forth.

3. The combination of the spherical arched top with its circular holder H, made smaller at its bottom part, as set forth.

139,917.—*Truss.*—DANIEL POMEROY and WILLIAM POMEROY, New York, N. Y., assignors to JULIUS R. POMEROY, DANL. POMEROY, and MARY E. POMEROY, same place. Application filed May 9, 1873.

An India-rubber spring is secured across a recess in the back of the pad. Upon this rubber spring a standard and adjustable slide are secured, the latter held at various points on the circular truss-band by a set-screw.

Claim.—1. The flanged slide F, standard D, and set-screw *k*, in combination with the truss band or spring, substantially in the manner and for the purpose specified.

2. In combination with the elements of the preceding claim, the rubber spring C, attached to the pad and standard in such a manner to allow of both direct and rotary elasticity of the pad, substantially as shown.

139,918.—*Wash-Boiler Attachment.*—WILLIAM E. RICE and JOSHUA BARNES, Brooklyn, N. Y. Application filed September 7, 1872.

An attachment to be placed in an ordinary wash-boiler; has a supporting-flange, a slotted top with valves resting on wires, and two vertical tubes connected by a showering-tube.

Claim.—In combination with the open-bottom vessel A adapted to sit down in an ordinary boiler, as described, the valves E and F, the vertical conduits D D, and the shower-tube C, all constructed and arranged to operate substantially as described.

139,919.—*Gas-Burner.*—JAMES RIGBY, Cincinnati, Ohio, assignor of two-thirds of his right to JOHN F. JOHNSON and GEORGE RHOREK, same place. Application filed March 14, 1873.

A pillar, adapted to receive the ordinary burner, has attached to it a smaller burner which carries a jet of gas a little above the top of the former, and is so inclined that the flames shall unite at an acute angle.

Claim.—A branch-burner, C B, constructed to be attached to an ordinary vertical gas-burner used in connection therewith, substantially as and for the purpose specified.

139,920.—*Cracker-Machine.*—LUCIUS A. ROCKWELL, Tremont, N. Y., assignor to himself and JOHN A. CURRIER. Application filed May 19, 1873.

The dough passes between grooved rollers, which divide it into skin-surfaced ropes, and these ropes are passed between pairs of reciprocating curved or notched knives, which cut off nearly cylindrical pieces of dough, each one of the amount necessary for one cracker. These pieces of dough are guided down into a channel formed between two moving dies, and, when sufficiently rolled and kneaded, they are discharged on an endless apron and moved forward to be brought under a flattener. As the flattener rises the apron moves forward, and the now flattened crackers are brought under the docking-pins, and then, after the docker rises, the apron delivers them on a plate of metal below the apron. The lumps of dough are guided to the flattener by a notched pusher that engages with them as soon as they are dropped on the apron from the kneading-plates or dies.

Claim.—1. The knives C C, formed as represented, and arranged and operating relative to each other and to the moving ropes of dough, as and for the purposes herein specified.

2. The molding-plates E F, chambered or grooved as shown, and operated relatively to each other, as shown, so as to receive, roll, and knead masses of dough, and discharge them in the form of skin-covered flattened spheroids, as herein specified.

3. The mechanism represented for communicating oppositely-reciprocating motions to the molding-plates E F—that is to say, the connecting-rods P leading from the crank-pins *p* to one of the molding-plates, E, the racks *e f*, and gear-wheels R, combined with the rolls A A and knives C C, and arranged to operate therewith, as herein specified.

4. In combination with the mechanism for forming skin-covered lumps of dough, as specified, the notched or tooth-edged pusher-plate I reciprocated over the surface on which the masses of dough are dropped, so as to place the dough upon the apron K in determined positions, as herein specified.

5. The reciprocating flattener J, with its attachments operated as specified, relatively to the intermittent carrier K, in combination with the mechanism for producing skin-covered spheroids of dough, and for placing them in exactly determined positions under the flattener, as herein specified.

139,921.—*Cleaning Cotton Waste.*—GEORGE SAGAR, Chicago, Ill., assignor to CHICAGO WASTE-CLEANSING COMPANY, same place. Application filed April 28, 1873.

The fabric is treated with a solution of spirits of salt and nitric acid combined with water, and then with a solution of soda ash.

Claim.—The ingredients herein set forth for cleansing fabrics, when combined and used substantially as described.

139,922.—*Filter.*—CHARLES C. SAVERY, Philadelphia, Pa. Application filed December 12, 1872.

A straining-plate having a flange resting on the bottom of the vessel and secured thereto by a tubular perforated bolt protected by a shield of wire-gauze, the water passing laterally through the meshes of the shield and through the perforations in the tubular bolt into the cooler.

Claim.—1. The straining-plate A, having a flange, *b*, and adapted to the vessel D, in combination with the body of filtering material retained between the plate and bottom of the vessel, as set forth.

2. The combination of the horizontal straining-plate A, adapted to the vessel, as set forth, and a central delivery-tube, as and for the purpose specified.

3. The combination, with the vessel D and straining-plate A, of a perforated tabular bolt G, securing the plate and serving as an outlet for the filtered water, as specified.

139,923.—*Reflector.*—FAUNT LE ROY SENOUR, Newport, assignor of one-half his right to JOHN A. SIMPSON, Covington, Ky. Application filed December 17, 1872.

The reflector is secured in the case by a backing of cement or plaster Paris, which serves also to protect the silver coating.

Claim.—The reflector of a locomotive head-light anchored within the case A by the cement backing H and flanged plate D, or its equivalent device, substantially as shown and described.

139,924.—*Exercising-Machine.*—REUBEN SHALER, Madison, Conn., assignor to HENRY L. SHALER, same place. Application filed April 4, 1873.

The frame supporting the passenger-tray has rollers, which are flanged to keep them on the curved way. The tray is unattached to the roller-frame, but slides thereon between fixed handlines or guys.

Claim.—1. In combination with the guide-frame *a*, the frame *c* having rollers *g* provided with the flanges *i i*, substantially as shown and described.

2. In combination with the roller-frame *c*, the carriage *l*, constructed to move freely back and forth upon the said frame, substantially as set forth.

3. The rollers *g*, guide-frame *a*, stanchions, cords, and carriage *l*, when these different parts are combined and arranged to operate substantially as shown and described.

139,925.—*Support for Wash-Tubs.*—EDGAR F. SHAW, Boston, Mass. Application filed May 26, 1873.

Four legs are pivoted to a central plate or bracket, with legs. The tops of the legs are provided with projections for the chime of the tub.

Claim.—The within-described support, consisting of a series of legs A pivoted at their tops to a central plate, B, and provided with grooves or projections *b c*, substantially as and for the purpose set forth.

139,926.—*Truss.*—JACOB A. SHERMAN, New York, N. Y. Application filed November 5, 1872.

The end of the thigh-strap is furnished with two flat springs extending forward in the same plane with it. The outer end of one of these springs is attached to the spring-bar of the waist-strap, and that of the other carries the pad. The pad is thus pressed to place by the yielding action of a spring, while it is also left free to accommodate itself to the hernia.

Claim.—The truss-pad *c*, connected to a bar or spring at the end of the strap passing between the legs, in combination with a spring or bar also connected with said strap and the bar *f* and waist-belt *e*, as and for the purposes set forth.

139,927.—*Can for Oil.*—HORATIO M. SMITH, Chicago, Ill. Application filed November 16, 1872.

Claim.—1. A shipping-can provided with the hinged or pivoted elbow-shaped vent-tube D, arranged in the can substantially as and for the purposes specified.

2. A shipping-can provided with a yielding elbow-shaped vent-tube, arranged in the can in the manner specified.

3. A shipping-can provided with the elbow-shaped vent-tube D, arranged in the can in the manner described, and attached thereto by means of the spring E, substantially as and for the purposes specified.

139,928.—*Dominoes.*—WILLIAM X. STEVENS, East Brookfield, Mass. Application filed March 15, 1873.

Dominoes usually match at their two ends only. These may be matched at three or more points.

Claim.—1. Dominoes or cards polygonal in form, having their faces marked near their side edges with character or figures matchable, one with another, at three or more of the sides so marked, substantially as and for the purpose specified.

2. The method of marking dominoes by means of sheet material stamped upon and into their faces, substantially in the manner described and set forth.

139,929.—*Loom-Temple.*—EDWARD S. STIMPSON, Hopedale, Mass., assignor to DUTCHER TEMPLE COMPANY, same place. Application filed May 9, 1873.

To hold the temple when drawn back, the shank is provided with an auxilliary shoulder, arranged on its inner side to act with the stand-shoulder, the strain of the cloth being sufficient to move the shank laterally and thereby latch it.

Claim.—The loom-temple provided with the auxiliary stop or shoulder *c* arranged on the inner side of its shank, substantially in manner, and to operate with the stand-shoulder *b* by means of the cloth, and for the purpose set forth.

139,930.—*Spooling-Machine.*—JOSEPH F. STONE, North Andover, Mass., assignor to himself, GEO. L. DAVIS, JOHN A. WILEY, GEO. G. DAVIS, J. H. STONE, and J. H. DAVIS, same place. Application filed January 21, 1873.

The plates are for closing the spiral slots to prevent the loose skewer, when used, from working endwise out of the spool. The weighted handles bear the frames down, so that the spools may be turned by the drum or pulley, and are convenient for raising them when the spools are full. The bush is slit, and being driven in between the pulley and shaft secures the two together.

Claim.—1. The spiral slots and bearings, closed upon the outside by the plates G′, in combination with the loose skewer to form an axis for the bobbin, substantially as described.

2. The weighted handle, in combination with the swinging-frame, substantially as described.

3. The conical bush I, in combination with the shaft and the pulley having a conical bore, substantially as described.

139,931.—*Clamping-Device.*—CHARLES STOUT, Waverly Heights, Pa., assignor to himself and CLINTON ROBER, same place. Application filed March 12, 1873.

Fence-rails and other irregular stock can be firmly held while being dressed.

Claim.—The combination with the lever B of a frame, A, between which and the lever a rail or other object may be clamped, as set forth.

139,932.—*Stove-Pipe Joint.*—ALBERT C. SWEETLAND, North Attleborough, Mass. Application filed October 21, 1871.

Claim.—The slip-joint connection B, consisting of the conical collars *b b*, cut with slits *c*, and united at their bases so as to form a fillet *a*, substantially as and for the purpose specified.

139,933.—*Shirt.*—GEORGE C. THOMAS, Chicago, Ill. Application filed April 17, 1873.

Claim.—The shirt-body A made open at the front, in combination with the bosom B, one side of which is attached to the body in the manner described, so that when the opposite side of the bosom is buttoned to the body, the lower portion of the bosom will be disconnected from the shirt-front, as specified.

139,934.—*Stove-Grate.*—JOHN S. VAN BUREN, Troy, N. Y. Application filed March 20, 1873.

Claim.—1. A grate having two sets of bars diverging from or near the center at different angles, so as to form side openings at the edge for the discharge of clinkers, substantially as specified.

2. The serrated edge, in combination with the bars *f e*, when arranged substantially as shown and described.

3. A grate having two sets of bars, which diverge from the center or near the center, one set being placed on a horizontal line and the other depressed below it, so that the edge which binds them together shall be serrated, substantially as shown and described.

139,935.—*Machine for Turning Spools.*—EZRA C. WALKER and WILLIAM M. GOODING, Newark, N. J. Application filed July 6, 1872.

The spool-blanks are thrown into a hopper, where they are arranged and deposited on an endless belt by revolving-agitators. This belt carries them forward and deposits them in a holder, which in turn transfers them to the lathe-centers.

Claim.—1. The combination and arrangement of the hopper C, agitators *b b*, endless belt 2, trough *r*, and stop 4, in the manner and for the purpose described.

2. The combination of the trough *r*, guide *p*, spider *f*, and curved lever *g*, with the slide Z, for the purpose of receiving the blank and carrying it into the lathe, as set forth.

3. The combination and arrangement of the sliding rod *y*, blocks *n* and K, cutters *o*, and lathe-mandrel 14, in the manner and for the purpose specified.

4. In a machine for turning spools, the combination of the carrying mechanism *f g* and the cutting-tools *u*, supported as described, with the slide Z, all operating as described.

139,936.—*Book-Mark.*—HENRY M. WARD and GEORGE E. DOLTON, Monee, Ill. Application filed August 7, 1871.

The clasps are provided with projecting tongues, which fit between the leaves of the book, and with barbed ends, by which the band over which the pointer slides, is held.

Claim.—An elastic band, A, in combination with the clasps B, and pointers C, for the purpose described.

139,937.—*Shirt.*—JOSEPH WIESER, Williamsport, Pa. Application filed May 9, 1873.

An additional plait is placed down the center of the bosom over the ordinary buttons or fastenings.

Claim.—In combination with a shirt-bosom opening in the center, the separate strip A attachable to either of the inner edges of said bosom lengthwise over the center thereof, substantially as and for the purpose described.

139,938.—*Vault-Cover.*—WILLIAM R. WILLIAMS, Indiana Township, Allegheny County, Pa. Application filed March 20, 1873.

Claim.—A sidewalk-grating frame, consisting of the outer shell or ring *a* having a flat flange, *b*, and a vertical flange, *c*, and a basket, *d*, for containing a filling having a roughened non-metallic surface, resting in the ring *a* upon a suitable seat, *e*, substantially as and for the purposes described.

139,939.—*Till-Alarm.*—JOHN F. BALDWIN, Nashua, N. H. Application filed October 26, 1872.

A series of spring-bolts within the rear of the drawer, connected with a swing-bar and operated by rods secured beneath the drawer, when thrown up, engage with a hinged-spring catch-plate and effectually lock the drawer. When either of the said bolts is depressed by the finger-rods acting on its appropriate bent lever or "key," the drawer on being pulled open is caused to sound an alarm-bell.

Claim.—1. The spring-supported bolts E having foot-piece G, combined with a spring-retracted key, D, having the toe *m* and angle *n*, operated by rod and finger-piece, as and for the purpose set forth.

2. A swing-bar, F, having the lugs *h*, combined with corresponding shouldered bolts E, as and for the purpose set forth.

3. The apron O, key E, and spring-bolt S, combined with drawer, to hold it firmly and closely locked.

4. The application to the lever T of the spring *z*, as and for the purpose specified.

139,940.—*Washing-Machine.*—EDWIN S. BLISS, Richburg, N. Y. Application filed May 17, 1873.

Springs are attached to cross-pieces which rest upon the journal-boxes of the upper roll and are held in position in the slots of the frame, and by metal loops attached to the uprights. Near the bottom of the frame is a cross-bar connected to the frame by tenons at one end, and passes over an inclined block, on which a button is pivoted to secure the machine to the tub, in connection with the cleat and block attached to the tub and frame.

Claim.—1. The spring F G, constructed as herein shown and described, in combination with the standards A, rollers D C, and loops H, substantially as and for the purpose set forth.

2. The slotted cross-bar K, block L, button M, cleat N, and notched-block O, constructed and arranged, in connection with the washing-machine, as herein shown and described, for securing said machine in a wash-tub, as set forth.

139,941.—*Turn-Table.*—WILLIAM H. BURCH, Port Gibson, Miss. Application filed May 5, 1873.

The turn-table has a pair of central parallel stringers strongly braced by adjustable stays in the several directions named, truck and end wheels, and a central screw-bearing, furnished with a de-

tachable point in a conical seat. The locking-bar is attached to a horizontal operating-shaft and lever by a V-shaped double brace.

Claim.—1. The stringers H, rails I, cross-beams L M, trucks N O, wheels F, center-screw D, and plates C P Q, constructed and arranged to operate in combination with each other substantially as herein shown and described.

2. The detachable point or toe *d'*, constructed and applied to the screw D substantially as herein shown and described.

3. The V-shaped locking-bar R in combination with the shaft S, by which it is operated, and with the notched blocks U attached to the ends of the turn-table, substantially as herein shown and described.

4. The arrangement of the stays V X Z, constructed as described, the posts W and braces Y, in connection with the stringers H and cross-beams L and M, substantially as and for the purposes herein set forth.

139,942.—*Muff-Lining.*—CHARLES F. BUTTERWORTH, Troy, N. Y. Application filed April 12, 1873.

The funnel-shaped end pieces of the lining are each shaped from one piece of fur upon a block. The central lining is of kid or other elastic leather.

Claim.—1. A muff-lining composed of the blocked end pieces A and the elastic kid middle piece D, constructed and arranged as and for the purposes described.

2. A muff-lining composed entirely of part fur and part elastic leather or kid, as shown and described.

139,943.—*Seed-Planter.*—WILLIAM CALL, Jr., Haverstraw, N. Y. Application filed March 15, 1873.

The handles of the machine constitute the side bars of the frame, and these are held in place by three cross-bars and mounted upon two wheels having a straight axletree, upon which is a five-pointed cam. The seed-box is mounted upon the frame, and the seed-slide is moved by the revolution of the cam.

Claim.—The main frame, consisting of two bars, C C, and three cross-bars, D D D', the sliding frame I I', and the sliding hoppers, combined and relatively arranged, in connection with a cammed axle on wheels, substantially as and for the purpose described.

139,944.—*Medicine-Spoon.*—JAMES L. COLBY and LE ROY B. THOMSON, Saxonville, Mass. Application filed February 15, 1873.

This spoon is made up of a hinged cover with crescent-shaped opening; a leg-support, (which also serves with its upper ends as springs to hold the cover down,) and a hinged leg to support the handle while the spoon rests on the table.

Claim.—The medicine-spoon body A, having hinged cover B, with crescent-shaped opening on top, a leg support, C, beneath, and a hinged leg, D, supporting handle end, as described.

139,945.—*Fire-Proof Roof.*—JOHN B. CORNELL, New York, N. Y. Application filed May 24, 1873.

The corrugated sheet-metal is secured to iron rafters by metallic brackets, the lower ends of which hook under the rafters, and the dovetailed ribs and grooves of the corrugated metal furnish a secure means of attachment for the fire-proof top coating, as well as the inner layer of mortar, without the use of lath.

Claim.—The combination of the iron rafters or beams, dovetail corrugated sheet-iron cover, fire-and-water-proof top cover and an inner coat of plaster, for a roof, substantially as specified.

139,946.—*Water-Trap.*—ROBERT CUNNINGHAM, Chicago, Ill. Application filed March 10, 1873.

The movable diaphragm A is for increasing on one side and diminishing on the other the space through which the metal is forced, the effect being the outflow of a greater mass at one side than the other, and all finding exit from the die through an annular space of uniform breadth. The further effect will be to cause the resultant tube to leave the die in a curved path.

Claim.—The combination of the diaphragm A A, or its equivalent, with the die B B and mandrel C, constructed and operated substantially as set forth.

139,947.—*Well.*—ADAHEL CURTIS, Bastrop, La. Application filed March 1, 1873.

A temporary guide-tube B is used in connection with the ordinary well-sinking tube upon which the wall is built, thereby economizing skilled labor as well as time and material.

Claim.—The casing-tube B, applied about the earth-box A so as to enable the bricks to be laid evenly, perpendicularly, and more economically, in the manner and for the purpose described.

139,948.—*Chair.*—WILLIAM T. DOREMUS, New York, N. Y. Application filed May 31, 1873.

The pedestal has tapering arms or uprights on each side of which are arranged tapering rubber blocks, held in place by arms or extensions of the seat frame, which are provided on their lower ends with flanges, and at their upper ends with blocks to hold the rubber blocks in place.

Claim.—The combination of the tapering arms B, the rubber blocks E, the arms D provided with flanges *d* at their lower ends, and blocks F or equivalents at their upper ends, with each other, and with the pedestal A and the seat-frame C of a chair, substantially as herein shown and described.

139,949.—*Gage for Horse-Collars.*—JOHN M. EVERITT, Hackettstown, N. J. Application filed May 8, 1873.

A graduated bar or rule is provided at its upper end with a rectangular arm, which is placed upon the horse's neck. A sliding transverse scale is brought into contact with the lower part of the neck, where it is held by a set-screw, and a swinging arm from the top cross-piece is allowed to fall on the opposite side, so as to mark on the lower scale the width of the animal's neck.

Claim.—The pivoted bar C operating upon the movable scale-bar D, in combination with the bar A, substantially as herein shown and described, and for the purposes set forth.

139,950.—*Hunting-Jacket.*—JEAN GARAUD, New York, N. Y. Application filed April 19, 1873.

A hunting jacket, having a pocket or receptacle in the back for game, is adapted to have a cartridge-pouch attached to its inside by means of loops for receiving the strap of the pouch, and a flap on which to button it.

Claim.—1. A hunting dress or jacket, A, with inner backlining B having side openings *a*, loops *b*, and buttons *c*, in connection with lapel *f*, substantially as described.

2. The combination of pouch C, constructed as described, with the subject-matter of the foregoing clauses, substantially as and for the purpose set forth.

139,951.—*Medical Compound or Catarrh Remedy.*—WILLIAM V. GREEN and JOHN M. KINTZEL, Wellsville, Ohio. Application filed May 19, 1873.

Cubebs, licorice, alum, ammonia.

Claim.—The herein-described compound composed of the ingredients, and in about the proportions herein named, for the purpose set forth.

139,952.—*Sofa-Bedstead.*—CHARLES F. GRUNDIN, Boston, Mass. Application filed May 5, 1873.

The frame is made in four parts, hinged together. The foot-frame and outer bottom frame, when closed up, form the inner seat and back-frame. The arm-braces are pivoted to the back or head frame, and connect, when the frames are folded, with arm-braces on the outer bottom frame. When the lounge is extended said arm-braces act as legs to the outer bottom frame.

Claim.—1. The head part A having two arms, *e e*, on a common connecting-rod, *f*, and the section C having braces A, each hinged to an opposite side of the section B, as and for the purpose described.

2. The part D having hooks R hinged to a section, C, having buttons *i*, and folding back against head A, as and for the purpose set forth.

139,953.—*Electrical Thermostat.*—JOHN H. GUEST, Brooklyn, N. Y., assignor to AUGUSTA GUEST, same place. Application filed March 29, 1873.

Around the point at which the conducting-wire enters the bulb of the thermometer a glass chamber is formed, to be filled with soluble glass or other fluid, for preventing access of air in case the wire should become loose.

Claim.—The sealed tube or vessel C connected with the bulb A, filled with a suitable liquid, and closed to exclude the air from the point of entrance of the wire in the bulb A, substantially as and for the purpose specified.

139,954.—*Medical Compound or Salve.*—GILES HALL, Joliet, Ill., assignor of one-half his right to GEORGE CLUBB, same place. Application filed May 26, 1873.

Mutton tallow, one pound; golden seal, two ounces; slippery-elm bark, one-half ounce; common chalk, one-half ounce; ground flax-seed, one-fourth ounce; oil of origanum, four ounces.

Claim.—1. The combination of the ingredients described, as and for the uses and purposes set forth.

2. The compound set forth, as a new article of manufacture.

139,955.—*Package for Caustic Soda or Alkali.*—HENRY B. HALL, New York, N. Y. Application filed May 17, 1873.

Metallic cup of soft iron, lead-foil, or lead and tin, &c. Pour caustic alkali in a liquid state, and seal by a cover of melted resin after the alkali has solidified.

Claim.—A package for caustic soda or alkali, consisting of a spun or stamped metallic cup and a cover of resin or other gummy substance poured in on the solidified contents in a liquid state, substantially as specified.

139,956.—*Self-Acting Switch.*—LEWIS W. HARRIS, Oriskany, N. Y. Application filed April 18, 1873.

The switch-rails are moved by the advancing train, the wheel-flanges of which encounter the long pivoted diagonal levers G G attached to the movable rails. The long levers are locked in position by spring-knees *d d'*, which are depressed so as to release the levers by the flange of the wheel operating upon the spring E, the depression of which depresses the locking-knees. The movable rails are joined by metallic ties of bow-shaped form.

Claim.—1. The movable tracks *e e* pivoted to one of the fixed ties and held relatively together by metal ties D D D H, combined with the peculiar-shaped levers G G, which are sheared or moved laterally by the wheels of a car, as and for the purpose set forth.

2. The locking device, composed of the spring F having knees *d d'*, combined with the lever-arms G G and U-shaped springs E E, as described, for the purpose set forth.

3. The metallic tie D, as shown in Fig. 4, adapted by its peculiar form to be securely attached to the flanges of the shifting-switch rails, substantially as described.

139,957.—*Lounge and Bedstead Combined.*—STEPHEN HIGGINS, Portland, Me., assignor of one-half his right to CHARLES H. BUCKNAM, same place. Application filed November 23, 1872.

The extension-frame slides out from the main frame, and is provided with two supplementary pivoted frames—one for the head-rest and the other for the bed part of the extension-frame. These supplementary frames are revolved when the extension is drawn out, and thus form a level support for the mattress.

Claim.—The combination, in a sofa-bedstead, of the back *a*, bars *c* and *b*, rest *m*, slides *n*, *q*, and *q'*, pivoted supplementary frames *e* and *j*, offset-hinges *k' k* and *p p*, and the stops *g g'* and *r* and *r'*, all in the manner and for the purposes as set forth.

139,958.—*Nursing-Bottle.*—WILLIAM HOBSON, Sandwich, Mass. Application filed June 2, 1873.

The draft-tube has a large flange, which rests upon the top of the cork. The rubber nipple is drawn over the edges of this flange, and, resting upon the under side, prevents the glass flange from striking the neck of the bottle. The device lessens the liability of breaking or manipulating the bottle.

Claim.—The flanged draft-tube A, the elastic nipple B, and the cork C, arranged together and in or applied to the neck of a bottle, in manner substantially as represented in the drawings, and herein-before explained.

139,959.—*Combined Collar and Cravat.*—FREDERICK D. JAMES, Tamworth, N. H. Application filed April 12, 1873.

A collar has tabs formed on it so as to be folded up to make a neck-tie bow.

Claim.—The collar A provided with the flaps *d d* and with the T-flap B, substantially as and for the purpose herein shown and described.

139,960.—*Coffee-Mill.*—SIMON C. JANTZEN, Philadelphia, Pa. Application filed November 19, 1872.

Canister of sufficient capacity to hold coffee for several days' use, and so constructed and arranged that the material to be ground is fed directly from the same to the grinding device.

Claim.—The combination of the canister I, constructed substantially as described, with the grinding devices C and D, as and for the purpose shown and described.

139,961.—*Attaching Metal Caps to Glass, Porcelain, &c.*—CECIL B. JENKINS, New York, N. Y. Application filed March 29, 1873.

A metallic disk having elastic projections, which impinges the glass forcibly by having the hole in the disk made slightly smaller than the object to which the cap is secured, is employed for attaching caps to bottles, lamps, &c.

Claim.—The disk C slotted to form elastic projections E, and applied to the bottom of cap A and about the neck D, as and for the purpose described.

139,962.—*Sewing-Machine.*—THOMAS K. KEITH, Haverhill, Mass. Application filed May 23, 1873.

The thread from the spool passes over the grooved tension-wheel, the axis of which has a gear that moves the gearing of the indicating mechanism, registering on the dials the number of yards of thread consumed.

Claim.—In combination with a sewing-machine mechanism, a mechanism, substantially as described, for registering the length of thread.

139,963.—*Ash-Leach.*—JOHN W. KERKODLE and ADAM H. HAUN, Lebanon, Ind. Application filed January 6, 1873.

A metallic ash-cylinder, having its under edge scalloped, is set on an inclined trough provided with a flange and spout.

Claim.—The ash-leacher, consisting of cylinder E, scalloped at H, cover F G, and trough A B D, all arranged as described.

139,964.—*Lamp.*—RIVERIUS MARSH, Flushing, N. Y. Application filed April 12, 1873.

A sheet-metal plate covers the upper surface of the lamp-fount. It is provided with a flange at the edge, raising it slightly above the surface of the fount, a collar for attachment to the lamp-wick, a drip-cup, a safety-tube depending within the lamp, and a screw-thread for attaching the burner.

Claim.—The combination, with a glass oil-reservoir, A, of a metal lamp top, provided with an annular extension covering the top of the lamp, so constructed as to form an oil-receiver, E, and a collar, G, and having the safety-tube I attached to said collar, substantially as specified.

139,965.—*Sawing-Machine.*—GEORGE MARSHALL, New York, N. Y. Application filed April 12, 1873.

The saw is made to reciprocate lengthwise of the table by means of friction-pulleys acting upon two bands stretched between carriers at opposite ends of the saw-frame.

Claim.—1. The foot-lever G having double roller F, combined with friction-rollers *e e'* to impart forward and reverse motion to carriage C, as set forth.

2. The saw-carriage C having projecting pieces *g* for stretching belts E E', with rollers a^1 and a^1 of the mandrel b^1, for adjustment of driving-belt D, as described.

3. The hinged guide K and cap L arranged, as shown and described, to operate as specified.

139,966.—*Steam-Plow.*—PETER J. MCDONALD, San Francisco, Cal. Application filed March 15, 1873.

The plows slide on transverse ways and meet at the center, when, by the action of a trip-lever, the drum is reversed, the plows moving back while the machine moves forward a sufficient distance for a fresh furrow.

Claim.—1. The slotted boxes E' in combination with the cords or chains *g*, pins *i*, and axle F, having holes for the reception of said pins, substantially as and for the purpose set forth.

2. The frame I, with its casting J, having the parallel flanges *j j*, and arranged to support one or more ways or pairs of ways, K K, substantially as set forth.

3. The slides Q, having, with their plows P P, a reciprocating motion, in combination with the horizontal ways K K, ropes or chains *u u'*, and reversible drum L, substantially as described, and for the purpose set forth.

4. The sliding rod *z*, with its operating-arms *y y'* kept in place by the spring *z'*, in combination with the spring-lever *b*, latch *c*, with its catch *n'* and trip-lever *l'*, the whole operated by the slide Q, substantially as set forth.

5. The reversing-gear, consisting of the bevel-wheels R R' R'', in combination with the clutches *p p'*, when operated by the weight of the triangular frames K *l m* by means of the latch *c* and spring-lever *b*, as and for the purpose set forth.

6. The ratchet-wheel 4, in combination with the lever 5 with its pawl 6, when operated by the rope 7 and drum 8, for the purpose described.

139,967.—*Animal-Trap.*—JACOB MERCHEN, Brookville, Ind. Application filed April 12, 1873.

For moles more particularly. The trap is placed in the path of the animal with the jaws distended by the loose chained piece, which, being removed by the victim, the jaws spring together.

Claim.—The mole-trap having legs A, with collars B and spring C, combined with wedge piece D, substantially as and for the purpose described.

139,968.—*Covering for Steam and other Pipes.*—CHARLES M. O'HARA, Fall River, Mass. Application filed December 12, 1872.

Claim.—The belt E with straps *h* for covering the joints and forming the connection between the casings of two adjoining sections of pipe, substantially as herein set forth.

139,969.—*Binder for Loaded Wagons and Sleighs.*—JACOB PAFF, Lawrenceburg, Pa. Application filed May 10, 1873.

The base-plate is provided at one end with a slotted hook and at the other with projecting ears, which serve as fulcrums for the binding-lever. This lever is also provided with a hooked arm for engaging with the chain when it is desired to draw the ends of the chain together in the act of binding. A suitable tripping device is also arranged to release the chain when it is desired to remove the load.

Claim.—A binder composed of the bed-piece A, lever B, pivoted hook C, arm D, slotted hook F, fulcrum-pin G G, and chain E, the same connected and arranged to operate substantially as and for the purpose specified.

139,970.—*Cotton-Press.*—WILLIAM W. PATRICK, Midway, S. C. Application filed April 5, 1873.

Power is applied by means of two levers supported by shafts between uprights worked by pulleys, ropes, and windlass, one lever having cam-shaped head and pendent arm and follower-block, and the other grooved to correspond with this head.

Claim.—1. The lever H having head *e*, in combination with pendent arm *f*, and follower-block L, to be adjusted substantially as described.

2. Lever I, having groove *e'* for head *e* of lever H, as set forth.

3. The combination of levers H and I by means of pulleys, ropes, and windlass to elevate and depress them, substantially as set forth.

4. The combination, with the shafts *a*, uprights D, box-frame F, and packing box E, of the lever H *e*, arm *f*, follower-block L, lever I *e'*, and pulleys, ropes, and windlass, substantially as described.

139,971.—*Beer-Strainer.*—CHARLES M. POWERS, Ridgewood, N. J. Application filed March 8, 1873.

A beer-strainer constructed with a sliding partition attached near its center, held in position by grooves or slides, by which it may be moved up and down, with a perforated bottom to separate the beer from the foam.

Claim.—A beer-strainer having a removable partition, with a removable strainer attached thereto, as shown and described.

139,972.—*Spike.*—SAVILL REDFERN, Churchville, N. Y. Application filed May 21, 1873.

A two-pronged spike, with the prongs at right angles to the body, to be driven into the side of the tie, and a notch in the shank or body to fit over the flange of the rail.

Claim.—The spike composed of the body *a*, shanks *f f*, and prongs *b b*, when said prongs are made of unequal length and are arranged to drive sidewise into the ties, substantially as and for the purpose specified.

139,973.—*Hopper for Grinding-Mills.*—MARTIN REPLOGLE, Moulton, Iowa. Application filed April 19, 1873.

Valve so arranged under two-part hopper that the pressure of the grain in either part will revolve the valve and close the other part when emptied of its contents.

Claim.—The combination, with a two-part hopper or spout, A B, of an automatic cut-off valve, D E G, substantially as specified.

139,974.—*End-Gate for Wagons.*—STEPHEN F. ROBERTSON, Rockford, Ill. Application filed October 19, 1872.

Metallic stirips are secured to the ends of the end-gate, which engage within a metallic flange upon the side board. The same is further secured by bolts passing down through the floor and secured by hand nuts.

Claim.—The combination of the bolt F and its hand-nut with the end board B, cleat E, hook e^1, plate D_6 eye d^1, and side board A, as described.

139,975.—*Cider Mill.*—LORING O. ROCKWOOD, Ottawa, Ill. Application filed April 11, 1873.

The shaft of one wheel passes through the hub of the other wheel when both revolve in the same direction, and are not concentric with each other. A flange at the bottom of the first wheel, acting as a moving floor, carries pomace to scraper at place of exit, and also small stray pieces of fruit to the point of contact with the pressing surfaces.

Claim.—1. Passing the shaft E of the wheel D through the hub of the wheel C, when both wheels revolve in the same direction, and are not concentric with each other, substantially as described.

2. The combination of the hollow axle B with the slide-boxes H H, bolsters J J, nut K, double wedge I, and shaft E, substantially as and for the purpose described.

3. The inclined feed-floor L, constructed and applied substantially as and for the purpose described.

4. The flange O at the bottom of the wheel D, for the purpose described.

139,976.—*Apparatus for Pitching Barrels.*—GEORGE SICHLER, New York, N. Y. Application filed May 24, 1873.

The horizontal bars of the upper skid are connected by rods and rest upon tongued cross-bars which slide in vertically-grooved posts, and are supported by movable pins. The bars of a tilting-skid, placed at the rear of the former skid, and having a weight at one end, are pivoted to a rod whose axles turn in an adjustable block.

Claim.—The cross-bars B C D, the posts E grooved upon their inner sides, the adjustable cross-bars F G, the skids I J, the adjustable blocks K, the round L, and the tilting and weighted skid M N O, constructed and arranged to operate in connection with each other, substantially as herein shown and described.

139,977.—*Tobacco-Drier.*—JAMES MORGAN SMITH, Milton, N. C. Application filed November 21, 1872.

Claim.—The process of curing tobacco yellow, so that it will keep well in bulk by thoroughly smoking and then drying it, by means of detachable heating-pipes, substantially as herein described.

139,978.—*Child's Carriage.*—FRANCIS SNYDER, New York, N. Y. Application filed May 5, 1873.

While the central portion of the bar D acts as a perch, the two ends are bent into a form similar to the letter C, and serve as springs for the carriage-body.

Claim.—The combined perch and springs D D D made in one piece of metal of the form shown, in combination with the toe-irons E attached to the front and rear of the body of a child's carriage, as and for the purpose set forth.

139,979.—*Clothes-Washer.*—GEORGE J. TERREL, North Blanford, Mass. Application filed May 5, 1873.

The wash-boiler attachment is constructed with two conical-shaped bottoms, the upper one being perforated, having a center pipe or conductor for water and steam, to which the lower or plain one is fitted, by a flange or projecting band, to the inside of the conductor.

Claim.—1. An apparatus for washing clothes in an ordinary boiler, consisting of the conical perforated false bottom A, vertical tube B, T-discharge-pipe C, and imperforate lining D, when the same are constructed and arranged as shown and described.

2. The removable lining D, in combination with the false bottom of a wash-boiler, as and for the purposes described.

139,980.—*Carving-Machine.*—HENRI THOMAS, Brooklyn, E. D., N. Y. Application filed April 19, 1873.

The carving tool and indicator are arranged to move coincidently by means of pantograph arms, sliding bars, beveled gear, and screw-threads, so that the pattern being rotated in one set of centers, the work is correspondingly carved in the other.

Claim.—1. The combination of the sliding work and pattern-carrying centers, and the vertically-adjustable and horizontally-swinging tool-carrying arms, all constructed and arranged and operating substantially as specified.

2. The center holder-plates D F, radius-bars H, links J, toggle-jointed bars K, sliding nut L, and screw M, combined and arranged substantially as specified.

3. The arms O P, block Q, bar X, slide W, bars V, and link U, combined and arranged substantially as specified.

4. The sliding-block Q, standard Y, arms O P, and their actuating devices, and the adjusting-screw Z, and crank-shaft Z', combined with the work and pattern centers, substantially as specified.

139,981.—*Loom for Weaving Hair-Cloth.*—JOHN TUBPIE, New York, N. Y., assignor to EDWARD H. FAULKNER, same place. Application filed December 9, 1872.

The hair-seizing device is carried by a strap attached to two pulleys on a rock-shaft, to which the required rapid movement and dwell are given through a geared sector operated by a reciprocating grooved cam, multiplying-gearing, and a second rock-shaft actuated by an eccentric. One of the pulleys is adjustable about its shaft, so as to allow of taking up the slack of the strap. Between the crank and the batten there is a yielding connection consisting of two parts, one sliding upon the other, and the parts are held in working position by two springs, one of which is regulated in its action by an adjustable collar. The Jacquard operates the take-up, but the parts can be disconnected by a treadle under the control of the attendant, when it is necessary to stop the take-up without stopping the Jacquard.

Claim.—1. In combination with the pulleys L^1 L^2, strap P, and hair-seizing device, the rock-shaft H, the multiplying-gearing, the shaft I carrying the cam I^1, connection J, and geared sector K, all arranged for joint operation, as and for the purpose specified.

2. In combination with the hair-seizing device the pulleys L^1 L^2, one being adjustable on its shaft so as to take up the slack of the strap P, substantially as herein specified.

3. In combination with the batten and the crank b, the yielding connection consisting of the adjustable spring *f*, the sliding connection C', the adjustable collar *c'*, the connection C, and the spring F, substantially as shown.

4. The tilting treadle R, rigid connection S, lever T, pawl *t*, connection V, and loose connection U, all arranged relatively to the lever W of the Jacquard and to the take-up mechanism of the loom, substantially as and for the purposes specified.

139,982.—*Butt-Hinge.*—SOMERS VAN GILDER, Knoxville, Tenn. Application filed May 17, 1873.

One leaf carries a fixed pintle-pin and central projecting hub, and the other leaf is diagonally divided, each part carrying a pintle-socket. The butt can be used for either a right or left hand slip-hinge.

Claim.—The leaf A', provided with the central socket C having the pintle B secured therein, in combination with the leaf D divided, as shown, into two parts, one having a socket, E, and the other a socket, F, for receiving the respective ends of the pintle, all as shown and described.

139,983.—*Button-Hole Cutter.*—CASPER VAN HOOSEN, New York, N. Y. Application filed March 29, 1873.

In each blade near the inner end is a curved slot, into which the margin of the cloth passes, and is gaged by a sliding stop in the lower one of the two blades. In the upper blade is a set-screw, which works through a nut and serves to limit the action of the blade, and thus determines the length of the button-hole. By these buttons the margin and length of button-hole are both made of varying lengths. A scale with fractional parts of inches is marked upon the lower blade.

Claim.—The notated scissor-blade A B, having each a corresponding curved slot at the inner ends of its cutting edge, a shoulder, a stop, F, and an adjustable cloth-gage, G, as and for the purpose described.

139,984.—*Coffee-Roaster.*—WILLIAM H. WELCH, Bloomington, Ill. Application filed March 5, 1873.

The rim is adapted for pot-holes of different sizes, and has notched standards, upon which the roaster may be sustained at any desired height.

Claim.—1. The rim *a* having the notched standards *b*, substantially as set forth.

2. The rim *a* provided with standards *b* and cover *u*, in combination with globe *b'*, all arranged and operated for the purpose of retaining the aroma of coffee during the process of roasting.

139,985.—*Cultivator.*—PHILIP F. WELLS, Milford, Mich., assignor to himself and D. WEBSTER WELLS, same place. Application filed April 12, 1873.

Claim.—1. A plow-standard, G, pivoted to the upper end to bar C, and held rigidly in a vertical plane between the bifurcations of a stud, J, on the cross-bar, as and for the purpose described.

2. The front plate F upwardly flanged and constructed to receive and retain the tongue and longitudinal bars, in the manner shown and described.

139,986.—*Harvester.*—JOHN WERNER, Jr., Prairie du Sac, Wis. Application filed March 15, 1873.

An endless apron-rake, composed of front and rear belts and connecting slats, slides over a fixed receiving-platform, so that grain falling obliquely is made to assume a position at right angles to the platform preparatory to its ascent up the elevator.

Claim.—The belts E F connected by cross-bars G H, and combined with a continuously-close platform, C, level with the tops of and extending to each of the rolls B B, as and for the purpose described.

139,987.—*Harrow.*—PARMENAS N. WOODWORTH, Stony Point, Cal. Application filed April 7, 1873.

A harrow, constructed in two triangular sections, and hinged together in V-shape form, and provided with teeth on the outside timbers, which slant outward and backward, while the teeth on the middle longitudinal timbers slant backward. Across the frames are two timbers in each section provided with teeth slanting in opposite directions.

Claim.—A harrow in which the teeth on the outside timbers of the frames A A slant outward and backward, while those on the middle longitudinal timbers slant backward only, in combination with the obliquely and backward slanting teeth on the cross timbers C C', slanting in opposite directions, substantially as and for the purpose above described.

139,988.—*Gyroscopic Toy.*—ARCHIBALD C. WÜRTELE, New York, N. Y. Application filed April 26, 1873.

Claim.—1. The improved gyroscopic toy formed by the combination with each other of the base A, pivot B, ring C, arm and ring D *d'*, inner ring E, screw-pivots F, wheel G, axle H, and screw-pivots I, substantially as herein shown and described.

2. The combination of the suspended weight J with the parts A B C D E F G H I, substantially as herein shown and described.

139,989.—*Whip-Socket.*—JAMES H. YOUNG, Newburg, N. Y. Application filed May 24, 1873.

The whip is held secure within the socket by means of the bristles, which are secured to the barrel of the socket.

Claim.—The whip-socket A, having bristles B extending inward and arranged to hold the whip in place, substantially as and for the purpose described.

139,990.—*Needle Setter and Threader for Sewing-Machines.*—CHARLES F. ALBERT, Philadelphia, Pa. Application filed May 9, 1873.

The notches at the top and bottom of the flanged plate and the spring, the point of which enters the groove, hold the needle firmly. The hooked pin in the eye, besides regulating the longitudinal position of the needle on the plate, also serves to draw the thread through the eye. The needle should be set a little lower for sewing thick material, and the pivoted arm is to be turned over the flanged portion of the plate.

Claim.—1. The combined needle holder and threader, consisting of a flanged plate, A, notched at *b*, spring *c*, and hooked pin *d*, arranged as set forth.

2. The combination, with the said holder, of a pivoted arm, *e'*, for the purpose specified.

139,991.—*Button.*—JAMES N. ALLEN, Providence, R. I. Application filed May 24, 1873.

Improvement upon patent No. 90,631. The improvement consists in making the shank with a rectangular recessed arm, and arranging coincident engaging points on the arm, and a bar which is pivoted to it, so that the two can be interlocked.

Claim.—The combination of the shank B, having a rectangular arm which is provided with a spring-slot, and a holding-bar pivoted to the end of the arm, and arranged to enter the spring-slot and be retained therein by the coincident engaging surfaces, substantially as described.

139,992.—*Washing-Machine.*—JOHN E. ANDERSON, Boiling Springs, Pa. Application filed March 12, 1873.

A washing-machine, constructed with a double sliding shoe or rubber connected at its center, having between them a water-feeding device, and pitmen on either side connected with upright levers, and the center cross-board by which motion is given it. At each end of the box is a suspended rubber located to operate in connection with sliding rubber.

Claim.—1. In combination with the rubber or shoe B, with one or more rubbing-surfaces, the water-feeding device C C, composed of inclined boards or strips, preferably hinged to vertical bars secured to the inner sides of the rubber, substantially as shown and set forth.

2. The combination of the elements of the above claim, with the pivoted or yielding rubber or rubbers E E, substantially as and for the purpose set forth.

139,993.—*Method and Mold for Manufacturing Glass-Ware.*—JAMES S. ATTERBURY and THOMAS B. ATTERBURY, Pittsburg, Pa. Application filed March 27, 1873.

Mold having movable bottom and a plunger provided with air-tube and valves; bottom elevated and molten glass poured in mold; plunger brought down forming part of article; bottom then dropped, and article finished in same mold by blowing through air-tube of plunger.

Claim.—1. The process of pressing and blowing glass-ware in the same mold, and thereby making a pressed and blown article of glass-ware from the same piece of glass, substantially as herein described.

2. The plunger D, provided with an air-passage and a valve, *e*, substantially as and for the purpose described.

3. The movable base B, and air-injecting plunger D, combined with a glass-mold, substantially as and for the purpose described.

4. The new manufacture of glass-ware, consisting of blown and pressed glass, either the blown or pressed parts being a continuation simply of the other, substantially as described.

139,994.—*Propelling Device for Vessels.*—BENJAMIN T. BABBITT, New York, N. Y. Application filed February 5, 1873.

A propelling-wheel is arranged in a shell or case, which is divided into two compartments, each of said compartments being connected to a channel, one of which leads to the bow and the other to the stern. The wheel is shifted laterally upon its axis or shaft, so as to occupy at pleasure either of the shell compartments, and the water being drawn through one channel is forced by the wheel through the other one, accordingly as the vessel is to be propelled ahead or astern.

Claim.—The combination of the wheel A, arranged as described, its case or shell divided to form two compartments, B and C, and the channels D F leading from said compartments, one to the bow and the other to the stern of the vessel, essentially as and for the purpose herein specified.

139,995.—*Bath-Tub.*—LOUIS BAGGER, Washington, D. C. Application filed December 6, 1872.

A bath-tub having an overturned edge to prevent water from splashing over the sides.

Claim.—The overturned, convex, or angular top edge of the bath-tub *c c*, continued either all the way round or only upon and along a portion of a bath-tub, substantially as and for the purpose hereinbefore set forth.

139,996.—*Propelling Canal-Boats.*—HALSEY H. BAKER, New Market, N. J. Application filed March 10, 1873.

A propelling-wheel, composed of a toothed surface or pinion, side treads or rollers corresponding with the pitched line of the pinion, and one or more flanges, travels over a track on the canal bank, composed of an open rack and side rails, and has attached at its center a universal joint connected to the end of a shaft, which shaft is operated by power on the boat, by which means the propelling-wheel is revolved on the rack, and motion imparted to the boat.

Claim.—1. The arrangement, substantially as herein described, of the universal joint E, which connects the shaft D with the propelling-wheel B, within said wheel and at the center of the latter.

2. The propelling-wheel composed of a toothed surface or pinion *k*, side treads *l l*, corresponding with the pitch-line of the pinion, and one or more flanges, *m m'*, substantially as specified.

3. The track G, composed of an open rack, *n*, and side rail or rails *o o'* arranged with their upper surfaces in the same line or plane as the pitch-line of the rack, essentially as described.

4. The rack *q* of the track and perforated web *r*, in combination with the rail *o*, and open rack *n*, substantially as shown and described.

139,997.—*Traction-Engine.*—DAVID H. BALL, Sinnamahoning, Pa. Application filed March 31, 1873.

Oscillating engines are connected by means of intermediate mechanism with the front and rear axles, allowing them to have lateral movement independent of each other. The wheels are so combined with their axles that they may have nearly a whole revolution before they become locked to the axle.

Claim.—1. In a steam road-wagon or traction-engine, the combination of one or more oscillating engines, with the connect-U U, and shaft V, for operating both the front and rear axles of the traction-wheels, substantially as set forth.

2. The wheels of a steam road-wagon loosely mounted upon the axles, and adapted to have a movement independent of one another by means of the key O, the reduced portion O', and projection O^3, substantially as set forth.

139,998.—*Temporary Binder.*—WILLIAM H. BARNARD, Washington, D. C. Application filed May 8, 1873.

The top is composed of one fixed piece and a central and end pieces adjustable by racks and spring-jaws. One of the latter binds the papers, while the other is raised to admit inspection from the beveled corner *a*.

Claim.—1. A bill or letter file, constructed with a bottom, beveled side B, straight side C, one end piece, and a three-part top operated by catches and racks, substantially as described.

2. The three part cover or lid provided with catches, which engage with racks on the box in such manner as to allow the vertical adjustment of a part of said lid in the box, for the purpose of permitting an inspection of its contents without their displacement, as set forth.

3. The combination of the racks H, with catches G, and strips E and F, substantially as and for the purpose described.

139,999.—*Fire-Damper for Windows.*—MOSES J. BARWICK, New York, N. Y. Application filed January 24, 1873.

Iron damper-plates, to be applied by the firemen to the outside of a window of a burning building, to check the circulation of air and the escape of flame. The shutters slide laterally, and are controlled by a rack and pinion. There is a sliding-plate also at the bottom to more effectually close the opening when necessary.

Claim.—The adjustable damper-plate applied to the upper portions of windows or openings in burning buildings, substantially as described, for the purpose set forth.

2. The combination of the adjustable plates A A', with a rack and pinion, or their equivalent, and pins to hold the plates in position, as described, for the purpose set forth.

3. The adjustable damper-plates, in combination with a valve or slide at the bottom thereof, as described, and for the purpose set forth.

140,000.—*Shirt Bosom Stretcher.*—EZRA BASSETT, Topeka, Kans., assignor of one-half his right to A. P. CHAPIN, same place. Application filed March 1, 1873.

The table is constructed in form of the bosom of a shirt, with a frame fitted to its outer edge, with a spring by which the shirt is held for ironing by a cross-bar on which it rests.

Claim.—The ironing-stretcher for shirt-bosoms, consisting of a board A, in connection with a clamping-frame C, having the spring pressing-bar D E, substantially as shown and described.

140,001.—*Photography.*—EDWIN L. BERGSTRESSER, Hublersburgh, Pa. Application filed March 25, 1873.

A negative plate is provided with rims or flanges on its surface so as to be held in any suitable frame or back, and make as it were its own printing-frame. It is also provided with a groove or gutter near its edges, and running wholly or partially around such plate to catch the surplus silver or other solution as it flows off toward the edges.

Claim.—1. A negative plate or glass having rims, flanges, or their equivalents, upon its surface, substantially as and for the purpose set forth.

2. A negative plate, provided with a groove in its face for catching the drain of silver or other solution, substantially as shown and described.

3. In combination with the negative plate, provided with rims or flanges, the hinged back and holding-springs, substantially as specified.

140,002.—*Circular Saw-Mill.*—MONROE BLACKBURN, Sullivan, Ind. Application filed April 15, 1873.

The automatic setting-lever I is made adjustable upon the bar H.

Claim.—The levers H I, arranged so that the point of connection can be changed to regulate the set, and used in connection with the wheel E, foot-block G, pawl *d*, wheel D, carriage B, and head-block C, the several parts being constructed and arranged as and for the purpose set forth.

140,003.—*Sliding Chandelier.*—GEORGE F. BLAISER, Philadelphia, Pa. Application filed April 12, 1873.

The lower cap has a slot through which the notched bar attached to the sliding pipe moves. A spring bears upon the bar to bring the flanges against the cap. By turning the pipe contrary to the action of the spring it may be readily lowered.

Claim.—1. The rack *d* secured to the sliding pipe D, as and for the purpose set forth.

2. In combination with the rack *d* and notched cap E, the spring *e*, as shown and described.

140,004.—*Plow.*—THOMAS E. C. BRINLY, Louisville, Ky. Application filed April 7, 1873.

Both the standard and mold-board are constructed with lugs and dovetailed recesses in such a manner that when the share is introduced, a single bolt will secure the whole firmly together.

Claim.—The mold-board C b b' g g' d, in combination with the standard A e e^1 e^2 s f^1, and the share B f f' f^2, and bolt b^2, all constructed and arranged substantially as specified.

140,005.—*Bed-Bottom.*—EDWIN L. BROCKETT, Nelson, Ohio. Application filed May 9, 1873.

Upon the head and foot pieces are grooved blocks, and upon the blocks is a continuous wire having cranks. A bottom slat, having oblique slots that hook over the cranks, sustain an upper slat having lever-braces.

Claim.—1. The continuous wire D having cranks *d*, combined with grooved blocks C *c'* having staples *c*, and arranged at intervals on head and foot pieces B B', to support the slats, in the manner described.

2. The cranked wire D journaled in frame A so as to be movable inwardly, in combination with slats having an oblique slot c^3, in each end, as and for the purpose set forth.

140,006.—*Globe-Valve.*—AUGUSTUS P. BROWN, New York, N. Y. Application filed July 25, 1872.

The valve has a spherical bearing and a chamber cast on its back, into which a spring is placed, upon which the valve-stem bears when closing the valve. When undue pressure arises from any reason, the valve compresses the spring and prevents the threads from jamming.

Claim.—1. In a globe-valve, constructed as herein shown and described, the valve B, provided with the chamber C, and with the resting-spring F, in combination with the guide D, the valve-stem G, and its fastening-nut E, substantially as herein shown and described.

2. The valve B, having the spherical bearing-face, and the chamber C, spring F, and guide D', in combination with the valve-stem, the fastening D, shoulder G, and shell A, all constructed and arranged, substantially as herein described.

140,007.—*Shipping and Show Case for Boots and Shoes.*—MATTHEW BUHLER, Lamoille, Ill. Application filed December 17, 1872.

The shipping-case is made in the usual oblong form, and is provided with a series of transverse shelves or partitions, and still further subdivided by an inclined partition extending the whole of the interior length of the case, thereby making separate divisions for each size of boots. When the top is taken off and the case set up on one end, it becomes a show-case.

Claim.—A shipping and show case, A, for boots and shoes, provided with a series of transverse partitions, *a*, and an inclined partition C, arranged as and for the purpose specified.

140,008.—*Button-Fastening.*—DOMENICO CANNATA, Jersey City, N. J. Application filed April 9, 1873.

A button is secured by the use of a loop or staple, which is notched so as to lock into a notched or slotted disk or washer on the under side of the fabric.

Claim.—The combination of the notched metal loop, applied to the eye of a button, and the annular plate, notched as specified, essentially as and for the purpose herein set forth.

140,009.—*Apparatus for Burning Hydrocarbons.*—MANUEL CARBONEL, Havana, Cuba, assignor of one-half his right to JOSÉ BENITO PEREZ, same place. Application filed March 27, 1873.

The liquid falls through the perforated supply-plate upon the inclined platform, where it is burned, the perforated plate preventing the backflow of the ignited gases, and the perforated fire bridges retarding its escape to the flue, and from its heated condition facilitating combustion.

Claim.—1. An inclined platform, D, arranged in conjunction with a perforated supply-plate, E, in a furnace for burning liquid fuel, when such plate E is arranged beneath, and at some distance from the supply-pipes F, substantially as set forth.

2. The combination of the perforated fire-bridges G with the inclined platform D, perforated supply-plate E, and channels I, as described.

140,010.—*Bridle-Bit.*—DANIEL H. CARPENTER, Hartford, Conn. Application filed April 25, 1873.

Claim.—1. The face-piece or nose-band D, constructed of any suitable elastic material, and attached to the upper sections of the lever-arms of a bit, in such manner as to operate substantially as described.

2. In combination with the elastic face-piece or nose-band D, arranged as stated, the strap D' connected with the nose-band and head-stall in such manner as to permit of its being adjusted substantially as described, as and for the purpose specified.

3. The flat rectangular mouth-piece A, when the same is so connected with the lever-arms of a bridle-bit as to operate substantially as described.

4. The lever-arms B B of a bridle-bit so formed and arranged that the bearings or eyes to which the reins are attached shall be above the mouth-piece and those of the curb below, substantially as described, as and for the purpose specified.

5. The metal plate curb C having hooks C' C', all formed out of the same piece of metal, the whole being so constructed and arranged as to permit of its being attached and used in connection with an ordinary bridle-bit, substantially as and for the purpose specified.

140,011.—*Fire-Alarm Telegraph.*—ROBERT CARTER, New York, N. Y. Application filed October 24, 1872.

By means of an earth-connection at each box and an earth from center of battery, an earth-circuit can be made to central office whenever metallic circuit is broken, an alarm apparatus being upon each side of battery.

Claim.—1. The combination of the earth-wire 6, 7, and the earth-wire 5, with a telegraphic fire-alarm circuit, substantially in the manner and for the purpose herein specified.

2. The combination of a spring or circuit-closer A, electrically connected with the earth, with the springs or circuit-closers B and B' connected with the line, substantially in the manner and for the purpose specified.

3. The combination of the insulating-space F, with the circuit-wheel C, substantially as and for the purpose specified.

4. The arrangement of the electro-magnets M and M' for giving an alarm, one on each side of the battery, substantially as and for the purpose specified.

140,012.—*Braider for Sewing-Machines.*—JAMES P. CHAFFEE, Washington, D. C. Application filed February 14, 1873.

The figure shows the under side of the attachment. The guides are adjustable on the plate for braids of different widths, and from the passage formed between the guides the braid passes over the cross-bar and into the slot where it is sewed to the cloth by the needle; may be secured to the cloth-plate by a screw through the slotted arm, and is adapted for machines having a "needle-feed."

Claim.—The plate A, provided with the slotted arm, the adjustable guides C C, the opening *f*, the cross-bar *e*, and the slot E, substantially as and for the purposes herein set forth.

140,013.—*Loom-Temple.*—NATHAN CHAPMAN, Hopedale, Mass. Application filed June 6, 1873.

Claim.—1. The toothed temple-roller provided with a fixed stop or pivot of hard metal, conical or hemispherical in shape, to turn against the end piece or lug of the case, which holds the roller on its shaft.

2. In combination with the toothed roller, the conical hard-metal pivot, as described, and constructed with a recess to serve as a bushing for the end of the roller-shaft.

3. The sheet-metal plate c^3 under the stock D fastened on the stud *c*, to cover the spring under the slot in the stock, and keep out the waste, dust, and dirt.

140,014.—*Oscillating Berth for Ships.*—ISAAC A CHOMEL, New York, N. Y. Application filed April 23, 1873.

Claim.—1. The single bolt a^1, with its lower end a^2, forming a universal point of suspension lower than the ceiling, and as low and as near the center of gravity as is practicable, in combination with a berth constructed and operating substantially as and for the purpose herein described.

2. The berth D, provided with a stiff suspension frame d^1, and adapted to be suspended from a universal joint, substantially as herein described.

3. The spring G, in combination with the suspension frame and berth, substantially as and for the purpose set forth.

4. A ship's berth suspended by a universal joint as near the center of gravity as is practicable, within a rigid frame, and guided in its oscillations by an articulated frame, substantially as described.

140,015.—*Signal-Lantern.*—SAMUEL W. CLARK and WILLIAM R. SYKES, London, Eng.; said SYKES assignor to said CLARK. Application filed February 19, 1873.

The colored glasses are attached to pivoted slotted arms, moving vertically before the lamp. A bent lever, (extending upward into a handle across the top of the lantern,) by moving in the slotted arms, causes either of the colored screens to be depressed in front of the lamp, accordingly as the handle is turned to the right or the left.

Claim.—In a hand signal-lamp, the vibratory bent lever *e*, in combination with the slotted arms *c c*, or their equivalents, on the shade-frames *b b*, arranged to operate the colored shades *a* a^1 in such a manner that both are removed from before the light when said bent lever is placed in its central or normal position, and one or other of the colored shades placed before the light by moving the lever in one direction or the other, substantially as shown and described.

140,016.—*Pump.*—HIRAM T. COLEMAN, Williamsburg, N. Y. Application filed May 15, 1873.

Rubber cushions lined with metal are placed beneath the beam to prevent injurious concussions, and to permit, when desired, extra motion of the beam.

Claim.—The cushions *d* placed on the pump stock or frame beneath the beam E, that connects with the plungers for the purpose of preventing concussion and allowing an extra degree of motion to the beam, substantially as specified.

140,017.—*Elevator.*—ALONZO W. CRAM, Litchfield, Ill. Application filed May 8, 1873.

The ejector is for elevating grain, coal, sand, dirt, &c. The steam-jets are arranged concentrically, forming a hollow cone-shaped vacuum-passage. On the end of the discharge pipe a hood is so arranged as to form a vent for the steam, thus breaking the force of the discharge.

Claim.—1. The inlet or suction tube A, the discharge-tube E, steam-chamber *c*, formed as shown, and having a series of annular jets *a a*, and an opening, *d*, for the supply of steam, the whole being constructed, combined, and arranged to operate substantially as described.

2. In combination with the inlet-tube A, steam-chamber having a series of jets, *a a*, arranged as shown, the discharge-tube E end-tube F and hood F', and vent-passage *f'*, the whole being constructed and connected so as to operate substantially as described.

3. The chamber *c* and jets *a a*, the tube A, having a funnel-shaped mouth, B, with strainer-bars *b b*, tube E, having end tube F, provided with a hood, F', so secured as to leave a vent-passage, *f'*, the whole being combined and arranged to operate substantially as described.

140,018.—*Registering Steam-Gage.*—GEORGE H. CROSBY, East Somerville, Mass. Application filed February 11, 1873.

A transmitting-lever linked to the opposite extremities of a double Bourdon pressure-tube, and operating the usual gage index, is connected by an adjustable link to a registering-lever which by acting on a ratchet-wheel indicates the number of excesses over a prescribed limit of pressure. The dial-cover of the gage and the handle of the steam-cock are secured together by a padlock passing through an eye in each.

Claim.—1. In a steam-gage, substantially such as described, the combination, with the transmitting-lever, which communicates motion to the pressure-indicating mechanism, of a registering-lever, operating in conjunction with the ratchet-wheel of the registering-index, as set forth, and connected with the transmitting-lever by a divided connecting-rod jointed to said levers, and having its two parts united by a screw-threaded coupling-sleeve, by means of which the working-length of the said rod can be increased and lessened at pleasure, substantially as and for the purposes specified.

2. The herein-described mode of locking together the steam-cock and body and removable top of a steam-gage by means of an eye-bolt, *p*, or its equivalent, passing through and binding together the top and body of the case, and arranged so that its eye will be opposite to and in coincidence with a corresponding eye or hole in the handle of the steam-cock, to permit the passage through both bolt and handle of the tongue or loop of the lock, by which they are bound together, as set forth.

140,019.—*Ice-Crusher.*—MICHAEL J. DIXON, New York, and WILLIAM TUNSTILL, Brooklyn, E. D., N. Y. Application filed May 20, 1873.

As ice falls from an inclined chute supported on a jaw bolted to horizontal bars and made adjustable by projections on its lower end fitting into a rack-bar, it strikes a cutter on the swinging jaw and falls into the hopper. The swinging jaw is operated by rods connected with a crank, and rods leading from this crank push forward a plunger, which moves the crushed ice from under the hopper.

Claim.—1. The jaw *a* supported at its lower edges by the rack-bars *d*, and connected to the sides *b* by bolts, as set forth.

2. The arrangement of the connecting-rods *g g*, cranks *h h*, shaft *f*, and swinging jaw *e*, in combination with the stationary jaw *a*, between the plates *b b*, as and for the purposes set forth.

3. The delivery-plunger *r* moving horizontally, or nearly so, beneath and in combination with the ice-crushing jaws *a e*, substantially as set forth.

4. The splitting-blades or projections *t'*, in combination with the supply-chute *t*, and ice-crushing jaws *a* and *e*, substantially as and for the purposes set forth.

140,020.—*Plug and Bunch Tobacco.*—ISAAC EPPINGER, New York, N. Y. Application filed May 2^3, 1873.

The filler is treated with licorice or other sweetening substance, in the usual manner, then formed into a rope or strand enveloped in a binder, after which a bright wrapper, leaf, in its natural condition, is wrapped around the whole; then the end is made a central core around which a coil is made; and the whole is finally subjected to pressure.

Claim.—Plug or bunch tobacco made as herein described, the same consisting of a rope or strand composed of a sweetened or prepared filler inclosed in a binder, in turn enveloped in a wrapper, the said rope being coiled around a central core forming a continuous part of the rope, and the bunch thus made being subjected to a pressure, as and for the purposes set forth.

140,021.—*Dynamic-Machine.*—LOUIS CHARLES ERRANI and RICHARD ANDERS, Liege, Belgium. Application filed August 1, 1872.

Oil is sprayed into the cylinder behind the piston, and being mixed with air, is ignited at the proper point by an electric device; the consequent expansion drives the piston forward, the momentum of the fly-wheel returning it to its first position. An ejector supplies the oil from the tank to the sprayer, the ejector being connected to a piston-blower driven by a crank attached to the main shaft.

Claim.—1. The combination, with the cylinder A and piston B, of the spraying device M, for producing motive power by or from any suitable hydrocarbon liquid, sprayed within the cylinder, and mixed with air, and subsequently ignited within the cylinder.

2. The combination of the electric igniter P, with the spraying device M, the piston B, and cylinder A of the motor, substantially as specified.

3. The blower K, in combination with the spraying device M, the tank N, the piston B, and the cylinder A, essentially as described.

4. The tank N, in combination with the wind-chamber *s*, and fluid-tube *f*, of the spraying device M, the piston B, the cylinder A, and the blower K, substantially as specified.

140,022.—*Apparatus for Drawing Oil from Casks.*—JOHN G. EVENDEN, Chicago, Ill., assignor to himself and F. CORTEZ WILSON, same place. Application filed May 22, 1873.

An air-tight jacket is placed around the pump-cylinder, which has an opening between the plunger and valve to admit oil into the air-chamber. An escape-pipe in the upper part of the pump-cylinder connects with a tube, (open at the top,) for carrying the oil that gets above the plunger back into the tank.

Claim.—1. In a hand-pump for liquid-vessels, the combination of a pump-cylinder with an air-chamber surrounding the cylinder, substantially as and for the purpose described.

2. In a hand-pump for liquid-vessels, the combination of a pump-cylinder, an air-chamber, and a drip-tube extending from the upper end of the cylinder down below the point where the pump passes through the head of the tank or vessel, substantially as described, for the purpose specified.

3. In a hand-pump for liquid-vessels, a combined air-vent and drip-tube, substantially as described, for the purpose specified.

4. The combination of a tapering jacket, C, with a pump-cylinder, A, extending longitudinally through the jacket, substantially as and for the purpose specified.

5. The combination of the pump-cylinder A, the tapering jacket C surrounding the cylinder, the discharge-spout D, the drip-tube and air-vent *m n*, and the plunger, valve, and opening from the cylinder into the air-chamber, substantially as described, for the purpose specified.

140,023.—*Bridle-Bit.*—JULES M. FABRE, Bordeaux, France. Application filed April 4, 1873.

The oscillation of the mouth-piece allows it to lie flat upon the tongue of the animal when the rein is strained, thus avoiding the infliction of unnecessary pain.

Claim.—A bridle-bit, the mouth-piece of which has an oscillating motion, independent of and within the side bars, which have stops confining said oscillating motion of the mouth-piece within certain limits, substantially as shown and described.

140,024.—*Cotton-Bale Tie.*—WILLIAM D. FIELD, Providence, R. I. Application filed May 14, 1873.

Claim.—1. A bale-tie composed of two hook-pieces, A A, pivoted together and arranged relatively to each other, substantially as described.

2. A bale-tie composed of the hook-piece A pivoted to a slotted link-piece, E, substantially as described.

140,025.—*Dumping-Cart.*—BENJAMIN G. FITZHUGH, Frederick, Md., assignor to JACOB BYERS, same place. Application filed October 5, 1872.

A lever is attached to the forward part of the body, the forward part of the lever extending forward parallel with the shafts; the lever being raised materially assists in dumping the cart, when the body assumes a horizontal position; the weight of the lever locks the body to the shafts; the end-board, either alone or combined with a section of the bottom of the body, is so hinged that it completes dumping as the body is being turned back to place.

Claim.—1. A lever at the front end of the cart extending forward therefrom, and arranged to operate upon a stop thereon, to dump the body by raising and pushing it back upon its hinges, and to bring it again in position by pulling upon said lever, substantially as herein described.

2. The lever A and its catch, H, operated by the weight of said lever, to automatically lock itself with the shafts, as described.

3. The combination, with the body and shafts of a cart, of the pivoted lever A, the stop F, and the catch H, arranged to operate as described.

4. The tail-board J pivoted to open when the body is about returning to its proper position upon the shaft, as set forth.

5. The tail-board constructed in one piece, or with a section of the bottom, and hinged or pivoted to swing or tilt independent of the body, to dump the load, substantially as described.

140,026.—*Fastener for Sashes and Doors.*—JOSIAH B. FROST, Jackson, Mich. Application filed April 5, 1873.

A two-part circular case is formed with projecting points upon the under side to mark the centers of the circles, and a strengthening flange or rim. A bolt and a spiral spring are placed within the case, being held in position by a face-plate, this construction making a simple form of spring-bolt or fastener, which is very readily attached to a sash or door.

Claim.—The sash and door fastener herein described, consisting of the two-part circular case A A with the flange N and points P P on the under side, and the face-plate F inclosing the bolt B and spiral spring, all substantially as and for the purpose shown and described.

140,027.—*Spittoon.*—FREDERICK GAISBERG, New York, N. Y. Application filed May 14, 1873.

The receptacle is inclosed in a low box with a hinged lid, which is lifted by pressing on a knob at the upper extremity of a rod inclosed in a tubular standard of the case. This rod is connected to the lid through a link and bent lever-arm, and these parts are inclosed in a hollow bracket that supports the tubular standard.

Claim.—A spittoon, consisting of, first, a box or hollow base, A, with lid B, a tubular standard, C, and a hollow bracket or console, D, constituting an ornamental case; second, a removable pan, E; and, third, a rod, F, with knob *w*, a link, G, and a bent lever-arm, H, attached to the hinge-edge of the lid, constituting means for operating the same, constructed and arranged substantially as herein described, for the purposes set forth.

140,028.—*Frame and Stock for Revolving Fire-Arms.*—CHARLES FRANCOIS GALAND, Paris, France. Application filed January 9, 1873.

Claim.—1. The plate G hinged to the frame forward of the trigger and covering the mechanism of the lock, combined with the stock L covering the spring, the said stock attached to the frame so as to secure the plate G, all substantially as set forth.

2. The screws T U, combined with their respective springs F S, for the purpose of securing and adjusting the said springs, substantially as set forth.

140,029.—*Vapor-Burner.*—MOSES F. GALE, New York, N. Y. Application filed March 10, 1873.

The retort, containing fragments of carbon, is surrounded by the flame-ring. Oil enters at top, and the resulting gases are forced down through tubes to the regulating-chamber, and thence to the jet-aperture.

Claim.—The combination of the retort A, tubes B B', regulating-valve G, reservoir C, all co-operating as described, and for the purposes set forth.

140,030.—*Vapor-Burner.*—MOSES F. GALE, New York, N. Y. Application filed July 24, 1872.

The inlet tube enters the vaporizing-chamber above the flame-openings. An interior tube conveys the gas to the regulating-chamber. The several chambers are separated by metallic disks or diaphragms.

Claim.—The tube A provided with the tube G, vaporizing-chamber E, perforated diaphragm F, chamber H, valve K, and inlet-pipe C, all constructed and arranged substantially as and for the purpose described.

140,031.—*Corn-Planter.*—THOMAS A. GALT and GEORGE S. TRACY, Sterling, Ill. Application filed September 23, 1872.

The frame of the machine is rectangular. The after part is supported upon a covering-wheel, while the forward end is supported upon a pair of wheels having a crank-axletree with provisions for adjustment. The seed-box is mounted upon the forward end of the frame, and the seed-valve is worked by a cam upon the axletree of the covering-wheel.

Claim.—The combination of the slide E', slotted rod H, cam-wheel I, upright lever i, and bracket h, pivoted to the middle portion of the rod H, substantially as and for the purpose set forth.

140,032.—*Head-Block for Saw-Mills.*—GEORGE B. GETTY, Bloomsburg, Pa., assignor to himself, ELIAS MENDENHALL, and ELI BARTON, same place. Application filed February 7, 1873.

The log is moved upon the head-blocks by knees, which are operated by pawls attached to a hanging lever, and this lever, by an inclined plane, secured to the floor of the mill.

Claim.—1. The stirrup G provided with the arm d and carrying the pawls f, which latter are adjustable in said stirrup to enable the board to be sawed any desired thickness, in combination with the inclined floor-irons h and rack-bar D, substantially as and for the purposes herein set forth.

2. In combination with the stirrup G and pawls f, the springs a, e, and i, substantially as and for the purposes herein set forth.

3. The combination of the rack-bar D with standard C, stirrup G with flanges b, and arm d, pawls f, springs a, e, and i, crank-shaft J, and irons h, all constructed and arranged to operate automatically, substantially as and for the purposes herein set forth.

140,033.—*Press.*—JOSHUA B. GODWIN, Washington, N. C. Application filed September 16, 1872.

Claim.—The double toggle-levers G G G G pivoted, respectively, to the platen E and the end frame A, and to an intermediate draft-block, b, for operation by the vibrating-lever I through chains or ropes H K, all arranged and combined substantially as shown and described.

140,034.—*Gas-Purifier.*—JAMES T. GOODFELLOW and FREDERICK A. SABBATON, Troy, N. Y. Application filed May 1, 1873.

The lime or other purifying material is placed on a series of endless aprons in a closed case, which is provided with devices for transferring the material in at the top and out at the bottom.

Claim.—1. A gas-purifier, having therein an endless screen, or two or more such screens, upon which the purifying material is supported in the form of a sheet-like layer or layers through which the gas is compelled to pass, and from which endless screen or screens the spent material is discharged by turning said screen or screens substantially as herein described.

2. The combination of a gas-purifier having therein one or more endless screen or screens, and a hopper or magazine from which the purifying material is delivered in a layer or layers upon the said screen or screens by turning the latter, substantially as described.

3. The combination of a gas-purifier having therein one or more endless screen or screens, a magazine or hopper for the fresh purifying material, and the gage J, or its equivalent, as herein described.

4. In combination with one or more rotary endless screen or screens in a gas purifier, the gas-intercepting guard or guards K arranged on the casing of the purifier and against the sheet-like layer or layers of purifying material on said endless screen or screens, as herein described.

5. In combination with two or more endless purifying-screens, mounted one over another, and simultaneously turned in opposite directions, in a gas-purifier, substantially as described, the deflecting gas-guard or guards L, arranged on the casing of the purifier, and between the discharging and receiving ends of adjacent screens, as herein set forth.

6. In combination with two or more simultaneously-turning screens, which deliver the purifying material from one screen to the other, in a gas-purifier, substantially as described, the gage or gages M arranged over and adjacent to the receiving place or places of said endless screen or screens, as set forth.

7. The combination of the clearing lag or lags N with the endless purifying screen or screens F, in a gas-purifier having a bottom, b, or guard or guards K, arranged, in respect to said endless screen or screens, as herein described.

8. A gas-purifier, in which the lime or other purifying material is supported on one or more endless screen or screens, in which the apertures are automatically enlarged and contracted in or by turning of said endless screen or screens, substantially as herein set forth.

9. A rotary endless gas-purifying screen having transverse rods e secured together by links f and intermediate rods g held loosely in and by said links f, and intermediate rods g held loosely in and by said links, substantially as herein described.

10. The combination of a gas-purifier, through which the purifying material is passed upon one or more turning endless screen or screens, a closed receptacle, R, which receives the spent material discharged from said screen or screens, and a closed hopper or magazine, I, which delivers the fresh material to the said screen or screens, substantially as described.

11. In combination with a gas-purifier having therein one or more endless turning purifying screen or screens, a hopper or magazine, I, furnished with a removable cover made gas-tight by a hydraulic seal, and with or without a cut-off valve, U, at the lower part of the magazine or hopper, as described.

12. In combination with a gas-purifier, from which the spent purifying material is discharged automatically, substantially as described, the valve V and discharge passage or receptacle R, having an opening in the bottom, with or without a valve therein, and furnished with a removable vessel or cover, S or S', connected with said passage or receptacle by a hydraulic seal, substantially as described

13. In combination with a gas-purifier having an elevated downward-discharge passage, surrounded by a dip-flange, k, a removable vessel, S, with or without carrying-wheels thereon, and having a surrounding water-trough, T, arranged so as to receive and seal the said dip-flange k, and the flange of a removable cup-like cover, which will fit over the said vessel upon removing the latter from the said discharge-passage, substantially as set forth.

14. A gas-purifier, in which the purifying material is supported in the form of sheet-like layers on screens with an intervening space or spaces, through which succession of alternate layers and spaces the gas is passed, and in which purifier the purifying material is introduced, changed in the layers therein, and discharged from the purifier, without either stopping the flow of gas through the purifier or interrupting the purifying action of the latter, or material loss of gas therefrom, by means substantially as herein described, or any equivalent therefor.

140,035.—*Machinery for Bending the Edges of Boot and Shoe Soles.*—BENJAMIN H. HADLY, Brooklyn, N. Y. Application filed June 7, 1873.

The upper or feed roll has a vertical flange, between which and the lower roll the edge of the sole is bent. The lower edge-bending roll immediately beneath the upper roll is beveled off from the center and fixed to a shaft, which revolves in bearings in an auxiliary frame. The main frame is forked or recessed to receive the auxiliary frame, its rear portion being pivoted to the main frame, while the front is supported by spring-power, thus providing a yielding bearing to accommodate for varying thicknesses of stock.

Claim.—1. A machine for bending or molding the edges of boots and shoe soles preparatory to the welt or upper being sewed onto them, consisting essentially of the following elements combined: First, a feed-roll, flanged or otherwise formed so as to present two faces at an angle with each other, against which the sole is bent, substantially as shown and set forth; and, secondly, a bending-roll, shaped, located, and actuated so as to press with equal, but yielding, pressure against both faces or angles of the feed-rolls, substantially as set forth.

2. The combination of the flanged feed-roll revolving in fixed or stationary bearings, with the bending-roll having its bearings in a frame or support pressed toward said flanged roll with spring pressure, and capable of an up and down vibratory movement upon a pivot or axis, to allow the said roll to move toward or away from both the body and the flange of the other roll, in order to automatically adjust itself to varying thicknesses of leather, substantially as shown and described.

3. The combination, with the vibratory auxiliary frame, and the bending-roll carried by the same, of the inclined roll-shaft, having its bearings in said frame, and the horizontal driving-shaft for said roll-shaft supported at one end by the said vibratory frame, and at the other end in a rocking bearing in the main frame, in which it can slide, as and for the purposes shown and set forth.

4. The combination, with the flanged feed-roll and bending-roll, of the adjustable edge-guide, arranged to operate in connection with said rolls, substantially as shown and set forth.

5. The combination, with the vibratory auxiliary frame, of the linked screw-rod, adjusting-nut, and spring held between said nut and the base of the frame, substantially as herein shown and set forth.

6. In combination with the vibratory auxiliary frame and linked screw-rod, the adjusting nut, spring, and sleeve intermediate between said spring and screw, substantially as shown and described.

140,036.—*Animal-Trap.*—JOSEPH H. HAIR, Galesburg, Ill. Application filed April 23, 1873.

A cage-trap reset by the prisoner, and the outer falling door of which is armed at the lower edge with inwardly-projecting points.

Claim.—1. The sliding gate C, when provided with inwardly-inclined points c, substantially as and for the purpose set forth.

2. The combination of the gate C with the lug c', platform D, bait pin or hook F, and lever D' with spring d', substantially as set forth.

3. The combination and arrangement of the gate C, bait-lever E, rod e, and spring-lever D' d', substantially as set forth.

4. The sliding gate C, platform D, spring-lever D' d', bait-pin F, swinging gate G, chain H, lever I, and link i', all combined and arranged substantially as and for the purpose set forth.

5. The sliding gate C, bait-lever E, connecting-rod e, lever D d', gate G, chain H, lever I, and link i', combined and arranged substantially as and for the purpose set forth.

140,037.—*Washing-Machine.*—SAMUEL HAWKINS, Chillicothe, Mo. Application filed April 7, 1873.

Is constructed with its box or tub in ordinary form with a metallic bottom, and an elastic concave rubber secured to the box by flexible straps, one end of which is attached to a windlass having a crank to give it tension. At its center is a corrugated cylinder, its shaft extending through the sides, and having a bearing in two uprights secured by buttons, with openings for the journals out of their center, which may be reversed to increase or diminish its distance from the flexible rubber. On the journals of the rubber are loose disks, by which the clothes are kept within the length of the rubber.

Claim.—1. The combination of the suds-box, rubbing-cylinder, loose disks or washers D D', flexible concave E, and windlass E' E² E³, all arranged and operating substantially as specified.

2. The rubbing-cylinder B B¹, suds-box A having elongated vertical slots b', and reversible supporting-bars C, the bearings in which are nearer to one end than to the other, substantially as and for the purpose specified.

3. The suds-box and rubbing-cylinder, in combination with the loose disks or washers D D', substantially as and for the purpose specified.

140,038.—*Last-Block Fastening.*—JOHN A. HECKENBACH and ANTON HAERTLE, Mayville, Wis. Application filed March 28, 1873.

A hook is attached to the bolt instead of making a hole through it. The plate D and socket d are one piece.

Claim.—The plate D having socket d, the bolt C having hook e, and the loose spring combined and applied in the upper section of a last, as shown and described.

140,039.—*Hand-Car.*—JAMES D. HINCKLEY, Adrian, Mich. Application filed April 8, 1873.

Peculiarity of construction affording great strength.

Claim.—1. A hand-car gallows-frame, constructed of two bent wooden arches, B, connected together by girts a, substantially as described and shown.

2. The combination, with the bent wooden arches B B, of the plummer-beams C C, secured thereto and to the sills of the car by the rods D, substantially as and for the purpose set forth.

140,040.—*Tanning Compound.*—JOHN B. HITZ, Guyandotte, W. Va. Application filed March 7, 1873.

The two compounds are added to the bark-liquor in given quantities during the tanning process. No. 1, japonica gum, salt, saltpeter, Epsom salts, alum, and sulphuric acid. No. 2, flour of sulphur, borax. Each dissolved in a given quantity of hot water.

Claim.—1. The compound No. 1 formed of the ingredients specified, and in about the proportions set forth.

2. The compound No. 2 formed of the ingredients specified, and in about the definite proportion set forth.

140,041.—*Shuttle for Sewing-Machines.*—WILLIAM HOCKENSMITH, Bridgeport, Conn. Application filed May 28, 1873.

When the screw is turned, the auxiliary lever is caused to bear with more or less force against the tension-bar, and a more equal tension is obtained than when the tension-lever is adjusted by a screw only at its end.

Claim.—In combination, with the tension-bar a within the shuttle-case, and extending into the recess C, the auxiliary lever D and adjusting-screw b, whereby the adjustment of the bar a is made through the said auxiliary lever D.

140,042.—*Soldering-Tool.*—ROBERT J. HOLLINGSWORTH, deceased, Baltimore, Md., assignor through himself and his administratrix, to LOUIS MCMURRAY, of same place. Application filed May 2, 1872.

Claim.—1. The formation in the soldering-block of one or more lateral openings for the escape of the steam or gas that may accumulate within the block during the soldering operation, substantially as shown and set forth.

2. In combination with a soldering-block formed with one or more lateral openings, as described, a cap-presser arranged to play up and down within the block, and provided with one or more holes for the passage of the steam or gas, during the soldering operation, from below the presser into the chamber above, substantially as shown and set forth.

140,043.—*Combined Roller and Irrigator.*—DEAN S. HOWARD, Drury's Bluff, Va. Application filed April 30, 1873.

A tight hollow roller is mounted upon hollow journals through which water or liquid manure is introduced at one end. A pump receives motion from the rotation of roller upon the ground.

Claim.—A roller irrigator, constructed and operated substantially as recited.

140,044.—*Cooking-Stove.*—JAMES R. HYDE, Troy, N. Y. Application filed April 3, 1873.

Improvement on his patent of March 11, 1873, in that the air-chamber entirely surrounds the fire-pot.

Claim.—1. The combination, in a reservoir cooking-stove, of an air-chamber surrounding the fire-box, a cold-air duct leading into the same, and a flue or flues leading from the chamber and conveying heated air directly under the reservoir.

2. The flue f, in the bottom plate G, extended in width at the front end, and contracted toward the rear, as and for the purposes specified.

3. The flue h, in the back plate H, made in elliptical shape, as and for the purposes specified.

140,045.—*Suspender.*—THOMAS J. IRVING, Baltimore, Md. Application filed February 27, 1873.

Claim.—The suspender herein described, constructed with non-elastic removable body A, elastic straps B B', slide C, and fastening-button a, or the equivalent of said button, substantially as and for the purposes specified.

140,046.—*Seed-Planter and Fertilizer Distributer.*—EZEKIEL P. JONES, Greensborough, N. C. Application filed March 22, 1873.

Two bearing-wheels support a disk-like seed-receptacle, the central portion of the wheels forming the ends of the disk. A diaphragm divides the receptacle into two parts, and circumferential band has suitable openings for the discharge of seed. Segmental brushes in front and rear of the wheel prevent the seed from falling at the wrong time. A hinged harrow covers the seed.

Claim.—1. A revolving seed-holder or distributing-drum, composed of two sections or shells attached to annular supporting rims and spokes, as and for the purpose specified.

2. A revolving seed-holder provided with a detachable partition, V', dividing the drum into two compartments, substantially as described, for the purpose set forth.

3. The segmental brushes B' B' arranged on the shields A' A', and brackets C' C', for operating in connection with a belt interposed between the two sections of the cone-cylinder I, substantially as and for the purpose specified.

4. The seed-drum, provided with solid heads, combined with the spokes and fellies of the traction-wheels, as and for the purpose specified.

140,047.—*Chair Fan Attachment.*—BENJAMIN L. JORDAN, Mercersburg, Pa. Application filed April 12, 1873.

A fan attachment to be applied to any ordinary chair, and operated by a treadle under the feet of the occupant of the chair.

Claim.—1. In combination with an ordinary chair, the removable base-board A, bearing a treadle, E', and operative mechanism to convey motion from said treadle to a vibrating arm, M, which bears a brush or fan, substantially as set forth.

2. The combination and arrangement of the base-board A, arms B B, slot a, and screw-hook D, as set forth, for convenient attachment of said board to the front and back rungs of a chair.

3. The treadle E', bell-crank F, and rock-shaft H, with their connecting-rods, combined with shaft J and arm M, as and for the purpose set forth.

140,048.—*Loose Pulley.*—LUTHER KNIGHT, Salem, N. Y., assignor of one-half his right to JOHN H. THOMAS and ARTHUR WHITLOCK, of same place. Application filed April 12, 1873.

The oil-chamber is in the center of the hub, and wholly surrounds the bushing. The oil is communicated to the shaft forming the bearing of the pulley through a tube filled with cotton-waste, by the revolutions of the said shaft.

Claim.—In a self-oiling loose pulley, the combination of oil chamber or reservoir, bushing, and tube, constructed as and for the purposes aforesaid, substantially as described herein.

140,049.—*Neck-Tie Supporter.*—ALBERT KOMP, New York, N. Y. Application filed May 15, 1873.

The hook for attaching the shield to the collar-band slides in a friction-guide upon the shield, making the shield adjustable in different positions.

Claim.—In combination with a neck-tie shield, the metal guide a and sliding hook b, substantially as and for the purpose described.

140,050.—*Fiber-Cleaning Machine.*—SALEM T. LAMB, Boston, Mass. Application filed March 24, 1873.

An improvement on the patent to W. B. Shedd, April 30, 1872, No. 126,337, consisting of, first, a transverse perforated water-tube in advance of the crushing-rollers, sprinkling the material as it is fed in; secondly, a hollow perforated cylinder parallel with the upper crushing-roller having projecting wings to act as scrapers upon a concave and yielding bed-plate beneath, upon which the material is carried to a pair of drawing-rollers, which deliver it upon the table; and, thirdly, a sprinkling-cylinder revolving in rear of the pressing-rollers having projecting wings, which act upon the upper pressing roller, and which are in turn acted upon by a stationary doctor.

Claim.—1. In machinery for cleaning fibers, a rotary scraper drum or hollow cylinder, having reticulated or foraminous walls to permit the escape of water introduced into said drum from a suitable source and under suitable pressure, substantially as and for the purposes shown and set forth.

2. In combination with the crushing-rollers and draft-rollers, the intermediate foraminous rotary scraper-drum for discharging water upon the material passing through the machine, and for operating upon the material passing between it and the bed below, substantially as set forth.

3. The combination with the draft-rolls H H' and bed *a* of the rotary cylinder N with blades *i*, under the arrangement as shown and set forth.

4. The combination, with the crushing-rollers, the intermediate foraminous rotary scraper-drum, and the draft-rollers, of the perforated drum N with arms or blades *i*, the said drums being designed to discharge water upon the material, and to operate substantially as shown and set forth.

5. The combination, with draft-rollers H H', bed *a*, and perforated drum N having arms or blades *i*, of the doctor or scraper O, substantially as herein shown and described.

6. In machinery for cleaning fibers, the combination, with the crushing-rolls and draft-rolls, of an intermediate perforated rotary scraper-drum discharging water upon the material between the two sets of rolls and operating upon the said material, as described, and a water-pipe placed in advance of the crushing-rolls to discharge water upon the material as it enters the machine, substantially as shown and set forth.

140,051.—*Manufacturing Crystalline Acid Phosphate of Lime for Yeast-Powder.*—JOHN E. LAUER, New York, N. Y. Application filed February 13, 1872.

The manufacture of crystalline acid phosphate of lime, by treating bone black first with sulphuric acid and afterward with muriatic acid.

Claim.—The manufacture of crystalline acid phosphate of lime, substantially as herein described—that is to say, by treating bone black first with sulphuric acid and afterward with muriatic acid—in the manner and for the purpose set forth.

140,052.—*Street-Railway Car.*—SAMUEL H. LITTLE, Rosemond, Ill. Application filed January 29, 1872.

The rear door is supported upon rollers, which travel upon a track arranged beneath the floor of the car. The door is operated from the front of the car by means of cord and pulleys.

Claim.—1. In a street-railway car, the combination of the sliding door F, bracket *f*, roller-frame G, rollers H, and rail *i* beneath the floor, all substantially as and for the purposes set forth.

2. The combination of the door F with the track *i* beneath the floor; the cord M, pulleys N N', drum O, and pulleys P P', all arranged substantially as described.

140,053.—*Plow.*—PETER LOEB, Dayton, Ohio, assignor of one-half his right to DAYTON MALLEABLE-IRON COMPANY, same place. Application filed May 10, 1873.

The standard is hollow, elliptical in cross-section, and provided with one or more internal strengthening plates. Upon its external lower portion there are formed seats for the land-side, share, and mold-board.

Claim.—1. The plow-standard constructed of the elliptical tube, as shown, and having opening B; boss b^1, and swell a^1, said standard changing gradually in its lower portion to an angular shape, and forming the mold-board wing A', and the recess a^2 for the land-side, substantially as specified.

2. The tubular plow-standard having one or more interior vertical cross-braces, B, substantially as set forth.

140,054.—*Pedestal for Stools and Tables.*—JOHN R. LOMAS, New Haven, Conn., assignor to BERNARD SHONINGER, same place. Application filed May 23, 1873.

The several parts of the pedestal are united each to the other by means of ribs on one part and a corresponding groove on the other part.

Claim.—A pedestal for stools, tables, and like articles formed from several parts united each to the other, by means of ribs on one part and a corresponding groove on the other part, substantially as set forth.

140,055.—*Spirit-Level.*—FRANK W. MARSTON, Philadelphia, Pa., assignor to JOAB MOSES, same place. Application filed March 5, 1873.

Two bubble-vials are permanently secured together at right angles, and attached to the frame or stock by a pivot at the angle. A screw at the extremity of the longer tube-case serves for the adjustment of both in the stock.

Claim.—1. A spirit-level in which the two tubes are adjusted at right angles to each other in the same frame, separable from the block, as and for the purpose set forth.

2. The tubes D D', secured at right angles to each other to a frame, B, and simultaneously adjustable by a screw, A, as set forth.

140,056.—*Device for Regulating the Twist in Spinning-Frames.*—CELESTIN MARTIN, Verviers, Belgium. Application filed April 4, 1873.

Under each arm is a swinging weighted regulator which keeps the yarn clear of a friction or holding surface or device when the proper twist is being given. When the yarn is twisted too hard it assumes a straight line, swinging the regulator on its pivot and coming in contact with the friction device, so that the twist is thereby stopped or moderated between such surface or device and the back rolls. When the proper twist is restored the regulator returns to place of itself ready to repeat the operation when necessary.

Claim.—The arrangement, on a spinning-machine, of a self-acting regulator, acting on each individual thread, substantially as and for the purpose herein shown and described.

140,057.—*Brake Reaction Movement.*—HORACE B. MARTIN, San Francisco, Cal. Application filed October 1, 1872.

Within the main driving-pulley are arranged two small beveled wheels which mesh into the two large beveled disks, arranged on the main shaft upon opposite sides of the main driving-pulley in such a manner that when the speed of one of the disks is retarded the speed of the other will be correspondingly increased.

Claim.—The brake reaction movement, substantially as described, consisting of wheel *b* with the contained transverse wheels *c c*, disks *d* d^2, wheels *e* and *f*, and brake *h*, as and for the purposes specified.

140,058.—*Nose-Bag for Horses.*—HUGH D. MCGOVERN, Brooklyn, N. Y. Application filed January 16, 1873.

The bottom of the bag is adjusted in height by the weight of the oats acting against a spiral spring within the bag.

Claim.—A nose-bag for horses having a spring, D, arranged within it, substantially as shown, for operating upon the bottom by crimping the lower end of the bag, as herein set forth, for the purpose specified.

140,059.—*Sewer-Cleaning Truck.*—WILLIAM S. MCHARG and ALBERT B. HILL, New Haven, Conn. Application filed May 28, 1873.

The sides of the frame are connected by bars and support buckets having flanges on their sides. The truck is supported on two or on three wheels—one at each end, or two at one end and one at the other. When but two wheels are used an adjustable roll is placed on each side of the frame to support it laterally.

Claim.—1. The truck herein described for transporting sediment in sewers, consisting of the frame A, cross-bars B, and supporting-wheel G, and with or without the lateral rolls E.

2. The buckets P provided with side flanges *a* to support the bucket in the truck, substantially as set forth.

140,060.—*Machine for Making Boot and Shoe Heels.*—ALEXANDER C. MCKNIGHT, Philadelphia, Pa. Application filed November 13, 1872.

From the periphery of a wheel cutting-dies of different sizes project, which, by the revolution of the wheel, are, in regular succession, forced down upon the stock, cutting the lifts, and then conveying them to a receiver, where they are temporarily secured together by nail-driving mechanism.

Claim.—1. A wheel or cylinder provided on the circumference with a series of lift-cutting dies, as arranged, and operating so as to have imparted to it a vertical, reciprocating, and intermittent rotary motion, substantially as and for the purpose herein shown and described.

2. The combination, with the die-wheel or cylinder C, of the plates or bars B and B^1, eccentric D, shaft E, ratchet-wheel S, with its arms N, N^1, N^2, and N^3, pawl P, stop P^2, pulleys J and K, and belt L, all arranged and operating substantially as and for the purpose herein shown and described.

3. In combination with the cutting-dies F, F^1, F^2, and F^3 of the die-wheel or cylinder, the radially-moving plungers G, and springs H, or their equivalents, for forcing the lifts out of the dies, as herein shown and described.

4. The combination, with each die, of a pointed rod or awl *j*, arranged and operating to punch a nail-hole simultaneous with the cutting of the lift, as herein shown and described.

5. The combination, with the plungers G, pins *l*, and springs H, of the disk I, provided with a cam-guide, *k*, for compressing the spring and producing a backward radial movement of the plungers, previous to discharging the lifts into the receiver, substantially as herein shown and described.

6. In combination with the mechanism for cutting the lifts of a receiver, Q, arranged to admit the lifts for the purpose of stacking or piling them together, substantially as herein shown and described.

7. The combination, in the receiver Q, of the adjustable blocks *o*, o^1, and o^2, operating to adapt it for various sizes of heel-blanks, substantially as herein shown and described.

8. The combination of the curved arm M and sliding plate R with the receiver Q, arranged and operating in the manner and for the purpose substantially as herein shown and described.

9. The combination of the nail carrying-plate V, provided with a lever, W, and spring r^1, with the nail-driving slide T, provided with the rods *p* and *q*, and spring *r*, arranged and operating substantially as herein shown and described.

10. The combination of the nail-driving slide T, rods *p* and *q*, spring *r*, studs X and *s*, cam *t*, disk U, upright shaft *y*, gear-wheel Y, sliding plates B^2 and B^3, eccentric D', and driving-shaft E, all arranged and operating substantially in the manner and for the purpose described.

11. In combination with the driving-slide T, the nail-carrying plate V, lever W, with its flexible finger or projection *w*, stud *v*, and spring *r*, all arranged and operating substantially in the manner and for the purpose described.

12. The combination of the vertical plate or bar B^3, presser-foot *p'*, eccentric D, and plate or bar B^2, arranged and operating in the manner and for the purpose herein shown and described.

13. The combination, in a machine for forming heels for boots and shoes, of a die-wheel cylinder, or its equivalent, having a vertical reciprocating and intermittent rotary movement imparted to it, a receiver in which the lifts are projected from the wheel and assembled, and a nail-driving mechanism for securing the lifts temporarily together.

140,061.—*Shoulder-Strap.*—JAMES C. MERRITT, West Point, N. Y., assignor to himself and JOSEPH J. WALTON, Newark, N. J. Application filed October 22, 1872.

A flat thumb-screw engages with the epaulet through an interposed washer which clamps the cloth of the coat against slight points projecting from the under side of the epaulet-plate.

Claim.—The nut *b* and pins *c* upon the plate or frame of a shoulder-strap or shoulder-knot, in combination with the washer *i* and screw *e*, as and for the purposes set forth.

140,062.—*Street-Lamp.*—JACOB G. MINER, Morrisania, N. Y. Application filed July 30, 1872.

Claim.—The flanged cylinder or globe E *e*, supported in the ring or frame C by means of the movable segments G^1 G^2 G^3, all combined and arranged for joint operation substantially as herein set forth.

140,063.—*Lifting-Jack.*—DANIEL L. H. MITCHELL, Forest, Miss. Application filed May 14, 1873.

The bed-plate having an arm for securing it to standard; spring which forces a pawl into a toothed bar; and a slot to receive a pin on the head which incloses the whole. Through this head passes an arbor having two ratchet-wheels—one meshing with a rack-bar, the other with an operating-lever.

Claim.—1. The bar or bed plate A, constructed as and for the purpose set forth.

2. The head E, with its gearing and ratchet-bars hinged to the bed-plate A, as and for the purpose set forth.

3. The combination of the bed-plate and its arm with standard C, as and for the purpose set forth.

140,064.—*Fastener for Shutters and Doors.*—DAVID J. MOFFITT, Thornton, Ind. Application filed May 17, 1873.

One or more sliding bolts, attached to a door or shutter, have one end bent into a peculiarly-shaped handle, while the other or free end is bent into a right angle to enable it to enter and engage with a peculiar staple, which is recessed by providing it with inwardly-projecting lips, this staple being attached to the door-frame or wall. By this construction the bolt serves to hold the door or shutter wide open, or, when closed, to bolt it securely.

Claim.—The door-holder, composed of one or more bolts, A A, having the hooks *a a* and handles *a' a'*, in combination with one or more recessed staples, B B *b*, substantially as shown and described.

140,065.—*Clock-Work Globe.*—LOUIS JEROME NAPOLEON MOURET, Paris, France. Application filed August 31, 1871.

The design of the invention is to make the globe represent the astronomical life of the earth, and to reproduce its various phenomena, positions, and phases; this is sought to be accomplished by a special construction and arrangement of mechanism for connecting and disconnecting the globe and its operative clock-work at will, and for accelerating and retarding the motions of the former. Means are also provided for poising the said globe so as to make its geometrical center coincide with its center of gravity.

Claim.—1. The mechanism employed for regulating the poise of the globe, consisting of the weights E E' E'' and screws *e f*, *e' f*, and *e'' f*, operating together as and for the purpose described.

2. The mechanism for rendering at will the movement of the globe dependent or independent of the movement of the pendulum, by means of the eccentric piece *c c' c''*.

140,066.—*Hound for Vehicles.*—ANDREW MÜHLEISEN, Ottawa, Ohio. Application filed May 19, 1873.

Perforation of the hound is avoided and firmness secured.

Claim.—The rear hounds for vehicles, bent from a single piece of timber, in combination with the metallic plate F having the socket G to receive the coupling-pin, substantially as herein shown and described, for the purpose specified.

140,067.—*Egg-Beater.*—DAVID MUNSON, Indianapolis, Ind. Application filed July 25, 1872.

A spoon beater with a series of upper and lower strips alternating with each other, the strips being perforated.

Claim.—1. The hand egg-beater, constructed of a series of upper and lower strips, alternating with each other to form a beater, essentially as described.

2. The strips of a hand egg-beater, perforated in the manner and for the purpose described.

140,068.—*Pressing Hosiery.*—OWEN OSBORNE, Philadelphia, Pa., assignor to THOMAS DOLAN & CO., same place. Application filed April 4, 1873.

A stocking of plain knitted fabric is made to have the appearance of a ribbed stocking by being pressed upon a grooved block.

Claim.—1. The within-described process of producing ribs upon hosiery of plain knitted fabric, by subjecting the same to pressure between heated dies when stretched upon a grooved and ribbed pressing-board.

2. The grooved and ribbed pressing-board, constructed as herein described for the purpose set forth.

140,069.—*Musical Wind Instrument.*—GEORGE E. PARKER, Newark, N. J., assignor to MOSES SLATER, New York, N. Y. Application filed April 9, 1873.

The head or cap of the valve-cylinder has a set-screw in its side, and, when the cap is in place, the neck of the screw fits into a slot in the edge of the cylinder. Tightening the screw then clamps cap and cylinder together.

Claim.—The combination, with the notched edge of the cylinder A, of the cover C, constructed as described, and the screw *s*, substantially as and for the purpose herein set forth.

140,070.—*Steam-Generator.*—HORACE PEASE, Dayton, Ohio. Application filed August 11, 1871.

By rotating the wrench-ring the crank-screws are turned so as to release the safety vent-plate, which may have been ruptured by over pressure of steam in boiler, and allow another to be replaced while the boiler is hot.

Claim.—In combination with a safety vent-plate, B, the crank-screws D and the wrench-ring E, substantially for the purpose set forth.

140,071.—*Adjustable Templet for Ships' Frames.*—ABRAM PERRIN, Marine City, Mich. Application filed January 21, 1873.

A bar-link chain, every second link of which carries a tapering metallic loop, disposed on alternate sides, through which loops are passed, two strips of sheet-metal, which are intended to conform to the contour of the vessel, said strip being held in relative position to the bar-links by wedges driven into the tapering loops.

Claim.—The adjustable templet for ships' frames, composed of the links A A' loops B, flexible strips C C', and wedges D, substantially as shown and set forth.

140,072.—*Can-Opener.*—CHARLES J. C. PETERSEN, Port Chester, N. Y. Application filed May 19, 1873.

A circular frame fits over the top of a can, and is held there by two projections upon one side, and by a sliding-bolt worked by a double handle upon the other. The lever carrying the cutting-blade is pivoted near a central point and rotated upon the head of the can. When the knife is not in use the lever is turned back and rested upon a projection formed upon the circular plate for that purpose. This may be operated without placing the hands upon the can.

Claim.—1. The body *a* having projections *b* constituting the clamping-ring, in combination with the sliding bolt *c* and compound handle *d g*, constructed and operated substantially as recited.

2. The combination of the projection *a* and lever *k* for protecting the knife when pressing for clamping the can.

140,073.—*Beer-Cooler.*—ANTHONY PFUND, New York, N. Y. Application filed June 6, 1873.

A metallic tank provided with man-holes, and having groups of tubes in a vertical, horizontal, or inclined position running through it, and a chamber below it, is placed in a vat. Water is conducted from a reservoir through pipes into the chamber and vat, and after circulating through the tubes and around the tank, is drawn off through pipes. A pipe is inserted in the bottom of the tank to draw the beer.

Claim.—1. The arrangement of a tank, A, in a vat, B, which is provided with a cold-water chamber, C, from which extend pipes *c* through the tank A, said tank being surrounded by an annular water-space *d*, substantially as herein shown and described.

2. The arrangement of the cooling-pipes *c*, which pass through the closed tank A in groups so situated that access can be had to all parts of the interior of the tank, substantially as set forth.

140,074.—*Lap-Board.*—GEORGE K. PROCTOR, Salem, Mass. Application filed March 26, 1873.

A lap-board having hinged and adjustable legs.

Claim.—1. The supporting-legs B, hinged to the lap-board and provided with adjusting devices, constructed substantially as described, for the adjustment of the lap-board, as set forth.

2. A lap-board having a drawer or box, I, substantially as and for the purpose specified.

140,075.—*Globe and Holder for Gas-Burners.*—GEORGE M. RAMSAY, New York, N. Y. Application filed May 2, 1873.

The globe has an expanded flame-chamber, a contracted throat at top, and contracted neck and expanded base at bottom. The supporters are formed of wires and attached to the gas-tube or lamp-post by a ferrule. The neck of the globe rests upon a coil of the wires, and the upper ends of the wires extend into the flame-chamber.

Claim.—1. The globe, constructed substantially as described, having expanded flame-chamber and base, and contracted throat and neck, as and for the purposes set forth.

2. The holder, consisting of the springs *b* and ferrule, or equivalent devices, arranged and adapted to operate substantially as and for the purposes set forth.

140,076.—*Elevator.*—WILLIAM R. RIGHTOR, Helena, Ark. Application filed April 30, 1873.

Two or more pairs or sets of vertical endless chains, to one pair or set of which platforms are rigidly attached by one edge, the opposite edge of the platforms being supported, when in horizontal position, by cleats carried by one or more of the other pairs or sets of chains.

Claim.—The combination of the endless chains A bearing the platforms I, and one or more endless chains B, moving simultaneously with chains A, and carrying supports K for the free edges of the platforms, substantially as set forth.

140,077.—*Coal Screen and Chute.*—MARTIN R. ROBERTS, San Francisco, Cal. Application filed April 26, 1873.

The screens, having different sized meshes, are arranged one above the other, and direct the coal to separate places. A metallic blank is placed upon the upper screen when it is desired to pass the coal without separating it.

Claim.—1. The receiving-hopper B B', in combination with the hopper C, with its screen or grating side D, chute F, with its toothed gate A, and one or more independent screens I, all combined and arranged substantially as and for the purpose above described.

2. The metal blank or false bottom K, in combination with the receiving-hopper B B', hopper C, chute F, and gate A, substantially as and for the purpose above described.

140,078.—*Form-Plate for Bottom of Shoe-Lasts.*—JOHN G. ROSS, Philadelphia, Pa., assignor to JUSTUS W. FRENCH, VIVIAN K. SPEAR, BENJAMIN DORE, and WILLIAM F. MORGAN, Lynn, Mass. Application filed May 1, 1873.

A rabbeted plate, which may be attached or detachable, extends beyond the vertical line of the last to receive the pressure-foot of the machine in sewing turned shoes.

Claim.—The form-plate B in combination with the last A and sole C, the said plate having its edge projecting over the vertical surface of the last to receive the pressure of the oblique presser-foot, and a cove in the outer corner of its edge to receive the edge of the sole C, the said plate being either detachable from or permanently secured to the bottom of the last, substantially as described.

140,079.—*Insect-Destroying Compound.*—WILLIAM B. ROYALL, Brenham, Texas. Application filed May 22, 1873.

Claim.—An insect compound composed of Paris green, cobalt, flour, and tragacanth, and licorice, mixed and applicable substantially in the manner set forth.

140,080.—*Metallic Corner-Shield for Boxes.*—JAMES F. SARGENT, Manchester, N. H. Application filed May 26, 1873.

The piece of metal is bent to fit over the corner, and the side edges are flanged to engage in grooves cut in the box. The ends of the shield are cut in V-shape, so that they shall fit respectively over the bottom and top edge of the box.

Claim.—The shield or corner-piece for boxes, &c., composed of the piece or plate A, adapted to fit the corner of the box, supplied with flanges a^2 a^2, and supplied with V-shaped slits or openings, substantially as shown and described.

140,081.—*Pencil Attachment for Dividers.*—WILLIAM SCHOLLHORN, New Haven, Conn. Application filed January 29, 1873.

A sleeve for holding the pencil has a concave bearing at each end, adapting it to the leg of a pair of compasses, to which it is clamped by a band carrying a set-screw.

Claim.—A lead-holder for compasses, consisting of the tube T, formed with its bearings *b b*, and combined with the loop L and set-screw S, substantially in the manner described.

140,082.—*Elevator for Buildings.*—ISAAC S. SCHUYLER and SAMUEL L. THURSBY, Brooklyn, E. D., N. Y. Application filed November 9, 1872.

A tube runs up from the height to which the platform is to be raised, and contains a piston and rod passing through packing, and attached to a car or platform. Liquid is forced into the tube below the piston by a pump to raise the platform, and is allowed to run back into a tank to lower it.

Claim.—An elevator for buildings, composed of a tube extending above the elevator containing a piston and rod, in combination with the car or platform running in guides, a tank for liquid and a separate actuating-pump, substantially as set forth.

140,083.—*Grain-Binder.*—QUINCY A. SCOTT, Pittsburg, Pa. Application filed May 9, 1873.

The cut grain is gathered from the swath by a rake which is attached to the main frame, and is carried to the cradle by rotating arms, thence to the binding-box by said cradle, where it is bound and dropped into the receiver.

Claim.—1. The central twister-pinion provided with journals and twister-heads on its opposite sides or faces, of a diameter equal to or greater than the diameter of the pinion, for the purposes substantially as described.

2. The twister or tying head and pinion, adapted to unite the two bands *n n'*, in combination with the cradle H and compresser-arm L', whereby one band is carried into the twister by the movement of the gavel in the cradle against the tension of said band, and the other by the return-arm L', which compresses the gavel in the binding-box, substantially as described.

3. The employment, in a grain-binder, of the removable spool-spindles O, provided with the arms or spurs for centering the band-spools, substantially as and for the purposes set forth.

4. The semi-cylindrical basket or cradle X, arranged to receive the bundles as they are automatically discharged from the binding-box, in combination with mechanism substantially as described, whereby a positive movement is imparted to said basket, for dumping it, as described.

140,084.—*Railroad Car-Spring.*—CHARLES H. SLICER, Baltimore, Md., administrator of WILLIAM SLICER, deceased. Application filed January 4, 1871.

The spring is tapered flatwise and edgewise from a point at about one-third of its length to each end.

Claim.—1. A coiled spring, the plate whereof has its outer face lengthened by a double taper, A D E, to prevent the straining or fracturing of the metal in forming the coils, essentially as described.

2. A coiled spring, the plate whereof has a double-edge taper, A B C, to form an active spring and an inactive base A *B*, and a double-face taper, A D E, in conjunction therewith, substantially such as is herein described.

140,085.—*Stone-Crusher.*—AUSTIN H. SMITH, Brooklyn, N. Y. Application filed January 15, 1873.

The form of the delivery end of the hopper accommodates the lateral spread of the descending stone and prevents clogging. The size of the crushed stone is regulated by moving the adjustable boxes, so as to change the axis on which the crushing-jaw swings.

Claim.—1. The hopper for a stone-crushing machine made with the delivery-mouth wider than the upper end of the hopper, and the crushing-jaws wider at the bottom than the top, for the purposes set forth.

2. The boxes *i*, adjusted by the screws *l*, in combination with the shaft or trunnions of the swinging jaw *d*, as and for the purposes set forth.

140,086.—*Knitting-Machine.*—JOHN SMITH and JOSEPH SMITH, Philadelphia, Pa., assignors to CONTERS BUTTON, same place. Application filed November 29, 1872.

Such of the levers as are engaged by the projections on the pattern-wheels are moved, and raise corresponding needles, so that they shall be elevated and depressed by the cams, for the purpose of knitting any desired pattern.

Claim.—A rotary knitting-machine, having vertical needles with projections *a* and fixed cams D, in combination with the radial levers B extending beneath but independent of the needles, and pattern-wheels A operating upon the levers, so as to throw the needles into or out of action with the cams, as set forth.

140,087.—*Process of Welding Steel to Cast-Iron.*—JOHN H. SMITH, Madison Run Station, Va., assignor of one-half his right to THOS. W. BOND and JOS. M. HANDERSON, same place. Application filed May 21, 1873.

Heat the parts to a welding heat and apply borax to the surfaces to be united, and re-heat the metal and bring together by strong pressure.

Claim.—The process of welding steel to cast-iron, substantially as described.

140,088.—*Can-Opener.*—LUCIUS B. SMITH, West Meriden, Conn., assignor to himself and NORMAN C. HALL, same place. Application filed May 28, 1873.

Two cutters are arranged at the end of a handle and in line with same. The two cutters are flat, sharpened at the point, and parallel, except at the ends, when one is turned outward.

Claim.—The combination of the two cutters *a b*, one of which is straight and the other curved outwardly, the two united at their upper end and attached to or made part of the shank B, and provided with a suitable handle, substantially as described.

140,089.—*Show-Case.*—WILLIAM C. SPELLMAN, Hartford, Conn. Application filed June 4, 1873.

A double folding case having flanged shelves and inclined partitions.

Claim.—1. In a show-case having horizontal shelves, the beveled upright partitions *e e*, in combination with the shelves C, having the flanges c c^1 c^1, as and for the purposes set forth.

2. The double frame A, hinged as shown, and combined with the horizontal shelves C having flanges c c^1 c^1, and with the vertical partitions *e e*, substantially as and for the purposes set forth.

140,090.—*Watch-Regulator.*—NICOLAS STAFLIN, Chicago, Ill. Application filed October 12, 1872.

A plate sliding in a curved slot of the graduated regulating-plate, carries a double worm-gear, one screw-wheel of which engages with a corresponding concave thread, ont in the watch-plate within the said curved slot, and also confines and carries the regulating-index by rising between the separated branches of the said index.

Claim.—1. The sliding plate I, constructed as described, and carrying the pinion *m* and worm-wheels *n p*, for adjusting the regulator C, substantially as described, for the purpose specified.

2. The sliding plate I, having the upturned flange *j*, in combination with the watch-plate A, and the index-plate G having the groove *k* to receive the flange *j*, and a rabbet to receive the narrow end of the plate I, substantially as described, and for the purpose specified.

3. The combination of the graduated operating-wheel R with the sliding plate and its operating mechanism, the regulator C, the index-plate G, and the threaded segmental recess *h*, substantially as described, for the purpose specified.

140,091.—*Loom-Picking Mechanism.*—JEREMIAH STEVER, Bristol, assignor to THOMAS C. MORTON, Waterbury, Conn. Application filed May 13, 1873.

The picker-staff is operated by a horizontal lever, which is forced back into working position by a face-cam, and is actuated by a second lever connected with a spiral spring working on a vertical axis supported on a bracket on the loom-frame. One end of the spring is attached to a ratchet, by means of which the tension can be adjusted.

Claim.—The levers L L' attached to their respective picker-staffs, combined with the respective springs N N', adjusting mechanism for said springs, and levers P P', and cams to actuate the said levers and springs, substantially as set forth.

140,092.—*Post-Office Box.*—EMORY STOCKWELL and WARREN H. TAYLOR, Stamford, Conn. Application filed March 26, 1873.

The metallic fronts or door frames are recessed so as to inclose sheet-metal plates composing the pigeon-holes. A single wire-pin projects through the horizontal rib so as to form the hinge for two doors.

Claim.—1. As a new article of manufacture, a series of metallic post-office letter-boxes, in combination with a metallic front, as described.

2. A post-office letter-box, so constructed that two of the doors thereof swing on one pivot.

140,093.—*Tobacco-Case.*—JOHN W. STONE, Lynchburg, Va. Application filed May 21, 1873.

A trunk-shaped box is provided with a fixed diaphragm in the lid for pressing upon the upper surface of the tobacco, an air-chamber being also thus provided in the top of the case for the preservation of the flavor.

Claim.—As a new article of manufacture, a tobacco-case, constructed as described, having the body A and the top B constructed with the fixed diaphragm C, and having the air-chamber *c*, substantially as and for the purpose set forth.

140,094.—*Wheelwright-Machine.*—GEORGE SWEET, Dansville, N. Y. Application filed May 21, 1872.

The felly is secured to the periphery of a revolving table, and is then brought into the proper position for boring the holes for the spokes and cutting the joints.

Claim.—1. The sliding bar *a*, with teeth *i i*, sliding in the guides *b b* on the arm *c*, and operated by means of the cam-lever E, substantially as and for the purposes herein set forth.

2. The elbow-lever J, with point *y* and spring *f*, operating in combination with the notched dial *h*, substantially as and for the purposes herein set forth.

3. The combination, with the dial B, its arms C, and circle D, and its toothed sliding bars *a* operated by the cam-levers E of the sliding saw and auger-carriages G G', all mounted upon the t-shaped frame A, and operated substantially as set forth.

140,095.—*Barrel-Head.*—JAMES W. TAYLOR, Ashland, Va. Application filed February 24, 1873.

The two parts of the head are expanded by means of an eccentric lever.

Claim.—The spring-bar *m*, in combination with the parts *a* a^1, the flange a^2, and the lever or eccentric E, substantially as and for the purpose set forth.

140,096.—*Guide for Circular Saws.*—SAMUEL TAYLOR, Olamon, Me., assignor to himself and JOSIAH C. TOWLE, Bangor, Me. Application filed May 24, 1873.

The roll is adjustable laterally, and held in position by means of a spring-pawl, which enters the teeth of a vertically-adjustable rack.

Claim.—The combination of the roll *g*, sliding bar *e*, spring-pawl and handle *h i*, and rack *j*, substantially as and for the within-described purposes.

140,097.—*Caster Attachment for Furniture.*—JOSEPH H. TRAVIS, Charlestown, Mass. Application filed May 26, 1873.

The casters are attached to a spring-frame, which latter is connected by levers to the chair. The weight of the person sitting in the chair brings the rockers to the floor, so that no weight is held by the casters. When the person rises from the chair the levers and springs lift it again, so that it rests entirely on the casters.

Claim.—The combination, with a caster, of a spring which automatically lifts the article from the floor, so that it may rest on the caster, except when forced down by the weight of the person, or otherwise, substantially as described.

140,098.—*Loom-Shuttle.*—WILLIAM TUCKER, Fiskedale, Mass., assignor to himself and CHARLES F. GROSVENOR, same place. Application filed April 9, 1873,

To prevent "floats" a disk is pivoted in the delivery end of the shuttle provided with notches in its periphery, and with a perforation to coincide in one position with the delivery-tube. A retaining-spring engages with one of the notches, and holds the disk in position so that another notch is presented above the shuttle for catching any obstructing thread. When a thread is so caught the disk is turned, by which the thread is held and broken and the weft-stop mechanism operated.

Claim.—The pivoted disk *d*, provided with the perforation 4 and notches 3 5, in combination with the tube *a* and spring *f*, applied to a loom-shuttle, and operating, substantially as described, to break the filling thread when defects occur in the fiber being woven, as herein set forth.

140,099.—*Earth-Closet.*—CHARLES A. WAKEFIELD, Pittsfield, Mass. Application filed March 24, 1873.

The closet is divided transversely by a vertical partition into an excrement and earth receptacle. The main seat and child's seat are arranged side by side. The child's seat is hinged over the earth-receptacle, and capable of adjustment into position either over the main seat or earth-receptacle, and is provided with a lid to admit of being opened when needed.

Claim.—1. The combination, with the main seat C and earth-receptacle D, arranged side by side, of the hinged child's seat E, made capable of swinging into position over the main seat or earth-receptacle, as required, substantially as specified.

2. The combination of a shutter or lid, F, with the hinged child's seat E, and the earth-receptacle D and main seat C, arranged side by side, essentially as described.

140,100.—*Metallic Roofing.*—PATRICK WALL, Allegheny, Pa., assignor to himself and JOHN S. HALL, same place. Application filed January 9, 1873.

Claim.—As an article of manufacture, a roofing sheet having a smooth surface in the space A along the edges, and corrugations in the space B, as and for the purpose described.

140,101.—*Stave-Machine.*—BENJAMIN W. WARNER, Rome, assignor to himself and ALBERT E. SMITH, Utica, N. Y. Application filed March 22, 1873.

The jointing-cutters are arranged upon two levers in such a manner as to receive a vertical movement through the agency of two cams secured to a partially-rotating vertical shaft, thus jointing the stave at the same time it is cut from the block by the saw.

Claim.—1. The combination of the oscillating supports N O, cams R, rock-shaft S, slotted arm U, and stud-bolt V, with a carriage, A, and the beveling and tapering cutters M, substantially as described.

2. The arrangement of bars Q and slotted ends T of the supports N and O with the rock-shaft S and the cams R, as described.

140,102.—*Table-Leaf Support.*—CHARLES H. WHEELER, St. Louis, Mo. Application filed March 18, 1873.

To the under side of the leaf is attached a slotted guide, having near one end an angular notch, in which the T-head of the hinged rod engages. To one side of the guide a latch is pivoted to the leaf, which engages with the T-head and holds it in the notch. On the other edge of the latch-plate is a cam, that when swung under the headed rod releases it from the notch, and allows it to slide on the slotted guide.

Claim.—1. The slotted guide, provided near one end with an angular notch, and rigidly attached to or upon the hinged leaf, in combination with the T-headed swing-rod or brace, substantially as and for the purpose specified.

2. In combination with the slotted and notched guide, and with the T-headed swing or brace-rod, the latch *c*, pivoted at one end upon the hinged leaf, and at its opposite end engaging with and locking in place the head of said rod, substantially as and for the purpose shown.

3. In combination with the slotted notched guide, and with the T-headed brace-rod, the cam pivoted upon the hinged leaf and operating to disengage the head of said rod from the notch of said guide, substantially as and for the purpose set forth.

140,103.—*Bolt-Machine.*—SYLVESTER B. WILKINS and AARON MARCELLUS, Rockford, Ill. Application filed September 21, 1872.

Upon the upper surface of the forming-die is an annular edge for removing the fin thrown out around the head of the bolt. The form of the die is such that the bolt will be pointed by means of the blow given to make the head.

Claim.—1. The combination of the drop-hammer C, having tooth *c''*, with the hook-lever D, lever D', rod *f* having collar *f'*, die B', and slotted anvil B, substantially as described.

2. The annular raised cutting-edge *b'* on the face of the forming-die B', Figs. 5 and 6', in the manner and for the purpose described.

3. The forming-die B', Figs. 5 and 5', having the bottom of the cavity formed to point the bolt-blank, and hole *c* below such cavity, and through the bottom of said forming-die, substantially as described.

140,104.—*Manufacturing Illuminating-Gas.*—ASA W. WILKINSON, New York, N. Y. Application filed December 11, 1872.

Claim.—A process of manufacturing a rich and superior illuminating-gas by first producing ordinary illuminating-gas from bituminous coal, or taking the natural light carbureted-hydrogen gas escaping in some places from the earth, then purifying the same by the usual process, and finally passing the purified gas through a retort or retorts kept at or near a cherry-red heat, into which a rich hydrocarbon, such as petroleum, naphtha, oils, resin, &c., is introduced, substantially in the manner herein set forth.

140,105.—*Carbureter.*—ASA W. WILKINSON, New York, N. Y. Application filed February 21, 1873.

Combination of a heating-chamber with an air-holder, an air-heater, and a spiral carbureter, the air-holder being constructed on the principle of a gas-holder, while the spiral passage of the carbureter is lined with some absorbent material.

Claim.—The combination of the heating-chamber F with the air-holder A and carbureter H, substantially as described, for the purpose specified.

140,106.—*Fire-Alarm Signal-Box.*—GEORGE WRIGHT, MINARD Y. HOLLEY, and HENRY R. MILES, Washington, D. C., assignors, by mesne assignments, to GAMEWELL & COMPANY, New York, N. Y. Application filed December 18, 1872.

Key inserted in key-hole and turned operates dogs D D, forcing plate A and detents C C to allow catch B to drop, thus releasing circuit-breaking mechanism without opening door of box.

Claim.—1. An automatic signal-box, operated by means of a key in the manner described, said key being applied from the outside to the outer door without opening the same.

2. The plate A, constructed, substantially as described, with detents C C, lever B, pin P, dog D D, and spring H, combined substantially as and for the purposes set forth in the foregoing specification.

REISSUE PATENTS.

5,446.—*Vehicle-Seat.*—JOHN BURT, Sturgis, Mich., assignor, by mesne assignments, to ALONZO F. HUNDELL and EDWIN R. WILLIAMS.—Patent No. 70,517, dated November 5, 1867. Application filed October 26, 1872.

One continuous piece, bent to form the back and sides of the seat, and to be directly attached to the seat-bottom.

Claim.—1. The back and sides of a vehicle-seat, composed of a single continuous piece of material without joint, substantially as set forth.

2. The bent and reclining seat back and sides formed in a continuous length from a single piece of material, substantially as set forth.

3. A vehicle-seat, in which the back and sides are formed from a continuous single piece of material without joint, substantially as set forth.

5,447.—*Bedstead-Fastening.*—LEVI W. BUXTON, Nashua, N. H.—Patent No. 23,525, dated April 5, 1859; extended seven years. Application filed June 12, 1873.

The rail and post have circular grooves. In the rail is placed an iron with serrated ends, and a hook that takes hold of a rod in

the groove in the post. The iron is held in the rail by a conically-formed pin.

Claim.—1. A rail-iron for fastening or securing the ends of the rails to the posts of bedsteads, having two curved ends, *m m*, to fit the curved parts *n n* of the groove in the end of the rail, while its rear part is provided with a hole to receive a fastening-pin, and its front part with a projecting hook device to enter the post and retain the rail and post securely together.

2. The combination, with the rail-iron *e*, of the serrations or teeth *l l* and re-enforced parts *j j*, substantially as and for the purposes set forth.

3. The combination, with the end of a bedstead-rail provided with curved grooved parts *n n*, and a rail-iron having curved ends *m m*, of a slightly conical or tapering fastening-pin, substantially as and for the purposes set forth.

5,448.—*Machine for Producing Folded Trimmings.*—CHAUNCEY O. CROSBY and HENRY KELLOGG, Milford, assignors to ELM CITY COMPANY, New Haven, Conn.—Patent No. 36,074, dated August 5, 1862. Application filed April 10, 1873.

Movable blades, in connection with sewing mechanism, fold and stitch a strip of material or tape carried on a spool and led through the tube *d'*, so as to form what is known as tape-trimming.

Claim.—1. In combination with a stitching mechanism and a work-plate, a blade or blades, substantially as described, having a reciprocating movement above the work-plate, and substantially toward the stitching device, to lay the fabric in successive and regularly defined folds, the stitching mechanism securing the folds by a continuous line of stitches.

2. In combination with a stitching mechanism and a work-plate, a blade or blades, substantially as described, having a reciprocating movement above the work-plate and substantially toward the stitching device, when the said blade or blades have a combined up and down forward and back movement in each full or complete operation.

3. In combination with a stitching mechanism and a work-plate, a blade or blades, substantially as described, having a reciprocating movement abovement above the work-plate and substantially toward the stitching device, when the said blade or blades in the extreme forward position lie within and define or form the edge of the fold or plait.

4. The combination of delivering apparatus, substantially such as described, with apparatus for folding, substantially such as described.

5. In combination, a delivering apparatus, an assistant folder, and a folding apparatus, all substantially such as specified.

6. In combination, a folding apparatus and an assistant folding contrivance, and a mechanism for stitching folds together, the combination being substantially such as described, and operating substantially as specified.

7. In combination, a blade or blades for making a fold, and apparatus for stitching, and apparatus for discharging, all substantially such as described, and operating substantially as set forth.

8. In combination, a delivering apparatus, a folding apparatus, a stitching mechanism, and discharging apparatus, all substantially such as described, and this either with or without an assistant folder, substantially such as described.

9. In a folding apparatus, the projections on and at right angles to the folders, or their equivalents, so that the moving folding edge shall nip tape, braid, &c., between itself and such projections, so as to make a sharp fold, as described.

10. An assistant folder, substantially as described, having an interrupted motion, in combination with a delivering apparatus having a continuous motion, as specified.

11. Folding-blades, substantially as described, grasping folded material, and moving at the same time and in the same direction with discharging apparatus grasping the same material, substantially as specified.

12. In combination with each other, elastic or yielding folding-blades, moving each over the other to form folds, so that they may change their relative level and press upon goods when folding them, substantially as specified.

5,449.—*Inhaler.*—WILLIAM H. CUTLER, Buffalo, N. Y.—Patent No. 135,411, dated February 4, 1873. Application filed May 13, 1873.

Paper substituted for sponge in the inhaling-tube.

Claim.—1. A core for inhaling instruments formed of paper.

2. A core for inhaling instruments formed of a tube or tubes of bibulous paper or analogous material, as specified.

5,450.—*Hand-Punch.*—ANDREW L. ECKERT, Newark, N. J., assignor to WILLIAM F. EBSE.—Patent No. 53,282, dated March 20, 1866. Application filed April 19, 1873.

Claim.—1. A ticket-punch, one jaw of which forms three prongs, substantially as shown and described, wherein the punch or male die is held and guided, substantially as and for the purposes set forth.

2. A ticket-punch, one jaw of which is slotted, substantially as shown, to receive the ticket to be punched, as hereinbefore set forth.

3. A ticket-punch, the spring-jaw of which is located within and pivoted to the other, substantially in the manner and for the purposes set forth.

4. The combination of a spring-lever with an independent reciprocating die, substantially as and for the purposes set forth.

5. The spring for keeping apart the handles, arranged to serve also the purposes of a suspension-ring, as set forth.

5,451.—*Step-Ladder.*—CARSON HATE, Waukesha, Wis., assignor to the KIP MANUFACTURING COMPANY.—Patent No. 46,105, dated January 31, 1865. Application filed May 21, 1873.

The platform is connected to the stile by a metallic bracket, to which the brace is hinged. The brace is formed in two parts which converge to a single point of support. Side braces are also used, attached by swivel-joints. The steps are strengthened by angle-irons placed underneath. Hooks and buttons are provided for securing the side-braces to the stile when not in use.

Claim.—1. The combination in a step-ladder of a stile, A, or its equivalent, a platform or top step, and a bracket, when said bracket connects the stile to the platform as herein set forth.

2. In combination with a stile, or its equivalent, a platform and a back-brace of a step-ladder, a bracket, when said bracket connects said parts together for the purpose specified.

3. The combination in a step-ladder of the braces E E, hinged to the platform C, inclined inward and connected together at their lower ends, forming a single bearing-point, substantially as herein set forth.

4. The adjustable side-braces G G and swivel-joints *b b*, in combination with the back-brace E, as and for the purposes herein set forth.

5. The angle-irons *a a*, connecting the steps and side pieces of a step-ladder, substantially as and for the purposes herein set forth.

6. In combination with the side-braces G G, the hooks *f* and and buttons *h*, for the purposes herein set forth.

5,452.—*Car-Truck.*—AARON HIGLEY, Cleveland, Ohio, assignor to HIGLEY CAR-JOURNAL COMPANY.—Patent No. 99,774, dated February 15, 1870. Application filed December 16, 1872.

Two cylindrical rubber springs divided by means of a flanged cap, are secured to the axle-box and car-sills by the posts which connect the stay-rod and sill. By this arrangement the axle-box is allowed a longitudinal and transverse freedom of movement.

Claim.—1. The combination of the springs D G and collar F with the arms C', stay-brace H, and post E, the several parts constructed and arranged substantially to operate in the manner and for the purpose specified.

2. The cap or collar F, in combination with the springs D and G, as and for the purpose substantially set forth.

3. The combination of the post E, cap F, and spring D, the post being connected rigidly with the brace H and frame A'', substantially as and for the purpose set forth.

5,453.—*Car-Axle Box.*—AARON HIGLEY, Cleveland, Ohio, assignor to HIGLEY CAR-JOURNAL COMPANY.—Patent No. 86,543, dated February 2, 1869. Application filed December 18, 1872.

The journal has its bearing upon interlapping friction-rollers, which have conical journals, to prevent the rollers grinding as the cars are turning curves.

Claim.—1. The interlapping friction rolls or rollers D D', case B, arms B', and springs C, all arranged to operate in the manner as and for the purpose substantially described.

2. The interlapping friction-rollers D D' having two points of bearing for the axle upon one roller, and one point of bearing upon the other, or the equivalent of the same, the object being to throw an equal bearing upon the journals of the friction-rollers, substantially as and for the purpose specified.

5,454.—*Bag-Machine.*—J. M. HURD, Auburn, N. Y.—Patent No. 43,773, dated August 9, 1864. Application filed March 25, 1873.

The end of a tube is spread flat by two hinged wings, so that it may receive suitable folds in that position, to form a square bottom.

Claim.—A machine or apparatus having a suitable supporting and former surface, which may be folded or closed up to flatten the finished bag, substantially as and for the purposes set forth.

5,455.—*Machine for forming Auger-Bits.*—WILLIAM A. IVES, New Haven, Conn. Patent No. 134,653, dated March 19, 1872. Application filed January 23, 1873.

The dies for grasping the auger are, at the end, of a shape the counterpart of that of the under side of the bit to be formed, and used in conjunction with these dies is a revolving-former for spinning the end of the auger blank down upon the bit-dies; and surrounding the former is a sleeve that is thrust forward at the proper time to bend the margin of the bit outward to form the floor-lips.

Claim.—1. In the process of forming the cutting end of boring instruments, the arrangement of two dies, the one within the other, the central or inner die operating to form the point and floor lip or lips, the outer passing over the other or inner die to turn up and size the lip or lips, substantially as specified.

2. In combination with dies or other suitable means for holding the auger, a revolving die or device, which forms the floor lip or lips and point, and turns up or sizes the head, substantially as described.

3. In combination with the dies I, for holding the auger and the forming-dies, the treadle I², attached to the slide or slides carrying the dies I, and so as to operate the said dies, substantially as set forth.

4. In combination with the dies *c* and *d*, the holding-dies I, substantially as and for the purpose specified.

5. In combination with mandrel F, and spindle G, and dies *c* and *d*, the cams *a* and *b*, so as to operate the said dies, as and for the purpose specified.

5,456.—*Sun-Shield for Horses.*—HUGH D. MCGOVERN, Brooklyn, N. Y.—Patent No. 120,208, dated October 24, 1871. Application filed May 24, 1873.

Claim.—1. A sun-shield for horses, constructed with an opening in the top thereof, for the purpose specified.

2. In combination with a sun-shield for horses, a rotating fan suspended within the shield for acting upon currents of air or heated air, substantially as described.

3. A sun-shield for horses, provided with a projecting front end having an inclined top surface for deflecting and conducting currents of air into the space between the shield and the upper portion of the horse's head, substantially as and for the purpose described.

4. A shield or horse-bonnet, A, provided with an elevated part or cap, B, having an aperture D, on the front, in combination with a fan, F, placed in the cap B, substantially as and for the purpose described.

5. A sun shield for horses provided with a raised portion for the purpose of facilitating the entry of a current of air, substantially as specified.

5,457.—*Cotton-Bale Tie.*—JOHN MCMURTRY, Fayette County, Ky., assignor by mesne assignments, to FREDERIC COOK, New Orleans, La.—Patent No. 27,866, dated April 10, 1860. Application filed June 2, 1873.

Claim.—1. The attachment of the ends of metallic bands by locking the same together, and bending the surplus ends beneath the body of the bands, as shown.

2. Uniting the ends of iron bands for bailing purposes by attaching the same together by hooks formed on one or both of said bands without the interposition of a link or buckle.

3. A tie, formed by hooking or looping the ends of metallic bands into each other without the interposition of a link.

5,458.—*Engraving and Carving Machine.*—THOMAS W. MINTER, New York, N. Y.—Patent No. 132,594, dated October 29, 1872. Application filed April 25, 1873.

By a special construction and arrangement of parts, sufficiently indicated in the claim, the machine is rendered capable of employing, automatically, the various cutting-tools usually employed in lathes or hand cutting, executing work on stone, steel, or other material, producing imitations of suitable designs.

Claim.—1. In an engraving or carving machine the arrangement of a spindle carrying a cutter-wheel, substantially as described, and having a swinging or traversing motion over the work upon a plane parallel to the same, or nearly so, essentially in the manner and for the purpose specified.

2. The combination of a tracing-pin and pattern-supporting platform, with a tool-carrying spindle extending over the surface of the work, and having a traversing motion over said surface in a plane parallel to the same, or nearly so, substantially as set forth.

3. The vibrating beam J, carrying the tracing-pin and the bracket *w*, which forms the bearings of the tool-carrying spindle, substantially as herein shown and described.

4. The rotary disks G G, applied to the platforms E E, and combined with the transverse screws H H², to be turned simultaneously by means of a single screw, I, as set forth.

5. The tilting platform E, applied to an engraving-machine, substantially as and for the purpose herein shown and described.

6. The worm-segment A, applied to the pivoted platform E, for connecting the same with the tilting-screw F, substantially as specified.

8. The screw I for moving the transverse screws H and H², when made vertically self-adjusting to adapt itself to the varying positions of said transverse screws, while the platforms are being tilted, substantially as specified.

9. The combination of the three longitudinal screws C, F, and I with the carriages B B², platforms E E, disks G G, and transverse screws H H², substantially as herein shown and described.

10. An engraving-machine employing a rotary cutter on a vibrating beam above a platform, adjustable substantially in the manner specified.

5,459.—*Base-Burning Stove.*—JAMES SPEAR, Philadelphia, Pa.—Patent No. 100 335, dated March 1, 1870.—Division A. Application filed March 18, 1873.

The fire-pot projects down toward the ash-pit between its lower end and the grate, which is of larger diameter than said lower end of the fire-pot, is an annular space or opening for raking out clinkers, &c. The burning coals in this space can be seen through the mica windows in the doors and apertures in the stove body. The grate is easily raked through said doors.

Claim.—1. A horizontally-vibrating grate with a surface for the coal to rest on larger than the lower or discharge end of the fire pot, supported at a distance from the lower end of the fire-pot sufficient to form the opening R for the removal of slate and clinkers over the periphery of the said grate.

2. The arrangement of a fire-pot with its lower or discharge end suspended or projecting downward within the air-chamber S, in combination with a vibrating grate of larger diameter than the lower end of said fire-pot, suspended at a distance below the said discharge-end sufficient for the removal of slate and clinkers over its periphery, as herein described.

3. The grate and fire-pot, combined and arranged as described, to form the opening R, in combination with mica lights, or mica lights in doors arranged around the said opening, as and for the purpose set forth.

4. The fire-pot E, suspended or projecting downward within the air-chamber S, in combination with a vibrating grate of larger diameter than the discharge-end of the said fire-pot, arranged at a distance therefrom sufficient for the removal of slate and clinkers over its periphery between it and the wall of the stove, and the mica lights around the opening R, all combined and arranged substantially as herein set forth.

5,460.—*Base-Burning Stove.*—JAMES SPEAR, Philadelphia, Pa.—Patent No. 100.335, dated March 1, 1870.—Division B. Application filed March 10, 1873.

Below the fire-pot a grate of larger diameter than the lower end of said fire-pot is suspended, so that an annular space or opening is made for the removal of clinkers, &c.

Claim.—A vibrating grate supported at a distance below, the discharge-end of the fire-pot sufficient for the removal of slate and clinkers over its periphery, as herein described, by means of arms C projecting downward from the fire-pot or cylinder, substantially as herein described.

INDEX OF INVENTIONS PATENTED JUNE 17, 1873.

	Class No.	Whole No.
Alarm signal box, fire, Wright, Holley and Miles	24	140,106
Alarm, till, J. F. Baldwin	24	139,939
Animal poke, C. Hinman	72	139,883
Animals, administering balls to, T. H. Rex	144	139,856
Ash leach, Kernodle and Haun	68	139,963
Auger bit, machine for forming, W. A. Ives, (reissue)	29	5,455
Bag machine, J. M. Hurd, (reissue)	7	5,454
Bale tie, cotton, W. D. Field	7	140,024
Bale tie, cotton, J. McMurtry, (reissue)	7	5,457
Barrel head, J. W. Taylor	49	140,035
Barrels, apparatus for pitching, G. Sichler	19	139,978
Barrels, forcing beer, &c., from, J. Devlin	118	139,889
Beam, composite, W. W. Lummus	21	139,908
Bed bottom, E. L. Brockett	62	140,005
Bedstead fastening, L. W. Baxton, (reissue)	62	5,447
Bedstead, sofa, C. F. Grundin	62	139,952
Bee hive fumigator, A. R. Denlinger	9	139,781
Beer strainer, C. M. Powers	88	139,971
Binder, temporary, W. H. Barnard	146	139,998
Bit stock, A. P. Daboll	20	139,876
Blind, inside, D. Y. Kilgore	62	139,899
Boiler attachment, wash, Rice and Barnes	136	139,918
Felt machine, Wilkins and Marcellus	14	140,103
Bolt and plate, clip king, H. M. Beecher	31	139,835
Book mark, Ward and Dolton	146	139,936
Boot and shoe heels, machine for making, A. C. McKnight	16	140,060
Boot and shoe heels, apparatus for manufacturing, J. Blakey	16	139,859
Boot and shoe soles, machinery for bending the edges of, B. H. Hadley	16	140,035
Boots and shoes, shipping and show case for, M. Buhler	54	140,007
Boring machine, H. Longwell	31	139,901
Bottle, V. H. Lyon	1	139,905
Bottle, nursing, W. Hobson	156	139,958
Bottles, attaching cork retaining bales to, L. B. Flanders	1	139,886
Box, post office, Stockwell and Taylor	146	140,092
Boxes, metallic corner shield for, J. F. Sargent	64	140,080
Bracelet, S. W. Grant	46	139,888
Brake reaction movement, H. B. Martin	167	140,057
Brick machine, Houck and Sawyer	20	139,894
Bridle bit, D. H. Carpenter	72	140,010
Bridle bit, J. M. Fabre	72	140,023
Brush, paint, J. J. Gorman	23	139,887
Burner, gas, J. Rigby	64	139,919
Burner, vapor, M. F. Gale	90	140,029
Burner, vapor, M. F. Gale	90	140,030
Burners, globe and holder for gas, G. M. Ramsay	64	140,075
Button, J. N. Allen	23	139,991
Button fastening, D. Cannata	23	140,008
Button hole cutter, C. Van Hoosen	44	139,963
Can, dinner, A. A. Arnold	136	139,851
Can for paint, &c., metal, G. H. Chinnock	107	139,866
Can for paint, &c., metal, G. H. Chinnock	107	139,869
Can, oil, H. M. Smith	107	139,927
Can opener, J. J. C. Petersen	86	140,078
Can opener, L. B. Smith	86	140,088
Canal boats, propelling, H. H. Baker	130	139,996
Car axle box, A. Higley, (reissue)	122	5,453
Car coupling, O. Albrecht	122	139,850
Car, hand, J. D. Hinckley	121	140,039
Car spring, A. Bridges	122	139,862
Car spring, railroad, W. Slicer	122	140,084
Car, street railway, S. H. Little	121	140,052
Car truck, A. Higley, (reissue)	122	5,452
Carburetor, A. W. Wilkinson	27	140,105
Carriage, child's, F. Snyder	31	139,978
Cart, dumping, B. G. Fitzhugh	31	140,025
Cartridge box, W. H. Elliott	162	139,885
Carving machine, H. Thomas	173	139,980
Case, show, W. C. Spellman	54	140,089
Caster attachment for furniture, J. H. Travis	24	140,097
Chair, W. T. Doremus	62	139,948
Chair fan attachment, B. L. Jordan	165	140,047
Chandelier, sliding, G. F. Blaisse	90	140,003
Clamping device, C. Stout	29	139,931
Clock work globe, L. J. N. Mouret	148	140,065
Coal screen and chute, M. R. Roberts	170	140,077
Coffee mill, S. C. Jantzen	86	139,980
Coffee roaster, W. H. Welch	154	139,984

Reflector, F. L. Senour	90	139,923
Roller and irrigator, D. S. Howard	73	140,043
Roof, fire proof, J. B. Cornell	126	139,945
Roofs, composition dressing for, H. O. Brown	126	139,864
Roofing, metallic, P. Wall	126	140,100
Safe vault, McCall and Wood	128	139,907
Sash and door fastener, J. B. Frost	24	140,026
Sash fastener, M. Judd	24	139,895
Saw mill, circular, M. Blackburn	130	140,002
Saw mill head block, G. B. Getty	130	140 032
Saws, guide for circular, S. Taylor	130	140,096
Sawing machine, G. Marshall	130	139,965
Scales, platform, J. F. Kesler	132	139,897
Screw threads on bolt and screw blanks, machine for swaging, R. Boekler	14	139,861
Sewing machine, T. K. Keith	134	139,902
Sewing machine braider, J. P. Chaffee	134	140,012
Sewing machine needle setter and threader, C. F. Albert	134	139,990
Sewing machine ruffler, G. E. Dolton	134	139 883
Sewing machine shuttle, W. H. Heckensmith	134	140,041
Sheet metal, machine for seaming, C. Brombacher	136	139,863
Ships, oscillating berth for, I. A. Chomel	137	140,014
Ships' frames, adjustable templets for, A. Perrin	137	140,071
Shirt, G. C. Thomas	38	139,933
Shirt, J. Wieser	38	139,937
Shirt bosom stretcher, E. Bassett	91	140,000
Shoe lacing fastening, B. B. Choate	16	139,871
Shoe lasts, form plate for bottom of, J. G. Ross	16	140,078
Shutter and door fastener, D. J. Moffitt	24	140,064
Soda or alkali, package for caustic, H. B. Hall	58	139,955
Soldering tool, R. J. Hollingsworth	136	140,042
Spectacles, temple for, G. W. Meigs	157	139,909
Spike, S. Redfern	103	139,972
Spinning frames, regulating the twist in, C. Martin	142	140 056
Spittoon, F. Gaisberg	62	140,027
Spool turning machine, Walker and Gooding	175	139,935
Spooling machine, J. M. Stone	17	139,930
Spoon, medicine, Colby and Thomson	156	139,944
Steam gage, registering, G. H. Crosby	148	140,018
Steel to cast iron, welding, J. H. Smith	60	140,087
Stone crusher, A. H. Smith	3	140,085
Stool and table pedestal, J. R. Lomas	62	140,054
Stove, base burning, J. Spear, (reissue)	154	5,459
Stove, base burning, J. Spear, (reissue)	154	5,460
Stove, cooking, J. R. Hyde	154	140 044
Stove grate, J. S. Van Buren	154	139,934
Stove machine, B. W. Warner	40	140,101
Stove pipe joint, A. C. Sweetland	154	139,932
Stove polish, J. I. Danforth	70	139,879
Strap, shoulder, J. C. Merritt	38	140,061
Suppositories, mold for making, L. R. Blackman	156	139,858
Suspender, T. J. Irving	38	140,045
Switch, self-acting, L. W. Harris	120	139,956
Table leaf support, C. H. Wheeler	62	140,102
Tanning apparatus, C. Herveux	92	139,892
Tanning compound, J. B. Hite	92	140,040
Telegraph fire alarm, R. Carter	50	140,011
Thrashing machine, L. C. Bickings	159	139,857
Thrashing machine, M. G. Carleton	159	139,866
Tobacco case, J. W. Stone	160	140,093
Tobacco drier, J. M. Smith	160	139,977
Tobacco, plug and bunch, I. Eppinger	160	140,020
Toy, gyroscopic, A. C. Wurtele	143	139,988
Trap, animal, J. H. Hair	143	140,036
Trap, animal, J. Merchen	143	139,967
Trimming, machine for producing folded, Crosby and Kellogg, (reissue)	38	5,448
Truck, sewer cleaning, McHarg and Hill	51	140,059
Truss, P. and W. Pomeroy	156	139,917
Truss, J. A. Sherman	156	139,926
Tub, bath, L. Bagger	8	139,995
Tub support, wash, E. F. Shaw	91	139,925
Turn table, W. H. Burch	120	139,941
Type writing machine, J. R. Pember	50	139,914
Valve, combined stop and check, A. A. Dame	152	139,878
Valve, globe, A. P. Brown	152	140,006
Vault cover, W. R. Williams	110	139 938
Vault, fire proof, G. W. Pittman	128	139,916
Vehicle hound, A. Muhleisen	31	140 066
Vehicle seat, J. Burt, (reissue)	31	5,446
Vessels, propelling device for, B. T. Babbitt	139	139,994
Wagons, end gate for, S. F. Robertson	31	139,974
Wagons and sleighs, binder for loaded, J. Paff	31	139,969
Washer, clothes, G. J. Terrell	91	139,979
Washing machine, J. E. Anderson	91	139,992
Washing machine, E. S. Bliss	91	139,940
Washing machine, A. Gregg	91	139,889
Washing machine, S. Hawkins	91	140,037
Watch regulator, N. Stadlin	36	140 090
Water traps, making, R. Cunningham	167	139,946
Wells constructing, A. Curtis	51	139,947
Wheelwright machine, G. Sweet	31	140,094
Whip socket, J. H. Young	31	139,989
Windlass and capstan, D. N. B. Coffin, Jr.	79	139,872
Windows, fire damper for, M. J. Barwick	4	139,999

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED JUNE 17, 1873.

Abbott, N. B., Composition pavement	139,848
Albertson, J. M., Baling press	139,849
Albert, C. F., Sewing machine needle setter and threader	139,990
Albrecht, O., Car coupling	139,850
Allen, J. N., Button	139,991
Andere and Errani	140,021
Anderson, J. E., Washing machine	139,992
Arnold, A. A., Dinner can	139,851
Ashurst, J. L., assignee	139,860
Atterbury, J. S. and T. B., Mold for manufacturing glassware	139,993
Babbitt, B. T., Vessel propelling device	139,994
Bagger, L., Bath tub	139,995
Bailey, J., Cooper's crose	139,852
Baker, A. O., assignee	139,888
Baker, H. H., Propelling canal boats	139 996
Baker, S. E., Pile driver	139,853
Baldwin, J. F., Till alarm	139,939
Ball, D. H., Traction engine	139,997
Bantz, E., Creating artificial currents	139,854
Barnard, W. H., Temporary binder	139,998
Barnes and Rice	139,918
Barton, E., assignee	140,032
Barwick, M. J., Window fire damper	139,999
Bassett, E., Shirt bosom stretcher	140,000
Beecher, H. M. Clip king bolt and plate	139,855
Beecher Manufacturing Company, assignee	139,855
Bergstresser, E. L., Photography	140 001
Bex, T. H., Instrument for administering balls to animals	139,856
Bickings, L. C., Thrashing machine	139,857
Blackburn, M., Circular saw mill	139,002
Blackman, L. R., Mold for making suppositories	139,858
Blaisse, G. F., Sliding chandelier	140,003
Blakey, J., Manufacturing boot and shoe heels	139 859
Bliss, E. S., Washing machine	139,940
Blunt, G. G., Grain drill	139,860
Boeklen, R., Machine for swaging screw threads on bolt and screw blanks	139,861
Bond, T. W., assignee	140,067
Bridges, A., Car spring	139 862
Brinly, T. E. C., Plow	140 004
Brockett, E. L., Bed bottom	140,005
Brombacher, C., Machine for seaming sheet metal	139 863
Brown, A. P., Globe valve	140,006
Brown, H. O., Composition dressing for roofs	139,864
Buckman, C. H., assignee	139,957
Buhler, M., Shipping and show case for boots and shoes	140,007
Burch, W. H., Turn table	139,941
Burt, J., Vehicle seat, (reissue)	5,446
Butterworth, C. F., Muff lining	139,942
Button, C., assignee	140,008
Buxton, L. W., Bedstead fastening, (reissue)	5,447
Busby, A. G., Magic lantern	139,865
Byers, J., assignee	140,025
Call, W., Jr., Seed planter	139,943
Cannata, D., Button fastening	140,008
Carbonel, M., Apparatus for burning hydrocarbons	140,009
Carleton, M. G., Thrashing machine	139,866
Carpenter, D. H., Bridle bit	140,010
Carter, R., Fire alarm telegraph	140,011
Caton, C., Miter box	139,867
Chaffee, J. P., Sewing machine braider	140,012
Chapin, A. P., assignee	140,000
Chapman, N., Loom temple	140,013
Chicago Waste Cleansing Company, assignee	139,921
Chinnock, G. H., Metal can for paints, &c.	139,868
Chinnock, G. H., Metal can for paints, &c.	139,869
Chinnock, G. H., Paper bag	139,870
Choate, B. B., Shoe lacing fastening	139,871
Chomel, I. A., Oscillating berth for ships	140,014
Clark, S. W., and W. R. Sykes, Signal lantern	140,015
Clubb, G., assignee	139,954
Coffin, D. N. B., Jr., Windlass and capstan	139,872
Colby, J. L., and L. B. Thomson, Medicine spoon	139,944
Coleman, H. T., Pump	140,016
Comstock, L. R., Manufacture of funnels	139,873
Cook, F., assignee, (reissue)	5,457
Cornell, J. B., Fire proof roof	139,945
Cram, A. W., Elevator	140,017
Crockett, S. J., Reed organ	139,874
Crosby, C. O., and H. Kellogg, Machine for producing folded trimming, (reissue)	5,448
Crosby, G. H., Registering steam gage	140,018
Crowell, J. H., Heddle eye opener	139,875
Cunningham, R., Device for making water traps	139,946
Currier, J. A., assignee	139,920
Curtis, A., Constructing wells	139,947
Cutler, W. H., Inhaler, (reissue)	5,449
Daboll, A. P., Bit stock	139,876
Dame, A. A., Flange union	139,877
Dame, A. A., Combined stop and check valve	139,878
Danforth, J. I., Stove polish	139,879
Davis, G. L., G. G., and J. H., assignees	139,930
Davis, J., Pipe stem	139,880
Dayton Malleable Iron Company	140,053
Denlinger, A. R., Fumigator for bee hives	139,881
Devlin, J., Forcing beer, &c., from barrels	139,882
Dixon, M. J., and W. Tunstill, Ice crusher	140,019
Dolan, T. & Co., assignees	140,068
Dolton and Ward	139,936
Dolton, G. E., Sewing machine ruffler	139,883
Dore, B., assignee	140,078
Doremus, W. T., Chair	139,948
Dutcher Temple Company, assignee	139,929
Dutcher, W. W., Loom temple	139,884
Ebbs, W. F., assignee, (reissue)	5,450
Eckert, A. L., Hand punch, (reissue)	5,450
Elliott, W. H., Cartridge box	139,885
Elm City Company, assignee, (reissue)	5,448
Eppinger, I., Plug and bunch tobacco	140,020
Errani, L. C., and R. Andera, Dynamic machine	139,021
Evendea, J. G., Apparatus for drawing oil from cans	139,022
Everitt, J. M., Gage for horse collars	139,949
Fabre, J. M., Bridle bit	140,023
Faulkner, E. H., assignee	139,931
Field, W. D., Cotton bale tie	140 024
Fitzhugh, B. G., Dumping cart	140,025
Flanders, L. B., Attaching cork retaining balls to bottles	139,886
French, J. W., assignee	140,078
Frost, J. B., Sash and door fastener	140,026
Gaisberg, F., Spittoon	140,027
Galand, C. F., Frame and stock for revolving fire arms	140,028
Gale, M. F., Vapor burner	140,029
Gale, M. F., Vapor burner	140 030
Galt, T. A., and G. S. Tracy, Corn planter	140 031
Gamewell and Company, assignees	140,106
Garaud, J., Hunting jacket	139,950
Getty, G. B., Saw mill head block	140,032
Godwin, J. B., Press	140,033
Goodfellow, J. T., and F. A. Sabbaton, Gas purifier	140,034
Gooding and Walker	139,935
Gorman, J. J., Paint brush	139,887
Grant, S. W., Bracelet	139,888
Green, W. V., and J. M. Kintzel, Medical compound	139,951
Gregg, A., Washing machine	139,889
Grosvenor, C. F., assignee	140,093
Grundin, C. F., Sofa bedstead	139,952
Guest, J. H., Electrical thermostat	139,953
Hadley, B. H., Machinery for bending the edges of boot and shoe soles	140,035
Haertle and Heckenbach	140,038
Hair, J. H., Animal trap	140,036
Hall, G., Medical compound	139,954
Hall, H. B., Package for caustic soda or alkali	139 955
Hall, J. S., assignee	140,100
Hall, N. C., assignee	140,088
Harris, L. W., Self-acting switch	139,956
Haun and Kernodle	139,963
Hawkins, S., Washing machine	140 037
Hays, C., Step ladder, (reissue)	5,451
Healey, J. I., Hydrant and fire plug	139,890
Heckenbach, J. A., and A. Haertle, Last block fastening	140 038
Henderson, J. M., assignee	140,087
Hendrickson, D. W., Blast and cupola furnace	139,891
Herveux, C., Tanning apparatus	139,892
Higgins, S., Lounge and bedstead combined	139,957
Higley, A., Car truck, (reissue)	5,452
Higley, A., Car axle box, (reissue)	5,453
Higley Car Journal Company, assignee, (reissue)	5,452, 5,453
Hill and McHarg	140,059
Hinckley, J. D., Hand car	140,039
Hinman, C., Animal poke	139,893
Hite, J. B., Tanning compound	140,040
Hobson, W., Nursing bottle	139,958
Heckensmith, W. H., Sewing machine shuttle	140,041
Holley, Miles and Wright	140,106
Hollingsworth, R. J., Soldering tool	140,042
Houck, G. O., and C. E. Sawyer, Brick machine	139,894
Howard, D. S., Combined roller and irrigator	140,043
Hubbell, A. F., assignee, (reissue)	5,446
Hurd, J. M., Bag machine, (reissue)	5,454
Hyde, J. R., Cooking stove	139,044
Irving, T. J., Suspender	140,045
Ives, W. A., Machine for forming auger bits, (reissue)	5 455
James, F. D., Combined collar and cravat	139,959
Jantzen, S. C., Coffee mill	139,960
Jenkins, C. B., Attaching metal caps to glass, &c.	139,961
Johnson, J. F., assignee	139,919
Jones, E. P., Seed planter and fertilizer distributer	140,046
Jordan, B. L., Chair fan attachment	140,047
Judd, M., Sash fastener	139,895
Keech, E., Elevator for buildings, &c.	139,896
Keeler, J. F., Platform scale	139,897
Keith, T. K., Sewing machine	139,902
Kellogg and Crosby, (reissue)	5,448
Kendrick, J. and J., assignees	139,875
Kent, J., Hanger for pulleys	139,898
Kernodle, J. W., and A. H. Haun, Ash leach	139 963
Kilgore, D. Y., Inside blind	139,899
Kintzel and Green	139,951
Kip Manufacturing Company, assignee, (reissue)	5,451
Knight, L., Loose pulley	140,048
Komp, A., Neck tie supporter	140,049
Lamb, S. T., Fiber cleaning machinery	140,050
Lauer, J. E., Manufacturing crystalline acid phosphate of lime for yeast powder	140,051
Leisher, G. W., Harvester	139,900
Little, S. H., Street railway car	140,052
Loeb, P., Plow	140,053
Lomas, J. Jr., Pedestal for stools and tables	140,054
Longwell, H., Boring machine	139,901
Lummus, W. W., Composite beam	139 902
Lummus, W. W., Beam for floors	139,903
Lummus, W. W., Beam for floors	139,904
Lyon, V. H., Bottle	139 905
Marcellus and Wilkins	140,103
Marsh, R., Lamp	139,964
Marshall, G., Sawing machine	139,965
Marston, F. W., Spirit level	140,055
Martin, C., Regulating the twist in spinning frames	140 056
Martin, H. B., Brake reaction movement	140 057
McAvoy, H. L., Fire extinguisher	139,906
McCall, M., and R. O. Wood, Safe vault	139 907
McDonald, P. J., Steam plow	139 906
McGovern, H. D., Nose bag for horses	140,058
McGovern, H. D., Sun shield for horses, (reissue)	5,456
McHarg, W. S., and A. B Hill, Sewer cleaning truck	140,059
McKnight, A. C., Machine for making boot and shoe heels	140,060
McMurray, L., assignee	140,042
McMurry, J., Cotton bale tie, (reissue)	5,457
McNeill, T. E., and R. M. Pratt, Feed water heater and condenser	139,908

Meigs, G. W., Spectacle temple	139,909
Mendenhall, E., assignee	140 032
Mercken, J., Animal trap	139,967
Merritt, J. C., Shoulder strap	140,061
Miles, Wright, and Holley	140,106
Miller, T. N., Manufacture of illuminating gas	139,910
Miller, W. P., Machine for grinding hay	139,911
Miner, J. G., Street lamp	140,062
Minter, T. W., Engraving and carving machine, (reissue)	5,458
Mitchell, D. L. H., Lifting jack	140,063
Moffitt, D. J., Shuttle and door fastener	140 064
Morgan, M. C., Organ reed	139,912
Morgan, W. F., assignee	140,078
Morse, J., assignee	140,055
Morton, T. C., assignee	140,091
Mouret, L. J. N., Clock work globe	140,065
Muhleisen, A., Hound for vehicles	140 066
Munson, D., Egg beater	140,067
O'Hara, C. M., Covering for steam and other pipes	139,968
Osborne, O., Pressing hosiery	140,068
Paff, J., Binder for loaded wagons and sleighs	139,969
Palmer, C. W., Reed organ	139,913
Parker, G. E., Musical wind instrument	140,069
Patrick, W. W., Cotton press	139,970
Pease, H., Steam generator	140,070
Pember, J. R., Type writing machine	139,914
Peres, J. B., assignee	140,009
Perrin, A., Adjustable templets for ships' frames	140,071
Peterson, C. J. C., Can opener	140,072
Pfund, A., Beer cooler	140,073
Piper, F. M., Cooler for wine, &c	139 915
Pittman, G. W., Fire-proof vault	139 916
Pomeroy, D. and W., Truss	139,917
Powers C. M., Beer strainer	139 971
Pratt and McNeill	139,908
Proctor, G. K., Lap board	140,074
Ramsay, G. M., Globe and holder for gas burners	140,075
Redfern, S., Spike	139,972
Replogle, M., Hopper for grinding mills	139,973
Rhorer, G., assignee	139,919
Rice, W. E., and J. Barnes, Wash boiler attachment	139,918
Rigby, J., Gas burner	139,919
Rightor, W. R., Elevator	140,076
Roberts, M. R., Coal screen and chute	140 077
Robertson, S. F., End gate for wagons	139,974
Rockwell, L. A., Cracker machine	139,920
Rockwood, L. O., Cider mill	139,975
Roser, C., assignee	139,931
Ross, J. G., Form plate for bottoms of shoe lasts	140,078
Royall, W. B., Insect destroying compound	140,079
Sabbaton and Goodfellow	140,034
Sagar, G., Cleaning cotton waste	139,921
Sargent, J. F., Metallic corner shield for boxes	140,080
Savery, C. C., Filter	139,922
Sawyer and Houck	139,894
Schollhorn, W., Pencil attachment for dividers	140,081
Schuyler, I. S., and S. I. Thursby, Elevator for buildings	140,082
Scott, Q. A., Grain binder	140 083
Senour, F. L., Reflector	139,923
Shaler, R., Exercising machine	139,924
Shaw, E. F., Support for wash tubs	139,925
Sherman, J. A., Truss	139,926
Shoninger, B., assignee	140,054
Sichler, G., Apparatus for pitching barrels	139,976
Simpson, J. A., assignee	139,923
Sister, M., assignee	140,069
Slicer, W., Railroad car spring	140,084
Smith, A. E., assignee	140,101
Smith, A. H., Stone crusher	140,085
Smith, J. and J., Knitting machine	140,086
Smith, J. H., Welding steel to cast iron	140 087
Smith, J. M., Tobacco drier	139,977
Smith, H. M., Can for oil	139,927
Smith, L. B., Can opener	140,088
Snyder, F., Child's carriage	139 978
Spear, J., Base burning stove, (reissue)	5,459
Spear, J., Base burning stove, (reissue)	5,460
Spear, V. K., assignee	140,072
Spellman, W. C., Show case	140,089
Staffin, N., Watch regulator	139,928
Stevens, W. X., Domino	140,091
Stever, J., Loom picking mechanism	139,929
Stimpson, E. S., Loom temple	140,092
Stockwell, E., and W. H. Taylor, Post office box	139,930
Stone, J. M., Spooling machine	140,093
Stone, J. W., Tobacco case	139,931
Stout, C., Clamping device	140,094
Sweet, G., Wheelwright machine	139,932
Sweetland, A. C., Stove pipe joint	140,015
Sykes and Clark	140,095
Taylor, J. W., Barrel head	140,096
Taylor, S., Guide for circular saws	140,092
Taylor and Stockwell	139,979
Terrell, G. J., Clothes washer	139,933
Thomas, G. C., Shirt	139,980
Thomas, H., Carving machine	140,048
Thomas, J. H., assignee	139,944
Thomson and Colby	140,092
Thursby and Schuyler	140,096
Towle, J. C., assignee	140,031

BOUND VOLUMES OF PATENTS.

The Office is now prepared to furnish to subscribers the monthly volumes of patents at $125.00 per annum, bound in half-sheep.

In these volumes the specifications are in full, the type of the same size as the printed patents and records; the drawings are in full, but are one-half the size (linear) of those attached to the patents and bound up for record; the illustrations are four on a page, but *fac-similes* of the originals, with the headings and signatures.

The volumes are the same size as the patents and the OFFICIAL GAZETTE, and have an average of 800 pages of specifications, 200 of drawings; total of each volume about 1,000 pages. They commenced with the issue of July 2, 1872, being the successors in this form of the weekly volumes of patents published under the joint resolution of Congress, passed January 11, 1871, which discontinued the publication of the illustrated annual report of the Commissioner of Patents, and provided for the publication in lieu thereof of complete copies of the specifications and drawings of patents issued subsequently to June 30, 1869. Under this resolution the volumes were to be placed for free public inspection in the capital of each State and Territory of the United States, and in the clerk's office of certain of the federal courts. The Commissioner is also authorized by the resolution to "furnish a complete set of such specifications and drawings to any public library which will pay for binding the same into volumes to correspond with those in the Patent Office, and for the transportation of the same, and which shall also provide proper custody for the same, with convenient access for the public thereto, under such regulations as the Commissioner shall deem reasonable."

After filling the requisition as provided above, a surplus remains which the Commissioner now offers at the rate of $125.00 per annum—say, 1,000 pages per month: 9,600 pages of specifications, 3,120 pages of drawings—12,720 pages.

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited, and the invention therein described will become public property, as against the applicant therefor, unless he shall make a new application within two years from the date of notice of the original allowance.

COMMISSIONER'S DECISIONS.

JOHN L. LAY *vs.* J. A. BALLARD.—*Interference.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the interference between the application of John L. Lay and the patent of John A. Ballard, for* GUIDING TORPEDO-BOATS BY ELECTRICITY.—*Decided June* 13, 1873.]

Where the inventor of a warlike machine which he could reduce to practice only by the aid of a national power, and which was of no service except to one engaged in actual hostilities, after endeavoring to induce our Government to take it up, procured a foreign potentate to do so, and reduced it to practice under contract with him, and with the means thus obtained reduced it to practice in this country, using diligence throughout, he was held entitled to date his invention back to the time when he made the drawings for the foreign machine, and he was awarded priority over one who invented afterward.

LEGGETT, *Commissioner:*

The invention in question "relates to a method of steering boats by means of electric currents transmitted from a shore battery through an insulated telegraphic cable, acting, through the medium of a battery carried upon the boat, upon a steering mechanism, so as to bring the control of the direction of the battery under the influence of an operator on shore or at some fixed point of departure." It "consists in combining with an electro-magnetic apparatus on board the boat, and operated from the shore, mechanism for shifting the steering apparatus as the electric currents are reversed."

Ballard has taken no testimony, and the date of his invention is therefore August 9, 1870, the date of filing his application for patent.

The decision of the Board, except upon one or two points, embodies my views of the case. They say: "There is little opportunity for controversy about the facts. Lay conceived the idea in 1866. In 1867 he made a full and clear drawing (Exhibit D) of the invention in detail, and described it as fully and clearly to Hubbe, a naval architect. From this time onward he appears to have been endeavoring, with reasonable diligence, to bring the matter before the Government and into actual embodiment. * * * * He was induced to enter into negotiations with the agent of the Viceroy of Egypt, and, visiting that country, completed preliminary arrangements early in 1870, and received, in advance, funds sufficient to enable him to commence building the boat on which to apply his invention. On the 19th day of July, 1870, Lay sent for Hubbe, who had been employed by the Government, in connection with Lay, in building torpedo-boats, and requested him to make working drawings of a torpedo-boat with the electric devices by which it could be steered by persons at a distance from it, such as he had described to him in 1867.

"Hubbe says that he went to work immediately, without any further instructions than those which were given him by Lay in 1867, and within two weeks had completed the working drawings. No change was made in the plan, with the single exception of the substitution of one old form of valve for another, made on account of a change of motor. The boat was completed in January of 1871, was taken to Egypt, tested, and proved satisfactory to the Egyptian Government. Lay received the balance of the sum originally agreed upon, returned to the United States, commenced negotiations with this Government, and, under some arrangement with it, built another boat on the same plan.

"Throughout the whole history of the invention there appears to have been on the part of Lay no lack of reasonable diligence. The invention is one of a peculiar nature and concerns only governments. No private individuals or company would be interested or permitted to blow up their own or others' vessels, or in time of peace would need such steering devices. Nor in fact could the invention be submitted to actual use except

in time of war. The intention in such weapons of defense is that they shall be so formidable as not to need to be used. Of the two ways, then, by which an invention may be made of public benefit—the publication of letters patent or the actual embodiment, and, as far as practicable, trial of the thing invented—Lay appears in this case to have chosen the better. By interesting the Government he had secured the necessary means for submitting the invention to such practical test as was possible in time of peace, and before the earliest date which Ballard can now claim had accomplished all that an inventor, as such, could do—the production of working drawings. These were followed up at once, and the boat made in all respects according to the invention, without delay. There were in this no uncertain sketches, nothing of mere experiment not followed up until the patent of another party was brought to notice, (for Lay was not advised of the patent of Ballard until late in 1871,) but intelligent, persistent, continued effort was followed in reasonable time by reduction to practice.'

"We see no good reason why, having finally, unaided, reduced the invention to practice and use, so far as use was possible, he should not be permitted to go back to the beginning of this reduction to practice, if not to the drawing, 'Exhibit D,' made in December, 1867, at least to the working drawings of July, 1870. * * *

"Lay's extraordinary diligence in reducing his invention to practice, and in bringing it to the notice of the only parties who could use it, goes far to justify him in neglecting to apply for a patent.

"And still further, as the invention concerned governments alone, a patent was not only of no use to him whatever, but might be positively disadvantageous, the common publication of the thing giving foreign governments better opportunity to appropriate it without profit to the inventor. * * * * He applied for a patent not long after learning that one had been granted to another party, and in our opinion there was no unreasonable delay."

The decision of the Board awarding priority to Lay is affirmed.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—NORTHERN DISTRICT OF NEW YORK.

THE BERDAN FIRE-ARMS MANUFACTURING COMPANY *vs.* E. REMINGTON & SONS.

An improvement which becomes necessary in the manufacture of a patented implement in order to overcome a difficulty growing out of a departure from the form of the model, and which is introduced into it by the workmen without the knowledge of the patentee, cannot be appropriated by him as his invention.

If such an improvement is embodied by the assignees of the patentee in a reissue, they cannot recover upon it against others who use it.

When in the manufacture of Berdan's fire-arm the hinge of the breech-piece was raised so high as to bring its upper surface above the line of the bore, and thus interfere with the insertion of the cartridge, it is questionable whether it is a patentable invention to cut away the obstructing portion of the hinge, and thus give that part of it a curved surface.

[*H. M. Ruggles*, for complainant.
Geo. Gifford, for defendant.]

WOODRUFF, *J.*:

I have very grave doubts whether the so-called device described in and covered by the reissued patent upon which this suit is brought is patentable. The manner of constructing and securing the breech-piece for a breech-loading gun, which formed the subject of the original patent to Hiram Berdan, was, so far as appears in this case, an original invention. In procuring reissues of that patent the plaintiff, his assignees, have sought to secure to themselves a monopoly of a curved surface on the hinge of the breech-piece, which was no feature of the invention in what were its distinguishing features, but which was an obvious mechanical necessity incidental to the application of Berdan's device, or to the application of any similar device, whenever the hinge-pin is placed so high as to raise the surface of the hinge above the line of the barrel. Cutting away an obstruction to the introduction of the cartridge did not require invention—it was inevitable.

But my conclusion in this case does not rest upon the doubt so expressed. I find as a fact established by the evidence that Berdan was not the inventor of the curve in the hinge, which is the subject of the patent sued upon.

His invention neither contained nor contemplated this feature in the breech-piece. He did not contemplate placing the hinge-pin so high as to render the curve necessary, nor did he give to the mechanics who, under his partial supervision, constructed the model of his actual invention, or the drawings from which his first gun was made, any instruction or suggestion embracing such a curve. The making of the curve in the hinge, when that gun was in fact constructed, resulted from a departure from Berdan's model by the workmen themselves, not by design, but through inadvertence. When the parts of the gun were completed and put together the workmen found that either by a departure in the working drawings (made by one of them) from the model, or by a departure in the gun from the working drawings, the hinge-pin was raised so high as to interfere with the insertion of the gun-barrel, and also to interfere with the insertion of the cartridge, and they, therefore, and as a matter of judgment, cut it away. They did it not to obviate a difficulty necessarily incident to the use of Berdan's invention, but a difficulty created by the workmen themselves through an inadvertent error and departure from Berdan's contemplated position of the hinge-pin. In short, he contemplated raising the hinge-pin as high as, with the hinge in the ordinary or straight-surface form, was conveniently practicable, and they made under his direction both model and drawing of his invention in that form; but when they made a gun they placed the pin so high as to create the obstruction above referred to, and they cut it away to cure the apparent defect.

In this Berdan was not consulted. He was not present when its necessity in that gun was discovered, nor was he present when it was done. Berdan did not invent it. If anything in the nature of invention pertains to it, that was done or made by the workmen without his knowledge.

The bill herein must be dismissed with costs.

U. S. CIRCUIT COURT—SOUTHERN DISTRICT OF NEW YORK.

HUGH W. COLLENDER *vs.* WILLIAM H. GRIFFITH.

THE SAME *vs.* THE SAME.

The defendant will not be permitted on the hearing to read depositions showing prior knowledge and use of the thing patented by persons whose names are not given in his answer.

It being shown that tables with the sides beveled inward from the top have been known before, a patent is void which claims the design of a billiard-table thus constructed, in order that the player may advance his foot farther under it.

It is a mere question of judgment, not invention, how far the bevel shall be carried, and a patent for the design of a billiard-table is not rendered valid because a much deeper bevel is shown in it than has been used in other tables.

If a patent for a design covers the ornamentation shown in it, it is no infringement to use the principal figure without the ornamentation.

A person who publishes by way of advertisement an engraving of an article he has on sale, cannot by copyrighting it prevent others who have an equal right to sell the article from using a similar engraving in advertising it.

WOODRUFF, *J.*:

These two suits were submitted together upon the same proofs. The only question argued by counsel was whether the testimony of certain witnesses called to prove the want of novelty in the alleged invention or new design, and who mention the knowledge and use thereof by persons not named in the defendant's answer, is competent. On that question I must hold that the evidence of the knowledge and use by persons not so named is incompetent, and must be rejected. The court has no discretion on the subject. Such knowledge and use is not a defense, under the statute, available to the defendant. It is therefore rejected. The counsel, on the argument of the question above stated, submitted the cases on the merits on briefs then or afterward submitted. The one suit is founded upon a patent for a design for a billiard-table; the other upon a copyright of an engraving exhibiting a view of the same billiard-table, with its ornamentation by carving, &c.

As to the first, I am of opinion that, in view of the state of the art and the proof of the prior existence and use of billiard-tables similar in form, there was no ground for such a patent. In truth, as a form of construction or configuration, it was not novel in any such sense that its adoption constituted invention. This is proved without the testimony which I have above rejected as inadmissible under the pleadings. It is to be remembered this is not a patent for the billiard-table itself, or for anything new in its actual construction, but only for a design embracing its shape or configuration, by whatever means it is effected. The principal, if not the sole, feature claimed is, the form of beveled sides and ends. Tables and designs for tables having such beveled sides and ends, both straight or in the form technically called "ogee," are shown to be old and in public use long before the complainant's alleged invention. This is so clearly established that the argument in behalf of the complainant proceeds mainly upon the ground that the inclination or bevel is greater in the complainant's design than in the others. It is at least doubtful whether that is true as to some of such prior designs; but, in any view of that point, the subject was one of degree of inclination and bevel, to be determined as matter of judgment, in view of the purpose such bevel is adapted to serve, and not matter of new discovery or invention. It embraced no new idea. In either the inward inclination of the lower part of the sides of the table, receding from the outer edge of the top or cushion bar, enabled the player to stand with one knee partially under the table, for convenience in some part of his playing. The extent of such recess was more matter of judgment in the manufacture, looking to the purpose for which it was desirable. Had the complainant invented something new in the mode of construction of the sides of the table—some new device by the use of which a table could be constructed with a greater bevel or inward inclination than was before practicable, or a new device by which a new result was produced in making any beveled side—that might perhaps have been secured to him; but I think it clear that a mere design which is practically a suggestion that a greater degree of inclination of the sides will make the table more convenient, when other tables already existed which, with a view to the same useful result in kind, were constructed with a similar bevel, is not invention, nor the proper subject of a patent. If it be possible, however, to include in the complainant's patent not merely the form or configuration of a billiard-table, but its peculiar ornamentation, then the complainant must fail, because the defendant does not use the complainant's ornamentation. I state this hypothetically, because, unless the complainant be confined to the specific ornamentation which his design exhibits, then there is nothing in that feature.

As to the copyright, these views are in a large degree applicable to that, also; and, besides, the engraving claimed to be the subject of copyright is not a work of art, print, lithograph, or engraving having any value or use as such. It is a mere copy of what the complainant has patented as a design, and constitutes the mode in which complainant advertises his tables. The defendant, having the right to make his own tables as he does make them, has an equal right to advertise them by showing the public their appearance by engraving, lithograph, or photograph.

The bills of complaint must be dismissed with costs.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

24,863.—*Sewing-Machines.*—Granted to E. A. GOODNS and E. L. MILLER, July 26, 1859; reissued February 9, 1864. Hearing July 9, 1873.

24,905.—*Piano-Fortes.*—Granted to JOHN U. FISCHER, July 26, 1859. Hearing July 9, 1873.

24,915.—*Casting Copper Cylinders.*—Granted to FREEBORN ADAMS, August 2, 1859. Hearing July 16, 1873.

24,923.—*Elevators for Warehouses, Factories, Mines, &c.*—Granted to ALBERT BETTELEY, August 2, 1859. Hearing July 16, 1873.

24,947.—*Journal-Boxes.*—Granted to JOHN A. MONTGOMERY August 2, 1859. Hearing July 16, 1873.

24,953.—*Meat-Cutters.*—Granted to JOHN G. PERRY, August 2, 1859. Hearing July 16, 1873.

24,963.—*Flour-Packers.*—Granted to SAMUEL TAGGART, August 2, 1859; reissued November 7, 1871. Hearing July 16, 1873.

24,987.—*Fishing-Reels.*—Granted to WILLIAM BILLINGHURST, August 9, 1859. Hearing July 23, 1873.

25,005.—*Governor-Valves.*—Granted to BENAIAH FITTS, August 9, 1859. Hearing July 23, 1873.

25,014.—*Machines for Cutting Out Wooden Ware.*—Granted to GEORGE R. HAY, August 9, 1859. Hearing July 23, 1873.

25,015.—*Wood-Saw Frames.*—Granted to JAMES HAYNES, August 9, 1859; reissued August 25, 1863. Hearing July 23, 1873.

25,017.—*Steam-Boilers.*—Granted to ROBERT HOOPER, August 9, 1859. Hearing July 23, 1873.

25,036.—*Post-Marking Stamps.*—Granted to MARCUS P. NORTON, August 9, 1859. Hearing July 23, 1873.

25,061.—*Elevator or Hoisting Apparatus for Hotels, &c.*—Granted to OBIE TUPTS, August 9, 1859. Hearing July 23, 1873.

25,071.—*Roof for Railroad Cars.*—Granted to A. P. WINSLOW, August 9, 1859; reissued August 8, 1865. Hearing July 23, 1873.

25,115.—*Self-Acting Wagon-Brake.*—Granted to BENJAMIN S. HEALY, August 16, 1859. Hearing July 30, 1873.

25,148.—*Weighing-Scales.*—Granted to FRANCIS M. STRONG and THOMAS ROSS, August 16, 1859. Hearing July 30, 1873.

25,149.—*Blanks for Shoe-Pegging Machines.*—Granted to BENJAMIN F. STURTEVANT, August 16, 1859; reissued June 12, 1866. Hearing July 30, 1873.

25,153.—*Carding-Engines.*—Granted to SAMUEL WETHERED, August 16, 1859. Hearing July 30, 1873.

25,166.—*Iron Fences.*—Granted to JOHN B. WICKERSHAM and HENRY JENKINS, August 16, 1859. Hearing July 30, 1873.

25,167.—*Mode of Lighting Gas by Electricity.*—Granted to ARCHELAUS WILSON, August 16, 1859. Hearing July 30, 1873.

25,183.—*Nail-Machines.*—Granted to DANIEL DODGE, August 23, 1859. Application filed May 23, 1873. Hearing August 6, 1873.

25,191.—*Machines for Making Paper-Bags.*—Granted to WILLIAM GOODALE, August 23, 1859. Hearing August 6, 1873.

25,199.—*Feeding Paper to Printing-Presses.*—Granted to RICHARD M. HOE, August 23, 1859; reissued June 30, 1871. Hearing August 6, 1873.

25,235.—*Manufacture of Iron.*—Granted to BERNARD LAUTH, August 23, 1859. Application filed May 22, 1873. Hearing August 6, 1873.

25,237.—*Horizontal Wheels.*—Granted to ABRAHAM ANDREWS and HARMON KALBACH, August 30, 1859. Application filed May 26, 1873. Hearing August 13, 1873.

25,239.—*Elastic Hose Tubing*, granted to JOHN C. BOYD, August 30, 1859. Application filed May 29, 1873. Hearing August 13, 1873.

25,269.—*Nail Machines*, granted to DANIEL DODGE, August 30, 1859. Application filed May 31, 1873. Hearing, August 13, 1873.

25,342.—*Stoves.*—Granted to EDWARD M. MANIGLE, September 6, 1859. Application filed June 5, 1873. Hearing August 20, 1873.

25,344.—*Machines for Wiring the Joints of Clothes Pins*, granted to ALVIN C. MASON, September 6, 1859. Application filed May 31, 1873. Hearing, August 20, 1873.

25,364.—*Watches.*—Granted to CHARLES E. JACOT, September 6, 1859. Hearing August 20, 1873.

25,373.—*Machines for Making Paper Boxes.*—Granted to SILAS B. TERRY, September 6, 1859; reissued May 17, 1870. Application filed June 5, 1873. Hearing August 20, 1873.

25,395.—*Heels for Boots and Shoes.*—Granted to SIMEON DODGE, Jr., and BENJAMIN POTTER, Jr., September 13, 1859. Application filed June 13, 1873. Hearing August 27, 1873.

25,434.—*Cotton-Scrapers.*—Granted to JONATHAN H. MITCHELL, September 13, 1859. Application filed June 10, 1873. Hearing August 27, 1873.

25,449.—*Boilers and Steamers.*—Granted to DANIEL R. PRINDLE, September 13, 1859. Application filed June 13, 1873. Hearing August 27, 1873.

25,463.—*Seeding-Machines.*—Granted to SILAS G. RANDALL, September 13, 1859; reissued May 25, 1869. Application filed June 11, 1873. Hearing August 27, 1873.

25,473.—*Scales.*—Granted to ANDREW TURNBULL, September 13, 1859. Application filed May 31, 1873. Hearing, August 27, 1873.

25,484.—*Grain-Separators.*—Granted to JONATHAN L. BOOTH, September 20, 1859; reissued September 25, 1860, and November 29, 1864. Application filed June 14, 1873. Hearing September 3, 1873.

25,488.—*Hydraulic Presses.*—Granted to M. H. CLARK, September 20, 1859. Application filed June 20, 1873. Hearing September 3, 1873.

25,499.—*Railroad-Car Seat.*—Granted to ELI WHEELER, September 20, 1859. Application filed June 17, 1873. Hearing September, 3, 1873.

25,506.—*Lamps.*—Granted to HALVOR HALVORSON, September 20, 1859; reissued June 6 and December 5, 1871. Application filed June 6, 1873. Hearing September 3, 1873.

25,508.—*Tailors' Shears.*—Granted to ROCHUS HUBISCH, September 20, 1859. Application filed June 20, 1873. Hearing September 3, 1873.

25,512.—*Bung-Hole Borer and Reamer.*—Granted to JOSIAH KIRBY, September 20, 1859. Application filed June 19, 1873. Hearing September 3, 1873.

25,544.—*Try-Cocks for Steam-Boilers.*—Granted to JOHN F. COOK, September 20, 1859. Application filed June 10, 1873. Hearing September 3, 1873.

25,565.—*Rolling-Mills.*—Granted to JOHN and GEORGE FRITZ, September 27, 1859. Application filed June 27, 1873. Hearing September 10, 1873.

25,569.—*Bedstead-Slats.*—Granted to TYLER HOWE, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,570.—*Mode of Arranging Couches in Railroad Cars.*—Granted to EDWARD C. KNIGHT, September 27, 1859. Application filed May 31, 1873. Hearing, September 10, 1873.

25,572.—*Molding Water-Troughs.*—Granted to JAMES ALLEN LOWE, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,586.—*Burglar-Alarms.*—Granted to ABBOTT O. ROSS, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,588.—*Steam Punching-Machines.*—Granted to JOHN SPARROW, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,640.—*Steam-Boilers.*—Granted to JOSEPH HARRISON, Jr., October 4, 1859. Application filed June 30, 1873. Hearing September 17, 1873.

25,662.—*Construction of Prisons.*—Granted to EDWIN MAY, October 4, 1859. Application filed June 23, 1873. Hearing September 17, 1873.

25,683.—*Hydrants.*—Granted to CHARLES L. STACY, October 4, 1859; reissued June 6, 1865. Application filed June 28, 1873. Hearing September 17, 1873.

25,747.—*Method of Combining Emery with Caoutchouc.*—Granted to THOMAS J. MAYALL, October 11, 1859. Application filed June 16, 1873. Hearing September 24, 1873.

25,796.—*Jacquard Machines.*—Granted to AVERY BABBETT, October 18, 1859. Application filed June 30, 1873. Hearing October 1, 1873.

26,243.—*Water-Closet Basins.*—Granted to WILLIAM BOCH, Sr., November 29, 1859. Application filed June 10, 1873. Hearing November 12, 1873.

27,539.—*Manufacture of Gun-Barrels.*—Granted to JAMES H. BURTON, March 20, 1860, and antedated to September 29, 1859; reissued December 26, 1871. Application filed July 1, 1873. Hearing September 10, 1873.

30,201.—*Apparatus for Freezing Liquids.*—Granted to FERDINAND PHILIPPE EDOUARD CARRÉ, October 2, 1860; reissued in two divisions February 18, 1873. Patented in France August 24, 1859. Application filed May 17, 1873. Hearing August 13, 1873.

EXTENSIONS GRANTED.

24,531.—*Improvement in Gas-Retorts*, granted to WILLIAM BEAUMONT, June 28, 1859.

Claim.—Making all that part of a retort which is most subject to expansion and contraction corrugated, to prevent fracture, as herein described.

24,563.—*Improvement in Arranging Couches in Railroad Cars*, granted to EDWARD C. KNIGHT, June 28, 1859.

Claim.—1. The mode of arranging berths or couches over backs of railroad-car seats, substantially as set forth.

2. The manner of supporting the backs of the seats by slides E and rod F, for the purpose herein shown and described.

24,588.—*Improvement in Hay-Spreaders*, granted to J. C. STODDARD, June 28, 1859; reissued June 1, 1869, numbered 3,481.

Claim.—1. The combination, in a hay-making machine, of a frame, connected with the axle of the supporting-wheels, and a frame carrying rotating rakes, and vibratable about said axle, the combination being and operating substantially as set forth.

2. The combination, in a hay-making machine, of two wheels, a draft-frame carrying a driver's seat, a vibratable frame carrying rotating rakes, and a catch on the draft-frame to hold up the rakes.

3. The combination, in a hay-making machine, of a draft-frame, carrying the driver, with a vibratable rake-frame, raised or lowered by the driver.

4. The combination, substantially as set forth, in a hay-making machine, of two wheels, a frame arranged between the wheels and carrying the driver, and a vibratable frame, also arranged between the wheels and carrying rotating rakes.

5. The combination, in a hay-making machine, of a frame vibratable on the axle of the supporting-wheels, with rotary rakes mounted on the frame outside the periphery of the driving-wheels, and raking a swath wider than the distance between the wheels.

6. The combination, in a hay-making machine, of a frame vibratable about the axle of the supporting-wheels, with rakes rotated from the outer side of the driving-wheels.

7. The combination, in a hay-making machine, of a frame vibratable about the axle of the supporting-wheels, and a main frame with a driving-belt traversing pulleys on the axle and rake-shaft, substantially as set forth.

8. The combination, in a hay-making machine, of a perforated rotating shield, with rake-teeth adjustable radially, relatively to their axis of rotation.

9. The combination, with a hay-making machine, of rotating rake-teeth, adjustable relatively to their axis of rotation.

10. The combination, with a hay-making machine having rotating teeth, of a stop to cause the teeth to cast as rakes.

11. Making one set of the adjustable rotating rake-teeth longer than the others, for use as a hay-rake, as set forth.

12. The combination, in a hay-making machine, of rake-teeth adjustable radially relatively to their axis of rotation, with a frame vibratable about the main axle.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date June 24, 1873.]

6,711.—*Center-Piece for Ceilings.*—BERNHARD DREYER, Philadelphia, Pa., assignor to WILLIAM H. FRENCH, same place. Application filed May 31, 1873.

6,712.—*Center-Piece for Ceilings.*—BERNHARD DREYER, Philadelphia, Pa., assignor to WILLIAM H. FRENCH, same place. Application filed May 31, 1873.

6,713.—*Carpet.*—ALFRED HEALD, Philadelphia, Pa., assignor to MCCALLUM, CREASE & SLOAN, same place. Application filed June 6, 1873.

1,338.—*Illuminating-Oil.*—THE DEVOE MANUFACTURING COMPANY, New York, N. Y. Application filed June 16, 1873.

1,339.—*Fountain-Pump.*—JOSIAH A. WHITMAN, Cranston, R. I. Application filed July 8, 1872.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date June 24, 1873.]

ORIGINAL PATENTS.

140,107.—*Book-Stand.*—JAMES B. ANNIN, Rochester, N. Y. Application filed May 9, 1873.

Two leaves or plates are hung by pivots to the ends of two levers, which in turn are centrally pivoted to a support which allows the swinging of the levers. To the bottom of each leaf is attached a stiff pendent arm, and the lower ends of these arms are pivoted to a single central lever, which is parallel with the upper levers and pivoted at its center so as to turn with them.

Claim.—The levers B B, connected together by the rods a a, in combination with the levers A A, levers C C, rods b b, and pivots f d, the whole constructed, arranged, and operating substantially as set forth.

140,108.—*Argand Burner.*—CHARLES E. BALL, Philadelphia, Pa. Application filed June 3, 1873.

A hollow shell, vertically adjustable within the outer case, is beveled outwardly at top so that the rim shall, together with the inwardly-projecting flange of outer case, form a valve and its seat. The rim and milled button of the inner case limit its motion.

Claim.—The inner shell B extending above the top of the outer shell A, and beveled outwardly at its upper edge, forming a valve having its seat on the edge of the outer shell in combination with said outer shell, arranged to operate as described.

140,109.—*Wardrobe-Bedstead.*—CHARLES L. BARRITT, Brooklyn, N. Y. Application filed May 23, 1873.

The mattress-frame is pivoted at one end to the head-board or sliding front, and the other end is connected by a spring with the top of the wardrobe-case. To the middle of the frame are pivoted levers, which in turn are pivoted to the sides of the wardrobe-frame. To the top of the extensible head-board two folding leaves are hinged, which serve to hold in a closed position the wardrobe-doors when the bed is folded up.

Claim.—1. The combination of the mattress-frame E and elevating-levers G with the frame A and cheek-pieces C of the extensible head-board B, arranged and operating substantially as described.

2. The combination of the spring K with the mattress-frame E and elevating-levers G, substantially as described, and for the purpose set forth.

3. The folding-leaves P and Q, made of different widths, and hinged to the head-board B, in combination with the wardrobe-doors R, all arranged and operating as and for the purpose set forth.

140,110.—*Wagon-Spring.*—WILLIAM H. BRACE, Nunda, N. Y., assignor to himself and J. R. WOODWORTH, same place. Application filed May 27, 1873.

To the side bars are secured short leaf-springs, which are coupled to the forward half-elliptic spring.

Claim.—In combination with the axles and front head-block of a wagon, the side-reaches D D, springs I I, couplings e e, and spring J, secured on the head-block for supporting the seat-arms and seat, substantially as herein set forth.

140,111.—*Wrench.*—BYRON C. BRADLEY, Chicago, Ill. Application filed July 15, 1872.

The jaws are so connected as to form a handle, and are hinged upon a rivet passing through a slot or mortise. They are adjusted by means of a projection and rack on the tail end of the wrench, which forms the handle.

Claim.—The combination of the extended jaws A B, provided with an ear and pivot H and slot C, with the notches F and point E located at the ends, so that a slight pressure of the hand will hold them in their adjustment, substantially as specified.

140,112.—*Rotary Churn.*—WILLIAM BRAND and GOTTLIEB PUDER, Evansville, Ind. Application filed April 10, 1873.

A revolving perforated barrel, provided with opening and lid on its side, has longitudinal beaters attached to opposite sides of its inner surface, on the outer edges of which beaters are secured blades having beveled edges, which incline to the sides of the churn. Two more strips, of triangular form, are situated beneath and between the perforated beaters, and running parallel thereto.

Claim.—The barrel-churn A, provided with perforated wings C C, inclined beveled edged blades D D below, and triangular strips G G between said wings, all substantially as and for the purpose herein specified.

140,113.—*Mandrel for Holding Tapered Cast Rings.*—GEORGE E. BERTELL, Rochester, N. Y. Application filed October 5, 1872.

The mandrel is grooved longitudinally, and has a shoulder on one end. The ring on which a screw is to be cut has a lug or internal projection, which fits into the groove and prevents the ring slipping on the mandrel. A collar or washer holds the ring against the shoulder, and also serves as a shoulder or seat for the next ring. In this way several rings are placed on the mandrel, and are held in place by a key driven in a slot in the end of the mandrel.

Claim.—The method of holding a number of castings together, while the threads are being cut, by means of the mandrel A, collars or sleeves B B and D, and the key K, or its equivalent, substantially as shown and described.

140,114.—*Corn-Planter.*—GEORGE J. CARPENTER, Adrian, Mich. Application filed February 18, 1873.

There are two rectangular frames jointed together at the middle. The forward section is supported upon bearing-wheels, and the after section is supported upon the forward end of the after section, and this is so connected to a lever upon the forward section by a rope or chain that the after section can be lifted from the ground at pleasure.

Claim.—1. The combination of the standards F carrying the shovels G, the bars *e*, and the radius-rods *b*, with relation to the frame C, rock-shaft *d*, arms *e*, cords *f*, and lever *g*, as and for the purpose set forth.

2. The combination of lever *g*, rock-shaft *d*, and cords *o o* and *f f* with the standards of the furrow-openers of the main frame C' carrying the shovels K K, as and for the purpose set forth.

140,115.—*Safety-Valve.*—WILLIAM CHURCHILL, St. Louis, Mo. Application filed March 25, 1873.

A chamber above the safety-valve communicates with the boiler, allowing the steam to hold the valve down. A small valve, held down by a weighted lever, when raised by the pressure, cuts off the steam from the safety-valve chamber and allows the steam in it to escape, the valve to raise, and the boiler steam to escape. A third valve is opened by a float; it sounds an alarm, and opens the safety-valve.

Claim.—1. The arrangement of the additional safety-valve D having ports *d*, valve-seat C' having steam-space *c*, exhaust-ports *c'*, and steam-pipe C, to operate as and for the purposes set forth.

2. An auxiliary valve, E, arranged to operate in combination with valve D, to prevent the reseating of the main safety-valve B, in the manner and for the purposes set forth.

3. The combination of the safety-valves D E B, to effect the discharge of the surplus steam from boiler and relieve same, in the manner and for the purpose set forth.

4. The combination of cylinder A, main valve B, steam-pipe C, valve-seat C', steam-space *c*, exhaust-ports *c'*, valve D, its ports *d*, valve E, seat *e*, socket-guide F, its ports *f*, valve-stem G, lever G', float g^3, and top lever H^1, to operate as and for the purposes set forth.

140,116.—*Device for Elevating Building Materials.*—JACOB H. COE, Brighton, Mich. Application filed May 8, 1873.

Two drums of varying diameters, one connected by tension-rope to carriage or conveyer and the other by another rope to a counter-weight; the drums governed by pawl, ratchet, lever, and spring.

Claim.—1. The drums I I' of varying diameters, in connection with the tension-rope N attached to the carriage C, and rope P attached to a counter-weight, R, as described.

2. The combination of the drums I I', tension-rope N, and rope P having counter-weight R with the pawling devices, as described.

140,117.—*Cigar-Trimmer.*—ANTHONY CRAMER, Detroit, Mich., assignor to himself and FRANK HUETTEMANN, same place. Application filed April 8, 1873.

The lever-knife works against a plate, recessed to hold the cigar, the straight knife having a shear-cut. A spring-gage works upon a guide-rod attached to the grooved bed-plate, by means of which the length of the cigar is determined.

Claim.—1. The plate B of a cigar-trimmer having stop *d*, and a recess ribbed for the cigar, combined with the laterally-bent lever-knife C having a straight shear-cutting edge, and held closely to the rib and plate, all as herein described.

2. The guide-rod F and spring-gage G, constructed as described, in combination with the bed-plate A of a cigar trimmer, as shown and set forth.

140,118.—*Mill-Pick.*—JOTHAM CUMMINGS, West Charleston, Vt. Application filed April 24, 1873.

Claim.—1. A mill-pick head consisting of the stationary part A and movable part C constructed and fitted together to hold the blade between them, substantially as described, the one being provided with the lips *b*, and the other with loop E, arranged and operating to clamp the two firmly together, as set forth.

2. The combination of the head A and plate C with an interposed blade, the head being formed with the flaring channels or recesses *c b* and wedge A', and the plate with the lips *k k*, loop E, and teeth *e e*, &c., substantially as and for the purposes stated.

140,119.—*Nut-Lock.*—EDWARD CZARNIECKI, Allegheny, Pa. Application filed September 11, 1872.

A circular washer, having a series of radial slots extending inward from its periphery, is provided with a tongue in the central opening that projects into a longitudinal groove in the bolt. When the nut is screwed up tight one of the pieces of the washer is turned up against the side, thus preventing any movement of the nut.

Claim.—The circular washer D, with a series of cuts, *c*, extending inward from its periphery on lines radiating from its center, and the opening *d* of the said washer provided with a tongue, as herein described, and for the purpose set forth.

140,120.—*Corner-Support for Blinds.*—GEORGE W. DAY, Haverhill, Mass. Application filed April 26, 1873.

A metallic plate to be applied to the joint of a wooden window-blind, to strengthen the parts and prevent change of figure by sagging.

Claim.—As an improved article of manufacture, the above-described improved blind-supporter, composed of the parts A and A', (respectively provided with flanges or abutments *e f*,) and the part A with the supplemental arm *g*, the whole being formed of a single piece of metal, and for application to a blind, in manner and for the purpose stated.

140,121.—*Machine for Slotting Links for Locomotives.*—WILLIAM H. DENNEY, Philadelphia, Pa., assignor of one-third of his right to JOHN F. KING, same place. Application filed February 15, 1873.

The blank is fastened to the index or face plate, to which a partial rotary motion is given, and the milling-tool, journaled on a slide-rest, is brought up and entered into a hole previously bored in the blank, and the slot cut as the work is revolved.

Claim.—The combination of bed A, head B, mandrel C, index-plate D, carriage . . d K, head M, mandrel N, and cutter P, substantially as and for the purpose hereinbefore set forth.

140,122.—*Building-Block.*—GASHERIE DE WITT, Belleville, N. J., and JAMES FAIRMAN, New York, N. Y. Application filed March 31, 1873.

Claim.—A building-block, column, or post, formed of a plastic material, inclosed in a permanent casing or basket of metallic open-work, which forms an integral part of the block when solidified, and strengthens and protects it from disintegration, substantially as specified.

140,123.—*Mode of Attaching Sleigh-Bells to Harness.*—BELA E. DEXTER, Gowanda, N. Y. Application filed March 17, 1873.

The bell-bow is pivoted to the saddle so as to be thrown down when the horse is to be blanketed.

Claim.—1. The bell-bow B, pivoted to the harness, substantially as and for the purposes set forth.

2. In combination with the bell-bow B and irons *b* the spring-latches *d*, or their equivalents, substantially as and for the purposes described.

140,124.—*Car-Coupling.*—MORDECAI DISNEY, Oakland, Cal., assignor to himself, HENRY C. KIBBE, and JOHN D. HILDRETH. Application filed January 9, 1873.

The link entering throws the pin D up, and, through the medium of the plate I, forces the pin K down so as to throw the upper arm of the bell-crank from under the frame which supports the coupling-pin, and the coupling is effected.

Claim.—1. The pin K, with its beveled lower end constructed to operate upon the arm E of the lever, substantially as and for the purpose set forth.

2. The oscillating plate I and the pin K, in combination with the pin D, constructed to operate substantially as and for the purpose described.

140,125.—*Ruler.*—JOHN G. ERNST, Baltimore, Md., assignor of two-thirds his right to THOMAS H. DENISON, same place, and A. J. FISHER, New York, N. Y. Application filed October 17, 1872.

A "scholar's companion," consisting of a box with a detachable top, which may be used as a ruler, the box itself to be constructed within so as to form a convenient receptacle for pencils, pen-holders, pencil-sharpener, sponge, and such like conveniences.

Claim.—The ruler A, secured to the box B by means of a fixed holding-stop, *a*, at one end and a hinged clasp, *b*, at the other, the said ruler having slots for the purpose, and the clasp arranged to prevent vertical or lateral displacement of the top, substantially as shown and described.

140,126.—*Medical Compound or Lotion for the Skin.*—ANNA FIELD, Springfield, Mass. Application filed June 7, 1873.

Benzoin, two ounces; citric acid, one-half ounce; borax, one dram; alcohol, one pint.

Claim.—The solution of the above-mentioned ingredients in substantially the same proportions.

140,127.—*Portable Rick-Cover.*—JOSEPH W. FITZGERALD, Jerseyville, Ill. Application filed May 14, 1873.

A portable rick-cover, composed of overlapping boards flexibly connected together by wires or rods and staples.

Claim.—The flexible rods *b b*, and the manner of attaching the boards thereto when used for the purpose described.

140,128.—*Screw-Tap.*—JAMES FLOWER, Detroit, Mich. Application filed April 8, 1873.

The reaming-cutters are fixed in slots in the shell, and the tapping-cutters are operated by cams on the end of a mandrel, which extends up into the shell, and is operated by a lever working in a transverse slot in the shell.

Claim.—1. The construction and arrangement with relation to the shell A A', of the spindle B, cams *b b*, lever B', and cutters C C, substantially as and for the purpose set forth.

2. The combination, with the adjustable shell-tap constructed as described, of the reamers D D, as and for the purpose set forth.

140,129.—*Electric Hotel-Annunciator.*—WILLIAM W. FOOTE, Saybrook, Ohio. Application filed November 30, 1872.

Slides concealing numbers held up by pin on armature and released when armature is attracted. Restored to position by devices of first claim, all the slides being operated on by frame K.

Claim.—1. The combination of the frame K B' B provided with pins *c c*, lever M, and crank-shaft C', for restoring the screens N N, all constructed and arranged to operate substantially as and for the purpose herein specified.

2. The frame K B' B provided with pins *c c*, lever M, and crank-shaft C', for restoring the screens N N, in combination with the electro-magnets I I, and armatures J provided with pins *a a*, substantially as and for the purpose described.

140,130.—*Portable Wardrobe.*—JOHN N. FOWLER, Green Point, N. Y. Application filed April 16, 1873.

The sides of the wardrobe have grooves near the edges of the inner faces, in which slide flexibly-connected slat-work; the two sides are connected by T-headed cross bars fitting in grooves or mortises in said sides. The back-grooved cross-bar is provided with hooks that slide transversely, and the wardrobe is attached to the walls of a room by locking-grooves that engage with pins fixed in the walls.

Claim.—1. The T-headed cross-bars H I J K fitting in corresponding grooves or mortises in the rigid sides, in combination with movable slat-work, as specified.

2. The rigid side pieces A B of the bent stripe A, doubly grooved, as indicated by *a a'*, in combination with the panel B and sliding slat-work, to close the front, as specified.

3. The exterior strapping *d* on the slat-work D, adapted to maintain the tightness of the joints on the curved upper portion of the wardrobe, in combination with rigid sides, having curved grooves at the top, and connecting cross-bars, as specified.

4. The transverse sliding hooks M, in combination with the grooved cross-bar H, and suitable rigid sides and movable slat-work, as specified.

5. The shelves L, and supports *l*, in combination with movable slat-work, detachable rigid sides, and rigid cross-connections H I J K, as herein specified.

6. A wardrobe or cupboard formed of detachable parts, with slat-work moving in grooves, as specified, and provided at the back with the locking-grooves *g*, adapted to receive headed-pins P fixed on the walls, and thereby to suspend the structure at will, and allow it to be firmly secured by the aid of a screw, T, inserted from the interior of the structure, all substantially as herein specified.

140,131.—*Car-Coupling.*—JAMES A. GALE, West Medway, Mass. Application filed October 16, 1872.

To each draw-head is pivoted a half-link, and to one arm of each link is pivoted a coupling-hook, so that when coupled the half-links form one continuous link.

Claim.—The plate or half-link *e* having the aperture *d*, channel *g*, concave upper side *h*, and hook *e*, arranged to operate as described.

140,132.—*Railroad-Tank Feeder.*—RICHARD JOHNSON GIDDONS, St. Louis, Mo. Application filed November 22, 1872.

The combination of elements claimed enables a moving locomotive to raise a weight, which, in falling, elevates feed-water by means of a pump.

Claim.—The rack-beams A A, shafts C and *c*, the former provided with the wheels B and E and cog *e*, and the latter with wheel B and cog *e*, in combination with the wheel *f*, weight-shaft *h*, and weight G guided in the frame K, when operated by a passing locomotive, substantially as and for the purpose herein before set forth.

140,133.—*Die for Cutting Screw-Threads.*—JOHN J. GRANT, Greenfield, Mass. Application filed April 16, 1873.

The divided dies are adjusted in an annular recess in the stock by means of the conical screws A and set-screws pressing against the sides of the dies, and are held firmly in place by the screws *s* working in screws A.

Claim.—1. The combination of the conical frustums upon which are formed screws working in internal screws cut in the stock, the outer screws working in internal threads cut in the said conical frustums, and the dies provided with recesses, all operating together as and for the purposes described.

2. The combination of the interposed conical frustums, and outer screws working therein, with the stock and dies and set-screws, when operating together as and for the purposes described.

140,134.—*Burglar-Alarm.*—EZEKIEL M. HENDRICKSON, Brooklyn, N. Y. Application filed December 26, 1872.

A series of fire-arm barrels, provided with suitable gun-locks, are discharged by clock-work, the detent of which is connected by cords to the doors or windows to be guarded, so that the opening of either releases the clock-work, causing the fire-arms to be successively discharged.

Claim.—The escapement M N and adjustable pendulum O P or their equivalents, the motive power *f* or its equivalent, in combination with the series of discharging means *b*, *c*, D, and G, arranged relatively to a corresponding series of barrels, H, and connection I K to a door, window, or the like, so that a series of reports may be induced at long or short intervals of time, as preferred, when the whole is set in operation by the act of opening the door or window, all constructed and arranged substantially as specified.

140,135.—*Reading-Gage.*—ROYALL S. HILDRETH, Laurens, N. Y. Application filed September 14, 1872.

A thin plate with a long narrow slot through which to see the line to be read, the plate being placed on the page to cover or hide the lines above and below, and thus assist the eyes in retaining the sight of the letters in cars or carriages, the shaking and jarring of which prevents holding the paper with that steadiness necessary for keeping the lines distinctly in view.

Claim.—As an article of manufacture, the adjustable reading-gage, consisting of plates A B, having grooved guides C C constructed and adapted to be used substantially as and for the purpose described.

140,136.—*Clamp.*—NICHOLAS J. HOLT, Howell, and JOHN LEACH, Detroit, Mich. Application filed April 24, 1873.

The jaws of the clamping-bars are operated by the toggle-levers C and D.

Claim.—The clamp-bar A having the pivoted lever C with bar D attached thereto, in combination with the sliding clamp-bar A', as described.

140,137.—*Quilting-Frame.*—WILLIAM HUDSON, Clyde Mills, Mich. Application filed March 17, 1873.

The quilting is adjusted upon the frame by the roller-bars and the ratchets and pawls. The frame is set at different angles by the pins in the circular plates. When not used for quilting, the frame is placed horizontally and used for a clothes-horse.

Claim.—The combination of the frame C, plates B, with the frame A, bars E, and ratchets and pawls D, when the said parts are constructed and arranged to operate substantially as and for the purposes described.

140,138.—*Base-Burning Cooking-Stove.*—HANFORD INGRAHAM, Naples, N. Y. Application filed April 5, 1873.

In order that the products of combustion may, on escaping from the fire, be directed at once upon the bottoms of the vessels, the escape-passages are arranged between the pot-holes, and consist of supplemental or detachable flues.

Claim.—1. The extra movable flues D D D or their equivalent, for the purpose and in the manner substantially as and for the purpose hereinbefore set forth.

2. The combination of the extra movable flues D D D, the boiler-holes F F F, the magazine-case E, the oven I, substantially as and for the purpose hereinbefore set forth.

140,139.—*Door-Check.*—JOSEPH P. ISRAEL and DANIEL W. MC LANE, Oil City, Pa. Application filed August 10, 1872.

A drop-latch is pivoted between two lugs upon the shank of the bumper, and catches over the edge of an escutcheon upon the base-board. The latch is furnished with a short arm which extends upward, and may be operated to release it by the foot or hand. This device serves the double purpose of a bumper and fastening to prevent the door from accidentally shutting.

Claim.—The combination of the bumper with a weighted latch-lever pivoted in lugs thereon, and furnished with an upwardly-projecting short arm and the escutcheon on the door, all substantially as described.

140,140.—*Puddling-Furnace.*—CHARLES JONES, St. Louis, Mo. Application filed February 12, 1873.

The bottom consists of an upper and lower plate, forming an intermediate cooling-chamber. From the lower plate, two pipes, bent at right angles and in reverse directions, depend into a water-bosh or receiver located beneath the puddling-bottom. The bottom is rocked by means of a pitman, and in moving back and forward the bent pipes or cups lift water into the space of the bottom, where it evaporates, cooling and preserving the bottom.

Claim.—1. The water-cups *d d'*, acting as receivers and exhausters, in combination with chamber D, as and for the purpose set forth.

2. In combination with smelting-chamber of furnace, the bottom C having water-cups *d d'*, and, arranged relatively therewith, the water-boshes B B', substantially as specified.

3. The combination of the bottom C, rollers c^4, arms c^5, side pitmen E, and crank statchment E', as and for the purpose set forth.

140,141.—*Apparatus for the Manufacture of Starch.*—THOMSON KINGSFORD, Oswego, N. Y. Application filed June 9, 1873.

Put the starch liquor into the tank, where it is allowed to remain at rest for a length of time for the starch and bran or fiber to settle to the bottom of the tank. The liquor which does not contain starch is drawn off by means of the plugs and spout.

Claim.—The combination and arrangement, in a siphoning cistern or tank, of the plugs B and spout E, all constructed and operated in the manner and for the purpose specified.

140,142.—*Clutch.*—WILLARD KNIGHT and NATHANIEL W. LEWIS, Bridgeport, Conn. Application filed December 20, 1872.

The head of the clutch is adjustable, and combined with the operating-sleeve, link, and dog of the pulley, whereby any wear or inaccuracy in the hold of the dog upon the inner circumference

of the flange or rim of the pulley may be easily and quickly compensated.

Claim.—1. The combination of the adjustable heads F and propelling-screws *f* (two or more) with the sleeve D and links or rods G, substantially as and for the purpose herein specified.

2. The combination of the pulley A or B, links or rods G, sleeve D, adjustable head F, propelling-screw *f*, and operating-lever E, substantially as and for the purposes herein specified.

140,143.—*Printing-Telegraph.*—ADOLPHUS A. KNUDSON, Brooklyn, N. Y. Application filed May 15, 1873.

The operation of printing throws in an extra pair of magnets the spring of whose armature furnishes, in drawing up the armature, the motive power to revolve type-wheel.

Claim.—1. In a printing-telegraph, as described, the use of an independent pair of magnets in the same circuit with the press-magnets, or in a separate circuit, if desired, for supplying the power to revolve the type-wheel, as described, and for the purposes set forth.

2. The combination of the magnets K, armature M, lever N, spring O or its equivalent, and clutch on the axis of the master-wheel P, to rotate the type-wheel, as described, and for the purposes set forth.

3. In combination with the type-wheel of a printing-telegraph, as described, the signal-bell and its striking mechanism when operated by the press-magnets, as described, and for the purposes set forth.

4. The combination of the arm T with the armature S of the press-magnets J, the bell-hammer W with its bracket Z, and the bracket Z', all combined and arranged substantially as described, and for the purposes set forth.

140,144.—*Cartridge for Fire-Arms.*—THEODORE T. S. LAIDLEY, Watertown, Mass. Application filed June 13, 1872.

Claim.—A tapered or bottle-necked cartridge for breech-loading fire-arms, in which the powder charge is compacted more densely at the rear than at the front end, and is throughout its length in contact with the sides of the cartridge-case.

140,145.—*Stench-Trap.*—THOMAS LEDBETER, Detroit, Mich. Application filed May 17, 1873.

The trap is so constructed that if the basin-outlet becomes clogged the water can be let off through the lateral sewer through the door in the top of the trap, thus avoiding the necessity of pumping out or bailing the basin.

Claim.—The trap A provided with the flanged openings *c*, and the door A' provided with the lugs *a* and eye-bolt *b*, arranged in a receiving-basin, B, substantially in the manner and for the purpose set forth.

140,146.—*Adding-Machine.*—GUSTAVUS LINDEROOS, Point Arena, Cal. Application filed August 11, 1871.

A series of registering-wheels, successively tripped, is arranged with the lower and larger one divided into one hundred spaces, with holes in each space for moving the wheel, a corresponding notation being marked around it, on the face-plate.

Claim.—The device shown, consisting of the main and secondary wheels and disks, marked as shown, and provided with arms, when inclosed between the plates, the upper having the openings, and the bar *a* and the wheels being held adjustably in place by the spring, the whole constructed and arranged as described.

140,147.—*Wire Fence.*—JAMES A. LITTLE, Cartersburg, Ind. Application filed October 12, 1872.

A portable bracket for supporting the wires of a fence. The braces are crossed and pivoted at the top, forming a bearing for the top wire. The bottom wire is steadied by an adjustable notched cross-bar secured to the braces.

Claim.—The portable bracket K', composed of the crossed pivoted braces L having the pin *a* and holes *a'*, and the pivoted connecting notch-bar L', used in connection with the fence as described, and for the purpose specified.

140,148.—*Vessel for Paints, Oils, Varnishes, &c.*—ROBERT MANSUER, Jr., Philadelphia, Pa., assignor of one-half his right to GEORGE BATES, same place. Application filed December 5, 1872.

Coils of thick paper or pasteboard cemented together are used for forming the cylindrical portion or sides of the case, and wood for inclosing the ends of the same, with a lining of tin-foil throughout, to prevent the materials saturating the paper or wood.

Claim.—A case for holding paints, oils, varnishes, &c., the sides of which are composed of coils of light pasteboard or heavy paper, B and C, cemented together and lined with tin-foil A, in combination with the wooden lid or cover F, and bottom piece H, lined with paper D and tin-foil A', the whole being held securely together by means of hoops or bands G and G', through which nails are driven, substantially as herein shown and described.

140,149.—*Street-Lamp.*—JOSIAH F. MARSH, Dubuque, Iowa. Application filed March 6, 1873.

The oil-reservoir surrounding the top of the lamp is separated therefrom by an air-passage, and is divided into two compartments, which are connected by a plug-valve. The lower compartment is calculated to receive a quantity of oil just sufficient for one night's burning.

Claim.—A fount or reservoir for street-lamps, when the same is composed of two or more compartments, and placed above the burner, substantially as described.

140,150.—*Manufacture of Latch-Needles.*—THOMAS T. MAYNE, Philadelphia, Pa. Application filed November 12, 1872.

A piece of flattened wire, bent up at each end, is of such a length that the blanks for two knitting-needles can be made from it. A punch descends and cuts the wire to the form of the finished article, when the wire is reversed and its end placed against a gage, and the operation repeated. The wire is then severed at the center, the points turned up, and a latch pivoted at the bulb left by the punch.

Claim.—1. Punching the recesses in the blank, in the manner described.

2. The punch *m* and its die, conforming to the shape of the desired recesses, in combination with the gage *y*.

140,151.—*Sword-Hanger.*—SAMUEL MCKEEVER, United States Army. Application filed April 21, 1873.

A stud, affixed to the upper sling-ring of the scabbard transversely to the length of the latter, is passed into a vertical slot in the rigid hanger depending from the belt while the sword is in about a horizontal position; then the sword being dropped to a vertical line is securely fastened.

Claim.—1. The rigid hanger A, slotted parallel with the axis of its length, substantially as described.

2. A sword-hanger, provided with an offset to raise the sword from contact with the body, as set forth.

3. The oblong stud *f*, attached to the upper sling-ring of the scabbard at about right angles to the length of the latter, substantially as and for the purpose described.

4. The combination of the disk *h*, attached to the scabbard, with the circular bearing-surface upon the hanger.

5. The combination of the slotted hanger, disk *h*, and stud *f*, substantially as and for the purpose described.

140,152.—*Pitman-Lubricator for Saw-Mills.*—JOHN MCKENZIE, St. Clair, Mich. Application filed March 8, 1873.

A loose spindle in oil-box, which changes position when the pitman changes the direction of its movement, opening and closing at regular intervals a valve in bottom of box, and thus regulating the flow of oil.

Claim.—The loose spindle F, having a valve, *c*, in combination with the oil-box E, constructed substantially as described, the spindle being adapted to change position when the pitman changes the direction of its movement, substantially as and for the purpose described.

140,153.—*Cigar.*—EDWARD B. MEAD, Pittsfield, Mass. Application filed May 21, 1873.

The mouth-piece is compressed at one end into a concave form on both sides, so as to be conveniently and firmly held in the mouth, and is formed into the cigar, the end portions being wrapped around it.

Claim.—1. The cigar mouth-piece, made of a glass tube flattened concavely on its opposite sides, and otherwise constructed as described and represented.

2. As an improved manufacture, a cigar provided with a glass mouth-piece made and arranged with and in it, as specified.

140,154.—*Running-Gear for Wagons.*—ISAAC O. MEDDOWS, Bonham, Tex. Application filed May 10, 1873.

The body of the vehicle rests upon friction-wheels, which are journaled in laterally-moving boxes. The friction-wheels travel in a groove formed upon the axle-bearing. The king-bolt is formed in sections, and through the center of the same the axle is received.

Claim.—1. In a carriage running-gear, the king-bolt formed of the parts O O', having shoulders *s s* and flanges P, in combination with the bolster H, bolt Q, and socket-plate R, substantially as described.

2. The wheels M' journaled upon the loose blocks M, in combination with the friction-blocks N N, and axle having grooves *d*, substantially as described.

3. In combination with the sectional king-bolt, the truss-rods S, as and for the purpose set forth.

140,155.—*Heating-Stove.*—GEORGE R. MOORE, Philadelphia, Pa. Application filed March 28, 1873.

The hanger is adjustable vertically and supports one side of the grate. The nib projecting from this plate engages with the notches and locks the grate in position.

Claim.—1. The guard-plate obtained by the hanger B closing the aperture for the grate-journal through the outside casing of the stove.

2. The pawl *a a*, in combination with the grate-hanging B, substantially as shown.

3. The nib *b*, or its equivalent, upon the hanging B.

4. The notched ring C, or its equivalent, upon the journal of the grate, for locking or latching the same upon the hanger B, by the nib *b*, and holding the grate at any desired angle upon which it may be placed.

5. The arm D and rod E, in combination with the grate A suspended upon adjustable hangings B B', substantially as and for the purpose described.

140,156.—*Governor for Steam-Heating Apparatus.*—SVEN J. OLSSON, Chicago, Ill. Application filed February 14, 1873.

A piston, operated by the pressure in the pipe, is connected to the valve by a weighted lever and valve-stem, and opens and closes said valve.

Claim.—A steam-governor, consisting of the combination and arrangement of the chambers C, C', and C'', canopy D provided with ports *a a*, cap D', piston E, and pivoted lever G attached to the cap and piston, all substantially as and for the purposes specified.

140,157.—*Adjustable Saw-Guide.*—FRANCIS H. PALMER, Whitefield, N. H. Application filed April 3, 1873.

The guide-pins are individually adjustable, and the operating parts protected by a shield.

Claim.—1. In combination with the arms G G and their adjusting-screws H H, the long nut *x* and clamping-screw J', as and for the purposes set forth.

2. In combination with the adjusting-screws, the removable shield L, for the purposes set forth.

140,158.—*Apparatus for Treating Ore and Manufacturing Iron and Steel.*—EDGAR PECKHAM, Antwerp, N. Y. Application filed May 9, 1873.

The ore, reduced to the size of small walnuts and mixed with an equal bulk of fine charcoal or coke, is charged into the upper chamber, where it is exposed to the direct action of heat and products of combustion, and is stirred or rabbled. After about twenty-four hours the ore is transferred to the retorts, its place being supplied with a fresh charge. From the retorts the sponge is let down into the cooling-vats, where it cools without exposure to the air. Each of the retorts forming the series being supplied with a cooling-vat, they can be worked separately or collectively and continuously.

Claim.—1. The combination of the chambers D, D^1, and D^2, one or more, the retorts F, F^1, and F^2, and the cooling vats or chambers L, L^1, and L^2, each chamber, retort, and cooling-chamber forming one section, constructed substantially as and for the purposes hereinbefore set forth.

2. The combination of two or more sections of chambers and retorts lengthwise, each chamber and retort forming one section, constructed substantially as and for the purposes hereinbefore set forth.

3. The combination of two or more sections of chambers, retorts, and cooling-chambers lengthwise, each chamber, retort, and cooling-chamber forming one section, constructed substantially as and for the purposes hereinbefore set forth.

140,159.—*Cutting Attachment for Sewing-Machines.*—ALFRED T. PERRINE, Charlestown, assignor to JOHN HITCHCOCK, trustee, Boston, Mass. Application filed June 7, 1873.

The cutter is pivoted to the needle-bar so that it may be turned out of action when the needle is to be changed or threaded, or when it is not desired to cut the fabric. The tapering pin acts as a wedge to retain the cutter more or less securely.

Claim.—1. A cutter attached to the needle-bar of a sewing-machine by means of a hinged joint, and arranged to be swung to one side, substantially as described, for the purposes specified.

2. The cutter *e*, constructed as herein set forth, and pivoted to the needle-bar of a sewing-machine, with its cutting-edge in a plane between said pivotal point and the needle, substantially as described.

3. In combination with the cutter *e* and the needle-bar of a sewing-machine, the taper pin *d* for securing said knife to the needle-bar, substantially as described, for the purpose specified.

140,160.—*Woven-Wire Fabric.*—J. WILLIAM C. PETERS, Chicago, Ill. Application filed November 11, 1872.

The spirals of one fabric are woven into those of the other, either at right angles or diagonally.

Claim.—The woven-wire fabric A, made of parallel spiral springs woven or looped together in the manner shown, and forming a continuous fabric, in connection with the fabric B, made in like manner and woven into the fabric A, as specified.

140,161.—*Screw-Cutting Machine.*—ALFRED PHILLIPS and ALBERT PHILLIPS, Cleveland, Ohio. Application filed October 25, 1872.

The blank-bolt is fixed to a sliding carriage which is drawn forward by the threads as they are cut. When the desired length is threaded an arm on the carriage pushes a sliding bar forward, and a projecting arm throws open the dies, when a spring, situated in the rear of the carriage, withdraws the bolt and closes the dies.

Claim.—1. The disk G, hollow mandrel H, sleeve J, arms *l l*, levers *o o*, dies I I, ring G', pieces *p p*, set-screws *q q*, the arm U, bar R, adjustable arms T T, arm V, and the carriage C, all constructed, combined, and arranged, and operating substantially as shown and described, and for the purpose set forth.

2. The rod D and spring E, in combination with the carriage C, as shown and described, and for the purpose set forth.

140,162.—*Billiard-Table.*—L. CORYDON PRINDLE, Chicago, Ill. Application filed March 5, 1873.

Intended more particularly for a portable billiard-table. Reversed it serves for an ordinary table-top.

Claim.—A portable billiard-table consisting of the marble or other bed A, formed of a single piece, in combination with the rail B and cushion *c*, when said parts are constructed and arranged substantially as described.

140,163.—*Medical Compound for Diphtheria.*—HIRAM PRUDEN, Erie, Pa. Application filed November 22, 1872.

Petroleum-oil, spirits turpentine, and camphor.

Claim.—A compound composed of refined petroleum-oil, spirits turpentine, and camphor, substantially in the proportions and for the purposes set forth.

140,164.—*Gas-Burner.*—JOHN RICHARDSON and THOMAS D. RICHARDSON, New York, N. Y. Application filed October 8, 1872.

Claim.—1. A compound gas-burner, consisting of an inner and an outer tube arranged to convey the gases separately to the point of combustion, and having their opposite ends arranged concentrically, so that said burner can be screwed on the compound pipe in the same manner that ordinary burners are attached to single pipes, substantially as herein shown and described.

2. A compound gas-burner consisting merely of two concentric tubes, secured together and arranged at their upper ends, as shown and described, but left uncovered at their lower ends, in order that they may be attached to concentric supply-pipes, as shown and set forth.

3. The compound flat-flame burner, consisting of the concentric tubes having their upper ends connected, and provided with the partitions *c* and slits or openings *c*, as shown and described.

140,165.—*Gas Pipe and Fixture.*—JOHN RICHARDSON and THOMAS D. RICHARDSON, New York, N. Y. Application filed November 16, 1872.

Claim.—1. The herein-described pipe for conducting two gases separately between distant points, consisting of two pipes secured one within the other, substantially as herein described, slot in their ends arranged concentrically, as set forth, so that different lengths or sections of the compound pipe may be screwed together and used in the same manner as ordinary single pipe.

2. The combination of the pipes A and B with the spiders C, or their equivalents, as and for the purpose described.

3. In combination with the compound pipe A B, the swivel D provided with the two passages or openings, substantially as described.

140,166.—*Apparatus for Repairing Knotter, Strainer, or Screen Plates of Paper-Machines.*—JAMES ROBERTSON, Lanswade, Great Britain, assignor, by mesne assignments, to L. ASHMUN & CO., Paterson, N. J. Application filed November 9, 1872.

The widened slots of the worn plate are contracted by means of a tool having a gag tongue and inclined faces, whereby the metal is swaged together to reduce the size of the opening.

Claim.—1. The mode of lessening or reducing the slots in a strainer-plate, substantially as herein shown and described, and for the purpose set forth.

2. The tool H I, constructed substantially as herein shown and described, to adapt it for use in reducing the slots in a strainer-plate, as set forth.

140,167.—*Wire-Way.*—JAMES H. ROGERS and JOHN W. ROGERS, Peekskill, N. Y. Application filed May 29, 1872.

The frame carrying the bucket descends along the inclined wire-way until the bar *k* is reached, when the rod E is released at upper end, allowing the bucket to descend vertically at that point to be filled. When filled, the rope is drawn upon and the bucket rises vertically until it reaches rod E, the frame being meanwhile held from advancing by the hook at the other end of E. On reaching the rod the bucket and rod rise together until pulley D is reached, when the hook is released and the bucket traverses back upon the rod to its former position. Both frame and bucket are then drawn up the incline together. For passing supports, the block B is provided with three wheels, the two outer ones of slightly larger diameter than the middle one, which outer pulleys, by means of short tracks N N, temporarily sustain the load and permit the block to pass the support by means of the notch M.

Claim.—1. The combination of pulleys B C D with the rods E and F and the cross-bar K, all to be used by means of the rope I and the wires, substantially as and for the purposes herein set forth.

2. The combination of track N N with block B and opening M, substantially as and for the purposes herein described and set forth.

140,168.—*Truss.*—ALEXANDER T. C. SCHORVERS, Hague, Holland. Application filed June 6, 1873.

From a single thin plate of steel is cut out the back and arms for the sides of the pad. The pad is inclosed in a case of vulcanized rubber, and connected by a ball-and-socket joint to the ordinary band, which passes around the body.

Claim.—1. A truss pad or cushion composed of a dome-shaped spring back, in combination with a central conical spring-cushion within the same, the whole being arranged and enveloped in a case of vulcanized India rubber or its equivalent, substantially as shown and described.

2. In combination with the dome-shaped spring back and the spring-cushion within the same, the arm or stem for connecting said parts to the spring-band of the truss, said arm being united with the pad by a ball-and-socket joint, substantially as shown and set forth.

140,169.—*Potato Masher and Strainer.*—RÉNÉ SEBILLE, Baltimore, Md. Application filed May 5, 1873.

The plunger is made with a double-beveled end, and combined with a cylindrical strainer.

Claim.—The double-beveled-faced plunger or potato-masher C, constructed substantially as described, in combination with the strainer A, as and for the purposes set forth.

140,170.—*Whiffletree.*—ALBERT J. SPRAGUE, Binghamton, N. Y. Application filed March 10, 1873.

The whiffletree is attached by moving back the hook B for the reception of the ring, when it is moved to its position in front of the guard, which prevents its detachment.

Claim.—1. In combination with the evener having its end rounded, the hook B pivoted eccentrically to the rounded end so that when the parts are in a working position the point of the hook shall be nearer the edge of the evener than when the hook is swung outward to receive the whiffletrees, substantially as set forth.

2. In combination with the evener and the pivoted hook B the guard *c*, arranged to operate substantially as set forth.

140,171.—*Mixing-Machine.*—JOHN W. STOCKWELL, Portland, Me. Application filed March 15, 1873.

An inclined horizontal mixer, revolved by a vertical shaft;

mixing-blade on one side, some distance from the bottom, and stationary cleaner reciprocating vertically on shaft.

Claim—1. The scraper and mixer *n*, made as described, and arranged to operate in the receptacle *a*, as herein set forth.

2. The combination of the cleaner *p* with the scraper and mixer *n*, arranged to operate in the receptacle *a*, as herein set forth.

140,172.—*Pantaloon-Tree.*—MICHAEL TAISE, South Boston, Mass. Application filed May 8, 1873.

A press-board upon which to iron and shape pantaloons, having its lower front portion roughened to prevent the garment from slipping up when being pressed.

Claim.—The piece A having the lower or projecting portion of its front roughened or provided with points or projections, substantially as and for the purpose set forth.

140,173.—*Rock-Drill Carriage*—ALEXANDER P. THOMAS and WILLIAM J. EVANS, Copper Falls Mine, Mich. Application filed October 28, 1872.

A four-wheeled truck, the sides of which are connected to the axles by screws so arranged that the sills may be lowered to rest on the bottom of the tunnel, (or on the rails of track, if any;) also, a rest carrying the drill-post, dovetailed in ways transversely placed across the carriage, with rack and pinion (or equivalent device) for moving the drill-post laterally across the face of the work, and also a clamp securing the drill-cylinder to it at any inclination and to the drill-post.

Claim.—1. The axles A A, sills B B B' B', screws C C C C and bed-plate D of a rock-drill carriage, constructed substantially as herein shown, for the purpose set forth.

2. The dovetail-ways E on the bed-plate D carrying the slide-rest F, and the drill-post G with a rack, *e*, and pinion *b*, for moving said slide-rest, as shown and set forth.

3. The clamp-gib *c* and set-screws *d* for clamping the rest F to the ways E, as described and shown.

4. The sectional clamp I, and bolts *e e' f f'* for securing the drill-cylinder J to the drill-post, substantially as described.

140,174.—*Trimming.*—JOSEPH THOMAS, Hoboken, N. J. Application filed March 19, 1873.

Braid is applied around the raw edge of fabric by a zigzag stitch, which holds the braid firmly and prevents the edge from fraying.

Claim.—The edging formed and produced by the combination and arrangement of the braiding, the single cloth, and the over-hand zigzag stitch or seam substantially in the manner described, and for the purposes and uses set forth.

140,175.—*Road-Scraper.*—WILLIAM P. WARREN, Serena, Ill. Application filed April 7, 1873.

The scraper is raised or lowered by depressing or elevating the wheels, and the front of the scraper is closed by the folding-board *u*, which holds the earth in. The scraper is dumped by raising the rear end by the lever O, the front end turning on the pivots at the ends of the links *m*.

Claim.—1. The wheels *b*, secured to the bars *c d*, and operated by means of the lever A, for the purpose of lowering and raising the body, substantially as set forth.

2. The folding-board *u*, in combination with the arms *v* and lever *a'*, substantially as shown.

3. The scraper *l*, links *m*, levers *o*, and cross-piece *n*, substantially as specified.

4. The combination of the folding-board *u* and scraper *l*, when the two parts are combined to operate as described.

140,176.—*Fly-Trap.*—THOMAS H. WHITING, Grand Haven, Mich. Application filed May 8, 1873.

The fly-trap is constructed with a base on which rests the cylinder, with opening for the flies to pass into it, and is connected to the wire-gauze cover by pivots. Within and above the base is a trough for water, and from it a cone-shaped cover to direct the flies. The top is constructed of perforated tin, closely fitted to the inside of the cylinder, and may be forced down, carrying with it the flies to the water-trough to be drowned.

Claim.—1. The chamber D^2 provided with the sliding or piston-top D^1, as and for the purpose set forth.

2. The construction and arrangement of the base-plate A, standard *a*, cylinder B, having secured within it the trough *b*, and cone C C' provided with the aperture *d*, the detachable wire-cloth cylinder D, and the top D^1 D^2, substantially as and for the purpose set forth.

140,177.—*Bill and Paper File.*—GEORGE T. WOLCOTT, Detroit, Mich., assignor to himself and HENRY P. GRAVES, same place. Application filed April 8, 1873.

A bottomless box with a series of grooves upon the inner surface of its sides, into which partitions are inserted, their lower ends provided with a projecting base, to which is attached an arch-shaped spring to clamp the papers.

Claim.—The described rack consisting of the case A, with ascending sides and open bottom partitions B, arranged in an ascending series, strips *b*, and springs C, combined and arranged as described, for the purpose set forth.

140,178.—*Potato-Planter.*—FREDERICK W. WORSTELL, St. Louis, Mo. Application filed November 15, 1873.

A potato-box on a pair of wheels has laterally placed in front an oblong box, supported by a caster-wheel. In this box are chopping-knives, actuated by gearing on the traction-wheels. The chopped potatoes are dropped automatically onto the endless belts beneath, also operated from the traction-wheels, and carried to a spout at each end, where they are dropped into a furrow.

Claim.—1. The combination of the boxes K, compartments *k k'*, hoppers L L', apertures l^2 l^3, boxes M M', arranged as herein shown and described, for the purpose set forth.

2. The combination of the boxes M M', bottom plates m^3 m^5, cutters m^3 m^4, top shaft N, rod *n*, crank-disk n^1, self-acting hand-shaft m^2, arranged to operate as herein shown and described, and for the purpose set forth.

140,179.—*Boot-Jack.*—HORACE ARNOT, Barclay, Pa., assignor to himself and G. W. DICKEY, same place. Application filed May 3, 1873.

Two jaws with slotted inclined parts grasp the heel, by the action of the foot, on a pivoted U-shaped rod-frame guided therein and attached to a foot-board.

Claim.—1. The boot-jack, consisting of foot-rest A, with jaws B, pivoted and secured thereto by washer-plate *a*, and face-plate C, in combination with rod-frame D, substantially as and for the purpose described.

2. The jaws B, having inclined link *d* at curved front end, and rectangular rear end *b* pivoted to the foot-rest A, as set forth.

140,180.—*Broom.*—JOHN D. BELL, Watteborough, Va. Application filed April 12, 1873.

The broom is constructed by passing the butts of the corn into a cylinder having another of smaller dimensions connected by a flange at its upper end, through which the handle is fitted, having a point, which, by forcing it through the broom-corn in the lower cylinder, wedges and firmly holds it, and the handle is pivoted to the upper cylinder, and can be removed for its repair.

Claim.—The tube or socket A, extension C, and handle E having a tapered and pointed end, all arranged and combined substantially as and for the purposes described.

140,181.—*Truss-Bridge.*—DANIEL C. BOWER, Troy, Ohio. Application filed May 24, 1873.

A rearrangement of the parts of an ordinary truss-bridge, dispensing with counter-braces, and making use of the dovetail-shaped blocks C in the spaces between the strands of the chords, through which and the triangular brace-shoes the vertical tension-rods are passed.

Claim.—An improved bridge, formed of the lower chord A, the top chord B, the dovetailed blocks C, the binding-rods D, the triangular blocks E, and the braces F, constructed and arranged in connection with each other, substantially as herein shown and described, and for the purposes set forth.

140,182.—*Combined Wheel-Harrow and Seeder.*—FRANK BRAMER, Little Falls, N. Y. Application filed April 9, 1873.

Concave disk-harrows have their adjustable frames made self-bracing to the main frame that carries the seed-box. The seed-slide is operated by a crank on one of the disks.

Claim.—1. The main frame, composed of the longitudinal bars A and oblique transverse bars A^1, in combination with the adjustable gang-bars C C^1, arranged to brace the frame, substantially as and for the purpose set forth.

2. The seed-distributer or agitator of a combined seeding-machine and wheel-harrow, connected with and operated by a crank on the shaft of one of the wheel-gangs through an adjustable pitman arranged at right angles to said shaft, substantially as and for the purposes set forth.

3. The construction of the pitman-connection, of the seed-distributer and harrow-wheel shaft, and of the parts I I^1 I^2 to permit the adjustment of its length and angle, as described.

4. The spools or thimbles L provided with notched or perforated hubs, or bosses, or pins for securing the harrow-wheels and causing their uniform rotation, substantially as described.

140,183.—*Self-Closing Faucet.*—ALEXANDER BRINCKMANN, New York, N. Y. Application filed November 9, 1872.

A rotating tube, with swivel discharge-tube, is arranged in a suitable case having an enlarged bowl with a branch, in which slides a water-pressed piston, the rod of which connects with a cam on the revolving stem and closes the exit-opening. In order to prevent the tube, while swinging to a dead point, from meeting a rigid resistance, a coiled spring is applied to a projecting tooth on the revolving tube.

Claim.—The combination of the tube C, the water-pressed piston H, rod *b*, and cam *d*, arranged and applied for the purpose of rotating said tube, as set forth.

140,184.—*Wadding, and Machine for its Manufacture.*—ANDREW CHAMBERS, Providence, R. I. Application filed March 29, 1873.

The wadding is made of old delaines or other mixed fabrics picked into fine particles, passed through a vat containing rolls running in a gummy solution, and then between boxes containing a surfacing material, which is thrown upon it by revolving brushes.

Claim.—1. As a new article of manufacture, waddings made of short fiber stock, such as herein described, and saturated with a gummy solution, and also coated or glazed on the surfaces, substantially as specified.

2. The combination of a vat, G, and carry-rollers H, with mechanism for forming waddings, substantially as specified.

3. The combination of boxes K, and brushes N, with the bath G, carrying-rollers H, and the lap mechanism, substantially as specified.

140,185.—*Sap-Protector.*—HENRY C. COLE and EDGAR D. SABIN, Wallingford, Vt. Application filed May 17, 1873.

The sap-protectors are attached to bands, which are fastened above and below the bucket to prevent rain and dirt from falling into the sap-bucket.

Claim.—A sap-protector attached to the tree and the bucket, substantially as shown and described.

140,186.—*Hand Corn-Planter.*—JOHNSON W. COLEMAN, Bridgeville, Mich. Application filed February 27, 1873.

The handle, with a plunger at bottom, reciprocates vertically on a front slide, on the top of which is the hopper. The back is hinged to ears at the bottom of the front piece, which ears, with a spring-jaw behind them, complete the box at bottom, the sides above being canvas. Fixed to the handle, at an upward angle, is a slotted plate, which, by working on a pin on the back-piece, makes the latter reciprocate the seed-cup slide in the hopper.

Claim.—The combination of the body A with hopper B, foot G, and spring-plate J, the seed-slide D, bar E, canvas H, and plunger K with angular arm E, all constructed and arranged substantially as and for the purposes herein set forth.

140,187.—*Ice-Elevator.*—EDWARD L. CONKLIN, New York, N. Y. Application filed June 5, 1873.

A series of friction-wheels are secured at intervals on a horizontally-placed shaft revolved by a steam-engine or other power, and a series of rope-drums, each provided with a friction-wheel faced to correspond with the friction-wheels on the shaft, each drum being pivoted in such a manner that, by a hand-lever, it may be put in motion by being thrown against the revolving friction-wheel on the shaft, when hoisting is required, and stopped by throwing it out of contact with the friction-wheel and against a stationary brake, when the ice-block has been raised to the height desired; or the ice may be lowered by its own gravity by moving the lever in a position between and out of contact with both friction-wheel and brake, the whole being so arranged that a number of drums may be operated independently of each other, and thus an equal number of boats may be simultaneously loaded or unloaded.

Claim.—1. For the purpose of handling ice, a series of rope-drums, F, provided with the friction-wheels J, alternately reversible from contact with one to the other of a series of revolving friction-wheels, E, and a series of stationary brakes, K, to alternately start and stop the motion of the drums F in such a manner that each drum may be operated separately, or all simultaneously, substantially as specified.

2. The combination of the drum F, pivoted with one end to the oscillating arm G, and provided with the V-grooved friction-wheel J, and operated by the lever H and rod I, with the revolving friction-wheel E, stationary brake K, and the sliding pulley L, all constructed substantially as and for the purpose specified.

140,188.—*Furniture-Spring.*—WILLIAM T. DOREMUS, New York, N. Y. Application filed June 7, 1873.

An improved spring for connecting the seat-frame of a chair to the pedestal, for connecting the parts of a jointed back, and for application to other parts of a chair, spring-bed, or other piece of furniture when a yielding connection is required.

Claim.—The combination of the plate A provided with a flange, *a'*, the plate B provided with a flange, *b'*, the rod or bar C, the pin D, and the rubber block E, with each other, substantially as herein shown and described.

140,189.—*Furniture-Spring.*—WILLIAM T. DOREMUS, New York, N. Y. Application filed June 7, 1873.

The lower plate has on one side an upright lug, and on the other side an upright flange bearing a lug. The upper plate is made with a depression to receive the bolt that connects the opposite lugs of the lower plate. Between the two plates a rubber block, recessed to conform to the upper plate, is interposed.

Claim.—The combination of the plate A provided with the flanges a^1 a^2, and the lugs a^3, the plate C provided with flanges c^2 c^3, and the depression c^4, the bolt B, and the rubber block D, with each other, substantially as herein shown and described.

140,190.—*Safety-Platform for Elevators.*—ROBERT DUNBAR, Buffalo, N. Y. Application filed May 16, 1873.

Elevator-platform having the forked lever pivoted to the cross-beam and their inner ends loosely arranged in the draw-head, and said levers having on their outer ends vertical pins on each fork for operating the toothed eccentric cams within the metal caps secured to the upright post and cross-beam.

Claim.—1. The forked levers E E pivoted to the hangers *d*, and their ends loosely arranged in the draw-head *e*, said levers being provided with vertical pins *f* on each fork for operating the cams *c c*, substantially as herein described.

2. The caps D D having within two eccentric pivoted cams, *c c*, in combination with the forked levers E E and with the T-shaped rail located in the standards *c c*, the whole constructed and operated as herein described.

140,191.—*Gas-Lighting Torch.*—ELLIOT P. GLEASON, Brooklyn, N. Y. Application filed January 4, 1873.

The spring-clamp E is held compressed by the button *e*, which secures the taper in the clamp.

Claim.—The combination, with the taper-holder E, of the clasp *e*, when the same shall be constructed and operate substantially as described.

140,192.—*Railroad-Car Spring.*—GEORGE F. GODLEY, New York, N. Y. Application filed January 21, 1873.

The spiral springs are so arranged within a follower that extra springs will be brought into use when the weight of the car is materially increased.

Claim.—1. A car-spring, having in combination spiral springs of different lengths and different sizes of spiral, the shorter and smaller ones being within the longer and larger ones, and the free ends of the shorter ones entering hollow thimbles or nipples in a follower, while the longer and larger ones surround such nipples, and the inner spring being coiled in a direction opposite that of its outer one, all substantially as described.

2. In combination, the partitioned case and the top and bottom followers, the partition and the followers having hollow nipples or thimbles *f*, adapted to receive and sustain within them the smaller and shorter springs, and to be surrounded by and to sustain the larger and longer springs, all substantially as described and shown.

140,193.—*Clothes-Drier.*—ALMERON GRAVES, Roscoe, Ill. Application filed September 28, 1872.

The cords pass over pulleys at the top of the standard and are connected with the arms, which are pivoted to a sliding collar, while the brace-bars are pivoted to the arms and to a fixed collar. To the end of the lower bars and braces, which serve as legs to the frame, metallic loops are attached so that the frame may be fastened by stakes to the ground.

Claim.—1. The metal loops I, pivoted to the ends of the bars G and F, as and for the purpose described.

2. The combination of cords L passing over pulleys K at the top of the standard, the arms B pivoted to the sliding collar D', the brace-bars E pivoted to the fixed collar D', and arms B, all as shown and described, whereby, when the cord L is pulled, the arms will fold upward and inward and the brace-bars fold alongside thereof against the standard H.

140,194.—*Circulating-Valve for Fire-Engines.*—CHARLES A. HAGUE, Hudson, N. Y. Application filed April 26, 1873.

The main valve has an opening through it, which is closed by a small valve held down by a spring. Pressure keeps the large valve closed until it is great enough to open the small one, which allows water to enter a chamber above the large valve and, by the greater area, force it down so as to allow the water to escape into the suction-chamber.

Claim.—1. The combination of the valves S *m* and *f* in a case, O, attached to the discharge and suction chambers of a pump, substantially as specified.

2. The arrangement of the valves S *f m*, tube J, spring A, case K, the spring C and its adjusting mechanism, substantially as specified.

3. The arrangement of spring C, adjusting cap-nut *b*, hand-wheel *a*, tube J, the valve *m*, and spring *h*, substantially as specified.

140,195.—*Elevator for Hods, &c.*—EDWIN HARLOW, New York, N. Y. Application filed February 18, 1873.

The cross-beam is supplied with racks arranged alternately on either side to hold hods, in combination with movable bars below, securing, with pins, the handles of the hods; also, flaps hinged to the platform and raised by weights, or their equivalents, in combination with the hod-elevating frame.

Claim.—1. The removable bars *l*, in combination with the platform *a* and racks *h* for the hods, substantially as set forth.

2. The racks *h* at the opposite sides of the cross-beam *b*, and arranged as shown, to allow the hods to be applied alternately at the opposite sides of said beam, as set forth.

3. The elevator-platform *a* and frame *b c*, provided with the rollers *c c* and guide-pins *g g* for the ways *f f*, as set forth.

4. The flaps *e*, hinged to the platform *p*, and raised by weights or their equivalents, in combination with the hod-elevating frame, substantially as and for the purposes set forth.

140,196.—*Electrical Protection for Boilers.*—ABRAHAM T. HAY, Burlington, Iowa. Application filed February 14, 1873.

A coil connected with a galvanic battery is arranged around the steam-drum or smoke-stack of a boiler in order to magnetize the said steam-boiler, with a view to prevent the formation of incrustation therein.

Claim.—1. For the removal of crustation, scale, or solid deposit, the magnetization of a boiler or other receptacle by means of a coil upon a core removed from contact with the fluid, applied in the manner and for the purposes substantially as described.

2. In combination with the coil, the direct circuit through the boiler or other receptacle, as and for the purposes substantially as described.

140,197.—*Pantaloon.*—FREDERICK T. HOYT, Brooklyn, N. Y. Application filed March 15, 1873.

Claim.—In a pair of pantaloons the elastic strap-pieces B B, provided with the slits D and permanently secured to the inner side of such garment, as shown, for the purpose of attachment to a jacket, as set forth.

140,198.—*Reversible Harrow-Tooth.*—GEORGE W. HURST, Avon, Ohio. Application filed April 12, 1873.

Constructing harrow-teeth in V-shape form, with the ends fastened on opposite sides of beams, provided with double cutting-edges.

Claim.—A harrow-tooth having two shanks slightly bent in opposite directions from each other, to enable them to be securely fastened on opposite sides of bar B, and thus brace each other, in the manner set forth.

140,199.—*Metallic Fabric for Smut-Mill Cases.*—HERBERT S. JEWELL, Brooklyn, N. Y. Application filed November 26, 1872.

Corrugated slips of sheet metal supported in grooved rings. Ribs formed by corrugations touch each other so as to form the interstices. Plain slips of sheet metal may be placed between the corrugated slips.

Claim.—1. The metal plate *c*, corrugated transversely, and sustained by rings to form the case of a grain-cleaner, substantially as set forth.

2. The corrugated-metal plates applied between and combined with straight plates to form the case of a grain-cleaner, substantially as set forth.

140,200.—*Railroad Signal.*—JOHN H. JOHNSON and JOHN E. LAYTON, Springfield, Ohio. Application filed January 4, 1873.

Two flags on upright arms springing from two horizontal rock-shafts at right angles to each other are so connected, by suitable connecting-links and crank-arms, with a spring-lever at the side of a railroad track as to be operated by each of the wheels of a passing train, and thus caused to wave simultaneously in different directions at a crossing or other suitable locality.

Claim.—The combination of the crank E^1 E^2 and flag-staff e^2 actuated by crank C, substantially as described, with the bent lever F, arranged to vibrate the flag-staff F at right angles to the plane of flag-staff e^2, substantially as described.

140,201.—*Reciprocating Winnower.*—HENRY KELLER, Sauk Center, Minn. Application filed April 5, 1873.

Upper and lower grading-screens made in two parts, the upper section above the plane of the lower one, so that the wind from the fan can act with better effect.

Claim.—The sieves A B and A′ B′, arranged with respect to each other and to the grain-box E F G H, as and for the purpose described.

140,202.—*Cable-Stopper.*—JAMES M. KILNER, Chester, England. Application filed July 24, 1872.

Claim.—The casting provided with two holes and a niche or slot in which any link of a chain may be partially embedded, so that the end of said link abuts against the projecting shelf, and the horseshoe-lever, constructed as described, and provided with a fastening-line, when combined together for operation as and for the purposes described.

140,203.—*Machine for Cutting Tobacco.*—FRANCIS S. KINNEY, New York, N. Y. Application filed April 26, 1873.

A single knife works upon inclined bearings, giving a shear cut, the knife being inclined to the plane of the bearings and its edge parallel to the bottom of the box.

Claim.—In combination with the box A, having vertical sides and bottom at right angles thereto, the inclined parallel guide-bars B, holder C, horizontal knife D, connecting-rod E, and crank F, operating as shown.

140,204.—*Envelope.*—SOL. KUH, Jefferson, Iowa. Application filed April 26, 1873.

The end is perforated to form a severing-line, the detached part forming a cover. The back is coated with sand to prevent its adhering to others when packed for shipment.

Claim.—1. An envelope constructed wider at one end than at the other, and the wide end provided with a series of slits or perforations, *a*, constituting a defined severing-line to provide a cover as and for the purposes set forth.

2. An envelope whose back is provided with a sanded or other gritty coating, as and for the purposes set forth.

140,205.—*Heating-Range.*—JOHN LAWLOR, New York, N. Y. Application filed December 9, 1872.

The dampers are so arranged that the products of combustion can be made to impinge against the casings of the passages of the air used for heating, or diverted direct toward the ovens and exit-pipe.

Claim.—The independently-operating dampers O and P, the vertical deflecting-plate Q, the side compartments S closed at the bottom, and the flues M, all constructed and arranged as shown and described, whereby the products of combustion may be caused to pass downward and then upward in said compartments on their way to the flues, as set forth.

140,206.—*Toy.*—HARVEY T. LEE, Chicago, Ill. Application filed April 14, 1873.

A cylinder, slotted upon its side, has its lower end closed by a whistle.

Claim.—The toy, consisting of the hollow slotted cylinder, constructed as described, and provided with the whistle, as and for the purpose set forth.

140,207.—*Metallic Clasp.*—CHARLES MARSHALL, Lockport, N. Y. Application filed March 8, 1873.

A piece of sheet metal is bent at one end to form a hook, which is reduced in width, and the other end is turned up at a right angle and has one or more teeth thereon. A second piece of metal, concave on the outside and convex on the inside, is riveted to it, and arranged to slide over the cloth or other fabric and hold it by pressure against the teeth.

Claim.—A clothes-hook composed of two parts, A F, the former having a hook, B, and curved point or points D, the latter pivoted to the former and shaped as described.

140,208.—*Rubber and Plumbago Compound for Bearings and other Purposes.*—THOMAS J. MAYALL, Boston, Mass. Application filed June 14, 1873.

Washed or prepared rubber, 100 pounds; sulphur 50 pounds; plumbago or black lead, 200 to 250 pounds. These ingredients, in the proportions specified, are ground and thoroughly mixed together in a heater in the manner ordinarily practiced in preparing vulcanizable rubber compounds. The mass thus obtained is run into sheets or made up into tubes, or molded into any desirable form, and vulcanized.

Claim.—1. The process of making the herein-described rubber and plumbago compound for anti-friction bearings, and for other purposes, the same consisting in first mixing together plumbago, rubber, and sulphur as the main ingredients, in the proportions herein stated, then molding the same; or forming it into sheets or sticks or tubes, and then subjecting the same to a heat ranging between the temperatures stated for the time specified.

2. The rubber and plumbago compound produced in the manner and by the process herein described.

140,209.—*Manufacture of Artificial Leather and Similar Fabrics.*—THOMAS J. MAYALL, Boston, Mass. Application filed June 16, 1873.

The prepared leather pulp is deposited on a feed-apron, and is first partly smoothed out and spread by guides to a pressure-roller. Thence it passes under an upper apron, and is spread and condensed into sheet-form by reciprocating pounders placed above the upper apron. It is then finished by a smoother and run into a heated drying-apron, traveling at the same rate of speed with the conveying-apron.

Claim.—1. In machinery for the manufacture of artificial leather or other material to be formed into sheets from a pulped mass, the combination, with a conveying or feed apron running over a suitable bed, and a series of reciprocating pounders located above said apron, to act upon the sheet of pulp carried by the same, as set forth, of an upper apron arranged to run in contact with the upper surface of the pulp-sheet, and intermediate between said conveying-apron and pounders, substantially as and for the purposes described.

2. In combination with the feed or conveying apron and upper apron intermediate between the same and the pounders, as set forth, the pressure roll or guides, or both, arranged in front of the upper apron and above the feed or conveying apron, to operate upon the pulp deposited upon the latter, before it enters between the two aprons, substantially as shown and described.

3. The combination, with the feed or conveying apron and upper apron intermediate between the same and the pounders, of the smoother located in rear of said aprons, and arranged to reciprocate back and forth over a table or platform upon which the sheet of pulp passing from between the two aprons is delivered, substantially as shown and described.

4. In machinery for the manufacture of artificial leather, the combination, substantially as herein described, with the sheet forming and condensing devices, of an endless apron of wire-gauze, or its equivalent, for receiving the sheet as it passes from said devices, traveling at the same rate of speed as that at which the sheet is fed to it, and provided with means, substantially such as shown and set forth, for heating and drying said sheet during its passage over the apron.

140,210.—*Cooking-Stove.*—GEORGE MCADAMS, Vevay, Ind. Application filed March 15, 1873.

The sides and bottom are made of one piece of sheet metal, the top and bottom of cast metal, and are suitably united and fastened together.

Claim.—1. The arrangement of cast-iron plates A, B, and C with sheet-metal side and bottom pieces D, substantially as described.

2. The connection of plates A B C having ribs *a*, by wedge-strips E and bolts *b*, with sheet-iron sides D, as set forth.

140,211.—*Cuff-Button.*—FLORENCE MCCARTHY, Chicago, Ill. Application filed April 13, 1873.

The shank is made of sheet metal, first bent at a right angle to the face of the button, then at an obtuse angle in the direction of its periphery, and afterward parallel with its face. It is attached by a single motion.

Claim.—The combination, with the button A, the angular tongue B having the straight portions *a*, *b*, and *c*, the part *c* acting to compress the cloth against the parallel surface of the button, substantially as described.

140,212.—*Machine for Cutting Screws.*—DAVID MCGUIRE, Northampton, Mass. Application filed March 26, 1873.

The mandrel has upon its end a hollow enlargement in which the collet of the die-stock is inserted, and the two are made to revolve together by means of projections and depressions upon their meeting ends. A set-screw holds the collet and die-stock in place.

1. A die-stock provided with a collet, D, having one or more clutch projections, *b*, in combination with a mandrel provided with a corresponding socket, C, and one or more clutch depressions, *a*, the whole being constructed and operated in the manner substantially as and for the purposes set forth.

2. In combination with a die-stock having a collet, D, provided with clutch projections *b*, and a mandrel having a socket, C, and clutch depressions *a*, the thumb-screw F and depression *c*, as arranged for the purpose set forth.

140,213.—*Agricultural Boiler.*—HORACE A. MEARS, Rockford, assignor to himself, SMITH SALISBURY, and BENJAMIN SANBORN, Pecatonica, Ill. Application filed March 29, 1873.

Designed for cooking food for cattle, boiling water, &c., and is set directly into the tub or barrel containing the food or water.

Claim.—The combination, within the case A, of the fire-chamber A′, draft-flue B, and smoke-flues B^1 B^2, all constructed, arranged, and operating as described.

140,214.—*Lamp-Chimney Supporter.*—WILLIAM MEARS and HENRY DAVIES, Newport, Ky. Application filed March 22, 1873.

The metallic chimney is vertically adjustable in a guide-tube, and may be clamped at any point. The guide-tube is slitted to form a spring. A set-screw, working through the bracket, bears against a projection upon one of the sections; or a pivoted block is pressed against the chimney-tube through the medium of a wedge and the set-screw; or the screw may operate directly upon the block.

Claim.—The guide-tube, bracket, and wedge-clamp combined with the chimney B, as and for the purpose described.

140,215.—*Reener for Thread.*—JOHN B. MELDRUM, Paterson, N. J., assignor to THE BARBOUR FLAX-SPINNING COMPANY, same place. Application filed March 29, 1873.

One jaw is adjustable on the other to adapt the vertical opening between them to the size of the thread being treated, and both jaws are adjustable on the plate by the horizontal screw, so as to bring the opening in the line of the thread's movement.

Claim.—The jaw C, provided with the extended base B, the supplementary jaw E adapted to slide on said base and be secured thereto by a slot and set-screw, when combined with the plate A by lug and screw, as shown and described, and for the purpose specified.

140,216.—*Mop-Wringer.*—JAMES H. NEWTON, Paxton, Ill. Application filed May 24, 1873.

Suspended from a block connected to the handle are side pieces having slots to receive the journals of the two rolls, having spiral or coiled springs inside of them to give them opposite action, the upper one having projecting angle-plates over it, on which rests a curved spring. To the slide on the handle cords are attached, which are passed over the rolls, by which a reversed action is given them. The mop is passed through the rolls, after which they assume their former position by the aid of the springs.

Claim.—1. The mop-wringer, consisting of mop A, rollers B B′ hung to arms C of lateral frame-piece D, handle E, and slide F with strings *b* *b*′, substantially as set forth and described.

2. The mop A having wire rod *d* attached to strings *b* *b*′, which connect slide F with rollers B B′, as set forth.

3. The hollow rollers B B′, having springs *c* *c*′ coiled around shafts *a* *a*′ in opposite directions to strings *a* *c*′, for the purpose described.

4. The frame-piece D with arms C having slots A, in combination with lugs *f*, bolts *g*, band-spring *i*, and shaft *a* of roller B, to press the same against roller B′, as set forth.

140,217.—*Shutter-Worker.*—HERVEY S. PHILLIPS, Wilmington, Del., assignor to himself and ROBERT BLAIR, same place. Application filed May 17, 1873.

A notched bar of peculiar shape, formed with angles or offsets, is attached to the inside of the shutter. A lever of suitable form engages with this bar, and is, in turn, connected with and operated by a curved or semicircular bar, which passes through the casing, and has a projecting handle inside the room. There are also projecting lugs on one end of the lever, by which it may, alternately, be moved from the outside, and which also serve as fasteners, sliding open the notches for intermediate points, the construction of the entire device allowing the opening or closing the shutter from inside the room, or permitting it to be conveniently held in intermediate positions.

Claim.—1. The combination of the bar E, lever G, and circular bar M, arranged to operate substantially as and for the purposed described.

2. The lugs I, J, and Q, in combination with the lever G, as and for the purposes described.

3. The combination of the circular bar M with the lever G, substantially as shown and described, and for the purposes set forth.

4. The lever G, in combination with angles, offsets, notches, or recesses, by means of which a blind or shutter may be held open or closed, or in any intermediate position, substantially as shown and described.

140,218.—*Cotton-Gin Knife-Roller.*—THOMAS H. RUSHTON and WILLIAM DOWSON, Bolton, England. Application filed February 27, 1873.

The knives around the roller are in zigzag form.

Claim.—A cotton-gin knife-roller provided with blades having two or more angles arranged in line with each other in the direction of the shaft, their inclined parts being parallel to each other, as and for the purpose described.

140,219.—*Rotary Stamp-Canceler.*—WILLIAM SCHACHT, Brooklyn, N. Y. Application filed March 29, 1873.

In apparatus for canceling internal revenue and other stamps, a mode of inserting and holding the type.

Claim.—The printing-roller D having shoulders *e*, recess O′, and pivoted lid H, with conical recess O and pins *g*, for the purpose of inserting and holding the types, as described.

140,220.—*Apparatus for Burning Liquid Fuel and Generating Steam.*—WILLIAM T. SCHEIDE, Tidioute, Pa. Application filed April 26, 1873.

The outer shell has a central pendent combustion-chamber, filled at its lower end with incombustible material, through which the liquid fuel passes from an inner shorter tube secured above and surrounded by an air-tube. The products of combustion pass through the water and thereby generate the steam.

Claim.—The improved apparatus herein described, formed of the cylinder A provided with a perforated head or cover, the central pendent combustion-tube B, the shorter air-tube E, and fuel-tube D, arranged to leave an annular space between them and concentric with the tube B, all combined as shown and described.

140,221.—*Rotary Vegetable-Cutter.*—NICHOLAS SCHLESSER, Chicago, Ill. Application filed November 11, 1872.

The operating-disk has radial slots in front of which the cutting-blades are adjustably held, and the sliced vegetable passes through, having been pressed into a hopper on the opposite side. The front bearing of the disk is hinged to an oblique brace in front of the shell, and provision is made to uncover with facility all the operating parts.

Claim.—The slotted rotary disk B, provided with the adjustable cutters C C, and having bearings in the hinged parts G and G′, in combination with the case or frame A, provided with the hopper D and the hinged wings H H, in connection with mechanism for operating the same, all substantially as specified.

140,222.—*Windmill.*—SAMUEL SHANNON, Shellsburg, Iowa. Application filed May 5, 1873.

A double-crank shaft and a reciprocating sleeve on the post on which the wheel-frame is pivoted, and around which it swings, is so contrived that a connection is made with a pump-rod or rods, if desired.

Claim.—The double-crank shaft A, two connecting-rods, N, reciprocating flanged sleeve O, and one or more pump-rods, Q, combined with the revolving frame B and standard C, substantially in the manner described.

140,223.—*Fastening for Safety-Valve Cases.*—GEORGE B. SIMON, Buffalo, N. Y. Application filed February 27, 1873.

A gib projects downward from the case through a slot in the seat, and is forced into position to hold by an inclined slot on the other side, in which the lock-bar is placed.

Claim.—The gib-hook *j* and locking-hasp *n*, in combination with the case F, and chamber A having the slotted flange A, substantially as described, for the purpose specified.

140,224.—*Stove-Grate.*—SAMUEL SMITH, East Bridgewater, Pa. Application filed April 12, 1873.

The grate is composed of straight horizontal bars with segmental bars at the ends projecting an equal distance above and below the straight bars. It turns upon trunnions and may be revolved in either direction. In the revolution the side bars pass between the ashes and coal, and the ashes and refuse fall below while the body of the fire or burning coal is held up.

Claim.—The horizontal bars *d* upon the shaft *f*, and provided with the segmental end bars *e*, in combination with the fire-pot contracted near the upper ends of the bars *e*, substantially as and for the purposes set forth.

140,225.—*Kindling-Wood Cutter.*—NICOLAS SONNICHSEN, San Francisco, Cal. Application filed March 1, 1873.

A splitting-knife is attached by a pivot to a vertical support, which is provided with a series of steps upon which the lower end of the block rests while being split.

Claim.—The frame A having step-projections B, and the knife D pivoted thereabove, at its front end, as and for the purpose described.

140,226.—*Earth-Auger.*—ANDREW SORG and SAMUEL C. BOLLMAN, Decatur, Ind. Application filed May 10, 1873.

The auger is a cylindrical shell divided into two parts, the smaller part being hinged to the larger one and secured in proper position for boring by a spring-bolt, which, when the auger is full, is released by a rope pulled from above. By continuing the pull the pivoted portion is turned on its hinges so as to compress and sustain the earth while the auger is raised.

Claim.—1. The earth-borer, consisting of main part A and pivoted part D D, of cylindrical shape, applied to shaft B, substantially as and for the purpose described.

2. The main part A, having ears or bands *d*, perforation *n*, teeth *a*, curved side extension *b*, and cutter C, as described.

3. The pivoted part D, having inclined top D′ strengthened by plate E, ears *f*, and teeth *a*, as set forth.

4. The top part D′, having spring *l* with shoulder *l*′, staple *m*, link *g*, in connection with rope *h* to disconnect spring *l* from hole *n*, and operate part D to lift earth, substantially as described.

140,227.—*Combined Scissors and Tape-Line.*—MARGARET J. STUBBINGS, Youngstown, Ohio. Application filed April 26, 1873.

A small tape-line case is attached to the side of a pair of scissors by means of an extended screw-pivot.

Claim.—1. The tape-measure B, provided with a convex inner side and threaded eye, *b*, and adapted for attachment to the extended screw-threaded pivot *d* of the scissors A, as shown and described.

2. The combination of scissors A with the tape-measure B, substantially as and for the purpose described.

140,228.—*Marking-Brush.*—FRANK W. WENTWORTH, Boston, Mass., assignor of one-half his right to GREENLEAF W. STACKPOLE, same place. Application filed April 11, 1873.

An elastic bulb, to which are attached tubes and a brush. The bulb is filled with ink that, with slight pressure of the hand, flows through the tube and brush.

Claim.—In a marking-brush, the combination of the fountain-handle C with the brush A and interior supply-tube D, all arranged substantially as described, and for the purpose set forth.

140,229.—*Car-Starter.*—AMOS WHITTEMORE, Cambridgeport, Mass. Application filed October 17, 1872.

Eccentric wheels are arranged beneath the car-bed, and when brought into contact with the rail lift the end of the car and serve as brakes. Being released, the car of its own weight moves forward with a force proportionate to its weight.

Claim.—1. The lifting roller eccentrics G, arranged beneath a car-bed so as to operate substantially as set forth.

2. The combination, with lifting-segments G, of a shifting device, I, arranged to be operated substantially as described.

3. The locking-rods E E^2, in combination with the eccentrics G, substantially as described.

140,230.—*Railway Frog.*—JOHN WOODVILLE, Washington, Ind. Application filed April 26, 1873.

The point of the rail at the entrance of the frog is slightly inclined to the general direction of the rails, so as to increase the gage of the track at that point enough to allow for the lateral play of the wheels. The movable point is supported by projections on its under side so as to clear small obstructions.

Claim.—1. The fixed points G and H, constructed and arranged slightly inclined, or at such an angle to the rails, that the gage of the track is increased on the radial lines *a* and *b*, as and for the purpose specified.

2. The arrangement of the tongue on rests, supporting it on the bottom of plate A, in the manner described.

140,231.—*Hair-Spring Stud for Watches.*—JOHN P. ADAMS, Ipswich, Mass. Application filed April 28, 1873.

The stud is formed at its top with tapering sides, and is fitted into a corresponding recess made in the side of the bridge or cock of the balance-staff, to which it is secured by a screw.

Claim.—The combination and arrangement, with the bridge in a watch-movement, of the hair-spring stud *c*, constructed of the shape hereinbefore described, and its upper surface being quadrangular in shape, and said stud *c* being attached to the side of the bridge by a screw, *g*, passing through the stud into the bridge.

140,232.—*Steam-Condenser.*—JOHN L. ALBERGER, Buffalo, N. Y. Application filed January 28, 1873.

A hydraulic engine, arranged on the same piston-rod with the steam-engine and air-pump, assists in actuating the same by the injection-water. The condenser-tubes are bent and left open, and secured to the bottom tube-sheet and left free at their upper ends to expand radially and vertically. Combines with the tubes and the vertical discharge-pipe a sleeve or tube surrounding the latter, to project above the same, and provided with openings at the lower end, through which the hottest water ascends to the mouth of the latter before it escapes.

Claim.—1. The combination, with the air-pump and injection-condenser of a steam-engine vacuum-pan, of the hydraulic engine A operated by the inflowing injection-water and connected with the air-pump, so as to actuate or assist in actuating the same, substantially as hereinbefore set forth.

2. The combination, with an injection-condenser, of the hydraulic engine A, steam-engine B, and air-pump C, arranged in line, and connected by a single piston-rod, *d*, substantially as hereinbefore set forth.

3. The combination, with the condenser K, provided with the diaphragm k^1, of the steam-pipes *l* rigidly secured to said diaphragm at their lower ends, and left free at their upper ends, to allow each pipe to expand radially and vertically and contract independent of the others, when said pipes are curved and left open at their upper ends, substantially as hereinbefore set forth.

4. The combination and arrangement, in a condenser provided with an injection-pipe, I', of the steam-pipes *l* and discharge-pipe M, substantially as and for the purpose hereinbefore set forth.

5. The combination and arrangement, in an injection-condenser provided with steam-pipes *l* and the discharge-pipe M, of the sleeve N surrounding the latter, substantially as and for the purpose hereinbefore set forth.

6. The combination, in a condenser, and with the injection-pipe I' and discharge-pipe M, of the steam-pipes *l*, bent down at their upper ends, with discharge-openings l^1, substantially as and for the purpose hereinbefore set forth.

140,233.—*Attachment for Sewing-Machines.*—ELIZA H. ALEXANDER, New York, N. Y. Application filed June 18, 1873.

Adapted to guide the material and lay a cord in a fold therein so that when stitched and straightened the stitching cannot be seen. The cord is passed through the tube, and the material is passed from the right under the guide, between it and the tube, and then back to the right over the guide. The needle passes through four thicknesses of material.

Claim.—The combination of the elevated guide D with the cord-tube C, when placed relatively to each other and to the needle of a sewing-machine, to operate as and for the purpose set forth.

140,234.—*Clothes-Line Fastener.*—JOHN C. AMES and PRESTON A. AMES, Baltimore, Md. Application filed June 5, 1873.

A rectangular metallic grapple, one end extending below the other, with projecting ears having slots or openings to receive the journals of the hook which pass through a slot in the grapple, with a cam on its inner end, which rests against the fence or post to sustain the weight upon the hook.

Claim.—An automatic hook and fastening for clothes-lines, consisting of the fence-grapple A, having slots and bearings *b b'*, and the line-hook C having journals *c c*, and rear projection *c'*, together applicable in the manner described.

140,235.—*Planing-Machine.*—JAMES ATKINS, Augusta, Me. Application filed June 15, 1872.

The presser-bar E moves in the inclined slots K, thus being adjusted near the curved line of the cutter-head with any thickness of plank to be dressed, and acting as a chip-breaker.

Claim.—The combination of the obliquely-slotted guide-stands or plates L with the presser-bar E, constructed as described.

140,236.—*Molasses-Pitcher.*—THOMAS R. ATTERBURY, Pittsburg, Pa., assignor to himself and JAMES S. ATTERBURY, same place. Application filed March 3, 1873.

The pitcher, pouring-spout, and drip-shoulder are made of glass, and have a metallic cap.

Claim.—A glass molasses-pitcher made with the lip C and the drip-shoulder *c*, the lip and shoulder both being continuations of the cup or body of the pitcher, in combination with a metallic cap, as shown and described.

140,237.—*Exercising Device.*—JAMES E. AUSTIN, Philadelphia, Pa. Application filed March 18, 1873.

The foot-strap secures one handle to the foot for room or office exercise.

Claim.—The exercising device, consisting of the handles A A', connected by the movable endless band B, held in place by the keepers *a a*, the handle A being provided with the foot-strap C, substantially as and for the purpose described.

140,238.—*Wash-Boiler.*—SIDNEY W. BARTHOLOMEW, Louisburg, N. C. Application filed April 28, 1873.

Is constructed with flanges on the under side of the false bottom, by which a labyrinthine passage is formed on each side of the center with valves for the control of the water and steam. In connection with the conducting side-pipes is a tank or opening through which the water and steam is passed to the perforated cross-pipe for distribution.

Claim.—1. The combination, with the false bottom D, of flanges disposed on the under side of the same so as to form passages, having each an ingress, M, and an egress, G, and a valve, R, arranged substantially as described.

2. The false bottom D, in combination with the valves R, flanges E F', forming labyrinthine passages, trunks I, pipes J K, and connecting-tube L, substantially as and for the purpose specified.

3. The false bottom D, in combination with orifices G M, cover N, valves R, trunks I, pipes J K, tube L, and boiler A, substantially as and for the purpose explained.

140,239.—*Artificial Stone.*—JOSEPH J. BARTLETT, New York, N. Y. Application filed April 9, 1873.

Asbestus is mixed with alkaline silicates (silicate of soda or potash) and then treated with muriatic acid.

Claim.—A compound obtained by mixing asbestus with alkaline silicates, and then treating the mixture with muriatic acid, substantially in the manner herein set forth.

140,240.—*Potato-Plow.*—HEDGEMON T. BASYE, Dyersburg, Tenn. Application filed July 11, 1872.

Claim.—The V-shaped draft-frame K, in combination with the side runners C B, handles H I, shovel A, and pivoted fingered cross-head L, all as shown and set forth.

140,241.—*Mode of Finishing Shoe-Soles.*—BRADLEY S. BRYANT, Hanson, Mass. Application filed May 14, 1873.

Claim.—1. A shoe-sole having its treading-surface covered with a layer or sheet of paper, the exposed surface of which is flocked, or covered with a coating of flock, as and for the purpose specified.

2. As an article of trade, forms for covering the treading-surface of shoe-soles, having upon one side an adhesive cement, and flocked upon the other side to represent buffed leather, substantially as described.

140,242.—*Chromatic Printing-Press.*—THOMAS H. BURRIDGE and JAMES M. KERSHAW, St. Louis, Mo. Application filed March 29, 1873.

The bed series of fountain-rollers ink in different colors, respectively, the F and G series of distributers, which are so arranged as to bring the rollers in either series opposite the intervals between the rollers of the other. The intervals are shorter than the rollers, so that the edges overlap to blend the colors. The H and J series of inking-rollers, in a traverse frame, get their ink from the F and G series of distributers, respectively, and are arranged to correspond with them, but their overlapping edges are slightly rounded. As the inking-rollers in their traveling frame are on the same plane as the distributers, provision must be made for the H series of inking-rollers to clear the G series of distributers, so the carriage is hinged by a double joint and an ear on the carriage strikes an elevation opposite ends of the G rollers.

Claim.—1. The combination of the frame A, the carriage I, the inking-rollers H, &c., and J, &c., the elevations P P', the distributing-rollers F, &c., and G, &c., the fountain-rollers B, &c., and D, &c., and the fountains C, &c., and E, &c., the separate series of inking-rollers being arranged relatively to each other as and for the purpose specified and shown.

2. The combination of the frame A, the carriage I, the inking-rollers H, &c., and J, &c., the elevations P P', the distributing-rollers F, &c., and G, &c., the fountain-rollers B, &c., and D, &c., the fountains C, &c., and E, &c., the platen K and cylinder L, the various parts being arranged and operating in relation to each other, substantially as and for the purpose shown and specified.

140,243.—*Refrigerator for Restaurants, &c.*—WILLIAM FRANK BYRNE, Vicksburg, Miss. Application filed May 17, 1873.

The refrigerator is detachable, is made into two compartments, and has a rotating cylindrical cover. The upper compartment has an ice-box with a leaden bottom. The space around this box is partitioned off into divisions for the reception of bottles and double dishes for mint, &c. The lower compartment is divided by a vertical perforated partition, and has perforated shelves and a perforated raised bottom, and is cooled by the ice-drippings, which pass from the ice-box through holes onto its bottom and then through it into a sewer.

Claim.—1. The arrangement of the two cooling-boxes A and G, revolving door F, doors I, rear cover E, and the open box C, with the partitions *c* and *c'*, the leaden ice-plate *d* with the holes *d'*, the drain-pipes D, D', and M, the shelves K, substantially as specified.

2. The detachable cooling-boxes A G, constructed and arranged substantially as specified.

3. The arrangement of the box A and the removable box C, with the divisions *c* closed at the bottom, and with space between for inserting the leaden ice-bearer *d*, as specified.

4. The combination of the lower box G with the drain-pipes D D', which effect the cooling of the said box by spreading the drained ice-water over the bottom, substantially as described.

140,244.—*Piston-Packing.*—JOHN W. CAREY, Baltimore, Md. Application filed May 13, 1873.

A screw-threaded cap is placed over the piston-hub. It draws up a conical nut, which is prevented from turning by a lug, and which forces loose pins out against the packing.

Claim.—The combination of the hollow screw G *g* fitting over hub a^1 of a piston-body with a nut, F, conical upon its outer surface, having side studs *f*, and working against loose pins, as and for the purpose described.

140,245.—*Scrap-Book.*—SAMUEL L. CLEMENS, Hartford, Conn. Application filed May 7, 1873.

Claim.—As an article of manufacture, a scrap-book, the surfaces of the leaves whereof are coated with a suitable adhesive substance covering the whole or parts of the entire surface, all as set forth.

140,246.—*Cotton-Bale Tie.*—FREDERIC COOK, New Orleans, La. Application filed November 19, 1872.

Claim.—A cotton-tie buckle with one mortise and two reversed tongues split off from the outer bars D.

140,247.—*Apparatus for Exhausting the Air from Fruit-Cans and other Vessels.*—LE ROY C. COOLEY, Albany, N. Y. Application filed June 10, 1873.

Steam is admitted to or generated in the condenser, and expels the air, after which the stop-cocks are closed and condensation induced, creating a vacuum. The pipe leading to the fruit-can is located at such a height above the bottom of the vessel that the water of condensation cannot overflow into the fruit-can.

Claim.—1. The air-exhausting apparatus consisting of a condensing-chamber having a bent blow-off tube, and provided with a pipe, E, for direct connection with the jar, said pipe being located at a point above the bottom of the condensing-chamber, as and for the purposes specified.

2. A series of condensing-chambers having the blow-off tubes D, the pipes E located as specified, and stop-cocks *d* and *c*, in combination with the steam-pipes B C and stop-cocks *c*, substantially as and for the purposes specified.

140,248.—*Stop-Cock.*—WILLIAM S. COOPER, Philadelphia, Pa. Application filed March 8, 1873.

A recessed cap or cover to prevent leakage around the screw-spindle.

Claim.—The combination, with a valve-casing, of a detachable plate, *f*, and a cap, A, recessed to receive the valve *b*, upper and lower packings *g h*, and spring *d*, substantially as specified.

140,249.—*Clothes-Wringer.*—ELBERT A. CORBIN and HERMANN ALBRECHT, Philadelphia, Pa. Application filed March 11, 1873.

Is constructed with suspended plates loosely held by a pivot in the extension or legs, which move to connect with the tube by the screws. Between the uprights or roller-frame is firmly attached a cross-bar, which serves to support the machine and prevent side motion.

Claim.—1. A clothes-wringer in which a plate, *d*, to be acted on by a screw, is hung loosely to and arranged to slide freely on each frame, and is combined with the jaws of the same, as and for the purpose set forth.

2. The combination, with the opposite frames and levers of a cross-bar, H, confined at the ends, substantially in the manner described.

140,250.—*Ore-Stamp Feeder.*—JAMES D. CUSENBARY and JAMES A. MARS, San Francisco, Cal. Application filed April 21, 1873.

At each fall of the stamp the tappet strikes and carries down one of the fixed arms partially rotating a shaft, which elevates a second fixed arm and pawl-bar, thereby turning a pocketed cylinder which feeds the ore from a hopper automatically to the stamp.

Claim.—1. The feeding-cylinder I mounted upon the movable timbers H H, substantially as and for the purpose above described.

2. The rock-shaft *p* with its fixed arms *q r*, in combination with the pawl-bar *o*, ratchet-wheel N, and feeding-cylinder I, when arranged to be operated by the tappet D, substantially as and for the purpose described.

140,251.—*Locomotive Fire-Box Crown.*—HENRY C. DARBY, WYANDOTTE, Kans. Application filed April 4, 1873.

An arch-plate is arranged over the crown-sheet of the furnace and secured thereto by screw stud-bolts, which are also riveted above and below the plates. The object is to dispense with the ordinary crown-bars and still secure the same amount of strength with less metal, and also to increase the radiation of heat.

Claim.—The fire-box crown herein described, constructed with an arch, A, placed above the crown-plate C, substantially as explained.

140,252.—*Supplemental Attachment for Cooking-Stoves.*—JUSTUS DAY, Holley, N. Y. Application filed April 8, 1873.

This supplemental cooking apparatus is provided with a central diaphragm, which descends into the flue of the cook-stove to force the products of combustion, in their circuitous passage, against the bottoms of the vessels placed in the top of the device.

Claim.—1. The attachment B, constructed of the top and bottom plates *b c* and drum *a*, when said top and bottom plates have vertical flanges *f f'* for the riveting of the drum in place, and the bottom-plate has an additional vertical flange, *h*, set in from the others, for holding the attachment in the griddle-holes, as herein shown and described.

2. In combination with the attachment B, the longitudinal diaphragm C, provided with the ports *k k*, when said diaphragm is fitted loosely in place, and is held by pins or equivalent, passed from the outside of the drum into sockets of the diaphragm, as herein shown and described.

3. In combination with the attachment B and diaphragm C, provided with the ports *k k*, the hinged damper *l*, arranged to cover one port and force the draft through the other port, and directly beneath the griddle, as herein shown and described.

4. In combination with the attachment B and diaphragm C, the damper-plate D, when made to fit said diaphragm, and to be removable therefrom, and closing the flue-space between the oven-plate and top-plate of the stove, as and for the purpose specified.

5. In combination with the attachment B, the diaphragm C, damper *l*, and damper-plate D, when arranged to operate in the manner and for the purpose specified.

140,253.—*Cooking Apparatus.*—MARY JONES DE LEON, Baltimore, Md. Application filed January 2, 1873.

Over the lamp is an annular boiler with a perforated lid. The heat, &c., passing through this boiler, is led by separate pipes to the several cups containing food to be warmed or cooked. Thus steam and hot air are used as heating agents. The lamp may be placed in the top of the annular opening in the boiler.

Claim.—1. In an apparatus for heating and cooking food, the combination of a lamp and the annular water-reservoir, having a perforated cover, with the plate or plates containing the articles to be heated, whereby said articles are subjected to the combined action of steam and dry heat, while the latter may be used for cooking purposes, by placing the lamp on its seat on the water reservoir, substantially in the manner herein set forth.

2. The combination of the vessel A, lamp B, reservoir C, plates D and E, conical cap G, and tubes I I, all constructed and arranged substantially as and for the purposes herein set forth.

140,254.—*Combined Corn-Planter and Cultivator.*—GEORGE DE VANY, Darbyville, Ohio. Application filed January 10, 1873.

There are two diverging beams, which carry the teeth and seed-box. The rear share-standards rise above the beams to receive the handles, which are secured by a bifurcated rod, which embraces both the standard and handle. The implement can be changed into a double-shovel plow by removing the seed-box and shifting the left-hand beam backward.

Claim.—1. In a walking seed-planter, the combination of the lever *e*, fulcrum-bolt *s*, projecting arm *t*, elbow-lever *p*, link *r'*, and spring *r*, used either with or without the secondary lever *u*, to constitute a mechanism for operating the seed-distributing slide, when all the parts are constructed and relatively arranged, in the manner herein shown and described.

2. The seed receiver or box F adapted for the reception of hopper H, and provided with a central bridge or partition, G, and brushes or cut-offs *i i*, as and for the purpose set forth.

3. The rear shovel-standards B^1 B^2, and handles C C', connected by means of a transverse rod, *a*, provided with bifurcated ends a^1, and clamp-plates a^2, as shown and described.

140,255.—*Telegraph-Pole.*—HIRAM DODGE, Beaver Dam, Wis., assignor of one-half his right to COLUMBUS GERMAIN, same place. Application filed May 24, 1873.

The cylindrical or conical metallic pole is slotted at the base and secured to a foot-post by a ring; it carries collars near the top, having extended arms for supporting the wires in wooden plugs for holding the glass insulators, the rests being further insulated from the pole by rubber bands. The top of the pole is covered by a cap.

Claim.—The combination of the base A, pole B, band *a*, cap C, collars D D, with perforated arms *d d*, and rubber collars, as described, all constructed and arranged substantially as and for the purposes herein set forth.

140,256.—*Sash-Fastener.*—DANIEL M. DENEHOO, Beaver, Pa. Application filed June 19, 1873.

As an improvement on the sash-fastener patented to the same party, No. 63,855, April 13, 1869, the concentric pivoted catch is formed into a weighted eccentric, having a wedge-shaped cam-surface, and hooks on the downwardly-projecting arm, the device being operated either by its own weight or by means of a spring, this construction giving a wedging movement, which, in combination with a peculiarly-shaped recess in the rack-bar, serves to hold the upper sash of the window firmly and prevent sagging.

Claim.—The latch D constructed as described, with arm *d* having hooks *f f* and a wedge-shaped cam-surface, *x y*, and operating with or without a spring, *h*, in connection with a rack-bar, B, and recess *a* or *a'*, substantially as and for the purposes herein set forth.

140,257.—*Mortising-Machine.*—JOHN DRIVER, Marysville, Cal. Application filed April 10, 1873.

A chain-saw, mounted on an ordinary frame of a mortising-machine, is supported and adjusted by a system of sliding plates and set-screws.

Claim.—The endless toothed chain *s*, in combination with the chain-wheel K, and grooved guiding-plate J with its grooved roller *r*, the grooved block *y*, and the adjusting-screw *i*, all constructed and arranged substantially as and for the purpose set forth.

140,258.—*Turned Shoe.*—WILLIAM DUCHEMIN, Boston, Mass., assignor to WILLIAM DUCHEMIN, trustee, same place. Application filed May 10, 1873.

The channel is cut on the grain side of the leather with the lip or opening in the direction of the center of the sole, throwing the deepest portion of the cut toward the sole edge. It is sewed elastingly through the welt sole and upper, and afterward turned.

Claim.—1. A turned shoe having its sole channeled on the lower or grain side, the overlapping surface of its lip being directed toward the center of the sole, substantially as and for the purpose set forth.

2. The mode of sewing turned shoes, consisting in uniting the sole, upper, and welt together by stitches, passing through angularly to the surface of the sole, substantially as and for the purpose set forth.

3. As a new article of manufacture, a turned shoe having its sole channeled on the lower or grain side and sewed angularly, and composed of the sole A, upper B, and welt C, substantially as and for the purpose specified.

140,259.—*Toy Automatic Swimmer.*—ISAAC F. EATON, New York, N. Y., assignor to ALBERT D. DAVIS, same place. Application filed November 21, 1872.

Scissor-levers pivoted in region of the loins have returning cross-bill points closed by springs to work the arms and legs. Clock-work mechanism located in the thoracic cavity operates a vertically-cogged disk which intermittingly opens said levers.

Claim.—As a new and improved article of manufacture, an automatic swimming human figure, constructed and operating substantially in the manner described.

140,260.—*Car-Brake.*—WILLIAM EBBITT, New York, N. Y. Application filed April 30, 1873.

The piston being moved by the vacuum created in the cylinder, communicates its motion, through multiplying levers, to main lever, in which is journaled a friction windlass-pulley made in two parts, one of which is moved into contact with the axle, the other moved by frictional contact therewith, winding up a chain connecting with the brake-bars. A windlass is provided to operate the brakes separately from the devices just described.

Claim.—1. The combination of a piston, *m*, a friction windlass-pulley, A, axle C, and brake-bar, substantially as described, for the purpose described.

2. The friction windlass-pulley A and lever B, in combination with the multiplying-levers *i j*, and the piston *m* with axle C and brake-bar, substantially as described.

3. The windlass D, lever B, and friction-pulley A, in combination with the multiplying-levers *i j* and piston *m*, axle C, and brake-bar.

140,261.—*Wash-Pounder.*—LEVI S. ENOS, Almond, N. Y., assignor of one-half his right to SYLVESTER B. ESTABROOK, same place. Application filed May 24, 1873.

Is constructed with an outer shell and an inner flange or projecting ring attached to a partition or dividing-plate by which it is secured to the cap, between which is a cylindrical connection through which the handle passes, having on its end a spiral spring. The handle extends below the shell, and when in use the air passes freely through the cylinder, the handle being raised by the concussion to permit it.

Claim.—In combination with the pounder A, the handle D and spring *b*, constructed and arranged as and for the purposes set forth.

140,262.—*Needle Retter and Threader for Sewing-Machines.*—GEORGE P. FARMER, Brooklyn, N. Y. Application filed March 22, 1873.

Claim.—A needle-threader, constructed as set forth—that is, of a single strip of metal indented to form open channels or grooves *a b*, and provided with a bent lip, *c*, which sustains the point of the needle and holds the latter in the groove *b*.

140,263.—*Means for Preventing Incrustation in Steam-Boilers.*—ROBERT A. FISHER, San Francisco, Cal. Application filed February 19, 1873.

Claim.—The application of a body of quicksilver, or an easily-fused metal or alloy, in the bottom of steam-generating vessels, which, becoming mobile at a temperature of about 212° Fahrenheit, will, by its agitation, prevent incrustation, substantially as set forth.

140,264.—*Manufacture of Illuminating-Gas.*—CHARLES GEARING, Pittsburg, assignor of four-eighths his right to GEORGE M. IRWIN, CHAS. WALTERS, and NANCY MILLIGAN, same place, and SIMON B. ROW, Clearfield, Pa. Application filed June 20, 1873.

Claim.—1. In a gas-machine where steam and air are carbonized by coming in contact with hydrocarbon liquids, drying and superheating said steam and air by passing it through a series of pipes and retorts before the hydrocarbon liquid is admitted, as and for the purposes herein set forth.

2. In a gas-machine, one or more retorts filled with pebbles, for the purposes herein set forth.

3. In a gas-machine passing the gas through a retort filled with pebbles and placed within an exterior retort, the space between the two retorts being filled with steam and air, as and for the purposes herein set forth.

4. The combination, in the furnace A, of the retorts B B' with interior retorts C C' filled with pebbles, the retorts D D' also filled with pebbles, and the retort E with transverse perforated partitions *a a*, all substantially as and for the purposes herein set forth.

5. The outside carbonizing-retorts G G', filled with pebbles, as and for the purposes herein set forth.

6. The injector J provided with the cup or bowl *u*, and used in combination with the steam-pipe H and air-pipes I I, each having a stop-cock, as and for the purposes herein set forth.

140,265.—*Lasting-Machine.*—CHARLES W. GLIDDEN, Lynn, Mass. Application filed May 6, 1873.

The matrix or box which receives the last and upper is provided with a flange with a groove formed upon its upper face, into which a guide-roll or pin projects, guiding it as it revolves, so that the entire circumference of the last is presented for the action of the crimper-slide. In the front end of the crimper-slide is a nail-tube, which is brought directly beneath a vertical rod or driver when the slide is moved forward to press the upper over onto the inner sole. The slide receives its reciprocal movement from a vertical bar with inclines upon its opposite sides which work in a slot in the rear end of the slide.

Claim.—1. In combination with mechanism for receiving the upper and last, a crimper-slide, *t*, operated by the inclines *z* on the bar *w*, substantially as shown and described.

2. In combination with the crimper-slide *t*, the nail-tube a^3 and nail-driver c^3, arranged and operating substantially as shown and described.

3. In combination with the crimper-slide *t*, nail-tube a^3, and driver c^3, the supply-tube b^3.

4. In combination with the crimper-slide, the box *f*, supported and pivoted substantially as shown, and made with the groove x^2 and flange *k*, the guide pin or roll *l* entering the groove, the pins or rolls *p p* pressing against the roll *l*, and the button *q* pressing the flange *k* up to the pin, all substantially as shown and described.

5. In combination with the crimper-slide *t*, and with the driver c^3, the bar *w* for imparting the forward and back movements to the slide and the downward movement to the driver, substantially as described.

140,266.—*Telegraph-Sounder.*—MILES W. GOODYEAR, New York, N. Y. Application filed May 10, 1873.

Claim.—The two electro-magnetic helices B B', the core of one of which forms the fulcrum for the armature-lever C, in combination with the armature-lever C, studs D D', and adjusting-screws *d d'*, which receive the blows of the armature-lever, all constructed and operating substantially as and for the purpose shown and described.

140,267.—*Mitering-Machine.*—FRANCIS D. GREEN, Williamsport, Pa. Application filed February 8, 1873.

The gage-bars C are pivoted near the middle line of the table and fastened thereto by a set-screw at any angle required on the arc of the graduated circles.

Claim.—The bars *c c*, pivoted at their inner ends to the slotted table A A, as shown, and provided with ears *a a* and thumb-nuts *d d*, all as and for the purposes set forth.

140,268.—*Three-Horse Equalizer.*—WILLIAM HASTINGS, Sr., Fowler, Ill. Application filed April 10, 1873.

A triangular frame is attached to the pole and hounds, to which is secured the equalizer.

Claim.—The diagonal sustaining-bar A, in combination with the transverse bar C, for the purpose of attaching and sustaining the equalizing-bar E, substantially as shown and described.

140,269.—*Vise.*—THOMAS HALL, Florence, Mass. Application filed March 24, 1873.

The handle of the vise is connected to the movable jaw by metallic straps bearing on the periphery of a circular disk forming part of the handle. The frictional contact of the straps retain the handle in any of its working positions. A projection on the side of the circular disk acts upon a lever that engages and disengages the clutch for holding the movable jaw in position. The circular bed-plate is formed in sections and the vise connected to it by a dovetailed groove in a circular disk that forms a portion of the body of the vise.

Claim.—1. In combination with the movable jaw A of the vise, the handle *c*, attached thereto by frictional bearings or straps T, for the purpose of holding said handle in any of its working positions, substantially as and for the purpose described.

2. The combination of handle C, movable jaw A, and clutch G with wedge D and toggle E F, or their equivalents, and rack H stationary jaw B, substantially as described, for purposes named.

3. The combination of the projection K on lever C, lever J or its equivalent, with clutch G and rack H, substantially as described.

4. The combination of the dovetailed ring or flange B on the vise with the sectional dovetailed bed-plate P, as and for the purpose described and represented.

5. The combination of the ring or flange B, bed-plate P, and notched bar H, as and for the purpose described and represented.

140,270.—*Steam-Lubricator.*—WILLIAM HAMILTON, Erie, Pa. Application filed June 2, 1873.

The lubricating-cup and the tubular bolt, cast together in one piece, extending horizontally through the cup, having at its extremity a conical valve-seat, through which passes the pointed valve-spindle, which regulates the flow of oil and keeps the valve-seat open.

Claim.—1. The chamber or cup A, and the hollow or tubular bolt B, each constructed as shown, and cast in one piece, in combination with the spindle D, formed as stated, the whole being arranged to operate substantially as described, as and for the purpose specified.

2. In combination with the chamber A and hollow bolt B, the supply-cock, consisting of the cup F and tube F', supply-channels *f f*, air-passages *g g*, and the valve-plug H, the whole being constructed and arranged to operate substantially as described.

3. The sediment-cock, consisting of the tube K, having a channel, k^3, with a flaring mouth or valve-seat, and the valve-plug L having a cone-shaped point, L', and the central T-shaped *l*, the whole being combined and arranged to operate substantially as described.

140,271.—*Self-Loading Wagon.*—THOMAS HANDY, Springfield, Ill. Application filed May 2, 1873.

The earth-box is constructed with two sides, connected by upper and lower transverse bars; a bottom composed of pivoted tilting sections, operated by levers and connecting-links, and a swinging door at the rear end, which is kept closed to hold the earth in the box by a hook on the rear edge of the bottom, the top and front end of the box being open. The box is raised and lowered by ropes or chains wound on grooved wheels located on a hoisting-shaft placed in a central longitudinal position on the frame of the machine, and it is guided in its vertical motion by guide-bars and loops. The box is emptied by tilting the pivoted sections of the bottom.

Claim.—1. The box M, constructed as shown, and connected with the rear axle C' and the plate A by means of the guide-rods Y Y' and brace rods Z Z', substantially as and for the purpose specified.

2. In combination with the pivoted traps U of the box M, the shafts V, the arms *u* and *v*, the connection W, and the levers X, substantially as and for the purpose shown.

3. In combination with the box M, and with the supporting-frame, the shaft H, grooved wheels I, cords or chains K, pulleys L, lever N, ratchet-wheels O and R, and pawl S, substantially as and for the purpose set forth.

4. The pivoted end piece T, and traps U, when constructed as shown, and combined with each other by means of the locking-stud *u'*, substantially as and for the purpose shown and described.

140,272.—*Ruling-Pen.*—WILLIAM O. HICKOK, Harrisburg, Pa. Application filed April 29, 1873.

Claim.—The within-described ruling-pen, consisting of the part A, composed of the plate and the short fingers, made of one piece of thick metal, and the points B B, made of thin metal, provided with sockets at their inner ends, which slip over and are soldered to the ends of the fingers of the part A, all substantially as and for the purposes herein set forth.

140,273.—*Portable Fence.*—ORLANDO HUFFMAN, Lucieville, Neb. Application filed October 18, 1872.

Upon the lower end of three posts are first nailed two bars or panels on one side, and one on the other side, alternating; next two bars are attached, one on each side of the upper ends of two of said posts, the bars extending, to which an additional post is secured; then another section is formed in a similar manner, after which the two-panel portion of one section is interlaced with the three-panel portion of the other, the projecting ends of the panels or bars serving as further security to the fence after sliding the end posts between the alternating bars.

Claim.—In portable fences, the sections herein described, constructed and adapted for connection in the manner substantially as specified—that is to say, the end of each section is left incomplete, as described, but when interlaced with its neighbor the two form a perfected and continuous fence, as shown.

140,274.—*Machine for Cutting Tape, &c.*—JAMES S. JEWETT, Gloucester, Mass. Application filed March 22, 1873.

Designed to cut tape into suitable lengths for boot-straps, &c. The movable blade is carried by a wheel and works in connection with a stationary blade. The speed of the feed-rollers may be varied to correspond to the required length of material by changing the size of the gears.

Claim.—In a tape-cutting machine, the rotating blade *b*, stationary blade *a*, the feed-rollers having gears *h h*, bevel-wheel A, double gear *z*, and gear *c*, when arranged and operating as described.

140,275.—*Book-Cover.*—ALBERT H. JOCELYN, New York, N. Y. Application filed May 6, 1873.

A sheet of paper, creased and indented centrally to form a line for doubling for strength, and for tearing to form the interlocking tongues, has adhesive corners, whereby its corners may be stuck when it is folded around a book as a cover.

Claim.—A book-cover having its back and sides in one piece and folded to give increased thickness and strength at or near the junction of such parts and provided with adhesive portions adapting it to be fitted to the sides and back of the book, essentially as described.

140,276.—*Whiffletree.*—DANIEL A. JOHNSON, Boston, Mass. Application filed February 20, 1873.

Between the upper and lower plates is interposed a friction-plate, which is allowed only a vertical movement, the plate being cushioned upon a rubber pad.

Claim.—1. In combination with the whiffletree and cross-bar the metallic casings F and D, the casing or friction piece D fitting into the lower case F, substantially as described, and for the purpose set forth.

2. In combination with the casings D and F the elastic material E, substantially as described, and for the purpose set forth.

140,277.—*Chicken-Coop.*—WILLIAM J. H. KAPPE, Quincy, Ill. Application filed April 28, 1873.

A folding-coop in which the sides fold down, leaving a space for feed-boxes attached to the folding end pieces, the top being secured by projecting cleats.

Claim.—The chicken-coop constructed with a bottom having the end cleats *a*, the sides *e* having notches *v* and hinged to the bottom boards, the ends B hinged to the end cleats *a*, and the top D having the projecting cleats *l*, substantially as specified.

140,278.—*Machine for Distributing Type.*—CHARLES KASTENBEIN, Clapham Road, England, assignor to EDWARD L. FORD, Brooklyn, N. Y. Application filed January 8, 1873.

The front line of dead matter held in galley A is fed up into the distributing-channel by a hand-lever and plate, and constantly fed forward by a weighted plunger. Upon depressing the keys corresponding to the forward letter a sliding gage, *a'*, adjusts (by cams *z*, crank *b'*, and bar *d*,) the delivery-orifice, turns the proper gate in the conduit-plate to form a continuous channel to the receiving-tube, and vibrates the pusher-plate *p*, which thrusts the forward type over the channel, down which it descends until it rests upon the plunger *s*, which was carried forward—to force the type into the receiving-tube against the pressure of a retiring spring-head—by the movement of the key and locked by the notch at *a'*, and retracted as the next key is struck.

Claim.—1. The combination of the finger-keys A, pitmen *r*, bell-cranks *w*, and slides S, constructed and arranged to operate as set forth.

2. The pusher *p*, operated from the key A through the medium of the bar *k*, rock-shaft G, arms *l m n*, and rod *o*, substantially as described.

3. The eccentrics *z*, gage-plate *a'*, rod *x*, keys A, and the described or equivalent connections for regulating the size of aperture for the passage of the type.

4. The spring-bar X, operating in connection with the pitmen *r*, in manner substantially as and for the purposes set forth.

5. The pitmen *r*, bell-cranks *w*, pushers S, springs *f*, and compartments K, operating in combination with the conduits and keys, substantially as described.

140,279.—*Type Composing Machine.*—CHARLES KASTENBEIN, Clapham Road, England, assignor to EDWARD L. FORD, Brooklyn, N. Y. Application filed January 8, 1873.

The type, supported on reglets at the base of their vertical channels over their respective conduits, which converge to a single delivery point, are ejected one at a time by pusher-bars, operated by the keys, which force their heads onto a shelf, *n*, so that they may, when released from the reglets, descend heel foremost, guided by the conduit, to the setting-tube, into which they are guided properly by a balanced arm, *f*, and along which they are successively pushed by a bar reciprocated by a cam-wheel until they are moved in proper lengths into the galley and justified by hand. The galley has adjustable side and end sticks, and the justified line is forced down by a plunger operated by a lever.

Claim.—1. In a type-composing machine, two parallel ranges of close boxes A and B for containing the type, said boxes being formed of the plates *a a* and partitions *b c*, substantially as hereinbefore described.

2. The relative arrangement of the vertically-moving keys L, and horizontally-moving keys R, operating in combination with the pushers C and D, respectively, substantially as and for the purposes set forth.

3. The reglets *d* and ledges *n*, when arranged as herein described, below the vertical parts of boxes A B, of the construction specified, and above the inclined or converging bottoms of said boxes, by which the different types are conducted to a common plane for delivery into the shield.

4. The pusher C or D, constructed with a bifurcated end with the lower portion prolonged, as shown in Fig. 4, to adapt it to catch the heel of the type as it is discharged from the reglet *d*, and operating in combination with the ledges *n* to drop the said type in proper position as the pusher recedes.

5. The pivoted guides *f* and *g*, placed in the throat F, and adapted to operate substantially as herein described, for the purposes set forth.

6. The twisted conductor G, extending laterally from the throat F of the vertical shield E, and arranged as described, to take the type in vertical position from the said shield and deliver it in inclined position, face forward, to the justification-desk.

7. The combination of two ranges of boxes A and B, connected by a hinge, Q, to admit of their ready separation, as explained, when required.

8. The justification-desk provided with a removable galley, M, and a slide-bar, T, the latter operated by pedal O, through the medium of rod S and lever *s*, substantially as described.

140,280.—*Reciprocating Churn.*—LUCIUS B. KEELER, Westerville, Ohio. Application filed April 16, 1873.

A box-churn, with stationary dashers, has journals on its two opposite sides, which rest in the upper forked ends of two tilts pivoted to the frame-work at opposite sides. The churn is reciprocated by a crank-shaft, to which it is connected by a bar.

Claim.—1. The forked tilts *b* and cross-bar *d*, the said tilts being pivoted to the frame A, and the forked ends of the tilts forming a bearing for the journals *a*, which are secured to the cream-box B, as and for the purpose herein specified.

2. The cream-box B, provided with the journals *a* for connection with the tilts *b*, in combination with the bar G, shaft H crank I, and frame A, substantially as and for the purpose set forth.

140,281.—*Production of Water-Proof Gum.*—DANIEL M. LAMB, Strathroy, Canada. Application filed May 3, 1873.

Vulcanizable water-proof gum possessing the properties of caoutchouc is produced by inspissating the juice of milk-weed and other plants capable of producing such gum.

Claim.—As a new article of manufacture, water-proof gum, made from the inspissated juice of plants of the asclepias or milk-weed family, or of any analogous plants possessing like properties.

140,283.—*Production of Water-Proof Gum.*—DANIEL M. LAMB, Strathroy, Canada. Application filed May 3, 1873.

Vulcanizable water-proof gum is produced from milk-weed or other plants by separating the juice from the fiber and inspissating the said juice.

Claim.—The art of extracting a water-proof gum from plants of the asclepias or milk-weed family, or other plants possessing similar properties, by subjecting the plants to fermentation, and inspissating the resulting liquid by evaporation.

140,283.—*Preparing Water-Proof Gums from Flax-Seed, &c.*—DANIEL M. LAMB, Strathroy, Canada. Application filed January 28, 1873.

A vulcanizable water-proof gum is produced by the maceration of flax or other analogous seed, straining off the viscid liquid thus obtained, and inspissating said liquid.

Claim.—The art or process of producing water-proof gum from flax-seed or other seeds possessing similar properties, by maceration, straining, and subsequent inspissation.

140,284.—*Bed-Bottom.*—SIMEON L. LEACH, Corry, Pa., assignor to HENRY R. ELLIS, same place. Application filed November 9, 1872.

Double slats, glued together, are attached to head and foot rollers and hung to elastic straps.

Claim.—In a bed-bottom, the wooden slats constructed of double strips united together with glue, as described, in combination with the rollers C and straps D, substantially as specified.

140,285.—*Ruffler for Sewing-Machines.*—WILLIAM H. LEWITT, St. Louis, Mo., assignor of one-half his right to THOMAS M. COCHRANE, same place. Application filed October 5, 1872.

The gathering-blade is adapted to move on the shuttle-covering slide, and is operated from the shuttle-driver by means of the pivoted lever and spring. The lever is pivoted at the back side of the shuttle-race, and its upper forked end embraces a pin on the sliding plate.

Claim.—1. The gatherer E, sliding plate C, lever H, and shuttle-driver slide G, arranged and operating as and for the purpose specified.

2. The gatherer E, sliding plate C, lever H, and spring K, when arranged and operated by the shuttle-driver slide G, as described.

3. The combination of the spring-catch L attached to the presser-foot and the gatherer E, when secured to the cloth-plate and operated from beneath, as and for the purposes set forth.

4. The combination of the spring-catch L, gatherer E, sliding plate C, lever H, driver-slide G, spring K, and cover-plate B, all arranged substantially as and for the purposes described.

140,286.—*Fruit-Ladder.*—ALVA LONGCOR and JAMES B. LONGCOR, Paw Paw, Mich. Application filed April 26, 1873.

Claim.—The bench A B C provided with hooks *a a* and *d d* and notches *b b*, and used in combination with the double ladder D E, all constructed and arranged substantially as and for the purposes herein set forth.

140,287.—*Electrical Stop-Motion for Machinery.*—EMILE MAERTENS, Philadelphia, Pa. Application filed November 27, 1872.

A spring-lever held by a detent is so arranged as to cut off the steam-power from machinery when released, and the said detent is tripped by the armature of an electro-magnet whenever its closed circuit is broken.

Claim.—The combination, with an engine or other motor, of the levers J G or equivalent stop device, a weight or spring operating said device, a trigger for securing said weight, and an electro-magnet arranged to actuate the trigger, as set forth.

140,288.—*Combined Table, Stool, and Stand.*—JOSEPH A. MARKLE, Philadelphia, Pa. Application filed April 21, 1873.

The two pairs of legs are made of such dimensions that one pair will fit within the other, both turning on a central pivot. To the outer pair of legs is fastened a central bar, to which is attached a pair of spring-bolts, each having double catches. The inner pair of catches lock the hinged table-top, and the outer pair lock the hinged elevated platform. A locking-arm rises from one of the legs and engages with and supports the table-top.

Claim.—1. The hinged platform J combined with the central bar B, substantially as and for the purpose set forth.

2. The doubly-constructed bolts G, in combination with the leaf E and platform J, substantially as and for the purpose set forth.

3. The arm L rising from one of the hinged legs, and combined with the leaf E, substantially as and for the purpose set forth.

4. The folding legs A C, central bar B, folding leaf E, and folding platform J, combined and operating as set forth.

140,289.—*Hemp-Brake.*—JAMES C. MATHERLY, Irvine, Ky. Application filed October 15, 1872.

A vertical shaft, at the center of a frame having radial arms above and below and connecting-columns at their extremities, carries a cam which operates a brake in each of these extensions by pressing down the inner end of the sword, when the outer weighted end falls. An adjustable spring-catch is made to detain the weighted end at the option of the operator.

Claim.—1. In a hemp-brake having a series of vibrating swords, I, the pivoted spring-stops or detents N, in combination with the cords R and screw-pin S, as shown, and for the purpose described.

2. The hemp-brake with its frame B C D, revolving cam M, fixed and vibrating swords, pivoted stops or detents for the latter, the hemp-holding arms, and the driving-shaft W, the several parts being constructed and arranged upon the frame to operate as shown and described.

140,290.—*Velocipede.*—LEWIS T. MCGILVRAY, Staunton, Va. Application filed November 27, 1872.

The velocipede is propelled by levers connecting, through intermediate gearing, with a crank on the rear axle.

Claim.—A vehicle having hand-levers, connecting-rods, crank-axles, and intermediate gear-wheels, combined and operated substantially as shown and described, and for the purpose set forth.

140,291.—*Hoe.*—ELIJAH W. MCLENDON, Griffin, Ga. Application filed December 12, 1872.

There are two curved head-plates between which the hoe-blades are secured by means of a screw-bolt that passes through them, and secured by a nut upon the inner plate. The screw is prolonged for a shank that enters the wooden handle.

Claim.—The combination of the jaws A B, screw-bolt C, and nut *d*, for clamping the implement blade, with the handle E and thimble G, all the parts being constructed substantially as set forth.

140,292.—*Sheep-Shears.*—ANDREW S. MCWILLIAMS, Colusa, Cal. Application filed April 21, 1873.

A spring-rest for the thumb is attached near the base of the blade, which is hollowed out to receive it when depressed. A rest is also placed upon the other blade, with semicircular rests for the fingers. These rests relieve the operator's hand from severe strain and abrasion.

Claim.—1. The thumb-rest *d*, when attached as described, in combination with the recess *i* in the back of the blade, substantially as described, and for the purpose set forth.

2. The blade B of a pair of sheep-shears, having the finger-rests or saddles *f*, substantially as and for the purpose above described.

140,293.—*Carpet-Sweeper.*—WILLIAM MILLER, Boston, assignor to himself and J. J. HATLINGER, Hyde Park, Mass. Application filed February 8, 1873.

At each end of the axle of the brush a rod extends upward above the top of the box, having screw-threads formed thereon to engage with a thumb-screw. The sides of the box are slotted for a short distance to allow the adjustment of the axle. Connected with the ends of the axle, so as to turn on them, are the ends of lever-arms that extend forward on each side and around the front of the box, where they connect at the center with the lower end of a handle, which is provided at its upper and lower ends with sliding axles, each formed with a screw-collar to engage with thumb-screws, so as to adjust the axles on the handle. Each axle is provided with a pulley, and the lower axle and pulley are connected by a shaft with a larger pulley that connects by a belt with a pulley attached to the main axle or brush-shaft.

Claim.—1. The screw-rods A, provided with thumb-screws *k k'*, and held in bearings *i i'*, in combination with the axle *c* of the brush *b*, substantially as described, for the purpose specified.

2. The adjustable axles *m m'*, provided with pulleys *n o o''*, in combination with the handle *l* and axles *c*, having the pulley *p'*, substantially as and for the purposes set forth.

140,294.—*Self-Feeding Tank for Railways.*—BENJAMIN D. MOODY, Darksville, Mo., assignor of one-half his right to JAMES M. FULLERTON and GEORGE W. SNYDER, Memphis, Tenn. Application filed April 16, 1873.

The weight of the locomotive upon the piston causes a supply of water to be forced up through the feed-pipe. After the passage of the locomotive the weighted levers replace the parts, an additional supply of water being drawn in through the valve and supply-pipe B.

Claim.—The herein-described apparatus for supplying water to locomotive-tenders, consisting of the tank A connected with the supply-reservoir by the pipe B provided with the check-valve *b*, the plunger C connected to the sides of the tank by the flexible diaphragm and supporting the frame D carrying the rail-bars E, the hinged bars F connecting the beams E with the fixed track, the weighted levers H, and the pipe L M, all constructed, arranged, and operating substantially as shown and described.

140,295.—*Tassel-Clip for Curtains.*—FREDERICK MÜLLER, Boston, Mass. Application filed October 15, 1872.

A screw passes through the bow-spring that unites the two side pieces of the clip and presses against the lower edge of the curtain-stick, and said screw is provided with a ring on the outer end that acts as a cam, and by pressing the lower arms of the clip apart causes the clip to engage the stick more closely.

Claim.—1. A tassel-clip composed of side pieces A, adapted to open from and to close upon each other, and connected by a spring or hinge, in combination with a screw, *g*, arranged between the pieces A and applied so as to act upon the curtain-stick in the direction of its width, substantially as and for the purpose described.

2. A tassel-clip composed of side pieces A, adapted to open from and to close upon each other by means of a spring or hinge, in combination with a flat or cam headed screw, *g*, constructed and arranged between the plates A, to force them apart at one end, substantially as and for the purpose described.

3. A tassel-clip composed of side pieces A and a screw, *g*, arranged and adapted together for the screw to secure the clip to the curtain-stick, by a clamping action in both directions of its thickness and width, substantially as described.

140,296.—*Brick-Machine.*—CHARLES HENRY MURRAY, Southwark, England. Application filed June 20, 1872.

The clay forced from the pug-mill is cut into proper sectional lengths by a vertical wire mounted on a laterally-reciprocating frame moving in guides; then pushed against and past a series of wires fixed in a stationary frame by a pusher actuated by means of a toothed segment and rack.

Claim.—1. The combination of the delivery-table *a'* with the lubricating-roller *a²* revolving in the vat *x*, for lubricating the under surface of the clay.

2. The combination, with the plain-surface receiving-table *a*, of the reciprocating pusher-board *f* and frame *f'*, for forcing the clay past the vertical cutting-wires *e*, arranged and adapted, as described, onto a movable board, *a²*, so that a convenient number of bricks may, without handling, be removed from the machine at the same time, as herein set forth.

140,297.—*Die or Mouth for Brick-Machines.*—CHARLES HENRY MURRAY, Southwark, England. Application filed June 20, 1872.

The clay, as it passes the delivery-aperture, is lubricated by fluid contained in boxes, the perforated faces of which are covered with cloth.

Claim.—A mold or aperture in brick-making machines through which the plastic material is delivered, with movable hollow boxes provided with perforated sides, forming the sides of the mold or aperture, substantially as and for the purpose set forth.

140,298.—*Skipping-Rod.*—JOHN MURPHY, Philadelphia, Pa., assignor to himself and GEORGE W. CARE, same place. Application filed April 11, 1873.

Claim.—The within-described skipping-rod, composed of a strip of rattan with the skin removed, and having at each end a collar, *x*, adapted to a recess in the handle B, in which the strip can turn, all as set forth.

140,299.—*Belt Shifter and Tightener.*—BERNARD O'BRYAN, Marietta, Pa. Application filed May 6, 1873.

A sliding frame, provided with bearings for sliding bar, having attached shifting-box, through which the belt passes. The sliding rod has slotted head moving upon oblique guide, which motion transfers the belt from the loose pulley to the runner, and thus tightens and shifts the belt at one operation.

Claim.—The sliding frame T T R S with its arms or bearings F for the sliding bar I with the guide-head *i*, the oblique guide H, in combination with the shifting box G and belt-tightening pulley E, all arranged and operated substantially in the manner and for the purpose described.

140,300.—*Calendar-Catch.*—ROBERT C. OGDEN, New York, N. Y. Application filed January 25, 1873.

Claim.—The crucial latch for calendars, consisting of a wire bent in the middle to form the pivot, and having one end transversely bent, first in one direction and then in the opposite direction, to form a brace, and the other end bent at right angles to said brace, first in one direction and then in the other direction, across the brace, to form the spring-latch portion *c*, substantially as specified.

140,301.—*Heater and Feeder for Steam-Boilers.*—JOSEPH PILKINGTON, Philadelphia, Pa., assignor of three-fourths his right to J. H. BILLINGTON & COMPANY, same place. Application filed March 27, 1873.

The supply-pipe to the heater, and the pipe from it to the boiler, are provided with check-valves. An exhaust-steam coil passes through the heater-cylinder. A steam-pipe, opened by a cock admits steam to the heater and causes water to flow from it to the boiler.

Claim.—The combination of the water-supply B, tank C, heating-pipe M, conducting-pipes D E F, and check-valves G H, all constructed and arranged to operate in connection with the generator A in the manner and for the purposes herein set forth.

140,302.—*Plow.*—JOHN C. POTTER, St. Helena, Cal. Application filed March 29, 1873.

The plow has a hinged handle which can be folded over to one side in order to pass obstructions.

Claim.—1. The rigid handle *h*, in combination with the hinged movable handle *l*, substantially as and for the purpose above described.

2. In combination with a rigid and a movable handle, the bracing-rod O provided with a rule-joint in the middle, substantially as and for the purpose above described.

140,303.—*Device for Connecting Car-Axles with Axle-Boxes.*—THOMAS PRITCHARD, Philadelphia, Pa., assignor of two-thirds his right to JOHN LOUGHLIN and CHARLES DARRAGH, same place. Application filed May 16, 1873.

Screw-bolts having a center bore are secured through the axle-box. The conical ends of the screw-bolts have their bearings in the conical steps which are secured to the ends of the axle.

Claim.—1. In combination with the journal-boxes of railroad cars and the hubs of the wheels, the adjustable screw-bolts D, and conical bearings F, substantially as and for the purpose set forth.

2. The bolts D having the central bore *b* and an outward extension, *b'*, in combination with the oil-chamber G and conical step F, substantially in the manner and for the purpose above described.

140,304.—*Mechanism for Operating the Doffer-Combs of Carding-Machines.*—JOSIAH K. PROCTOR, Philadelphia, Pa. Application filed March 7, 1873.

The main operating-shaft has upon it a conical eccentric which is prevented from turning independently of the shaft by means of a feather, but which can be moved endwise to take up wear between it and its sleeve by turning one of the nut-bearings which constitute the end walls of an oil-tank in which the shaft, conical eccentric, and sleeve work. A stem connects the sleeve with the comb-shaft. The nut-bearings have channels communicating with oil-cups outside the end walls of the tank. Springs in the eccentric bear against a collar on the main shaft and prevent the former being forced too tightly into the sleeve.

Claim.—1. The combination of the removable nut-bearings with the center-shaft, provided with a sliding conical eccentric and sleeve, for the purpose specified.

2. The combination of the center-shaft and sliding eccentric cone with the eccentric sleeve, as set forth.

3. In combination with the eccentric cone and the shaft collar and sleeve, the springs in the former, substantially as specified.

4. The oil-tank and drip cup or cups in combination with the center-shaft, said cup or cups being arranged to receive the drip from the shaft-bearing at a point outside the wall of the tank, as specified.

5. In combination with the oil-tank, drip cup or cups, and center-shaft, the nut-bearings and bosses, having oil-channels, as specified.

140,305.—*Corn-Harvester.*—EDMUND W. QUINCY, Peoria, Ill., assignor of one-half his right to JOHN H. HALL, same place. Application filed March 22, 1873.

Two endless chains, each having two sets of arms projecting at right angles from the upper edge of each chain, are used, one for severing and the other for elevating the ears to the husking and husk-hatcheling rollers.

Claim.—1. The combination of endless chains F F, husking-rollers H H, and toothed cylinder or roller I, substantially as and for the purpose set forth.

2. The combination of the inclined platform B, provided with the endless chains F F, with the body of a wagon by means of the bar or brace C and clamps *a*, substantially as set forth.

3. The combination of the troughs G G with inclined platform B and endless chains F F having pushers *m*, substantially as set forth.

4. The combination of the fixed vertical knives *o o* with the platform B and the endless chains F F, substantially as set forth.

5. The inclined platform B, carrying the endless chains F F, having knives, knockers, or pushers, and provided with slot *b*, troughs G G, fixed knives *o o*, slots or holes *d d*, husking-rollers H H, toothed cylinder I, and spout *q*, in combination with a brace, C, and clamp for attaching the whole to the body of a wagon, substantially as set forth.

140,306.—*Sofa.*—JONATHAN Q. RAND and JOSEPH F. MCSHERRY, Baltimore, Md. Application filed June 3, 1873.

Two drawers are arranged under the seat so as to be drawn out in front; one of the drawers has a hinged detachable lid with recesses on one of the parts for the blacking-box; the other drawer has a detachable lid with a hole therein and a cover for the same, so that said drawer can be used as a commode. To the under side of said drawers legs are hinged near to the center, so that when the legs are folded the free ends come nearly to the front of the drawer. When the drawer is pushed in the upper part of each leg engages with the cross-strip of the sofa and folds the leg up.

Claim.—1. A lounge provided with drawer A, having removable plate *a*, with hinged portion *b*, foot-rest *c*, and recesses *e e*, drawer B, having removable plate D, with cover *m*, all constructed and combined substantially in the manner and for the purposes as shown and set forth.

2. The combination of hinged legs *n* with the drawers A B and slots *s* of the bottom rail of the lounge, substantially as set forth.

140,307.—*Door-Latch.*—ORIN B. RAND, Kalamazoo, Mich. Application filed November 29, 1872.

The inner end of the operating-spindle passes through a plate with two arms of unequal length, which arms are connected by rods to two spring latches or bolts at the top and bottom of the door. A spring upon the spindle forces its squared end into a corresponding recess in a plate in the rear when the hand is removed from the knob. This securely locks the bolts in place. To operate the bolts the spindle is pulled outward against the force of the spring and the square end released from its fastening.

Claim.—The spindle L, spiral spring S, cylinder P, knob G, and plate I, all arranged so that the knob is locked from turning, in combination with the lever-flange B, operating the rods and spring-latches, when constructed, arranged, and operated as described and shown, for the purpose set forth.

140,308.—*Trunk-Lock.*—THOMAS L. RIVERS, Newark, N. J. Application filed March 27, 1873.

Claim.—1. The recessed plate A provided with a guide and guard, *a*, and the latch, which vibrates in a line at right angles to the face-line of the plate, in combination with the body-plate B, which is provided with the recess *b* and the keeper *g*, arranged so that an eye in the latch may engage therewith and be disengaged therefrom by means of a key, substantially as shown and described.

2. The longitudinally-curved latch, composed of spring metal, in combination with the lock-case, and arranged so that its free end will engage with the coincident bearing-surfaces on the plate when subjected to undue strain, substantially as described.

140,309.—*Steam-Engine Valve-Gear.*—CHARLES ROGERS, Allegheny, assignor to himself and JAMES A. HUTCHISON, Pittsburg, Pa. Application filed January 6, 1873.

The inflexible tappet-arm of a direct-acting engine is provided with a spring secured on each side thereof, which, striking against the tappets on the valve-stem, completes the throw of the valve. An adjustable balancing device, consisting of a top plate and adjustable side plates with inclined joints, is arranged over the slide-valve. The top plate is arranged in regard to the valve so that

the steam enters inside of the chest and outside of the valve at the same time.

Claim.—1. The inflexible tappet-arm *g* having the springs *g'* attached thereto, in combination with the tappet-nuts, piston-stem, and valve-stem of a direct-acting engine, arranged substantially as set forth.

2. The valve-stem b^1 carrying and operating a piston, *f*, in the box or case D, each piston having one or more double inclines, *e*, in combination with the wedge-shaped end or ends *d* of one or more blocks, D', and a spring or springs for pressing the block or blocks to their work, the parts being relatively arranged substantially as and for the purposes set forth.

3. The arrangement, inside the steam-chest and outside the valve, of the top plate *a* and adjustable side plates *c*, making, with each other, an inclined joint, *c'*, substantially as set forth.

4. The arrangement, inside the steam-chest and outside the valve, of the top plate *a*, whereby, in connection with ports *s s'*, the valve will take steam past the end of the top plate, substantially as set forth.

140,310.—*Wheel for Furniture-Casters.*—CEVEDRA B. SHELDON, New York, N. Y. Application filed May 23, 1873.

The two halves of the wheel are struck up of sheet metal, and each piece has a half-hub, a cup-shaped central, and a half rim for the portion which travels the floor. A central ring of cast metal is used as a brace under the inner edges of the rim of the wheel. The two parts are held together by a tubular rivet.

Claim.—A four-part caster-wheel, formed of two sections, B B, each struck up of a single piece of metal, having flanges b^1 b^1, the detachable brace-ring D and the end-upset tube C, all constructed and put together substantially in the manner set forth.

140,311.—*Wheel for Furniture-Casters.*—CEVEDRA B. SHELDON, New York, N. Y. Application filed March 22, 1873.

The body of the wheel is struck up from two disks of sheet metal. Each piece is formed into a back plate, a half-hub, and a double rim, formed by turning the edge back upon itself. A tubular rivet screws the two parts to each other.

Claim.—A pulley or caster wheel made up of two sections, divided on a plane passing through the rim or axis, said sections being each made with the cup *a*, half-hub a^1, inside face a^2, and double rim or edge formed from a single piece of sheet metal.

140,312.—*Pitman Connection.*—JOSEPH A. SHEPHARD, Portsmouth, Ohio. Application filed December 30, 1872.

An expansible split wrist to be inserted in the heel of the knife, and receiving a pin with a split shank and a tapering head, the shank screw-threaded; the outer end expanding after the nut is screwed on.

Claim.—The split harvester-pitman C D E, having the described orifice *e e'*, in the described combination, with the split, threaded, and flaring pin F F', and nut H, the whole being formed and arranged in the manner and for the purpose set forth.

140,313.—*Lap-Board.*—EDWIN J. SPRAGUE, Youngstown, Ohio. Application filed March 22, 1873.

A bar is held against the end of the board by elastic bands, forming a spring-clamp for holding the cloth.

Claim.—1. The combination of a lap-board, provided on its under side with cleat-pins or bars, with removable socket bracket-pieces, substantially as described, whereby said lap-board is supported for use without the intervention of the operative, as described.

2. The combination of a lap-board and spring-clamp cloth-holder, substantially as hereinbefore described.

140,314.—*Paint-Brush.*—STRANUS STANDISH, Eureka, Nev. Application filed May 26, 1873.

Is constructed with its handle secured to it by a screw and nut formed in the metallic cap, which passes through the cap, and is held securely, by a button and pivot on its end, within the brush, and by a conical compressor.

Claim.—A brush-handle, having the screw *a* and round smooth end a^1; the compressor B, conical on the outside, perforated cylindrically, and held on the part a^1 of handle, and the shell D having nut *d* and shoulder *d'*, constructed and applied together to hold the bristles C, in the manner described.

140,315.—*Apple Paring, Coring, and Slicing Machine.*—JOHN STEWART and WILL CAMPBELL, Fowler, Ill. Application filed May 13, 1873.

The arched paring-knife is combined with a convex anti-friction roller. The knife is mounted on a platform having on one side a segment of cogged wheel so flattened as to have the shape of the fruit to be pared. The cogged guide engages with a yielding ratchet attached to the frame of the machine. The coring and slicing knives are combined in one blade, so that as the apple is cored it is also sliced spirally. The holding-fork is made of two swivel rods, so as to hold the fruit against the action of the slicing-knife.

Claim.—1. The guide M of a paring-knife, formed according to the contour of the fruit to be operated upon, substantially as set forth.

2. The double-spiral fork E, as and for the purpose shown and described.

3. The convex friction-roller W, in combination with the knife Z, substantially as shown and described.

4. The cogged guide M, supporting a paring-knife, rotated by means of a yielding ratchet, F', substantially as shown and described.

5. The combination of the yielding ratchet F', cogged guide M, standard R, spring S, and knife Z, substantially as shown and described.

6. The combination of the yielding ratchet F', cogged guide M, standard R, spring S, knife Z, spring *w*, stud *y*, and shoulder *v*, substantially as shown and described.

7. The combination of the yielding ratchet F', cogged guide M, standard R, spring S, knife Z, spring *w*, stud *y*, shoulder *v*, traveling-screw F, and rod *o*, substantially as shown and described.

8. The combination of the hook K, guide C', and slot D', substantially as shown and described.

9. The combination of the platform *q*, rod *o*, and traveling screw F, substantially as shown and described.

10. The combination of the arched coring-knife I and slicing-knife H, substantially as shown and described.

11. The combination of the coring-knife I, slicing-knife H, hook K, and guide C', substantially as shown and described.

12. The combination of the adjustable rest U, cogged guide M, and arm T, substantially as shown and described.

140,316.—*Machine for Polishing Malt.*—CHARLES STOLL, Brooklyn, N. Y. Application filed April 16, 1873.

The malt is polished by passing down between a drum having cone-shaped projections on its outer surface and a shell with like projections on its inner surface. The intervening space between the drum and shell, increasing from top to bottom, allows the malt to spread, and all danger of packing and crushing the same is avoided.

Claim.—In a machine for polishing malt, the drum A having conical projections *a*, in combination with the shell C having projections *b*, the intervening space increasing gradually from the top toward the bottom, with the bottom E and its discharge-opening, with or without the radiating ribs *c*, substantially as and for the purpose described.

140,317.—*Plaster-Sower.*—GEORGE SWEET, Dansville, N. Y. Application filed May 14, 1873.

A skeleton beater, constructed of longitudinal rods secured at intervals and at the ends by circular plates. The beater is journaled in a hopper constructed to receive it, and provided with partitions cut away beneath, under which it revolves.

Claim.—The skeleton beater, composed of the shaft D, straight longitudinal rods A A, and disks C C, in combination with the hopper, having partitions B placed over the disks to form divisions in the hopper, all substantially as set forth.

140,318.—*Sectional Cam for Ore-Stamps.*—JAMES M. THOMPSON, San Francisco, Cal. Application filed May 13, 1873.

The cam is made in two sections, each having about one-half of the collar or hub attached, and provided with a projecting arm or flange, which is received into a corresponding recess on the other section. The cam is secured to the shaft by a key passing through the collar and through a transverse recess in the shaft. It may also be secured by a key entering a parallel groove in the shaft and a transverse groove of the collar.

Claim.—1. The two parts or sections *a b* of a cam, formed as shown in the drawings, substantially as described, and secured to each other in the manner and for the purpose set forth.

2. The dowel or pin A, fitted into corresponding holes *p* in the shaft, and on one of the cam-sections, substantially as and for the purpose described.

3. The bolts or keys *k k* used in combination with and passing through the bolt-holes in the hub or collar of the cam, and the key-ways formed in the shaft, substantially as and for the purpose set forth.

4. The cam-shaft, provided with the key-seats *p p* in the different places corresponding to the different portions of the cams on it, substantially as described.

140,319.—*Draw-Bridge Safety Switch and Signal.*—ELISHA H. TOBEY, St. Louis, Mo., assignor to himself and ST. LOUIS RAILWAY SUPPLIES MANUFACTURING COMPANY, same place. Application filed January 10, 1872.

Claim.—A switch to a siding-track, placed at some distance from a draw-bridge, is so connected with the locking-bolt for securing the latter that the main track over the draw-bridge will be open only when the bolt is properly in place. Suitable signals, both at the switch and at the draw-bridge, indicate to the engineer the condition of the road.

Claim.—The draw-bridge bolt D and switch-arm *k* for operating the switch, located at a considerable distance apart, in combination with the connections *e* E F I *i* J K, for operating one from the other, as explained.

140,320.—*Machine for Napping, Brushing, &c., Tubular Knitted Fabrics.*—CLARK TOMPKINS and IRA TOMPKINS, Troy, N. Y. Application filed February 7, 1872.

The tubular fabric, after it has been washed and dried, is carried up from its supporting-roller about the loosely-supported conical-shaped spreader, which stretches the fabric, and from the spreader the fabric is led to the take-up rollers. The revolving ring-disk is provided with napping and brushing apparatus, which operates on the web as the disk rotates, and the napping and brushing devices are rotated through the stationary toothed disk by means of small pinions carried by the revolving disk on the shaft of the napping or brushing devices.

Claim.—1. The gravitating or weighted spreader E, arranged below the cloth-supporting roller and the take-up rollers, and over which the tubular-knitted fabric is straightened, as described.

2. The combination of a rotating and traveling brush or brushes with a conical spreader having a cylindrical base, as described, and for the purposes set forth.

3. The conical gravitating or weighted spreader E, arranged between the cloth-supporting and take-up rollers, and combined with a recessed ring for stretching the knitted fabric and holding it tant during the process of brushing, as described.

4. The guide-rod 10 in combination with the conical spreader, as described, and for the purposes set forth.

5. The combination of the brush-frame with the ring-disk L, whereby the brush is carried around the tubular web, as described, and for the purposes set forth.

6. The combination of the brush-frame pinions U' and U with the stationary disk G and revolving disk L, whereby the brush receives a rotary motion, as described, and for the purposes set forth.

7. The combination, with the brush-frame, of the adjustable guide-wheel V and spring W, whereby the action of the brush upon the fabric is controlled, as described, and for the purposes set forth.

8. The combination of a shipping-bar, Y, spring W, and stop 11, with the brush-frame, as described, and for the purposes set forth.

9. The combination of the guiding-rail Z, rods 1 and 2, and weight 3, when it may be desired, with the conical spreader E, for resisting the friction of the fabric, as described, and for the purposes set forth.

140,321.—*Refrigerating Apparatus.*—JACOB L. TRIPLER, Merchantville, N. J. Application filed May 13, 1873.

The cooler is supported upon legs resting on a frame, and the refrigerating compartments sit upon tubes and surround a cylinder, in which are placed gratings for supporting the ice and freezing mixture. Water passes from the tubes and cylinders through pipes into a pan formed in the frame. The room is cooled by the cold radiating from the tubes and cylinder.

Claim.—1. The non-inclosed freezing-tubes E E surrounding the ice-receiving chamber B, so that cold air is produced by direct radiation from the freezing-tubes and ice-chamber, at their sides and bottom, substantially as set forth.

2. An ice-receiving receptacle, B, surrounded by freezing-chambers, substantially as and for the purpose set forth.

3. The ice-receiving chamber B and freezing-tubes E formed with gratings H H, elevated above the bottoms of said chamber and tubes, so as to leave cold-air spaces below said gratings, substantially as and for the purpose set forth.

4. The compartments F applied to a refrigerating apparatus, which refrigerates the room in which the apparatus is located, substantially as and for the purpose set forth.

5. The collars *e* on the tubes E for directing condensed matters to a place of collection, substantially as set forth.

140,322.—*Flier for Covering Bonnet-Wire.*—ERASTUS H. TYLER, Rockville, Mass. Application filed April 11, 1873.

For winding two binding-threads about the longitudinal threads covering a bonnet-wire or the like. The gage has two notches in it, through each of which a binding-thread passes, and, by moving the gage toward or away from the end of the auxiliary arm, the distance apart of the binding-threads will be increased or diminished.

Claim.—The combination of the adjustable gage D and the auxiliary arm E, substantially as described, with the flier B, to operate as explained.

140,323.—*Spittoon.*—WILLIAM H. TERRELL, Philadelphia, Pa. Application filed May 14, 1873.

The cover is made in two parts, the front part hinged to the back or stationary part; the stationary part has a spring that impinges on a lug on the under side of the hinged or movable part; and the hinged part is connected by a rod with the hinged bottom, so that when the cover is raised the bottom is closed.

Claim.—The two-part cover B B', the former stationary and provided with a spring, D, while the latter is movable and provided with a lug, C, combined with the rod E, hinged bottom D', and body F, as and for the purpose set forth.

140,324.—*Lady's Toilet-Cabinet.*—JOHN C. VETTER, Indianapolis, Ind. Application filed May 10, 1873.

The lower cabinet-case is provided with a top recessed to receive a sewing-machine and curved sliding doors in front to permit the withdrawal of a folding chair that slides on guides or ways. The upper cabinet-case has drawers on each side of the sewing-machine, to which are hinged sector-shaped sides that swing out at right angles and are covered by a folding curved cover that, when not required, folds to the back of the case. One tier of drawers is hinged so as to swing outward and expose a rear set of drawers. Above the curved cover is a drawer that has a folding shelf and folding legs; said legs rest on a curved cover when opened for use.

Claim.—1. The circular or segment-shaped cabinet-case, having the table-top C slotted at *d* and recessed at *e*, for the reception of a sewing-machine, and the chamber K with guides *b''* for the reception of a folding and adjustable chair, Z'', having the sliding base *a''*, substantially as specified.

2. The combination, with the cabinet-chamber K having guides *b''*, of the chair Z'' having the folding back *f'''*, spring *g''*, adjustable pivoted seat *e''*, hinged legs *l'*, sliding base *a''*, and folding rear leg *l''*, substantially as specified.

3. The combination and arrangement, in the segment-shaped casing, of the curved sliding doors I, weights *a*, pulleys *b*, cords *c*, spring-catches *w''*, hooks or shoulders *w''*, and spring-release *v''*, substantially as specified.

4. The cabinet having the hinged case Q turning outward, and bearing the folding sector-shaped side S, in connection with the sewing-machine table *e*, the folding cover having the curved hinged wall A, and the opposite hinged sector-shaped side S, substantially as specified.

5. The drawer P', and the folding-desk Z hinged to the front wall of said drawers, and provided with the folding legs *n'*, adapted to rest when unfolded on the cover P, substantially as specified.

6. In connection with the cabinet-table top *c*, and the side supports D D' extending upward therefrom, the hinged sector-shaped sides S', beaded at *m*, and the folding cover P, curved at A, said curved portion being grooved at *o* to fit the beads of the sector-shaped sides, substantially as specified.

140,325.—*Reflector.*—HENRY B. WALBRIDGE, Brooklyn, N. Y. Application filed June 10, 1873.

A truncated conical reflector is located beneath another, similarly truncated, but more flaring. A third reflector, conical and inverted, is located within the first, its base lying in the plane of the top of first. A ring of burners is placed between the first and third reflectors.

Claim.—The improved reflector herein described, consisting of the reflecting hollow truncated cones A and B, the central reflector E, and the gas burners or jets, one or more, located as described, for the purpose specified.

140,326.—*Crimping and Fluting Machine.*—ROBERT WERNER, Hoboken, N. J. Application filed April 17, 1873.

The tongue is placed before a crimping-machine to gather the fabric and hold it in the grooves in the rollers. It gathers more or less material down, according to its depression by an adjusting-screw.

Claim.—In combination with the rollers B and C, frame F, and an adjusting device, H, the movable tongue G, when arranged to operate substantially as and for the purposes described.

140,327.—*Whiffletree.*—BAILEY S. WESCOTT, Corning, N. Y., assignor of one-half his right to LORAINE DODGE, same place. Application filed April 26, 1873.

The staple, by which the whiffletree is connected to the cross-bar, is so attached to the whiffletree that it may yield when draft is applied.

Claim.—In a whiffletree, the combination of the staple *e* having the loop *g* and threaded arms *k* with the adjustable nuts *m*, the springs *s*, and the removable stop-plate *d'*, substantially as specified.

140,328.—*Nut for Securing Piston-Heads to Piston-Rods.*—JEROME WHEELOCK, Worcester, Mass. Application filed March 27, 1873.

The nut is slotted radially through one side, and, at right angles to the plane of the slot, has two set-screws, which, after the nut has been screwed upon the rod and down into a recess in the piston-head, are, to prevent expansion of the nut, driven outward until their heads bear against the walls of the recess. To remove the nut the screws are driven inward, and a wedge is forced into the slot.

Claim.—A slotted piston-head nut, in combination with a device or devices for preventing the expansion of said nut when upon the rod, and for permitting expansion when it is desirable to remove it from the rod, substantially as herein described.

140,329.—*Medical Compound for the Cure of Consumption, &c.*—WILLIAM H. H. WHITE, San Francisco, Cal. Application filed December 11, 1872.

Wild mountain peach leaves are dried, ground into powder, and then steeped in whisky. The sediment is then removed and pressed, after which it is mixed with black cohosh, and is ready for use.

Claim.—1. A medical extract, for the treatment and cure of consumption and other diseases arising from a cold, made from the leaves of the wild mountain peach.

2. The process above described for obtaining the extract of the wild mountain peach, for the purpose specified.

140,330.—*Combined Baker's Oven and Range.*—JOSEPH WILLIAMS, Topeka, Kans. Application filed November 18, 1872.

Over the baker's oven is a plate having the usual pot-holes of a range. The oven is heated by the main furnace outside of it, and also by the supplemental furnace inside. Below the oven is a chamber filled with sand for purpose of retaining heat.

Claim.—1. The oven F and small furnace E, when used for the purpose hereinbefore described and set forth.

2. The oven F constructed with double floor *b b'*, and the space *c* between filled with sand, as and for the purposes set forth.

3. The combination of the range-top A, heated by the furnace H in the manner described, with the oven F, heated in the manner described, as and for the purpose hereinbefore described and set forth.

140,331.—*Fluting and Plaiting Machine.*—MARTHA E. WILSON and ALBERT J. PERRY, Galesburg, Ill.; said PERRY assignor to said WILSON. Application filed April 4, 1873.

The fluting-bars rest upon a bed-plate under clamping-bars having their inner edges rabbeted to receive and hold in place the ends of the fluting-bars. The clamping-bars are adjustable for different-sized fluting-bars by spacing-slats. By moving one of the clamping-bars laterally the fluting-bars can be removed.

Claim.—1. The clamping-bars B B', having rabbeted edges *b b'*, in combination with the screws C C' C'', base A, and fluting-rods *e*, substantially as and for the purpose specified.

2. The clamping-bar B', provided with the slot *c*, in combination with the screw-bolts C' C'', base A, and fluting-rods *e*, substantially as and for the purpose specified.

3. The clamping-jaw I, adjustably arranged to hold the fluting-rods *e*, in combination with the jaws H, base A, and bars B B', substantially as and for the purpose specified.

140,332.—*Railway Frog.*—JOSEPH WOOD, Red Bank, N. J. Application filed May 14, 1873.

The main rail of the frog-point is strengthened by plates of iron or steel placed on each side of it so as to fill up the cavity of the web and form a solid bearing, against which the second rail is

applied and secured by bolts. The space between the webs is entirely filled, forming practically a solid point.

Claim.—A railroad frog having the main rail of the point or tongue strengthened by the use of plates of iron or steel placed on each side of it, and riveted to the web thereof at the part where its crown and flange are cut away for the purpose of splicing on the other point-rail, substantially as shown and described.

140,333.—*Process of Separating Vegetable Fibers.*—WILLIAM E. WOODBRIDGE, Little Falls, N. Y. Application filed August 14, 1872.

The "rotary" is provided with a series of cocks around its center, the uppermost of which is automatically opened and closed as the vessel revolves. This operation allows the steam generated from the chemical solution to escape until its strength has been reduced and the proper quantity absorbed by the material, when the steam is shut in to be used as a vehicle for heating.

Claim.—1. The method herein described of securing the escape of steam from the space above the rotating contents of the drum or treating-vessel, by the employment of any suitable number of escape-cocks inserted within the drum, and operated substantially in the manner hereinbefore set forth.

2. The modification of my previously-patented process herein described as being adapted to the use of the boilers commonly found in paper-mills—that is to say, the employment of an alkaline solution and desiccative heat in connection with the retention of so much of the steam produced during the heating and desiccation of the saturated fibrous material as may be desirable to serve as a distributing vehicle for the heat applied, whether the heating-vessel be rotary or stationary.

140,334.—*Manufacture of Shovels.*—EDWARD A. YERKES, Philadelphia, Pa. Application filed March 29, 1873.

A series of pairs of dies, that swage a neck on the middle portion of a rectangular bar, flatten the neck, and stamp recesses in the rectangular portions contiguous to the neck, all so that when the blank is folded on itself by bending at the middle of the neck the then parallel neck portions will constitute the straps, the two recesses, the socket, and the two rectangular portions—the blades.

Claim.—1. The improvement in the manufacture of shovels involved in the successive squeezing operations stated, and the results of which are illustrated in Figs. 1 to 9, inclusive, for the purpose described.

2. The dies F F, with the concavities G G', substantially as and for the purpose set forth.

3. The die K, with the guide L, and die M, constructed and operating substantially as and for the purpose set forth.

4. The series of squeezing-dies, as set forth and illustrated in Figs. 10 to 23, inclusive, for the purpose described.

140,335.—*Hat-Press.*—RUDOLPH EICKEMEYER, Yonkers, N. Y. Application filed May 20, 1871.

In the stationary jaws of the press is a flexible diaphragm bag-presser containing water or other suitable matter having similar essential characteristics. The movable jaw carries the hat-mold. A plunger renders the interior capacity of the bag variable. A spring is so combined with the bag as to prevent injury to tender hats from sudden action of the press. The bag is provided with a safety-valve to guard against undue pressure. A clamping-ring confines the diaphragm to the press-head in such a manner that the former is preserved intact and is not weakened by bolt-holes, &c. The brim portion of the mold is so formed that the brim of a hat will be carried without stretching it, and said brim portions are made in two pieces and are separable from the crown-mold. An apparatus is arranged to superheat steam in its passage to the press. The machine is operated automatically and can be arranged to rest at certain steps in the operation, or continuously operate.

Claim.—1. In combination with the jaws of a press operated by a toggle or other suitable mechanical device, a flexible diaphragm bag-presser and a mold, substantially as described, the combination being such that the pressure to press the hat is caused by the movement of the movable jaw of the press toward the fixed jaw, in contradistinction to locking the press-head and mold together, and then applying the pressure directly to the diaphragm or bag-presser, as in former bag-presses.

2. In combination with a flexible diaphragm or bag-press, and a mold in the jaws of a press operated by a toggle or other suitable mechanical device, a confined body of incompressible matter possessing the requisite fluid-like character within the flexible diaphragm or presser, which acts as an inelastic but mobile cushion to support the flexible diaphragm or bag-presser against the pressure of the press, and to cause it to conform to the mold, substantially as described.

3. In combination with a diaphragm or flexible bag-presser and a mold, in the jaws of a press operated by mechanical means, the adjustable regulating-plunger, whereby the determined pressure of the press is regulated by increasing or diminishing the size of the chamber occupied by the confined body of water, substantially as hereinbefore described.

4. In combination with the diaphragm or flexible bag-presser and the confined body of water, a spring for protecting tender hats from the sudden action of the whole force of the press, substantially as hereinbefore described.

5. The safety-valve, in combination with the press-head and diaphragm, whereby the excess of water under a regulated determined pressure may escape, substantially as described.

6. In combination with the press-head and diaphragm or flexible bag-presser, the clamping-ring, when the clamping-surfaces are free from the clamping-bolts, substantially as described, so that the rubber diaphragm or flexible bag-presser is not weakened by cutting holes for the bolts, as in former presses.

7. The shaping-weight, in combination with the diaphragm or flexible bag-presser and the mold, substantially as and for the purposes described.

8. The lower jaw of the press fitted to the clamping-ring of the press-head, substantially as described, whereby the flexible diaphragm-presser is always supported at the proper point by the fixed jaw when pressing a hat, independently of the molds, substantially as hereinbefore set forth.

9. The peculiar construction of the brim part of the diaphragm or flexible rubber bag-presser, which enables it to surround the brim of the mold and extend below the same to permit of being pressed under the curl of the brim without stretching, substantially as described and shown.

10. In combination with a diaphragm or flexible bag-presser, a mold made with the brim part separable from the crown part, substantially as and for the purposes described.

11. In combination with a diaphragm or flexible bag-presser, a mold in which the brim part is made in two pieces, separable from the crown part, substantially as and for the purposes described.

12. In combination with a bag-press for pressing hats, heated by steam, a superheating apparatus for superheating the steam on its way to the press, substantially as described.

13. In combination with the movable jaw or press-head, a flexible diaphragm or bag-presser, and the mold, the lifting and lowering mechanism, substantially as described.

14. In combination with the movable press-head, a flexible diaphragm or bag-presser, and the mold, a lifting and lowering mechanism, and a pressing mechanism, substantially as described.

15. In combination with the movable jaw or press-head, diaphragm, and mold, a lifting and lowering mechanism, a pressing mechanism, and an automatic reversing mechanism, substantially as described, whereby the motion of the lifting and lowering mechanism and the pressing mechanism is reversed at each extremity of the movement of the press-head, and the action of the press-head arrested at the desired point, or suffered to continue without intermission, substantially as described.

REISSUE PATENTS.

5,461.—*Separating Zinc from Gold and Silver.*—EDWARD BALBACH, Jr., Newark, N. J.—Patent No. 64,934, dated May 21, 1867. Application filed June 7, 1873.

Retort formed with a neck at one end, and rests upon the bridge or bearer of fire-brick.

Claim.—A black-lead retort, arranged within a furnace, substantially as described, so that it can be turned up for the reception of the alloy, and for distilling off the zinc, and then turned down to empty it of its contents, as and for the purpose herein described.

5,462.—*Strap-Machine.*—AARON F. STOWE, Worcester, Mass.—Patent No. 125,766, dated April 16, 1872. Application filed May 27, 1873.

Claim.—The combination, with a feed-roll, C, of a small spring-pressed contact-roll, E, having its axis beneath, parallel to, and in front of, feed-roll, as and for the purpose described.

5,463.—*Paper-Cutting Machine.*—GEORGE A. WALKER, Boston, Mass., assignor to WM. G. ELY, Norwich, Conn.—Patent No. 118,308, dated August 22, 1871. Application filed May 31, 1873.

An eccentric working in an oblong slot at the end of the cutter-bar draws it horizontally against the pressure of the pivoted rods which cause its vertical movement, thus accomplishing a draw cut.

Claims.—1. In combination with the cutter-bar *b*, and with the links *g g* for suspending it and controlling its movement, the eccentric *e* and slot *n*, the whole being constructed and arranged to operate substantially as shown and described.

2. The cutter-frame, guided as shown and described, and having the cutter-stock adjustable by means of the adjusting-screws *u v*, or their equivalent, substantially as shown and described.

5,464.—*Butter-Package.*—HENRY P. ADAMS, Cleveland, Ohio.—Patent No. 132,555, dated October 29, 1872. Application filed June 5, 1873.

The package is formed from two thin strips of wood placed transversely and locked at the end by tongues and slits, and, when filled with butter, is placed in quantities in an air-tight box having an opening and valve so that it may be filled with brine and hermetically sealed.

Claim.—1. The process of packing butter for transportation or preservation in thin wooden envelopes or packages without openings in their side, and that may be unfolded from around the inclosed butter and leave the latter intact in form, substantially as described.

2. In combination with the butter-package A', formed of two thin strips of wood bent transversely about each other, the slots or slits in the ends of one of said pieces to form a lock and retain said pieces in box form, without other separate fastening devices, substantially as described.

3. In combination with the tight exterior case B and the rectangular butter-packages A' A', in close layers within it, a filling or packing of brine, which completely fills all the interstices, whereby the butter is not only kept sweet, but safely transported, substantially as described.

4. In combination with an exterior packing-case, constructed so as to be hermetically sealed, a valve that closes from the inside of the case to cover the opening through which the brine is introduced, substantially as described.

5,465.—*Apparatus for Obtaining Air or Gas with Hydrocarbon Vapors.*—E. HALL COVELL, Brooklyn, N. Y.—Patent No. 24,199, dated May 31, 1859; extended seven years. Application filed June 20, 1873.

The pressure of the gas or air is governed by a regulator. The charging with hydrocarbon vapor is effected in a series of trays

with free passages over the liquid so that the vapor is taken up simply by passing over the surface.

Claim.—1. The combination of a chamber for vaporizing hydrocarbon, provided with a pan or pans, or other surfaces, in substantially a horizontal position, and arranged in the manner described, so that a free current of air or gas may be forced in a horizontal direction over the surface of the liquid hydrocarbon contained therein at rest, with a forcing apparatus, and inlet and outlet cocks or valves for the admission of the air or gas to be charged and the delivery of the mixed gas, substantially as herein set forth.

2. The combination of a chamber for vaporizing hydrocarbon, in which the liquid is held at rest on horizontal surfaces, arranged in the manner described, so that the air or gas is forced to pass horizontally over them, with an apparatus for forcing said air or gas over said surfaces, substantially as herein set forth.

3. The combination of a chamber for vaporizing hydrocarbons, an apparatus for forcing air or gas into said chamber, and a self-regulating device for equalizing, checking, or controlling the pressure, substantially as set forth.

4. The combination of a self-regulating apparatus and a vaporizing-chamber, substantially as herein set forth.

5. The combination of a gas or air forcing apparatus, a reservoir, and a self-regulating device, substantially as herein set forth.

6. The combination of a chamber for vaporizing hydrocarbons, a reservoir provided with a self-adjusting device for regulating the pressure of the mixed gas, and a commingling-chamber, substantially as herein set forth.

7. The combination of a vaporizing-chamber, a reservoir, and a self-regulating device and valve, substantially as herein set forth.

8. The combination of a commingling-chamber, self-regulating device, and outlet-cock *j*, for the purposes substantially as herein set forth.

9. The combination of the reservoir-pipe for admitting air or gas to it, and an adjustable cock or fluid-valve for regulating the quantity and flow of the air, substantially as herein set forth.

10. The combination of the vaporizing-chamber, the reservoir, forcing apparatus, regulating device and valve, and inlet and outlet pipes, substantially as herein set forth.

11. The combination of a chamber for vaporizing hydrocarbons, with partitions or channels for extending the surface and reducing the depth of the liquid, with a regulating device, arranged in the manner described, so that a current of air, under regulated and controlled pressure, may pass over said extended surface, and every portion of it, substantially as set forth.

12. The combination and arrangement of pipes for feeding the liquid hydrocarbon to the pans, and drawing off the heavy unvaporized liquid, whenever desired, from each pan or division separately, substantially as herein set forth.

5,466.—*Lubricating Axle for Vehicles.*—JESSE SCOTT EGGLESTON, Auburn, N. Y., assignor, by mesne assignments, of one-half interest to E. H. KELLOGG, New York city.—Patent No. 122,374, dated January 2, 1872. Application filed March 26, 1873.

A recess is formed in the solid spindle of the axle for the lubricant, and a plate is supported therein to hold a wicking and form, with the axle-box, a chamber above the plate.

Claim.—1. The journal of a vehicle-axle having a cavity or recess in its upper portion to contain a lubricant, in combination with a removable cap-plate, D, supported in the top portion of the cavity, substantially as described, for the object specified.

2. A cap-plate having one or more pendent tubes, E, in combination with an axle journal or spindle having a cavity or recess, C, substantially as described.

3. In combination with the cap-plate D and an axle having oil-recess C, the tube or tubes E, and capillary conductor F, for effecting a distribution of the lubricant, as herein set forth.

4. The cap-plate D having one or more openings, h, in combination with an axle journal or spindle having a cavity or recess, C, substantially as described.

5. The cap-plate D, in combination with a journal or spindle having a cavity or recess, C, to form a secondary chamber, *g*, substantially as and for the purpose specified.

5,467.—*Wagon-Top.*—ANDREW R. TULLY, Harlem, N. Y. Patent No. 58,001, dated September 11, 1866. Application filed February 15, 1873.

A fine and broad spring-stay attached to the rear end of the wagon-frame, and secured at its upper end to the rear bow, preventing said bow from being drawn forward by the shrinking of the leather cover, and also preventing the creasing and crumpling of the cover by keeping it always distended.

Claim.—1. In combination with the cover of a folding carriage-top, metallic plate or ribbon spring-stays, arranged to stretch the cover and fold therewith, substantially as shown and described.

2. The knobs *a*, connected to the metal strap or stay concealed beneath the leather strap H, substantially as shown, and for the purpose specified.

INDEX OF INVENTIONS PATENTED JUNE 24, 1873.

	Class No.	Whole No.
Adding machine, G. Linderoos	42	140,146
Air from fruit cans, &c., apparatus for exhausting the, L. C. Cooley	58	140,947
Air or gas with hydrocarbon vapors, apparatus for charging, E. H. Covell, (reissue)	64	5,465

Paper machines, repairing knotted strainers or screen plates of, J. Robertson	108	140,166
Paring, coring, and slicing machine, apple, Stewart and Campbell	88	140,315
Pen, ruling, W. O. Hickok	146	140,272
Piston heads to piston rods, nut for securing, J. Wheelock	151	140,328
Pitcher, molasses, T. B. Atterbury	88	140,236
Pitman connection, J. A. Shepard	67	140,312
Planing machine, J. Atkins	173	140,235
Planter, corn, G. J. Carpenter	133	140,114
Planter, hand corn, J. W. Coleman	133	140,186
Planter and cultivator, combined corn, G. DeVany, Jr	133	140,254
Planter, potato, F. W. Worstell	133	140,178
Plow, J. C. Potter	114	140,302
Plow, potato, H. T. Boaye	114	140,240
Printing press, chromatic, Burridge and Kershaw	117	140 242
Quilting frame, H. Hudson	38	140,137
Railway frog, J. Wood	120	140,332
Railway frog, J. Woodville	120	140,230
Railway signal, Johnson and Layton	120	140 200
Railway tank feeder, E. J. Gibbons	118	140,132
Railways, self-feeding tank for, B. D. Moody	154	140,294
Range, heating, J. Lawlor	154	140,205
Reflector, H. B. Walbridge	90	140 325
Refrigerating apparatus, J. L. Tripler	58	140,321
Refrigerator for restaurants, &c., W. F. Byrne	58	140,243
Rick cover, portable, J. W. Fitzgerald	30	140,127
Ruler, J. G. Ernst	146	140,125
Rubber and plumbago compound for bearings, &c., T. J. Mayall	84	140,208
Sap protector, Cole and Sabin	63	140,185
Sash fastener, D. M. Donehoo	24	140,256
Saw guide, adjustable, F. H. Palmer	130	140,157
Saw mills, pitman lubricator for, J. McKenzie	130	140,152
Scissors and tape line combined, M. J. Stubblings	44	140,227
Scraper, road, W. P. Warren	110	140,175
Screw cutting machine, D. McGuire	14	140,212
Screw cutting machine, A. and A. Phillips	14	140,161
Screw tap, J. Flower	14	140,128
Screw threads, die for cutting, J. J. Grant	14	140,133
Sewing machine attachment, E. H. Alexander	134	140,233
Sewing machine cutting attachment, A. T. Perrine	136	140,159
Sewing machine needle setter and threader, G. P. Farmer	134	140,262
Sewing machine ruffler, W. H. Lewitt	134	140,285
Shears, sheep, A. S. McWilliams	44	140,292
Shoe soles, finishing, B. S. Bryant	16	140,241
Shoe, turned, W. Duchemin	16	140,258
Shovels, manufacture of, E. A. Yerkes	141	140,334
Shutter worker, H. S. Phillips	94	140,217
Skipping rod, J. Murphy	143	140,298
Sofa, Rand and McSherry	62	140,306
Sower, plaster, G. Sweet	133	140,317
Spittoon, W. H. Tyrrell	62	140,323
Spring, furniture, W. T. Doremus	61	140,188
Spring, furniture, W. T. Doremus	62	140,189
Stamp canceler, rotary, W. Schacht	146	140,219
Starch, apparatus for the manufacture of, T. Kingsford	11	140,141
Steam, apparatus for burning liquid and generating, W. T. Schaide	148	140,220
Steam condenser, J. L. Alberger	150	140,232
Steam lubricator, W. Hamilton	87	140,270
Stone, artificial, J. J. Bartlett	153	140,239
Stove, base burning cooking, H. Ingraham	154	140,138
Stove, cooking, G. McAdams	154	140,210
Stove grate, S. Smyth		140,244
Stove, heating, G. B. Moore	154	140,155
Stove supplemental attachment, cooking, J. Day	154	140,258
Strap machine, A. F. Snowe, (reissue)	92	5,462
Sword hanger, S. McKeever	44	140,151
Table, stool, and stand, combined, J. A. Markle	62	140,288
Tape, &c., machine for cutting, J. S. Jewett	37	140,274
Telegraph pole, H. Dodge	52	140,255
Telegraph, printing, A. A. Knudson	50	140,143
Telegraph sounder, M. W. Goodyear	50	140,266
Thread evener, J. B. Meldrum	134	140,215
Tobacco cutting machine, F. S. Kinney	160	140,203
Toilet cabinet, lady's, J. C. Vetter	62	140,324
Toy, H. T. Lee	143	140,206
Toy automatic swimmer, I. F. Eaton	143	140,259
Trap, fly, T. H. Whiting	63	140,176
Trap, stench, T. Ledbeter	8	140,145
Trimming, J. Thomas	38	140,174
Truss, A. T. C. Schoevers	156	140,164
Type composing machine, C. Kastenbein	117	140,279
Type distributing machine, C. Kastenbein	117	140,278
Valve cases, fastening for safety, G. B. Sisson	152	140,223
Valve, safety, W. Churchill	152	140,115
Vegetable cutter, rotary, N. Schlesser	88	140,221
Velocipede, L. T. McGilvray	31	140,290
Vise, T. Hall	100	140,209
Wadding and machine for its manufacture, A. Chambers	98	140,184
Wagon running gear, I. O. Meddows	31	140,154
Wagon, self loading, T. Handy	31	140,271
Wagon spring, W. H. Brace	31	140,110
Wagon top, A. R. Tully, (reissue)	31	5,467
Wardrobe, portable, J. N. Fowler	62	140,130
Wash pounder, L. S. Enos	91	140,261
Watches, hair spring stud for, J. P. Adams	36	140,231
Whiffletree, D. A. Johnson	31	140,276
Whiffletree, A. J. Sprague	31	140,170
Whiffletree, B. S. Weed, 2d	31	140,327
Windmill, S. Shannon	118	140,222
Winnower, reciprocating, H. Keller	159	140,201
Wire fabric, woven, J. W. C. Peters	170	140,160
Wire way, J. H. and J. W. Rogers	120	140,167
Wood cutter, kindling, N. Sonnecheen	174	140,225
Wrench, B. C. Bradley	100	140,111
Wringer, mop, J. H. Newton	22	140,216
Zinc from gold and silver, separating, E. Balbach, Jr, (reissue)	99	5,461

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED JUNE 24, 1873.

Adams, H. P., Butter package, (reissue)	5,464
Adams, J. P., Hair spring stud for watches	140,231
Alberger, J. L., Steam condenser	140,232
Albrecht and Corbin	140,249
Alexander, E. H., Sewing machine attachment	140,233
Amee, J. G. and P. A., Clothes line fastener	140,234
Annin, J. R., Book stand	140,107
Arnot, H., Boot jack	140,179
Ashmun, L., & Co., assignee	140,166
Atkins, J., Planing machine	140,235
Atterbury, T. B., Molasses pitcher	140,236
Austin, J. E., Exercising device	140,237
Balbach, E., Jr., Separating zinc from gold and silver, (reissue)	5,461
Ball, C. &., Argand burner	140 108
Barbour Flax Spinning Company, assignee	140,215
Barritt, C. S., Wardrobe b datest	140,109
Bartholomew, S. W., Wash boiler	140,238
Bartlett, J. J., Artificial stone	140 239
Basye, H. T., Potato plow	140,240
Bates, G., assignee	140,148
Bell, J. D., Broom	140,180
Billington, J. H., & Co., assignees	140,301
Blair, R., assignee	140,217
Bollman and Lorg	140,226
Bower, D. C., Truss bridge	140,181
Brace, W. H., Wagon spring	140,110
Bradley, B. C., Wrench	140,111
Bramer, F., Combined wheel harrow and seeder	140,182
Brand, W., and G. Puder, Rotary churn	140,112
Brettell, G. E., Mandrel for holding tapered cast rings	140,113
Brinckmann, A., Self-closing faucet	140,183
Bryant, B. S., Finishing shoe soles	140,241
Burridge, T. H., and J. M. Kershaw, Chromatic printing press	140,242
Butler, H. V., assignee	140,160
Byrne, W. F., Refrigerator for restaurants, &c	140,243
Campbell and Stewart	140,315
Carey, J. W., Piston packing	140,244
Carpenter, G. J., Corn planter	140,114
Carr, G. W., assignee	140,258
Chambers, A., Wadding and machine for its manufacture	140,184
Churchill, W., Safety valve	140,115
C emens, S. L., Scrap book	140,245
Cochrane, T. M., assignee	140,225
Coe, J. H., Elevating building material	140,116
Cole, H. C., and E. D. Sabin, Sap protector	140,185
Coleman, J. W., Hand corn planter	140,186
Conklin, E. E., Ice elevator	140,187
Cook, F., Cotton bale tie	140,246
Cooley, L. C., Exhausting the air from fruit cans, &c	140,247
Cooper, W. S., Stop cock	140,248
Corbin, E. A., and H. Albrecht, Clothes wringer	140,249

Covell, E. H., Charging air or gas with hydrocarbon vapors, (reissue)	5,465
Cramer, A., Cigar trimmer	140,117
Cummings, J., Mill pick	140,118
Cusenbary, J. D., and J. A. Mars, Ore stamp feeder	140,250
Csarniecki, E., Nut lock	140,119
Darby, H. C., Locomotive fire box crown	140,251
Darragh, C., assignee	140,303
Davis, A. D., assignee	140,250
Davies and Mears	140,214
Day, G. W., Corner support for blinds	140,120
Day, J., Cooking stove supplemental attachment	140,259
De Leon, M. J., Cooking apparatus	140,253
Denison, T. H., assignee	140,125
Denney, W. H., Machine for slotting links for locomotives	140,121
De Vany, G., Jr., Combined corn planter and cultivator	140,254
De Witt, G., and J. Fairman, Building block	140,122
Dexter, B. C., Attaching sleigh bells to harness	140,123
Dickey, G. W., assignee	140,179
Disney, M., Car coupling	140,124
Dobson and Rushton	140,218
Dodge, H., Telegraph pole	140,255
Dodge, L., assignee	140,307
Donohoo, D. M., Sash fastener	140,256
Doremus, W. T., Furniture spring	140,188
Doremus, W. T., Furniture spring	140,189
Driver, J., Mortising machine	140,257
Duchemin, W., Turned shoe	140,258
Dunbar, R., Safety platform for elevators	140,190
Eaton, I. F., Toy automatic swimmer	140,259
Ebbitt, W., Car brake	140,260
Eggleston, J. S., Lubricating axle for vehicle, (reissue)	5,466
Eickemeyer, R., Hat press	140,335
Ellis, H. R., assignee	140,284
Ely, W. G., assignee, (reissue)	5,463
Enos, L. S., Wash pounder	140,261
Ernst, J. G., Ruler	140,125
Estabrook, S. B., assignee	140,261
Evans and Thomas	140,173
Fairman and De Witt	140,122
Farmer, G. P., Needle setter and threader for sewing machines	140,262
Field, A., Medical compound	140,126
Fisher, A. J., assignee	140,125
Fisher, R. A., Preventing incrustation in steam boilers	140,263
Fitzgerald, J. W., Portable rick cover	140,127
Flower, J., Screw tap	140,128
Foote, W. W., Electric hotel annunciator	140,129
Ford, E. L., assignee	140,278, 140,279
Fowler, J. N., Portable wardrobe	140,130
Fullerton, J. M., assignee	140,294
Gale, J. A., Car coupling	140,131
Gearing, C., Manufacture of illuminating gas	140,264
Germain, C., assignee	140,255
Gibbone, R. J., Railroad tank feeder	140,132
Gleason, E. P., Gas lighting torch	140,191
Glidden, C. W., Lasting machine	140,265
Godley, G. F., Railroad car spring	140,192
Goodyear, M. W., Telegraph sounder	140,266
Grant, J. J., Die for cutting screw threads	140,133
Graves, A., Clothes drier	140,193
Graves, H. P., assignee	140,177
Green, F. D., Mitering machine	140,267
Hague, C. A., Circulating valve for fire engines	140,194
Hall, J. H., assignee	140,305
Hall, T., Vise	140,269
Hamilton, W., Steam lubricator	140,270
Handy, T., Self-loading wagon	140,271
Harlow, E., Elevator for hods, &c	140,195
Haistings, W., Sr., Three-horse equalizer	140,268
Hatlinger, J. J., assignee	140,293
Hay, A. T., Electrical protection for boilers	140,196
Hendrickson, E. M., Burglar alarm	140,134
Hickok, W. O., Ruling pen	140,272
Hildreth, J. D., assignee	140,194
Hildreth, R. S., Reading gage	140,135
Hitchcock, J, assignee	140,159
Holt, N. J., and J. Leach, Clamp	140,136
Hoyt, F. T., Pantaloon	140,197
Hudson, W., Quilting frame	140,137
Huettemann, F., assignee	140,117
Huffman, O., Portable fence	140,273
Hurst, G. W., Reversible harrow teeth	140,198
Hutchison, J. A., assignee	140,309
Ingraham, H., Base burning cooking stove	140,138
Irwin, G. M., assignee	140,264
Israel, J. P., and D. W. McLane, Door check	140,139
Jewell, H. S., Metallic fabric for smut mill cases	140,199
Jewett, J. S., Machine for cutting tape, &c	140,274
Jocelyn, A. H., Book cover	140,275
Johnson, D. A. Whiffletree	140,276
Johnson, J. H., and J. E. Layton, Railroad signal	140,200
Jones, C., Puddling furnace	140,140
Kappe, W. J. H., Chicken coop	140,277
Kastenbein, C., Machine for distributing type	140,278
Kastenbein, C., Type composing machine	140,279
Keeler, L. B., Reciprocating churn	140,280
Keller, H., Reciprocating winnower	140,201
Kellogg, E. H., assignee, (reissue)	5,468
Kershaw and Burridge	140,242
Kibbe, H. C., assignee	140,194
Kilner, J. M., Cable stopper	140,282
King, J. F., assignee	140,121
Kingsford, T., Apparatus for manufacture of starch	140,141
Kinney, F. S., Tobacco cutting machine	140,203
Knight, W., and N. W. Lewis, Clutch	140,142
Knudson, A. A., Printing telegraph	140,143
Kuh, S., Envelope	140,204
Laidley, T. T. S., Cartridge for fire arms	140,144
Lamb, D. M., Production of water-proof gums	140,281
Lamb, D. M., Production of water-proof gums	140,282
Lamb, D. M., Preparing water-proof gums from flaxseed, &c	140,283
Lawlor, J., Heating range	140,205
Layton and Johnson	140,200
Leach and Holt	140,136
Leach, S. L., Bed bottom	140,284
Ledbeter, T., Stench trap	140,145
Lee, H. T., Toy	140,206
Lewis and Knight	140,142
Lewitt, W. H., Sewing machine ruffler	140,285
Linderoos, G., Adding machine	140,146
Little, J. A., Wire fence	140,147
Longcor, A. and J. B., Fruit ladder	140,208
Loughlin, J., assignee	140,303
Maertens, E., Electrical stop motion for machinery	140,287
Manoure, R., Jr., Vessel for paints, &c	140,148
Markle, J. A., Table, stool, and stand combined	140,288
Mars and Cusenbary	140,250
Marsh, J. F., Street lamp	140,149
Marshall, C., Metallic clasp	140,207
Matherly, J. C., Hemp brake	140,289
Mayall, T. J., Rubber and plumbago compound for bearings, &c	140,208
Mayall, T. J., Manufacture of artificial leather, &c	140,209
Mayne, T. T., Manufacture of latch needles	140,150
McAdams, G., Cooking stove	140,210
McCarthy, F., Cuff button	140,211
McGilvray, L. T., Velocipede	140,290
McGuire, D., Machine for cutting screws	140,212
McKeever, S., Sword hanger	140,151
McKenzie, J., Saw mill pitman lubricator	140,152
McLane and Israel	140,139
McLendon, E. W., Hoe	140,291
McSherry and Rand	140,306
McWilliams, A. S., Sheep shears	140,292
Mead, E. B., Cigar	140,153
Mears, H. A., Agricultural boiler	140,213
Mears, W., and H. Davies, Lamp chimney supporter	140,214
Meddows, I. O., Running gear for wagons	140,154
Meldrum, J. B., Evener for thread	140,215
Miller, W., Carpet sweeper	140,293
Milligan, N., assignee	140,284
Moody, B. D., Self-feeding tank for railways	140,294
Moore, G. R., Heating stove	140,155
Muller, F., Curtain tassel clip	140,295
Murray, C. H., Brick machine	140,296
Murray, C. H., Die or mouth for brick machines	140,297
Murphy, J., Skipping rod	140,298
Newton, J. H., Mop wringer	140,216
O'Bryan, B., Bell shifter and tightener	140,299
Ogden, R. C., Calendar catch	140,300
Olsson, S. J., Governor for steam heating apparatus	140,156
Palmer, F. H., Adjustable saw guide	140,157
Peckham, E., Treating ore and manufacturing iron and steel	140,158
Perrine, A. T., Sewing machine cutting attachment	140,159
Perry and Wilson	140,331
Peters, J. W. C., Woven wire fabric	140,160
Phillips, A. and A., Screw cutting machine	140,161
Phillips, H. S., Shutter worker	140,217
Pilkington, J., Steam boiler feeder and heater	140,301
Potter, J. C., Plow	140,302
Priadle, L. C., Billiard table	140,162
Pritchard, T., Connecting car axles with axle boxes	140,308
Proctor, J. K., Mechanism for operating the doffer combs of carding machines	140,304
Praden, H., Medical compound	140,163
Puder and Brand	140,112
Quincy, E. W., Corn harvester	140,305
Rand, J. Q., and J. F. McSherry, Sofa	140,306
Rand, O. B., Door latch	140,307
Richardson, J. and T. D., Gas burner	140,164
Richardson, J. and T. D., Gas pipe and fixture	140,165
Rivers, T. L., Trunk lock	140,308
Robertson, J., Repairing knotted strainers or screw plates of paper machines	140,166
Rogers, C., Steam engine valve gear	140,309
Rogers, J. H., and J. W., Wire way	140,167
Row, S. B., assignee	140,284
Rushton, T. H., and W. Dobson, Cotton gin knife roller	140,218
Sabin and Cole	140,185
Salisbury, S., assignee	140,213
Sanborn, B., assignee	140,213
Schacht, W., Rotary stamp canceler	140,219
Schaide, W. T., Burning liquid and generating steam	140,220
Schlesser, N., Rotary vegetable cutter	140,221
Schoevers, A. T. C., Truss	140,168
Sebille, E., Potato masher and strainer	140,169
Shannon, S., Windmill	140,222
Sheldon, C. B., Wheel for furniture casters	140,310
Sheldon, C. B., Wheel for furniture	140,311
Shephard, J. A., Pitman connection	140,312
Sisson, G. B., Fastening for safety valve cases	140,223
Smyth, S., Stove grate	140,224
Snyder, G. W., assignee	140,304
Sonntchsen, N., Kindling wood cutter	140,225

Sorg, A., and S. C., Bollman, Earth auger	140,226
Sprague, A. J., Whiffletree	140,170
Sprague, A. J., Lap board	140,313
Standish, S., Paint brush	140,314
Stewart, J., and W. Campbell, Apple paring, coring, and slicing machine	140,315
St. Louis Railway Supplies Manufacturing Company, assignee	140,319
Stockwell, J. W., Mixing machine	140,171
Stoll, C., Machine for polishing malt	140,317
Stowe, A. F., Strap machine, (reissue)	5,462
Stubbinge, M. J., Combined scissors and tape line	140,227
Sweet, G., Plaster sower	140,317
Taine, M., Pantaloon tree	140,172
Thomas, A. P., and W. J. Evans, Rock drill carriage	140,173
Thomas, J., Trimming	140,174
Thompson, J. M., Sectional cam for ore stamps	140,318
Tobey, E. H., Draw bridge safety switch and signal	140,319
Tompkins, C. and I., Machine for napping, brushing, &c., tubular knitted fabrics	140,320
Tripler, J. L., Refrigerating apparatus	140,321
Tully, A. B., Wagon top, (reissue)	5,467
Tyler, E. H., Filer for covering bonnet wires	140,322
Tyrrell, W. H., Spittoon	140,323
Vetter, J. C., Ladies' toilet cabinet	140,324
Walbridge, H. B., Redector	140,325
Walker, G. A., Paper cutting machine, (reissue)	5,463
Walters, C., assignee	140,364
Warren, W. P., Road scraper	140,175
Wentworth, F. W., Marking brush	140,298
Werner, R., Crimping or fluting machine	140,326
Wescott, B. S., Whiffletree	140,327
Wheelock, J., Nut for securing piston heads to piston rods	140,328
White, W. H. H., Medical compound	140,329
Whiting, T. H., Fly trap	140,176
Whittemore, A., Car starter	140,229
Williams, J., Combined bakers' oven and range	140,330
Wilson, M. E., and A. J. Perry, Fluting and plaiting machine	140,331
Wolcott, G. T., Bill and paper file	140,177
Wood, J., Railway frog	140,332
Woodbridge, W. E., Separating vegetable fibers	140,333
Woodville, J., Railway frog	140,230
Woodworth, J. R., assignee	140,110
Worstall, F. W., Potato planter	140,178
Yerkes, E. A., Manufacture of shovels	140,334

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 31, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of those classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks)	6,500
SEWING-MACHINES and attachments	2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes	4,000
PRINTING; including presses, type, and printers' furniture	2,500
CARRIAGE-WHEELS; including hubs, spokes, tires, and axles	1,200
FELTING and HATS; including caps, bonnets, flock, &c	1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments)	1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs	1,400
CARRIAGES and WAGONS; (excepting wheels, hubs, and axles) (in progress.)	

The specifications of patents have been reprinted back to November 20, 1866; from that date to June 30, 1871, on the larger paper; from July 1, 1871, to the present time, on the smaller paper.

The following abbreviated forms of the Patent Office classification by subject-matter may be of assistance to persons ordering copies of specifications and drawings by class. Of course the classes vary somewhat in number of patents, and in following a branch of industry it may be necessary to group several classes to secure absolute completeness. These groupings will readily suggest themselves to the inventor or mechanic.

Aërated liquor apparatus	1
Air and gas engines	2
Amalgamators, ore-mills	3
Architecture	4
Artificial limbs, &c	5
Baking	6
Baling-presses	7
Baths, closets, &c	8

COMMISSIONER'S DECISIONS.

JOHN W. MASURY.—*Extension.*

[*In the matter of the application of John W. Masury for extension of Patent No. 24,748, granted July 12, 1859, for* IMPROVEMENT IN PAINT-CANS.—*Decided July 10, 1873.*]

LEGGETT, *Commissioner:*

This invention consists in providing the top of a can for containing paint or other substances "with a rim or ring of thin soft metal," forming an annulus around the cover, and connecting it with the "top edge" of the can. This annulus may be readily cut with a knife, and the object of its employment is to enable the entire cover to be conveniently disconnected from the "top edge" of the can and removed without disturbing the contents. It is obvious that such a construction is well adapted to the purpose contemplated. It leaves the salient points of the can their full strength for packing and transportation; it does not diminish its capacity for holding or detract from the perfectness and security of its sealing qualities; and it renders it always readily openable, thus overcoming a great objection to soldered vessels, which it is necessary to employ for prepared paints, milk, fruit, and vegetables, now everywhere in vast demand.

The patent has been twice sustained in suits in which the novelty of the invention was placed in issue. The scope of the invention has also been so far defined that it is unnecessary for me to inquire whether it comprehends an annulus of thin or taggers tin, as well as one "of thin brass or other soft metal."

It appears, however, from the testimony submitted by the opposition, that this applicant was not the first to secure the general result at which he aimed, and consequently I do not see how he could be allowed to invoke the doctrine of equivalents. It is a well-known fact that tinners always use up their taggers tin in such parts of tin structures as require least strength and stiffness; and if, with this view, taggers tin had been used for the ends of hermetically-sealed cans prior to applicant's invention, it would certainly be giving an unjustifiable scope to his patent to construe his claim to include taggers tin simply because it is found to contain the quality of being easily cut with a knife. If taggers tin was so used before applicant's invention, then applicant should be limited to his special device of an annular rim of "thin brass or other soft metal."

The claim in terms does thus limit him, and I cannot act upon a presumption that he will be allowed more than he has claimed. It is in this view of the case that the testimony of the opposition, even if all admitted, could have but little weight.

De Lignac's English patent was considered by the court, and I think justly held not to exhibit the same invention. He presents the idea of opening a can by cutting through soft metal, and that is all. As Judge Blatchford remarks, he does not embody this idea "in a form which was practically of any substantial utility, and the means he adopted were substantially different from those adopted by Masury." The soft metal is shown as connecting the upper and body portions of the *side* of the can, and is not a part of the top or cover at all. That soft metal could be cut with a knife was always known. To employ it so as not to deteriorate the can, to preserve all its qualities, and still to avail of the use of the soft metal in the most advantageous way to effect the opening of the can, was the province of invention. De Lignac practically accomplished nothing in this direction. A comparison of the merits of devices actually produced is the proper measure of invention in a case of this kind. The fact that only a little step is necessary to pass from a crude and valueless device to one of great simplicity and excellence, when that step is once thought of, does not detract from the importance of an invention or from the merit

of an inventor. Masury's device is as manifestly an improvement upon De Lignac's as the pointed screw (made by simply putting a gimlet-point upon a screw) was upon the old blunt-ended screw.

The French patent of Chartonet of May 20, 1859, falls still further short of anticipating this invention. It does not definitely describe any device. The entire patent comprises only four lines, in which the invention is said to be a box for preserves, of which "the cover is very thin and can be easily attacked with a pen-knife." Neither the material nor form of the box or cover is stated, and the use of soft metal is not specified at all.

The testimony in behalf of the Borden Condensed-Milk Company, with reference to the novelty of this device, cannot be admitted. Although it appears in proof that a suit was brought against them for infringing Masury's patent, in the early part of this year, which is still pending, they delayed opposing this extension until after the time for taking testimony had expired. The case was reopened to admit them, and all the additional time was given they asked for. They failed, however, to give due notice of the names of their witnesses, in compliance with Rule 113, and proceeded with their examination *ex parte*. Notwithstanding this defect of notice, which, under the circumstances, would be fatal, I have read the affidavits submitted and I do not find that they would be of such probative force, if admitted, as to warrant the refusal of this extension. Their credibility and effect depend altogether upon the memory of witnesses, some of them interested, of facts alleged to have transpired more than fourteen years ago. None of the cans said then to have been manufactured are produced. The courts have uniformly refused to acknowledge the sufficiency of testimony of this character to invalidate a patent, and I should not be justified either in admitting this testimony or in pronouncing against the novelty of this invention upon it.

The testimony in behalf of Geo. T. Lewis is of much the same character. The only difference is that an exhibit is put in for the purpose of corroboration—"Exhibit Green"—which serves to flatly contradict the memory and statements of the witnesses. If their accounts, merely, were to be taken as sufficient proof, the novelty of applicant's device would be fairly defeated. But "Exhibit Green" cannot be readily cut by a knife, even if it be admitted to be an annulus of the nature, except its thickness, of that shown by Masury, which I think extremely doubtful. Walker swears these cans were *patented* to Wilson, Green, and Wilson in 1857.

The records of the Office show that they took out a patent for a certain can in that year, which I have no doubt is the one they made. Liethead, their foreman, says that all the cans made by them were substantially the same, for the first few years, for powder and paint cans. The commencement of the manufacture of the latter, according to his memory, was about March or April, 1858. He also says the rim—"Exhibit Green"—was generally *the last thing put on*. If Everett's testimony were corroborated by a specimen (made before 1859 and actually showing this invention) from the many thousands of cans he has made since 1853, it would then amount to proof. I do not regard the novelty of the invention under consideration as in the least shaken by anything appearing in this case. Its importance is amply attested, in connection with the direct testimony, by the undisputed fact of its extensive and almost universal use.

This fact, in the present case, relieves the inventor from the duty of showing diligence in introducing his invention into public use, although he is not without merit in this regard, having made and sold about a million of his cans a year for the past ten years. When it happens, upon the mere production of an invention and placing it upon the market, as Masury did, even while his application for patent was pending, that it soon commends itself to general adoption, there is nothing further for the inventor to do to introduce it. He has thus fully introduced it to the public himself, and none the less because he has been early and largely followed by infringers. In such a case he need only exercise reasonable diligence in seeking to obtain adequate remuneration, by legally asserting his claim, and this it appears Masury has done. After unsuccessfully endeavoring, prior to 1863, to induce parties who were using his invention to take license under his patent, he instructed his counsel to bring suits against them. Under advice to bring a single test suit, an action was commenced in 1863 in the Circuit Court of the Southern District of New York, but it was not defended. In September, 1864, pursuant to the same purpose, another suit was brought, which came to issue and at different terms was set for hearing. The parties were present with their witnesses for trial, but owing to pre-engagement of the court the cause was not tried. In 1867 or 1868 the defendant relinquished that branch of his business involving the use of cans, and declined to be at further expense to defend, preferring to pay Mr. Masury the amount of profit made, if he obtained judgment. The issue did not come to judgment on its merits, but a settlement was effected. All this is proved, and there is no evidence to contradict it. The only answer made to it is the assertion that it is "absurd." In 1869, the suit *Masury* vs. *Tieman* was brought and was decided in favor of Masury in May, 1871. Since the termination of that suit many prominent firms engaged in the paint trade have made settlements. In the summer of 1871 the suit *Masury* vs. *Anderson & Pierce* was brought and decided in favor of Masury in May last. Another suit has since been instituted against the Borden Condensed-Milk Company. Three or four years' delay transpired between the time Masury admits he was informed that company were infringing his patent, and the time he brought his suit against them; but in the mean time he was engaged in two other suits to enforce his patent in the same jurisdiction. I think he is shown to have been reasonably diligent throughout in endeavoring to protect his patent and obtain proper remuneration for his invention.

His account admits the receipt of about $13,800, from which is deducted about $4,800 for expenses of litigation and procuring patent. His receipts all date subsequent to June 1871, after the successful termination of his suit, *Masury* vs. *Tieman*. He swears that only one party is now under his license to manufacture. Remonstrants insist that he ought to have returned about $60,000, not yet collected for alleged infringements by the Borden Condensed-Milk Company, during the four years that he has been aware of such alleged infringements, and at least $50,000 for profits on account of his own manufacture. If he had made no endeavor to secure a recognition of his rights under his patent, and it was shown that he had actually received the latter sum, beyond a fair manufacturer's profit, there would be reason to demand a different return from him. But he alleges that the sales by infringers, against whom he has maintained five suits during the term of his patent, have rendered it impossible to obtain any more for cans made according to his invention than for other cans, and he swears that he has received no more. The inference is sought to be raised that he has, by testimony, not showing the ordinary profit of manufacturers of cans, but what different individuals have themselves been accustomed to charge in another State. Masury swears that the average manufacturer's profit on tin cans in New York and vicinity is from twenty to twenty-five per cent., and this is all the evidence adduced on this point. He says that he calculates to make a profit of twenty per cent. Not having succeeded in charging others prior to 1871, although almost constantly prosecuting them, it is not very reasonable that he should be called upon to charge himself. I find no proof that he has actually received more from his invention than he has returned, except probably the profit he ought to have made on his own manufactures since he began to get returns from licenses in 1871. His own manufacture should have netted him, since that date, whatever profit, on account of the invention, others could pay and sustain themselves in the business. This is a defect in his account, as is also his failure to set forth in his statement the fact that he has an English patent, and whether or not it has netted him any profit. But he swears that he has received nothing on account of his English patent, and adding to his receipts all that could justly be charged him since he has finally succeeded in making collections from others, his remuneration would be far from commensurate with the value of his invention, estimating it, as he does, at the lowest rate of license charge.

Referring to the effect upon the public interests of granting this extension, it is urged that large established manufacturers will be placed under contribution if it be granted. It does not appear, however, that the patentee has yet been extortionate in his demands, and no more can be apprehended in this case than in any other grant of exclusive privilege under a patent. It must be admitted that the public have received the advantages of the invention without rendering that commensurate remuneration to the inventor which sound policy, looking to the encouragement of inventions, contemplates shall be vouchsafed him, when, in addition to inventing, he has made reasonable efforts to secure adequate compensation. The argument that established interests will be disturbed is of no force whatever, in any case, unless it refers to existing public rights in an invention. Property in this invention has not yet vested in the public. Pirating by individuals confers no rights, and gives no title to consideration. Whatever individual interests parties may have, on account of unauthorized investments in the property of others, are not to be regarded.

The remarks of the learned judge in *Cook & McComb* vs. *Ernest*, OFF. GAZ., vol. 2, p. 87, where the same argument was used by alleged infringers, is applicable in this connection. He said: "It is now claimed that an injunction should not issue, because it would disturb the existing order of things—that is, it would put a stop to infringements and give a protection to the property of complainants which the defendants will not voluntarily accord. In other words, the claim is that, because the defendants have been invading the rights of claimants, * * they should not be enjoined, lest the existing order of things be disturbed.

"The very purpose of the bill of complaint is to disturb the existing order, and to induce a new order, by which the complainants may be protected in their property and rights."

The extension will be granted upon payment of the required fee.

E. WHEELER.—*Appeal.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the application of Elbridge Wheeler for patent for* MANUFACTURE OF WROUGHT-IRON OR STEEL TUBES.—*Decided July* 1, 1873.]

An application claiming the rolling of tubes without a mandrel from a hollow fagot composed of layers of bars riveted together, is answered by a patent describing the same process, except that it does not mention how the bars are attached together, that being a requisite which every mechanic would supply without its being specified.

LEGGETT, *Commissioner:*

Applicant forms a tubular pile from layers of rolled bars, fitted and riveted together so as to break joints, and rolls and welds it without the aid of a mandrel. He claims:

"As an improvement in the art of manufacturing tubes, rolling the same without the use of a mandrel, directly from a hollow fagot consisting of two or more layers of bars securely connected, as set forth."

It is not new in the art of rolling, as exhibited by the references, to weld tubes without the use of a mandrel. Neither is it now to form hollow piles for rolling from layers of segments which break joints.

The English patent of Clay, No. 2,821, shows such layers forming such piles. But neither the drawing nor specification exhibits any means of uniting the segments together in the pile. It is obvious that they must be secured together in some manner, else they would fall apart, and it would be impossible either to form or to roll the pile. An inspection of the drawing, which exhibits a cross-section of the pile, suggests at once that the pieces must be riveted or otherwise secured together. It is not essential, even to one not skilled in the art, to show or describe rivets for the purpose; because rivets or some equivalent means, such as bands or dowel-pins, must be adopted.

After the piles are formed it is proposed to roll them "either with or without" a mandrel. This does not mean always *with* a mandrel, as applicant seems to suppose, but sometimes *without* a mandrel.

This patent is a complete anticipation of his alleged invention. The necessity and the means of securing the segments together in forming the piles for rolling are so obvious that the omission to expressly set them out would not prevent a mechanic from making the device, and employing the process in question, as readily from the description and drawing of the patent as

from applicant's specification and drawings which exhibit the rivets.

The decision of the Board is affirmed.

N. I. DONALDSON.—*Reissue.*

[*Appeal from the decision of the Primary Examiner in the matter of the application of Niles I. Donaldson for reissue of Patent No. 134,861, for* MEDICAL INHALER.—*Decided July 1, 1873.*]

It is proper to specify in the reissue of a patent for a medical inhaler in what parts two medicated liquids, when two are used, shall be placed, though no mention was made of them in the patent.

Such an explanation is in fact required by section 26 of the act of 1870.

LEGGETT, *Commissioner:*

The original patent describes an inhaler provided with either one or two inlet-tubes, each tube having a bulb for the reception of medicinal liquid. The bottle or main receptacle is filled about half full of water, "medicated or otherwise, as preferred," into which the open end of each tube is immersed. There is no specification as to where the medicinal liquids are to be placed when only one inlet-tube is employed—whether they are to be mixed together in the one bulb, or whether one of them is to fill the bulb and the other to be placed in the water through which the vapor of the other must pass to the exit or inhaling tube.

But when two are used, it is set forth that each is to be filled with one of the liquids usually employed for producing medicated vapor. Applicant now specifies in his application where the liquids are to be placed when only one inlet-tube is used. He says in such case "the alkali is placed in the main receptacle with the water, the acid being introduced into the bulb of the inlet-tube." This does not add a new feature—*new subject-matter*—to the device itself. It only explains the manner in which the device is to be operated when constructed as described in the patent. Such explanation is required by section 26 of the statute, and should have been embraced in the original specification. Its omission there was such an inadvertence or mistake as a reissue is designed to correct. If a process were in question an amendment of this nature might constitute a substantial modification of it, and therefore be inadmissible. But being in this instance merely explanatory of the way of using the device for the purpose it was intended to subserve, when constructed according to the patent, it is proper and necessary.

The Examiner curiously suggests that other parties using only one tube are entitled to test in the courts whether they are infringing the patentee or not, and whether they cannot prevent him "from using their arrangement."

It should have occurred to him that if this is a matter belonging to others who can invoke any such test, they must be patentees, and in that case an interference would be required.

But it is not easy to perceive that an explanation how this device, as described in the patent, is to be made serviceable for the purpose contemplated, could constitute an invention and be the property of one not the inventor of the device.

The decision of the Examiner must be reversed.

CHASE AND WHITE *vs.* CHASE.—*Interference.*

[*Appeal from the decision of the Board of Examiners-in-Chief in the matter of the interference between the patent of Chase and White and the application of W. H. Chase, for patent for* COVER FOR SEWER-BASINS.—*Decided June 16, 1873.*]

Where two persons have taken out a patent as joint inventors each of them seems to be estopped from setting up a claim that he is the sole inventor, so long as the other denies it.

If such a claim can be considered at all, it must be established by clear proof.

If one originates the general idea of an improvement, and another aids him in developing it and reducing it to a practical form, they may be considered joint inventors.

Where one person invents part of an apparatus and another suggests the idea of another part which is perfected by the first, and the whole is elaborated and reduced to form on the united consultations of both, the second cannot claim to be the sole inventor.

LEGGETT, *Commissioner:*

Chase and White took out a joint patent for a cover and trap for sewer-basins, April 2, 1872. The device consists of three principal features—a corrugated cover having a man-hole through it, and suitable flanges; a gutter-plate upon which the cover is supported, forming the mouth or opening from the gutter into the sewer; and the valve for closing this mouth suspended on pivots a little above its center, so that its own gravity will keep it closed ordinarily, but a very slight pressure of water from the gutter will open it sufficiently to permit the escape of the water into the sewer-basin. The design of the corrugated cover is to prevent pedestrians from slipping and falling, and the purpose of the valve is to cut off the exhalations of the sewer, while at the same time it automatically opens to admit sewage.

The claim of the patent is as follows:

"A cover or trap for sewer-basins, consisting substantially of the corrugated top A, cast in one piece of iron, with the flange C and the cover B, plate D, and valve E, all as and for the purposes herein set forth."

Chase is superintendent of sewers in this city, and White is engaged in iron manufacture. It appears that the invention was adopted by the city authorities of Washington, and a number of the traps and covers have been made by White, through negotiations of Chase, for the city government, marked "Wm. H. Chase and Geo. White, patent, April 2, 1872."

After the lapse of about five months, some disagreement having in the meantime arisen between the parties, Chase filed an application September 16, 1872, claiming to be the sole inventor. It was held by Commissioner Fisher in a similar case—*De Lill* vs. *Avery & Hill*, Decisions, 1870, p. 128—in substance, that a party to a joint patent was estopped from asserting his sole proprietorship, where it was denied by the other party. I have no doubt of the soundness of this opinion. But certainly if this were not the case, it ought to be clearly proved on the part of such an applicant that he was in fact a sole inventor. I concur with the Board that "Chase is very far from proving himself to have been the sole inventor." The weight of evidence is decidedly the other way. White first produced the corrugated cover and brought it to the notice of Chase. Chase, in connection with that, as admitted by White, conceived the idea of the gutter-plate and a valve.

He made a rude model of the plate and cover and took it to White. It had no valve in it, and Chase does not appear to have had any definite idea how a valve was to be adapted to it. White explained how the valve might be applied, as he and his brother swear, and the model-maker testifies that he worked out the model under the joint instructions of Chase and White. The production of the combination which constitutes the invention was apparently as much the work of White as of Chase. Each produced independently certain parts of it, and both joined in completing and embodying the whole. The attorney who prepared the application says White introduced him to Chase as the attorney who was to take out their patent; that upon particular inquiry he took the full names of the parties for this purpose at the time. Chase signed the specification, upon examining it and the drawing, (notwithstanding he swears he did not,) after White had signed it. Against all this, and his own oath, there is nothing but the bare assertion of Chase that he was the sole inventor, and that in making affidavit to the joint application he did not know what he was about. The testimony of Richards and Murtagh goes to show that Chase probably had a general idea of the invention in his mind before he saw White about it, but nothing more. When they consulted together White's suggestions were such that they came to a definite agreement how the device ought to be made, and he made it accordingly.

This is the ordinary process of joint invention. It is the result of the mutual contributions of the parties. If one suggests an idea in a general way and the other falls in with it, and by his aid develops it and gives it definite practical embodiment, the two may be considered joint inventors. The mere suggestion of the valve by Chase, and his conversation about it, did not constitute him the sole inventor. The thing itself was old. Its practical application was to be accomplished for the use contemplated in connection with a sewer-trap. That is what White *suggested* and consummated. He was not ordered to make a trap with a valve, upon specific directions, accompanied with a model or drawing showing him so much that no suggestions were necessary in order to accomplish it. He had already made the top, and he was consulted as to how a desirable improvement in connection with it, which Chase had thought about, might be accomplished. He is clearly upon the proof a joint inventor with Chase.

The decision of the Board awarding priority to Chase and White is affirmed.

WHEELER AND WHEELER.—*Reissue.*

[*Appeal from the decision of the Primary Examiner in the matter of the application of Harriet W. Wheeler and Wm. H. Wheeler, assignees, for a reissue of Patent No. 68,674, granted to L. H. Wheeler, September 10, 1867, for* WINDMILL.—*Decided June 28, 1873.*]

Such combinations of the parts shown in a patented machine as are operative in themselves, and constitute distinct and separate parts of the thing patented, may be embraced in separate divisions upon a reissue of the patent.

But several parts of a patented machine which will together constitute a new invention not hinted at in the original, cannot be selected and claimed by themselves on a reissue.

THACHER, *Acting Commissioner:*

In the original patent granted to Wheeler, he describes a windmill provided with a hinged vane and a "side vane," the latter at about right angles with the axis of the wind-wheel. The purpose of these two vanes is to render the motion of the wind-wheel uniform by turning it, automatically, when in operation, more or less "edge to the wind," according to the violence of the current. To stop its motion entirely the hinged vane is to be turned parallel with the side vane and wind-wheel.

It is not necessary to describe the details of the mechanism by which this operation of the vanes upon the wind-wheel is accomplished. It is sufficient to say that the two vanes are, according to the patent, to be used together to jointly control the motion of the wheel. There is no suggestion in the patent that either could be operated alone to accomplish the object contemplated, or any other specified object. It is now alleged to have been discovered that each is practically operative alone (or at least that the hinged vane is) for the object in view, and it is sought to obtain a divided reissue covering them, respectively, when independently employed in windmills. If this allegation be true, then there is ground for new patents, but not for the reissue sought.

The Examiner says that none of the parts of this device are new *per se*. The novelty, then, must consist in their combination. No doubt such combinations of the parts shown in the machine as are new combinations, as there shown and operated, may be claimed; and so far as they are "distinct and separate parts of the thing patented," may be divided by reissue. But in an application for reissue parts of a device cannot be selected to make up a new device not hinted at in the original patent. That constitutes new invention, and is not proper subject-matter for protection by reissue of the old patent. The discovery that the omission of one of the material elements of a machine or combination invented and patented will leave an operative and valuable machine or combination, is such a discovery as warrants the grant of a new patent. See *Minter* vs. *Mower*, Webster's Patent Cases, p. 138; *Russell* vs. *Crowley*, *ibid*, 458.

This is precisely the discovery applicant has made. It amounts to an improvement upon his first invention, and cannot be fairly said to be a distinct part "of the thing patented."

The decision of the Examiner adverse to the basis of division of reissues here presented is sustained, and in view of this decision it is not necessary to go into the minor points presented.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

24,915.—*Casting Copper Cylinders.*—Granted to FREEBORN ADAMS, August 2, 1859. Hearing July 16, 1873.

24,923.—*Elevators for Warehouses, Factories, Mines, &c.*—Granted to ALBERT BETTELEY, August 2, 1859. Hearing July 16, 1873.

24,947.—*Journal-Boxes.*—Granted to JOHN A. MONTGOMERY August 2, 1859. Hearing July 16, 1873.

24,953.—*Meat-Cutters.*—Granted to JOHN G. PERRY, August 2 1859. Hearing July 16, 1873.

24,963.—*Flour-Packers.*—Granted to SAMUEL TAGGART, August 2, 1859; reissued November 7, 1871. Hearing July 16, 1873.

24,987.—*Fishing-Reels.*—Granted to WILLIAM BILLINGHURST, August 9, 1859. Hearing July 23, 1873.

25,005.—*Governor-Valves.*—Granted to BENAIAH FITTS, August 9, 1859. Hearing July 23, 1873.

25,014.—*Machines for Cutting Out Wooden Ware.*—Granted to GEORGE R. HAY, August 9, 1859. Hearing July 23, 1873.

25,015.—*Wood-Saw Frames.*—Granted to JAMES HAYNES, August 9, 1859; reissued August 25, 1863. Hearing July 23, 1873.

25,017.—*Steam-Boilers.*—Granted to ROBERT HOOPER, August 9, 1859. Hearing July 23, 1873.

25,036.—*Post-Marking Stamps.*—Granted to MARCUS P. NORTON, August 9, 1859. Hearing July 23, 1873.

25,061.—*Elevator or Hoisting Apparatus for Hotels, &c.*—Granted to OTIS TUFTS, August 9, 1859. Hearing July 23, 1873.

25,071.—*Roof for Railroad Cars.*—Granted to A. P. WINSLOW, August 9, 1859; reissued August 8, 1865. Hearing July 23, 1873.

25,115.—*Self-Acting Wagon-Brakes.*—Granted to BENJAMIN S. HEALY, August 16, 1859. Hearing July 30, 1873.

25,148.—*Weighing-Scales.*—Granted to FRANCIS M. STRONG and THOMAS ROSS, August 16, 1859. Hearing July 30, 1873.

25,149.—*Blanks for Shoe-Pegging Machines.*—Granted to BENJAMIN F. STURTEVANT, August 16, 1859; reissued June 12, 1866. Hearing July 30, 1873.

25,153.—*Carding-Engines.*—Granted to SAMUEL WETHERED, August 16, 1859. Hearing July 30, 1873.

25,166.—*Iron Fences.*—Granted to JOHN B. WICKERSHAM and HENRY JENKINS, August 16, 1859. Hearing July 30, 1873.

25,167.—*Mode of Lighting Gas by Electricity.*—Granted to ARCHELAUS WILSON, August 16, 1859. Hearing July 30, 1873.

25,183.—*Nail-Machines.*—Granted to DANIEL DODGE, August 23, 1859. Application filed May 23, 1873. Hearing August 6, 1873.

25,191.—*Machines for Making Paper-Bags.*—Granted to WILLIAM GOODALE, August 23, 1859. Hearing August 6, 1873.

25,199.—*Feeding Paper to Printing-Presses.*—Granted to RICHARD M. HOE, August 23, 1859; reissued June 20, 1871. Hearing August 6, 1873.

25,235.—*Manufacture of Iron.*—Granted to BERNARD LAUTH, August 23, 1859. Application filed May 22, 1873. Hearing August 6, 1873.

25,237.—*Horizontal Wheels.*—Granted to ABRAHAM ANDREWS and HARRISON KALBACH, August 30, 1859. Application filed May 28, 1873. Hearing August 13, 1873.

25,239.—*Elastic Hose Tubing*, granted to JOHN C. BOYD, August 30, 1859. Application filed May 29, 1873. Hearing August 13, 1873.

25,309.—*Nail Machines*, granted to DANIEL DODGE, August 30, 1859. Application filed May 31, 1873. Hearing, August 13, 1873.

25,343.—*Stoves.*—Granted to EDWARD M. MANIGLE, September 6, 1859. Application filed June 5, 1873. Hearing August 20, 1873.

25,344.—*Machines for Wiring the Joints of Clothes Pins*, granted to ALVIN C. MASON, September 6, 1859. Application filed May 31, 1873. Hearing, August 20, 1873.

25,364.—*Watches.*—Granted to CHARLES E. JACOT, September 6, 1859. Hearing August 20, 1873.

25,373.—*Machines for Making Paper Boxes.*—Granted to SILAS B. TERRY, September 6, 1859; reissued May 17, 1870. Application filed June 5, 1873. Hearing August 20, 1873.

25,395.—*Heels for Boots and Shoes.*—Granted to SIMEON DODGE, Jr., and BENJAMIN POTTER, Jr., September 13, 1859. Application filed June 13, 1873. Hearing August 27, 1873.

25,434.—*Cotton-Scrapers.*—Granted to JONATHAN H. MITCHELL, September 13, 1859. Application filed June 10, 1873. Hearing August 27, 1873.

25,442.—*Boilers and Steamers.*—Granted to DANIEL R. PRENDLE, September 13, 1859. Application filed June 13, 1873. Hearing August 27, 1873.

25,443.—*Seeding-Machines.*—Granted to SILAS G. RANDALL, September 13, 1859; reissued May 25, 1869. Application filed June 11, 1873. Hearing August 27, 1873.

25,473.—*Scales.*—Granted to ANDREW TURNBULL, September 13, 1859. Application filed May 31, 1873. Hearing, August 27, 1873.

25,484.—*Grain-Separators.*—Granted to JONATHAN L. BOOTH, September 20, 1859; reissued September 25, 1860, and November 29, 1864. Application filed June 14, 1873. Hearing September 3, 1873.

25,488.—*Hydraulic Presses.*—Granted to M. H. CLARK, September 20, 1859. Application filed June 20, 1873. Hearing September 3, 1873.

25,499.—*Railroad-Car Seat.*—Granted to ELI WHEELER, September 20, 1859. Application filed June 17, 1873. Hearing September, 3, 1873.

25,506.—*Lamps.*—Granted to HALVOR HALVORSON, September 20, 1859; reissued June 6 and December 5, 1871. Application filed June 6, 1873. Hearing September 3, 1873.

25,508.—*Tailors Shears.*—Granted to ROCHUS HEINRICH, September 20, 1859. Application filed June 20, 1873. Hearing September 3, 1873.

25,512.—*Bung-Hole Borer and Reamer.*—Granted to JOSIAH KIRBY, September 20, 1859. Application filed June 19, 1873. Hearing September 3, 1873.

25,544.—*Try-Cocks for Steam-Boilers.*—Granted to JOHN F. COOK, September 20, 1859. Application filed June 10, 1873. Hearing September 3, 1873.

25,565.—*Rolling-Mills.*—Granted to JOHN and GEORGE FRITZ, September 27, 1859. Application filed June 27, 1873. Hearing September 10, 1873.

25,569.—*Bedstead-Slats.*—Granted to TYLER HOWE, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,570.—*Mode of Arranging Couches in Railroad Cars.*—Granted to EDWARD C. KNIGHT, September 27, 1859. Application filed May 31, 1873. Hearing, September 10, 1873.

25,572.—*Molding Water-Traps.*—Granted to JAMES ALLEN LOWE, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,586.—*Burglar-Alarms.*—Granted to ABBOTT O. ROSS, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,588.—*Steam Punching-Machines.*—Granted to JOHN SPARROW, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,640.—*Steam-Boilers.*—Granted to JOSEPH HARRISON, Jr., October 4, 1859. Application filed June 30, 1873. Hearing September 17, 1873.

25,662.—*Construction of Prisons.*—Granted to EDWIN MAY, October 4, 1859. Application filed June 23, 1873. Hearing September 17, 1873.

25,683.—*Hydrants.*—Granted to CHARLES L. STACY, October 4, 1859; reissued June 6, 1865. Application filed June 28, 1873. Hearing September 17, 1873.

25,747.—*Method of Combining Emery with Caoutchouc.*—Granted to THOMAS J. MAYALL, October 11, 1859. Application filed June 16, 1873. Hearing September 24, 1873.

25,796.—*Jacquard Machines.*—Granted to AVERY BABBETT, October 18, 1859. Application filed June 30, 1873. Hearing October 1, 1873.

26,243.—*Water-Closet Basins.*—Granted to WILLIAM BOCH, Sr., November 29, 1859. Application filed June 10, 1873. Hearing November 12, 1873.

27,539.—*Manufacture of Gun-Barrels.*—Granted to JAMES H. BURTON, March 20, 1860, and antedated to September 29, 1859; reissued December 26, 1871. Application filed July 1, 1873. Hearing September 16, 1873.

30,201.—*Apparatus for Freezing Liquids.*—Granted to FERDINAND PHILIPPE EDOUARD CARRÉ, October 2, 1860; reissued in two divisions February 18, 1873. Patented in France August 24, 1859. Application filed May 17, 1873. Hearing August 13, 1873.

EXTENSIONS GRANTED.

24,598.—*Improvement in Harvester-Rakes*, granted to MCCLINTOCK YOUNG, Jr., June 28, 1859; reissued May 17, 1870, numbered 3,978.

Claim.—1. The combination of the radial rake, revolving around its shaft, and oscillating on a pivot, both eccentric and transverse to said shaft, the fixed double-walled cam, to guide and support the rake and mechanism connecting the rake and cam, substantially as set forth.

2. The combination of the fixed double-walled cam, the radial rake revolving around its shaft and oscillating on a pivot, both eccentric and transverse thereto, and the guide, located on the gearing side of the platform, to hold down the rake when discharging the gavel from the platform, substantially as set forth.

Disclaimer filed June 27, 1873.

Disclaims second clause of claim as above set forth.

24,700.—*Improvement in Harvesters*, granted to LEWIS MILLER and JACOB MILLER, July 5, 1859.

Claim.—Extending the finger or platform bar, one or both, far enough under the yielding-bars, by which they are hung to the main frame, as that the two may be united by suspension-rods, which allows them a yielding motion in one direction, makes them rigid in another direction, and prevents the motions of the main frame from being communicated to the finger-bar, substantially as described.

24,664.—*Improvement in Elastic Railroad Frogs*, granted to GEORGE P. SANBORN and WILLIS MANSFIELD, July 5, 1859. (WILLIAM R. SANBORN administrator of the estate of GEORGE P. SANBORN, deceased.)

Claim.—1. An elastic frog constructed of layers of plate metal and wood, substantially in the manner specified, and either with or without layers of vulcanized rubber.

2. Constructing an elastic frog with end slots suitable to receive the lower flange and neck of a rail, as specified, whereby the frog may be kept in alignment, as described.

24,654.—*Improved Pin-Sticking Machine*, granted to J. W. NARMORE, July 5, 1859.

Claim.—1. Operating the driver or drivers and the crimping and feeding apparatus, or any portion of the same, by means of a clutch or clutches, carried by a constantly-rotating shaft and thrown into gear therewith to effect such operation by the action of the sliding bed or pin-carriage, as the latter, after having received the pins, completes its movement to the necessary position for the sticking operation, substantially as herein described.

2. The combination, with a single reciprocating sliding bed or pin-carriage and a single conductor, of two drivers and two sets of crimping and paper-feeding apparatus arranged on opposite sides of the mouth of the conductor in such a manner that the said bed or carriage, in every movement in either direction, is caused to be filled with pins from the conductor, and to convey them to a proper position relatively to one or the other of the drivers, to be thereby driven into the paper supplied and crimped by its respective feeding and crimping apparatus, substantially as herein described, whereby a saving is effected of the time heretofore lost in running the bed twice under the conductor to be once filled.

3. Effecting the combination between the sliding bed or carriage and a clutch carried by a constantly-revolving shaft to operate a driver, a crimper, and a feeding apparatus, or either of them, by means of a toothed lever, E or E', a spring, T, a notched slide, F or F', plate U or U', with an inclined edge and a sliding-tooth, *i*, the whole applied and operating substantially as herein described, to permit one and only one revolution of the loose portion of the clutch, and hence but a single operation of the part or parts driven by it.

24,688.—*Improved Machine for Boring or Mortising Blind-Stiles*, granted to LEONARD WORCESTER, July 5, 1859.

Claim.—1. Combining the transversely-reciprocating carriage A A with the cam-cylinders L L, by means of the pairs of vibrating levers E E and *f f*, substantially in the manner and for the purposes herein set forth.

2. The notched plates N N for sustaining the stiles during the operation of mortising or boring the same when the said plates are combined with reciprocating bearings and other suitable mechanism in such a manner that the necessary laterally-reciprocating and longitudinally-feeding movements will be imparted to said plates, substantially as herein set forth.

3. Combining the bearings of the bit-shaft G with the reciprocating carriage C, when the said shaft is so arranged with relation to the notched plates N N that the bits which project from the ends of said shaft will act upon the stiles as they are automatically presented to them, substantially as herein set forth.

4. The combination and joint operation with each other of the reciprocating carriages A A, the notched plates N N, the pairs of levers E E and *f f*, the cam-cylinders L L, the reciprocating spring-pawls K K, and the bit-carrying cylinder G, substantially as herein set forth.

24,685.—*Alarm-Attachment for Tills*, granted to E. B. WHITE, July 5, 1859. (LAURANA C. WHITE administratrix of the estate of EDWIN B. WHITE, deceased.)

Claim.—1. The bolt-plate *b* provided with bolts C, connected by a joint, *c*, to the box B, and connected to a bell-striking apparatus, substantially as shown, in connection with the keys *k* and a stop, D, the whole being applied to the till, substantially as and for the purpose set forth.

2. In combination with the bolt-plate *b*, bolts C, and keys *k*, the bar *j* and screws *o'* in the parts *k'* of the keys, when the bolt-plate and bar *j* are both connected with the lever A, or to the bell-striking apparatus, in any proper way.

3. The employment or use of the sliding plate G, combined and arranged, with the bolt-plate *b* and stop D, to operate automatically, as and for the purpose set forth.

4. The employment or use, for the purpose specified, of a supplemental spring *u*, fitted in a socket, *t*, or otherwise arranged to resist the movement of the bar *j*, when said bar *j* is used in connection with spring-bolts C, substantially as described.

24,665.—*Improvement in Protecting Surfaces of Articles of Iron*, granted to THADDEUS SELLECK, July 5, 1859.

Claim.—A horseshoe or other article, as indicated herein, made by uniting Franklinite pig-metal with the surface of iron, as set forth.

24,668.—*Improvement in the Picker-Motion for Power-Looms*, granted to WILLIAM STEARNS, July 5, 1859.

Claim.—1. Extending the picker-staff down, through, and below the rocker, and through the rail, as described.

2. The rocker D, made to receive the staff, in the way and manner described.

3. In combination with the rocker D, the hook G or G', whether made separate or cast on the rocker, for the purposes set forth.

4. Making the picker-staff adjustable in the rocker, in the manner described, or in some equivalent manner.

5. Making the stud surrounded by the coiled spring P smaller in the middle than at the ends, to allow the spring to contract in diameter, in the middle, as it is drawn in working.

6. Making that portion of the stud surrounded by the stationary end of the coiled spring permanent or stationary, and that portion surrounded by the moving end of the spring to revolve, to facilitate the working of the spring.

Disclaimer filed June 30, 1873.

Disclaims first and sixth clauses of claim, as above set forth.

24,680.—*Improvement in Corrugating Sheet Metal*, granted to WILLIAM E. WORTHEN and HENRY B. RENWICK, July 5, 1859.

Claim.—The method of corrugating or molding sheet metal by several dies acting in succession, substantially in the manner specified, upon a sheet resting upon a bed die or dies so as to cause the metal to conform to shape, substantially in the manner herein described.

24,635.—*Improvement in the Construction of Sheet-Metal Coffins*, granted to ISAAC C. SHULER, July 5, 1859.

Claim.—1. The arrangement of stiffening the lower part of a sheet-metal coffin by locking together the scrolled edges of the sides and bottom, forming a firm rim when they are soldered together, substantially as described.

2. The sheet-metal rim *c* on the outside of the walls as a means of stiffening the base, either with or without a filling of molten metal, according to the size of the coffin.

3. The rim *d* of sheet metal, single or scrolled, forming an inside chamber which may be filled with molten metal or left hollow, according to the size of the coffin.

4. A cast-metal rim, *f*, with a deep groove on the under side, which receives, straightens, and stiffens the walls, and which serves to support the lids.

5. Setting the pillars or braces *x* at the corners and around the body of the coffin between the inward projections of the rims *d* and *f*, which gives them an extended purchase, for the purpose of stiffening the walls, substantially as described. I also claim the peculiar braces *k* to prevent the lateral racking of the bottom.

6. The arrangement of pressing inverted beads or recesses in any required number in the sheet metal of the lid, walls, and bottom of a metal coffin, on the inside and on the outside of the same, which may be filled with molten metal in the large size and left empty in the small size coffins, for the purpose of securing, by a peculiar mode of manufacture, of a level surface between the indented parts described.

7. The arrangement of fastening firmly, on the under side near the outer edge of the air-tight lid of a sheet-metal coffin, a cast-metal rim or its equivalent, for the purpose of strengthening this lid, and also for fitting into the groove in the rim F on the upper edge of the walls of the coffin, substantially as described.

8. The arrangement of fastening around the face-window on the under side of the air-tight lid of a sheet-metal coffin a cast-metal sash or rim, *m*, which receives and supports the face-glass, when it is cemented, in its proper place.

9. The arrangement of fastening permanently on the under side, near the outer edge of the sheet-metal blind *m* which covers the glass in the face-window of a sheet-metal coffin, a cast-metal rim, O, or its equivalent, for the purpose of strengthening and furnishing a means of securing the same to the outer lid which covers the air-tight joint, substantially as described.

10. The arrangement described, of two entire distinct separate sheet-metal lids.

DISCLAIMERS FILED.

24,668.—WILLIAM STEARNS.—*Improvement in Picker-Motion for Power-Looms*, granted July 5, 1859. Disclaimer filed June 30, 1873. Disclaims:

"The first and sixth clauses of the claim to the invention set forth in his said patent."

24,598.—MCCLINTOCK K. YOUNG, Jr.—*Harvesting-Machine*, granted June, 28, 1859; reissued to assignees CYRUS H. MCCORMICK and LEANDER J. MCCORMICK, May 17, 1870, No. 3,978. Disclaimer filed by inventor and assignees June 27, 1873. Disclaims:

"The second clause of claim of said reissue."

24,588.—JOSHUA C. STODDARD.—*Improvement in Hay-Spreaders*, granted June 28, 1859; reissued June 1, 1869, No. 3,461. Disclaimer filed June 26, 1873. Disclaims:

"That part of the claim in said specification which is in the following words, to wit:

"'9. The combination, with a hay-making machine, of rotating rake-teeth, adjustable relatively to their axis of rotation.

"'10. The combination, with a hay-making machine having rotating teeth, of a stop to cause the teeth to act as rakes.

"'11. Making one set of the adjustable rotating rake-teeth longer than the others for use as a hay-rake, as set forth.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date July 1, 1873.]

6,735.—*Printing-Type.*—ANDREW LITTLE, New York, N. Y. Application filed June 20, 1873.

6,736.—*Printing-Type.*—RICHARD SMITH, Philadelphia, Pa., assignor to MACKELLAR, SMITHS & JORDAN, same place. Application filed June 16, 1873.

6,737.—*Cooking-Stove.*—WALTER S. STEVENSON, Philadelphia, Pa., assignor to THOMAS, ROBERTS, STEVENSON & CO., same place. Application filed June 4, 1873.

6,738.—*Carpet.*—JOHN T. WEBSTER, Falls of Schuylkill, Philadelphia, Pa., assignor to JOHN & JAMES DOBSON, same place. Application filed June 16, 1873.

6,739.—*Carpet.*—JOHN T. WEBSTER, Falls of Schuylkill, Philadelphia, Pa., assignor to JOHN & JAMES DOBSON, same place. Application filed June 16, 1873.

6,740.—*Carpet.*—JOHN T. WEBSTER, Falls of Schuylkill, Philadelphia, Pa., assignor to JOHN & JAMES DOBSON, same place. Application filed June 16, 1873.

6,741.—*Plaster Cast.*—FREDERICK S. BATCHELLER, Providence, R. I. Application filed June 16, 1873.

6,742.—*Picture-Frame Molding.*—STEPHEN GARRISON, Baltimore, Md. Application filed June 13, 1873.

6,743.—*Flower-Stand.*—JOSEPH E. MORRIS, Minneapolis, Minn. Application filed June 28, 1873.

6,744.—*Toy Bank.*—FRIEND W. SMITH, Bridgeport, Conn. Application filed June 20, 1873.

6,745.—*Cooking-Range.*—SAMUEL S. UTTER, Brooklyn, N. Y. Application filed June 7, 1873.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date July 1, 1873.]

1,340.—*Liquors, Wines, Bitters, Syrups, and Cordials.*—WILLIAM S. DUNHAM, New York, N. Y. Application filed June 23, 1873.

1,341.—*Playing-Cards.*—CHARLES K. PEVEY, Worcester, Mass. Application filed June 23, 1873.

1,342.—*Forks, Spoons, and Other Table Ware.*—C. B. ROGERS & BROTHERS, Meriden, Conn. Application filed June 25, 1873.

1,343.—*Soap.*—SHERWOOD & GENIN, Buffalo, N. Y. Application filed April 28, 1873.

1,344.—*Machine-Wound Bobbins or Spools for Sewing-Machine Shuttles.*—JAMES HERBERT BULLARD, Chicopee Falls, Mass. Application filed June 20, 1873.

1,345.—*Fertilizer.*—HUNT, RANKIN & LAMAR, Macon, Ga. Application filed June 14, 1873.

1,346.—*Sugar-Cured Hams.*—OAKFORD & COMPANY, Baltimore, Md. Application filed June 19, 1873.

1,347.—*Roofing-Slate.*—THOMAS W. PARRY, Lehigh township, Northampton county, Pa. Application filed June 14, 1873.

1,348.—*Playing-Cards.*—CHARLES K. PEVEY, Worcester, Mass. Application filed June 16, 1873.

1,349.—*Playing-Cards.*—CHARLES K. PAVEY, Worcester, Mass. Application filed June 25, 1873.

1,350.—*Files, Rasps, and Steels.*—THE SHEFFIELD FILE WORKS, Albany, N. Y. Application filed June 25, 1873.

1,351.—*Preparation for Toothache.*—RACHEL A. TRACY, Brooklyn, N. Y. Application filed June 24, 1873.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date July 1, 1873.]

ORIGINAL PATENTS.

140,336.—*Tool for Working in Leather.*—JAMES S. ALEXANDER, Pittsburg, Pa. Application filed March 5, 1873.

Claim.—A combined tool, consisting of a bit, *a*, and knife *e*, fitted with a handle, *f*, having an awl, *g*, the whole combined and arranged substantially as described and shown.

140,337.—*Compression-Cock.*—EDMUND ALLT, New York, N. Y. Application filed September 2, 1872.

Claim.—The combination of the shell A of the cock and its cap B with the soft-metal washer G and packing *s* contained in said washer, substantially as and for the purpose set forth.

140,338.—*Trunk-Fastener.*—JOHN ARNOLD, Newark, N. J.* Application filed June 2, 1873.

Claim.—1. The revolving lock-shaft C provided with the segmental projection *d*, operating in a recess on the inside of the casing A, as and for the purpose set forth.

2. In combination with the shaft C, constructed as described, the hasp B and casing A, all constructed and arranged as and for the purpose set forth.

140,339.—*Car-Wheel.*—ANSON ATWOOD, Brooklyn, N. Y., assignor of one-half his right to ISRAEL D. CONDIT, Millburn, N. J. Application filed June 10, 1872.

The body of the wheel is formed with alternate convex and concave projections and cavities. The tire is formed with its inner surface concave. Between the body and tire is interposed rubber on the convex surface of the body, and oakum within the concavities.

Claim.—1. The body of a car-wheel, its rim having alternate convex and concave sections, in combination with a tire having a concave inner surface.

2. The wheel when packed with rubber and oakum or other fibrous material in the alternate cavities between the tire and the body of the wheel, as herein described, and for the purposes herein set forth.

3. The combination of the tire A having a concave inner surface with the rim C having concave cavities and convex projections, by means of the packing, substantially as described, and for the purpose set forth.

140,340.—*Electrical Anemometer.*—FRANK S. BALDWIN, St. Louis, Mo. Application filed April 21, 1873.

Two wipers, connected with the wind-vane and insulated on opposite sides, are so arranged in connection with two insulated metallic circles, having projecting points, that when the vane moves in one direction metallic contact is made with only one set of points, and when in the opposite direction with only the other set. These contact-points being in circuit connection with electro-magnets, a swinging frame is caused to press against a clock-revolving cylinder or fillet at each contact, and thus print a record of the direction of the wind at such times.

Claim.—1. In combination with the indicating-arm A^2 of the wind-vane, the metallic plates *a a'* insulated on one side, constructed and arranged to form electrical contact as the arm moves in one direction, but not when it moves in the opposite direction, substantially as and for the purpose set forth.

2. In combination with the dial B of the wind-vane, the metallic circles *b* b^1, having projecting points b^2 b^2, for operating with the moving plates *a a'*, substantially as and for the purpose set forth.

3. The moving plates *a a'* and projecting points b^2 b^2, respectively connected by circuit-wires with the magnets I I', and their armature clutch-lever G^1, substantially as and for the purpose set forth.

4. The combination of a type-wheel, *d'*, lantern-wheel E, roller e^3, arm F, spring *f*, and swinging frame D with the clutch-lever G^1 and electro-magnets I I', for printing on the recording-cylinder C^1, substantially as and for the purpose set forth.

5. The swinging frame D and its type devices, as described, armature N, in combination with magnet K and its circuit connections, as and for the purpose set forth.

6. The magnet K, binding-screw M, vibrating lever L, in combination with rock-shaft G, as and for the purpose set forth.

7. The arrangement of the swinging frame D and its type devices, armature N, magnet K, lever L, binding-screw M, in combination with either circuits formed by the magnets I I', substantially as shown and described.

140,341.—*Apparatus for Steaming Hats.*—CHARLES W. BANTA, Orange, N. J. Application filed March 15, 1873.

The hats are supported upon a perforated shelf in a chamber, into which steam is admitted from a combined generating and superheating boiler. A circulation of water is kept up through the water-back by means of the water therein, when heated, being discharged into the steaming-chamber, from which the cooler water is conducted to the water-back.

Claim.—1. The system of pipes arranged in the described relation, consisting of the water-circulating pipes a^1 and a^2, and the steam-pipe E, in combination with a boiler, and with a steaming-chamber provided with perforated shelves for the purpose of subjecting hats or other objects to a bath of dry steam.

2. The boiler or water-back *a*, the described system of pipes, and the steaming-chamber, in combination with the water-gage b^2, substantially as and for the purpose set forth.

3. The boiler, the described system of pipes, the steaming-chamber, and the water-gage, in combination with the surface-pipe cock *c*, substantially as set forth.

140,342.—*Bag-Machine.*—NICHOLAS BIEDINGER, Cincinnati, Ohio. Application filed June 9, 1873.

The bag-tube is fed by an apron and projected between two drawing-rolls, which, moving in opposite directions, slip the upper ply back upon the lower ply, when the knives sever the two, leaving one end, as the feed takes place, projecting beyond the other.

Claim.—The described arrangement of two oppositely-rotating drawing-rollers, D E, between the delivery end of the apron A and the severing-knife K, said rollers having the coacting pads or protuberances F F', substantially as and for the purpose set forth.

140,343.—*Brick-Kiln.*—DANIEL BLOCHER, Baltimore, assignor of one-half his right to JONATHAN H. SEYMOUR, Hagerstown, Md. Application filed December 18, 1871.

Through the orifices H a poker may be inserted to agitate the burning fuel.

Claim.—1. A brick-kiln having a fire-place, I, constructed at the ends of the arches, said fire-place having grated fronts, all being constructed and arranged substantially as and for the purpose set forth.

2. In combination with fire-places in the arch of a brick-kiln, constructed as described, the holes or openings H, arranged as and for the purpose set forth.

3. In combination with the fire-places in the arch of a brick-kiln, as herein described, the protecting hoods G, arranged to operate as and for the purpose set forth.

140,344.—*Clothes-Wringer.*—WILLARD P. BROOKS and JOHN D. HARTZELL, Ozawkie, Kans. Application filed October 25, 1872.

The standards of the wringer are constructed to fit on a washing-machine and have the legs or clamps wide apart. Between the standards are the rollers, and on the shafts between the standards are spools and elastic bands. On each side of the rollers are boards with openings, serving to guide the clothes to the rollers.

Claim.—In a clothes-wringer, the combination and arrangement of the frame H, holding-legs F, rollers J K, spools M, bands L, and guide-board O, as shown and described.

140,345.—*Oil-Tool Extractor.*—SAMUEL BUCKLEY and PERLEY H. LAWRENCE, Lawrenceburg, Pa. Application filed March 5, 1873.

The rotating piston-stem of a hydraulic pump has attached to it a die or grapple, which is operated in unscrewing the joints of the tools in an oil-well.

Claim.—1. In an oil-tool extractor the rotating piston-stem of a hydraulic pump, in combination with a die or grapple affixed thereto, so as to be operated thereby in unscrewing the joints of the tools, substantially as set forth.

2. As a means for making connection with the tools in the well, the combination of the rotating piston-stem D^2 and a threaded screw-die, A, affixed thereto, substantially as set forth.

3. The rotating piston-stem D^2 with one or more wings, *d'*, in combination with the barrel D, with a corresponding number of wings, *d*, relatively arranged and operative under fluid pressure, substantially as set forth.

4. A port or ports leading from the pumping-chamber b^2, and entering the piston-chamber between two piston-wings, one of which wings shall be on a stem, and the other on the barrel, and one of which is capable of a rotary movement under the pressure so imparted, substantially as set forth.

5. In combination with the port or ports *e'*, entering the piston-chamber between two adjacent faces of the piston-wings, the port or ports *e* entering the same chamber between the other two or opposite faces of the same wings, substantially as set forth.

6. A series of spikes or projections of any known form forced outwardly against the walls of the well by water-pressure, substantially as set forth.

7. A series of spikes or projections capable of being forced out intermittently against the walls of the well, in combination with a hydraulic apparatus arranged to rotate a screw-cutting die or grapple, while the pump itself is, by means of the spikes or projections, secured against rotating, substantially as set forth.

8. The combination of pump, spikes, or projections, and rotating piston-case D, whereby, with the upward stroke of the plunger, the spikes will lose their hold on the walls of the well, and the pump and piston-case be free to rotate back, while the die A or grapple retains its hold on the tool or part of a tool below, substantially as set forth.

140,346.—*Cap or Cover for Bottles.*—JAMES G. CHILLINGWORTH, London, England. Application filed April 4, 1873.

To allow of the tin-foil used to seal bottles being removed with ease from the corks, the latter are first covered with clean tin-foil and then dipped in wax. By giving the wax a twist the whole covering can be removed.

Claim.—A cap or covering for the corks of bottles, consisting of tin-foil and wax or composition, applied in the manner and for the purpose specified.

140,347.—*Drop-Light for Chandeliers.*—ROBERT CORNELIUS, Philadelphia, Pa. Application filed March 11, 1873.

Within a box upon the end of the supply-pipe is placed a rigid collar perforated to receive the fluted sliding pipe. A disk, similarly perforated, is placed below the collar, and is governed by a coiled spring. The sliding pipe is, by combined action of spring, disk, and collar, clamped in place. By turning sliding pipe against the action of spring, it may be moved up or down.

Claim.—The combination, in a chandelier, of the sliding pipe C, the spring I, the friction-collar G, and disk E, arranged, combined, and operated substantially as hereinbefore set forth.

140,348.—*Drop-Light for Chandeliers.*—ROBERT CORNELIUS, Philadelphia, Pa. Application filed April 1, 1873.

Upon the end of the main pipe is a core-box containing a screw-threaded conical core. Inside this core a divided nut is operated by the polygonal sliding pipe in such manner that, by turning in one direction, the pipe is unclamped and may be slid to required elevation, and the reverse motion will firmly clamp the pipe in place.

Claim.—The combination and arrangement, in a chandelier, of the pipe E, the sliding pipe B, the collar D, the cone-bed box C, and the cap G, formed, combined, and operating for the purposes and in the manner hereinbefore substantially set forth.

140,349.—*Railroad-Car Brake.*—GEORGE W. CROWE, Cincinnati, Ohio. Application filed September 11, 1872.

To a bar which is pivoted to the beam of the truck the brake-levers are pivoted. Power being applied to one of the brake-shoes, the same is forced against the wheel, and the latter tends to carry the shoe in the direction of its revolution, which raises the shoe and depresses the brake-shoe, which is pivoted to the opposite end of the lever.

Claim.—In combination with post B, cords or chains *c c'*, lever C, and brakes G G', the pivoted levers H H', and auxiliary brakes I I' J J', arranged to operate substantially as and for the purpose specified.

140,350.—*Funnel.*—WILLIAM B. CROWTHER, Philadelphia, Pa. Application filed April 22, 1873.

Two funnels, one placed within the other, are united by a curved flange projecting outwardly from the inner funnel so as to leave a continuous air-space between the two. At the upper end of the inner funnel are arranged inwardly-projecting nozzles, from which is discharged any liquid that may be forced up through the air-passages.

Claim.—The improved funnel herein described, composed of cups *a* a^2 and tubes *b* b^2, united by a curved marginal flange, *g*, on the inner cup, embracing the upper edge of the outer cup, the inner cup being further provided with inwardly-projecting vents *s f*, (one or more,) for the purpose set forth.

140,351.—*Shifting Top for Buggies.*—ROBERT C. DUHL, Scott township, Columbia county, Pa. Application filed May 22, 1873.

The shifting seat, which is designed to support the top, fits into a recess in the permanent seat, and can be removed at pleasure.

Claim.—The movable or shifting seat A, having false bottom *a a*, bolts *b b b*, or equivalents, in combination with permanent seat B, the whole constructed to operate substantially as and for the purpose set forth.

140,352.—*Fire-Proof Tile-Floor.*—WEAR L. DRAKE, Evanston, Ill. Application filed December 3, 1872.

The hollow tiles meet above and below the supporting-beam, and at the same time leave an air-space to protect the metallic girder from the heat. A tension-rod ties the chord of the arch and resists thrust.

Claim.—1. The hollow tiles A, so constructed as to form an air-chamber, *b*, inclosing the upper and lower edges, or either of them, of the joists B, substantially as and for the purposes described.

2. The arrangement of the hollow tiles A, constructed as described, with the joists B, and tension-rods C, substantially as set forth.

140,353.—*Cultivator.*—REUBEN ELLWOOD and RICHARD L. PITCHER, Sycamore, Ill. Application filed December 7, 1872.

A frame converging forward is attached to the axle of a pair of carrying-wheels. On each side descends a sleeve holding a rod rigidly fixed to the front end of each drag-bar. To the top of each rod a horizontal cross-bar is fixed, having a slotted plate on its rear end. The plate of each drag-bar can be connected by a lateral rod or be disconnected for independent adjustment. The drag-bars are raised by chains and levers pivoted on segmental racks, between the teeth of which a pin on the lever is held by a spring. The chains are attached not directly to the drag-bars, but to horizontal arms pivoted at their rear ends thereto.

Claim.—1. The combination and arrangement of the beams G, rods N, and brackets M with the arms *a*, provided with the slot or holes *c* and rod *d*, substantially as and for the purposes specified.

2. The combination and arrangement of the beams G, rods N, brackets M, with the arms *a*, rod *d*, and locking device *e f*, substantially as described.

3. The swing-bar K, in combination with a beam, G, and chains L, substantially as specified.

4. The combination of the rack with the bracket A by spring *i* and pin *j* of the lever, constructed and operating substantially as described.

5. The foot-rest I, when provided with projections above and below the plow-beam, in combination with the clamp *n*, so that it can be both vertically and laterally adjusted, substantially as described.

140,354.—*Reservoir Cooking-Stove.*—ANDREW B. FALES, Troy, and HILAN SEABURY, Albany, N. Y.; said SEABURY assignor to said FALES. Application filed April 3, 1873.

The boiler has an indentation in its lower front side, and this is adapted to coincide with the opening in the rear stove plate. A damper journaled in the middle flue-plates can direct the draft down to the said opening into the chamber formed by said indentation, and thence to the exit-pipe, or cause the smoke, &c., to pass through the usual stove-flues out of contact with the boiler.

Claim.—The boiler-receptacle F herein described, one side of which forms a portion of the rear wall of the stove, and having a depression or draft-passage, I, for the oscillation of the damper G, in combination with each other and with the flues C C and D, all constructed and arranged substantially as described, for the purpose specified.

140,355.—*Machinery for Making Plow-Handles.*—ARTHUR B. FARQUHAR, York, Pa. Application filed March 7, 1873.

The material from which the handles are to be made is secured to a sliding carriage and passed between suitable guides over rotating cutters, which give the desired form to the handle.

Claim.—1. A form or holder having self-adjusting spring-guides F F and clamp D, when constructed and operated substantially as and for the purpose set forth.

2. The combination of the form or holder A A with the table I, having cleats M M and self-adjusting guide-springs H H, when constructed and operating substantially as and for the purpose set forth.

3. The combination of the form A A, the table I, and the cutter-heads J J, when all constructed and operated substantially as and for the purpose set forth.

140,356.—*Ironing-Table.*—JACOB FRANKENFIELD and WILLIAM E. KICHLINE, Bethlehem, Pa. Application filed February 13, 1873.

An ironing-board arranged upon a pair of legs at one end, with a brace or support leading from them with a foot, and an adjustable brace or support leading from the other end of it, and held in connection with the legs by a notch in a cross-piece, by which the two legs are supported, and the parts sustained by a cord from them to the supporting-braces.

Claim.—The combination of the board A, legs B B, oblique supports C C, and brace or braces D D, substantially as herein specified.

140,357.—*Guide and Core-Barrel for Revolving Rock-Drills.*—GIDEON FREDERICK, Pottsville, Pa. Application filed May 26, 1873.

A tubular guide and core-barrel for a revolving rock-drill, the outer surface of which guide is grooved and armed with diamonds or other hard substances.

Claim.—1. The above-described revolving rock-drill guide and core-barrel, forming a part of the drill-rod, and constructed with external grooves, substantially as and for the purpose set forth.

2. The above-described revolving rock-drill guide and core-barrel, whose outer surface is armed with diamonds, substantially as and for the purpose set forth.

140,358.—*Toy Money-Box.*—RUSSELL FRISBIE, Cromwell, Conn., assignor to the J. and E. STEVENS COMPANY, same place. Application filed March 31, 1873.

The front and back are provided with knobs which fit into a socket in the roof. When thus fitted, drawing the two bases toward each other locks the roof in place.

Claim.—1. The latches or hooks *c d* attached to the sides *a b*, for the purpose of holding on the roof, substantially in the manner herein described.

2. The roof and sides, constructed as described, in three pieces, *a b c*, and secured by one screw, substantially as herein specified.

3. The combination of the socket *g*, the recess *i*, and the screw *h* with the sides *a* and *b*, substantially as herein described.

140,359.—*Step-Ladder.*—CHARLES FRIZELL, Boston, Mass. Application filed April 10, 1873.

The sides of the ladder are made in two parts, which are connected at intervals by short bars or rungs, from which extend diagonal braces supporting the steps.

Claim.—1. The sides A, when constructed with bars *a a* and tie-rods *b*, substantially as and for the purposes specified.

2. The combination and arrangement of tie-rods *b*, braces *d*, and steps *c*, substantially in manner as and for the purposes specified.

140,360.—*Smoking-Tube.*—AUGUST GEDIES, New York, N. Y. Application filed March 28, 1873.

A plug, having an elastic ring for inserting in the mouth-piece and for receiving the outer shell, has a recess for receiving a cigar and a bearing for receiving a case into which tobacco may be placed for smoking. The outer end of the exterior case is perforated to admit air. The case is also pierced near its rear end for the same purpose.

Claim.—The combination, with the mouth-piece B, of the plug A, having chamber *a* and elastic ring *n*, smoking-tube C, and casing D, with ventilating-holes *v* and *s s*, substantially as and for the purposes herein set forth.

140,361.—*Stirrer for Maple-Sugar.*—FURMAN B. GRAVES, Cortlandville, N. Y. Application filed March 8, 1873.

Claim.—The combination of the removable shaft *j* with the stirrers *k k* and the pail or tub *d*, when placed in a portable frame, substantially as and for the purpose above described.

140,362.—*Sewing-Machine Table and Chair Combined.*—LAURENCE N. B. GRAY, Boston, Mass., assignor of one-half his right to EDWD. B PAUL, same place, and DEXTER A. REED, New York, N. Y. Application filed May 19, 1873.

The seat has four curved legs, the same being hinged thereto. The front ones are connected to the treadle-shaft by a pin or bolt. The height of the seat is adjusted, by means of a curved notched bar which is attached to the round of the front pair of legs and engages with the round of the back pair. The back is made so as to fold over the seat, and the whole chair can be folded closely under the table when not required.

Claim.—In combination with a sewing-machine top, A, cross-piece C, and treadle-shaft D, the folding-chair, composed of curved legs E E' and F F', pivoted to the seat G and connected together by rounds N and M, curved arm L provided with notches P P P, the seat G being raised or lowered and held in position by said arm L, the hinged folding back H, spring I, and set-screw J, when constructed and arranged to operate in the manner described, as and for the purposes set forth.

140,363.—*Chair and Step-Ladder Combined.*—BENJAMIN F. GREEN, Syracuse, N. Y. Application filed June 6, 1873.

The ordinary chair and step-ladder has a spring-clamp and dowels with serrated plugs to prevent the ladder from slipping.

Claim.—The apex spring-clamp *d e*, dowels *i j*, and serrated plugs *k*, as herein shown and described, in combination with the hinged sections A *a* B *b* of the chair and ladder, as and for the purpose specified.

140,364.—*Barrel-Transporter.*—JAMES GRIFFING, Ipswich, Mass. Application filed June 12, 1873.

Two curved metallic bars hinged together at one end and provided with handles embrace the barrel below its middle, and fastened by a hasp and latching-stud to admit of the barrel being easily raised upward or moved from place to place.

Claim.—The barrel-transporters, substantially as described, consisting of the curved and hinged jaws A B, the handles C C, the connection-hasp D, and the latching-stud E, all arranged and combined essentially as specified.

140,365.—*Cotton-Gin.*—BENJAMIN D. GULLETT, Amite City, La. Application filed April 14, 1873.

A series of blades are arranged edgewise beneath the revolving brush, in lines parallel to the axis of said brush, and in a manner to form a space which converges to and diverges from the middle blade.

Claim.—The arrangement of blades *g*, or their equivalent, with relation to the revolving brush of a saw-gin, substantially as described, for the purpose set forth.

140,366.—*Roofing Composition.*—WILLIAM H. HAIGHT and THOMAS S. GLADDING, Leavenworth, Kan. Application filed March 18, 1873.

Candle-tar, thirty gallons; rubber solution, five gallons; glycerine, four gallons; water-cement, twenty-five pounds. Mix over a slow fire.

Claim.—A compound composed of the ingredients, and substantially in the proportions and for the purposes above set forth.

140,367.—*Rotary Fluid-Motor.*—HENRY Q. HAWLEY, Albany, N. Y. Application filed March 7, 1873.

The loose shouldered pistons are placed in shouldered piston-chambers, which communicate with each other at their inner ends by a groove, and at their outer ends are provided with loose metallic packings. The actuating fluid has free access to these chambers, and presses the packings outward to the case and the pistons themselves back from the case. The ends of the wheel are provided with grooves in which is loose metallic packing, which is kept in position by the actuating fluid entering the groove behind the packing through apertures in the face of the wheel.

Claim.—1. In a rotary fluid-motor, an inner wheel carrying pistons in separate chambers communicating with each other, but not with the passage containing the actuating fluid, when said wheel revolves concentrically with a portion of the periphery of the case and eccentrically with the remainder, substantially as and for the purpose described.

2. The loose shouldered pistons P and the shouldered chambers S operating together, in combination with an exterior case, substantially as and for the purpose described.

3. The pistons P constructed with chambers and loose packing, as described, when combined with an inner wheel, operating substantially as and for the purpose set forth.

4. The combination of the grooved case A with the eccentric wheel W carrying the loose pistons P, said wheel and pistons having chambers, shoulders, and pins, substantially as described.

140,368.—*Side-Stick for Printers' Galleys.*—ROBERT B. HINDLE, St. Louis, Mo. Application filed November 29, 1872.

The side bars are linked together at their ends so as to move freely, and are sustained a proper distance apart by two dogs pivoted to one bar and engaging in a rack upon the other.

Claim.—The combination of the side-bars A A', pivoted arms *a a'*, swinging arms B B', rack C, grooves *b b'*, all arranged to form an improved side-stick, substantially as set forth.

140,369.—*Book-Support.*—ROBERT B. HINDLE, St. Louis, Mo. Application filed November 29, 1872.

Two bars linked together at their ends are adjusted the proper distance apart by two dogs pivoted to one, and, engaging a rack on the other, support the book. The upper bar carries a clamping device, which slides in a guide-slot therein.

Claim.—An improved book support and holder consisting of the combination of upright E, slide *s*, swinging arm F, set-screw G, swivel-foot *g*, supporting-bar B, grooves s^1 s^2, pivoted arms *a a'*, rack D, swinging arms C, and standard A, all constructed to operate as and for the purpose set forth.

140,370.—*Boring-Bit.*—STEPHEN HIPKINS, Jr., South Wheeling, W. Va., assignor of one-half his right to RALPH HEATHERINGTON, same place. Application filed January 8, 1873.

The main cutters B have secondary cutters D arranged on their edges; the central cutter C has the secondary cutters on opposite edges.

Claim.—1. In a boring-bit, the adjustable supplemental or clearing cutters D, in combination with the main cutters B, for the purpose described.

2. In a boring-bit, the combination of the main cutters B and the bit-shank, consisting of the parallel straight-holding ridges *a*, with the discharging spiral ribs *b*, and grooves *c d*, constructed as and for the purposes described.

3. In a boring-bit, having the main cutters arranged upon its shank, as described, the center projecting cutter *e*, having adjustable supplemental or clearing cutters D arranged upon its opposite faces, and to project from its opposite edges, as described.

4. The combination, in a boring-bit, of the straight and spiral ribs *a b*, grooves *c d*, main cutters B, the center cutter *e*, and the adjustable clearing cutters D and holders E, the several parts being constructed and arranged for operation as described.

140,371.—*Spike-Extractor.*—AMBROSE F. JACKSON, Minneapolis, Minn. Application filed January 25, 1873.

The lever B has two fulcrum-points, *a a'*, which bear, respectively, on pins *a* and *a'* in the standard A.

Claim.—The spike-puller, consisting of the block A having two fulcrums, *a a'*, and the lever B recessed at its end to form jaws, and provided with the guide-slot *z*, the ends of which, *z'* and *z''*, form seats for said fulcrums, substantially as specified.

140,372.—*Tassel.*—GEORGE E. JENKINS, Philadelphia, Pa., assignor to OGDEN, MILSTED & Co., same place. Application filed May 14, 1873.

The blocks forming the tassel are fitted closely to the metallic stem, and are confined thereon by the adjustable fastening. The curtain-cord is attached at the eye.

Claim.—The single metallic stem or bar F with its eye or opening *f'*, and adjustable removable fastening at *f''*, in combination with a series of separate blocks having central bores respectively to correspond in diameters with the diameter of the said stem or bar, substantially as and for the purpose hereinbefore set forth and described.

140,373.—*Shirt-Bosom Supporter.*—GEORGE F. JOHNSON, Philadelphia, Pa., assignor of two-thirds his right to WASHINGTON G. WALTER and D. W. J. HUTTON, same place. Application filed May 3, 1873.

Frame for supporting a shirt-bosom.

Claim.—The frame A, consisting of the vertical side pieces B B, the horizontal piece D, and horizontal neck-piece E, in combination with the central strip or strips C C and horizontal piece or pieces D' D', substantially as and for the purpose set forth.

140,374.—*Hose-Coupling.*—JOSIAH W. KENNEDY, St. Louis, Mo. Application filed April 3, 1873.

An internally screw-threaded sleeve is slipped over the hose and a friction-ring after it. An internal tube having a raised rim is then inserted in the hose and the other ring introduced between the sleeve and hose; the sleeve is then screwed tightly onto the screw-nut.

Claim.—1. The internal tube-section S, having a raised rim on its outer surface, in combination with the sleeve K and screw-threaded nut or rim D, as and for the purpose set forth.

2. The combination and arrangement of the internal tube-section S, having a raised rim on its outer surface, with the sleeve K, screw-threaded rim D, and friction rings B and C, as and for the purpose set forth.

140,375.—*Apparatus for Cooling Air.*—THOMAS D. KINGAN, Indianapolis, Ind. Application filed June 18, 1873.

Several boxes containing ice and salt are connected with each other by tubes; and a pump draws the brine from a box at one end of the series and forces it up into a box at the other end, causing a continuous circulation for equalizing the temperature.

Claim.—The combination of the pump *d*, the tubes *c' c* and *e' e*, and the tubes *b* and *b*, with the refrigerators *a*, *a*, and *a*, for the purpose and in the way substantially as set forth.

140,376.—*Card-Grinding Machine.*—THOMAS C. KIRKHAM, Ancaster, Canada. Application filed March 22, 1873.

The traversing grinding-wheel is capable of adjustment to varying lengths of card.

Claim.—1. The slotted bar L, carrying the shift *m* for adjusting the belt I to varying lengths for the purpose of regulating the travel of the grinding-wheel, substantially as shown and described.

2. The arrangement of the adjustable collars D D in combination with the shaft A and movable boxes *c c*, to which the traversing motion is attached, substantially as and for the purpose specified.

140,377.—*Lock for Doors, &c.*—THEODORE KROMER, Freiburg, Grand Duchy of Baden. Application filed April 17, 1873.

The bolt is held in the locked position by a hinged latch, the free end of which engages with a projecting spring-pin arranged in the bolt. The latch is provided with a tongue that enters the true notches in a series of sliding pins, when properly adjusted, and releases the bolt. The outer ends of the notched sliding pins are made conical, so as to fit into corresponding recesses in the pins of the push-key.

Claim.—1. The notched or grooved sliding pins *a*, with tapering or conical ends a^1, operating in combination with the key *c*, with pins c^1 having conical or tapering recesses, substantially as and for the purposes hereinbefore described.

2. The spring-pins *d* operating in combination with the sliding pins *a*, substantially as and for the purposes hereinbefore described.

3. The sliding bolt *f* with spring-stud f^1, and stud or projection f^2, operating in combination with the hinged latch *e* with inclined face e^2, substantially as and for the purposes hereinbefore described.

4. The spring *h*, operating in combination with the sliding bolt *f*, spring-stud f^1, and hinged latch *e*, substantially as and for the purposes hereinbefore described.

140,378.—*Rotary Steam-Engine.*—JOHN LEAVER and JOHN WOOK, Canal Fulton, Ohio. Application filed April 26, 1873.

The revolving cylinder is provided with removable concave-faced piston-blades in its rim, and combined with a case on which is a steam-chest divided by a partition, to make the engine reversible.

Claim.—The combination, with a cylinder having a steam-chest thereon, of a concentric piston-wheel having removable piston-blades, with concave faces secured to the rim thereof, the several parts being constructed and arranged substantially as and for the purpose specified.

140,379.—*Combined Shirt-Bosom Support and Shoulder-Brace.*—SAMUEL F. LONG, Cleveland, Ohio. Application filed May 16, 1873.

A combined shoulder-brace, shirt-bosom support, and chest-protector.

Claim.—The springs C D and E and A B, as arranged, in combination with the covering *f* and elastic straps F, G, and H, substantially as and for the purpose set forth.

140,380.—*Washing-Machine.*—SAMUEL MARTIN, Parshallville, Mich. Application filed March 14, 1873.

Is constructed with a bed of rolls working on friction-wheels within a box of ordinary form, having a stop to limit its action, which move in connection with a corrugated cylinder, the journals of which pass through each side of the box into sliding uprights connected with springs below its bottom, by which the tension is governed, the slides having a cross-bar on which the springs rest.

Claim.—The arrangement of the movable bed of rolls H H and I I, with its stop N, in combination with the corrugated cylinder, the journals of which pass through the sides of the box, and connect with the sliding uprights K, supported in brackets connected by the cross-piece O, which sustains the springs V, to give tension to the cylinder E, as shown and described.

140,381.—*Reed-Organ Stop-Action.*—ISAAC T. PACKARD, Fort Wayne, Ind. Application filed March 31, 1873.

Draw-stop action, consisting principally of a lever, to fully open one stop, and at the same time to only open the other a very little.

Claim.—In combination with the stop-valves *a* and *b*, the sliding bar A provided with the cams D and E and the pin *c*, constructed and arranged substantially as and for the purpose described.

140,382.—*Thill-Coupling.*—ALEXANDER J. PATTERSON, Genesee, assignor of one-half his right to EMERY W. OSBORNE, Rochester, N. Y. Application filed April 23, 1873.

The clip-bolt is conical, as is also the thill eye, that wear may be compensated for. Between the thill-eye and the nut is a follower, and the coupling is tightened by the nut being screwed against the follower and on the clip-bolt, suitable packing being interposed.

Claim.—The coupling-head E, having conical pin *a*, thill-eye D, packings *d d*, follower G, jam-nut H, and stay-pin *h*, combined and arranged to operate in the manner and for the purpose specified.

140,383.—*Process for Preparing Iron Chips, &c., for Re-Melting.*—ARIEL PEVEY, Portland, Me. Application filed June 28, 1872.

Iron chips, &c., are moistened in a solution of lime-water and beer-returns and pressed into a core-box, provided with radial ribs upon its bottom and sides, until the same is full, when the core is removed from the box and allowed to dry, after which it is placed into a mold and melted iron poured upon it, which enters the grooves formed by the ribs upon the core-box, and thereby incloses the core in a cast iron netting or basket.

Claim.—1. The method herein described of forming a core or block of iron chips, scraps, or other small pieces or particles of iron, for the purpose herein set forth.

2. The method herein described of forming a core or block of iron chips, scraps, or other small pieces or particles of iron by wetting said pieces or particles of iron with a solution of lime in water, and then pressing said pieces or particles into molds, for the purpose herein described.

3. The method of uniting pieces or particles of iron into a core, cake, or block, by wetting said pieces or particles of iron with a liquid solution of lime, and then pressing them together, as and for the purpose herein described.

140,384.—*Harness-Pad.*—MARTIN W. POND, Elyria, Ohio.—Case A. Application filed December 2, 1872.

The yoke is hinged in its center and rigidly connected to the pad.

Claim.—1. In combination with a jointed yoke and separate fulcrum-pads, as described, the ends F provided with angular projections *b*, in the manner and to obtain the advantages herein stated.

2. The harness-tree having the yoke A' A' rigidly connected to the pad-plates *a*, independent lever-pads B B', the central hinge or joint A, and the set or cut back of the yoke, the several parts being constructed and arranged for use as described.

140,385.—*Harness-Pad.*—MARTIN W. POND, Elyria, Ohio.—Case B. Application filed December 2, 1872.

A center-cap to connect the tree secured by a staple, which serves as a loop for the back-strap and likewise forms the hinged joint. The tree-plates are concaved to adapt themselves to the pad. The upper flanges of the tree-plate have turned-over lips at its lower ends to hold the back-band in proper position.

Claim.—1. The center cap and flanged plates A F, secured and held in position by the staple D, which forms the pad-joints, and the loop E for the back-strap, as described.

2. The flanged pad-plates F, having a concave form in their cross-section, as and for the purpose described.

3. The turned-over lips F' of the flanged plates F, as and for the purpose described.

4. The coach harness-pad having the jointed flanged cap A, flanged concave pad-plates F with turned lips F', and the back-band in two separate and distinct sections B B', the several parts being constructed and arranged for use with a double fulcrum-pad, C C, substantially as described.

140,386.—*Log-Turner.*—ISAAC W. POOL, Eau Claire, Wis. Application filed April 19, 1873.

A chain, to which motion is given by a system of gearing, is provided with teeth and placed upon an oscillating frame, by which it is brought in contact with the log to be moved, through the agency of a lever and pair of segmental gears.

Claim.—1. The spurred chain C, applied to a log mover and turner, B, which is applied loosely on a shaft, *g*, in combination with wheels *c c'*, substantially as described.

2. The toothed segment *b* on the vibrating log mover and turner B, in combination with the toothed segment *h* on the shaft *i* of lever F, substantially as described.

140,387.—*Bed-Bottom.*—EDMUND W. QUINCY, Peoria, Ill. Application filed February 5, 1873.

A frame is formed by attaching the outside slats permanently to the cross-bar. Upon the cross-bar are blocks between which the slats are held. Underneath the whole are four India-rubber cylinders, clamped to the cross-bar by metallic straps.

Claim.—The construction and arrangement of the frame A A B B, slats B B, &c., blocks a a, &c., straps b b b b, &c., and rubber cylinders C C, &c., at corner of the frame, as described.

140,388.—*Pruning-Shears.*—JOHN G. ROGERS, Berrien county, assignor of one-half his right to S. S. WHITE, Michigan City, Mich. Application filed May 13, 1873.

These shears are operated by a hand-lever pivoted at one end to the long shank or pole upon which the shears are mounted. The pendent link which connects this hand-lever to the shear-blade is adjustable vertically, so as to allow a greater spread of the shears to grasp a large limb.

Claim.—The above-described pruning-shears, consisting of the blade A with its hook B, blade C with its elbow-shaped shank D, adjustable connecting-bar E with notches a a a, and forked lever F, as and for the purposes hereinbefore set forth.

140,389.—*Device for Attaching Hubs to Axles.*—OSCAR F. SHEPARD, Cincinnati, Ohio. Application filed September 25, 1872.

A detachable collar is screwed upon the axle against a fixed collar, and a cap which clasps the collar is screwed upon a band on the inner end of the hub.

Claim.—The combination of the axle A B C having a screw-thread at b, detachable collar c, hub D having the band e, and cap E, substantially as and for the purpose specified.

140,390.—*Process of Hardening Edge Tools.*—LEVERETT W. STUART, Hawley, Pa., assignor to GUSTAVUS AMES, Rochester, N. Y. Application filed June 27, 1872.

Claim.—The process of hardening edge tools, by applying an edge thereof under pressure against a revolving smooth-faced metallic wheel, as described.

140,391.—*Treating Offal and Manufacturing Gas.*—JAMES TURNER, Chicago, Ill. Application filed December 27, 1872.

The gas and vapors from the rendering-tank are passed through a condenser, the waters allowed to escape, and the gas carbureted by passing through a hydrocarbon.

Claim.—The mode herein described of suppressing the offensive odors arising from rendering animal substances and utilizing the gases therefrom, by separating the gases from the moisture and carbureting the same, substantially as specified.

140,392.—*Extension-Table.*—WILHELM VALENTIN, New York, N. Y. Application filed June 5, 1873.

The extension-leaves are hinged together, and one of them is pivoted to the frame of the table. When not in use they are swung under the closed table-top. When the table is extended the leaves are turned over on the pivots and unfolded; then the leaves are flush with the stationary top. The leaves extend longitudinally on the table, and the width of the two leaves corresponds with the width of the table.

Claim.—In combination with the frame A and sliding leaves B B, the extension-leaves F G, hinged together and supported on pivots n n, attached to one of the leaves, and turning in cross-bars E E fast to the frame A, substantially as and for the purpose set forth.

140,393.—*Platform for Stoves.*—WILLIAM WESTLAKE, Chicago, Ill. Application filed August 16, 1872.

An improvement on a former patent to same inventor. The upper edge of the platform has a bead spun over a wire.

Claim.—The platform for stoves herein described, consisting of the interior A covered by the two pieces of metal a b, and having its upper edge protected from injury, substantially as and for the purpose set forth.

140,394.—*Joiner's Work-Bench.*—HENRY WHITE, Chicago, Ill. Application filed January 16, 1872.

The standards for the support of the top are framed together at each end, as at A. The top is made with side pieces E and under battens F F, to rest on and around the standards, to which they are fastened by buttons N at the ends.

Claim.—1. The standards A, when constructed in the manner and for the purposes set forth.

2. The top D, in combination with the standards A, when used in the manner and for the purpose set forth.

3. The pins H and buttons N, in combination with the standards A and top D, when constructed in the manner specified, and for the purposes set forth.

140,395.—*Mallet.*—SILAS M. WILLIS, Athol, Mass. Application filed March 15, 1873.

The face has a skin of rawhide cemented to it.

Claim.—A mallet, A, with a skin of rawhide cemented to its face, substantially as set forth.

140,396.—*Combined Harvester and Thrasher.*—JAMES HAZEL ADAMSON, Auburn, Australia, assignor to WILLIAM TAYLOR and M. STUART TAYLOR, Alameda, Cal. Application filed May 14, 1872.

A combined harvester and thrasher has two concentric revolving conical screens capable of vertical adjustment, the inner of which screens has both spiral and radial vanes to act as elevators.

Claim.—1. The cone D, when constructed of two or more concentric perforated or gauze tubes, in combination with the conveying tube E, beaters F, and comb P, constructed and operated substantially as and for the purpose set forth.

2. The concave N with its series of lugs o o, in combination with the beaters F F with their corresponding slots, and the comb P, all constructed and arranged as described.

3. The comb P, having a slot between each alternate tooth extended, for the purpose of allowing the beaters to operate on the heads successively, as specified.

140,397.—*Blower for Gas-Engines.*—JOSEPH H. BEAN, Cincinnati, Ohio. Application filed April 21, 1873.

A continuous blast is produced by mounting two bellows upon the same base, their nozzles opening into a common air-chamber and provided with check-valves. Each bellows is operated by a cam-wheel acting on a spring attached to the upper board. A cam-block is placed behind the spring to enable the bellows to expand without a sudden shock. The spring actuates a lever attached to the inlet-valve stem, insuring the proper working of valve.

Claim.—1. In a blowing-machine of substantially the described construction, the combination of the cam-wheels, the spring, and the lever controlling the valve, substantially as described.

2. In a blowing-machine of substantially the described construction, the combination of the cam-wheels and regulating cam-block, substantially as described.

3. In a blowing-machine of substantially the described construction, the combination of cam-wheels, spring-lever controlling the valve, and cam-block, as described.

140,398.—*Wash-Boiler.*—ARP BECKER, Peotone, Ill. Application filed March 28, 1873.

A wash-boiler constructed with a detachable bottom resting upon projections formed upon the lower end of the conductors and supports at each corner, and having floating valves covering apertures to control the supply of water and steam. The conductors are arranged on the ends and sides of the boiler, with closed tops and perforated sides.

Claim.—The construction and arrangement of the false bottom C provided with the arched ribs b b b, the openings c c, the cages d d, the floats D D, and the channel-ways C', with relation to the tubes B in the boiler A, substantially as shown and set forth.

140,399.—*Saw-Filing Machine.*—WILLIAM B. BIZZELL, La Grange, N. C., assignor to himself and W. H. HARDEE, same place. Application filed April 26, 1873.

The file-holder is capable of fixed adjustment at any angle. The file moves in guides, and can be adjusted vertically for various lengths of teeth. The clamp is graduated lengthwise for regulating the movement of the file-holder.

Claim.—The clamp A, rule D, clamps E, set-screw F, guide-frame G, set-screw H, file-handle I, and adjustable screws L, in combination with each other, substantially as herein shown and described, and for the purpose set forth.

140,400.—*Nailing Boots and Shoes.*—LYMAN R. BLAKE, Brooklyn, N. Y., and ABA S. LIBBY, Lawrence, Mass. Application filed August 14, 1872.

Claim.—1. Nails, cut from wire of lenticular section, with the one-sided points, substantially as shown and described.

2. Soles and uppers of boots and shoes united by side-pointed nails, the form of which points causes them to upset or clinch as they strike the anvil-surface upon which the boot or shoe is supported.

3. Soles and uppers of boots and shoes united by means of side-pointed nails, the form of which points causes the nails to assume inclined positions as they enter the soles, substantially as described.

4. Soles and uppers of boots and shoes united by side-pointed nails, the nails being alternately pointed upon opposite sides, and being thereby caused to assume opposite inclinations as they enter the sole.

140,401.—*Water-Wheel.*—OLIVER J. BOLLINGER, York, Pa. Application filed May 24, 1873.

The lug of a pivoted or hinged gate of a water-wheel is made with a vertical hole to receive the stud, and a transverse hole to receive the wedge-key. The cross-headed stud is made with a transverse notch to receive the key for securing it detachably to the lug of the pivoted or hinged gate.

Claim.—1. The lug B of a pivoted or hinged gate of a water-wheel, made with a vertical hole to receive the stud, and a transverse hole to receive the wedge-key, substantially as herein shown and described.

2. The cross-headed stud C, made with a transverse notch to receive the key for securing it detachably to the lug B of the pivoted or hinged gate of a water-wheel, substantially as herein shown and described.

140,402.—*Toy.*—LAURANCE BRYAN, New York, N. Y. Application filed April 12, 1873.

A trundle-wheel has bearings in the end of a push-rod or handle. Upon the handle is secured a small bellows, in the top of which is a whistle operated by the alternate inflation and collapse of the bellows. A pitman connects bellows-handle and wheel.

Claim.—A mechanical toy whistle composed of the frame D, handle B, bellows E F, whistle C, wheel A, wrist-pin G, and connecting-rod H, as shown and described.

140,403.—*Harrows.*—ALEXANDER C. CARNES, Smithville, Tenn. Application filed November 11, 1871.

The side-pieces have the general form of sled-runners, and are provided with a series of oblique notches upon the lower edge, into which are fitted cross-beams, and to the beams are bolted flat spring-teeth, projecting rearwardly.

Claim.—The longitudinal timbers A having notch a', the inclined cross-timbers B, and the teeth C, combined substantially as and for the purpose described.

140,404.—*Vise.*—DANIEL S. COE, New Hartford, Conn., assignor to CHAPIN MACHINE COMPANY, same place. Application filed March 1, 1873.

The inner ends of the right and left screw-rods are supported by bearings in a yoke, which also holds and preserves the parallelism of the other moving parts.

Claim.—The combination of the yoke G with the bar C, the right screw D and the left screw F, substantially as herein shown and described.

140,405.—*Bolt and Rivet Cutter.*—DE LANCY D. CONN and PETER POLDER, Panama, N. Y. Application filed April 30, 1873.

A device for holding rivets to be cut is pivoted to an ordinary bolt-cutter, and can be turned to one side when the bolt-cutter is used.

Claim.—The rivet-holding device E attached to the bolt-cutting device, consisting of the lever B, eccentric C, and cutter D, and operating substantially as described, and for the purpose set forth.

140,406.—*Cloth-Holder for Sewing-Machines.*—LOUIS ALADIN DUPRÉ, Donaldsonville, La. Application filed May 31, 1873.

The holders are to be applied to the edges of fabrics to be united on a sewing-machine, to hold them properly together, and to obviate basting.

Claim.—The device A, consisting of a strip of thin sheet steel made wider at one end and narrower at the other end, having a single bent point at its narrower end, two bent points at its wider end, and a short slot in its wider end, and bent so that its narrower end may be passed through the slot in its wider end, and the two ends may project parallel with each other, substantially as herein shown and described, and for the purpose set forth.

140,407.—*Stop-Valve.*—GEORGE W. EDDY, Waterford, N. Y. Application filed April 5, 1873.

The ball is prevented from turning when forced by means of the screw against the concave disks by means of sockets upon the latter and bosses upon said ball.

Claim.—The concave disks D J having sockets b, combined with ball E having bosses, as and for the purpose described.

140,408.—*Medical Compound.*—AARON FUQUA, Woodville, Ky. Application filed May 31, 1873.

Red oak bark, sweet gum bark, cinnamon bark, blackberry root, cloves, pimento, extract of logwood, refined sugar, brandy or other spirits, and water.

Claim.—The medical compound above described, substantially as and for the purposes set forth.

140,409.—*Rotary Hog-Scraper.*—ROBERT FYFE, New York, N. Y. Application filed September 14, 1872.

An adjustable rotary scraping device for dressing hogs, operated by a belt and shifting-pulley or other adjustable device.

Claim.—A rotary scraping or scuttling instrument with blades C, handles F, and apparatus adapted to rotate it while being held in the hands of an attendant and applied to the carcass of a hog, the blades being adapted for scraping off the hairs when so applied and operated, all substantially as specified.

140,410.—*Apparatus for Moistening the Atmosphere.*—JAMES G. GARLAND, Biddeford, Me. Application filed January 11, 1873.

The atomiser is provided with a compressing-pump and air-chamber, together with a water-reservoir and cistern, and with an automatic apparatus for regulating the supply of water.

Claim.—1. The combination, with the atomizer, pressure-blower, and water-supplying cistern, of a reservoir for supplying the cistern, and an automatic-supply regulating-valve, substantially as specified.

2. The combination of the filter with the reservoir, the cistern, and the atomizer, substantially as specified.

3. The combination of the overflow-pipe G with the atomizer, cistern, and the water-supply cistern, substantially as specified.

140,411.—*Iron Railway Tie.*—CHARLES W. GULICK, New Brunswick, N. J. Application filed April 19, 1873.

Claim.—Wrought-iron ties for railroad tracks, having transverse flanges B formed solid upon them to form grooves to receive the rails, and having holes formed through them to receive the clamps, substantially as herein shown and described.

140,412.—*Neck-Tie Fastener.*—JOSIAH A. HARD, Lawrence, Kans. Application filed May 6, 1873.

Claim.—The spring-wire frame A, provided with the bent ends a a and hook b, in combination with a neck-tie shield, B, all constructed and arranged to operate substantially as and for the purpose described.

140,413.—*Stalk-Cutter.*—BENJAMIN R. HARNESS, Schooley's Station, Ohio. Application filed April 29, 1873.

Claim.—The frame A having a series of longitudinal openings to receive cutters, and mounted on wheels having fixed axles, in combination with one or more star-shaped cutters rigidly fixed upon the shaft of the bearing-wheels and receiving a rotary motion therefrom, and working in concert with depending stationary knives, substantially as shown and described.

140,414.—*Engine-Governor.*—JOSHUA HENDY, San Francisco, Cal. Application filed April 7, 1873.

The valve-stem is made in two parts, which are held together by a weighted pawl pivoted to the upper end of the lower stem, and engaging with a groove on the lower part of the upper stem. When the speed becomes too great or the belt breaks the stems are parted and the valve is closed.

Claim.—1. The divided stem C L, in combination with a mechanism for connecting and disconnecting the two parts, substantially as set forth.

2. The weighted catch Q secured to the lower stem C, in combination with a groove in the lower end of the upper stem L for connecting or disconnecting the two stems, as described.

3. The sleeve, made with the projecting section S, in combination with the catch Q, for the purpose of automatically disconnecting the two stems, substantially as set forth, and for the purpose described.

140,415.—*Dress-Protector.*—ADOLPH HERRMANN, New York, N. Y. Application filed May 24, 1873.

A reversible protector for the bottoms of dresses.

Claim.—A reversible dress-protector formed of stiffened fabric or other suitable material folded longitudinally so that its edges meet or overlap each other along the central line, and provided with transverse plaits secured by two rows of stitching about equidistant from the edges and from each other, substantially as hereinbefore shown and described.

140,416.—*Dash-Board Bag.*—SAMUEL HIPKISS, Charlestown, Mass. Application filed April 5, 1873.

An expanding bag is provided with spring-hooks for attachment to the dash-board of a vehicle.

Claim.—A bag or receptacle, B, provided with spring-hooks C, adapted for attachment to the dash-board of a vehicle, in the manner set forth.

140,417.—*Protecting-Mask for Bee-Keepers.*—LOUISA C. HUFF, Sonina, Ala., assignor of one-half her right to JAMES J. HUFF. Application filed March 22, 1873.

A head and neck covering of a flexible material with elastic band surrounding the face, bowed wires in front of the face, over which a netted fabric is extended, a tube for the mouth extending through this netted work.

Claim.—A honey-bee screen made up of the parts a, b, c, d, and e, as herein recited.

140,418.—*Belt-Guide for Paper-Machines.*—ROBERT HUTTON, Holyoke, Mass. Application filed April 26, 1873.

As the belt runs to one side it engages a bar, N, which slides the rod J and moves one of the star-wheels to engage the revolving arm O, by which it and its screw-shaft are revolved to move the journal-box and incline the roller so as to feed the belt in the contrary direction. When arm O engages the other star-wheel further motion of the shaft ceases.

Claim.—The combination, in an automatic wire belt adjusting apparatus, of the following instrumentalities: A sliding journal-bearing, C, propelling-screw E, actuating star-wheels G, bell-crank L, shifting-bar M, plates N, and a revolving blade, O, when arranged in connection with the belt and one of the rollers, substantially in the manner described.

140,419.—*Belt-Fastener.*—ANDREW HYDE, Springfield, Mass., assignor of one-half his right to JOHN W. TRAFTON, same place. Application filed March 20, 1873.

Claim.—The device for joining the ends of belting, consisting of the bar b with its spring-hook ends h h, in combination with the yoke d, the parts being constructed substantially as shown and described.

140,420.—*Heel-Trimming Machine.*—ELISHA U. JONES, Woodhaven, N. Y. Application filed May 17, 1873.

The plate G, supported upon the end of a vertical shaft, is made in the form of a double cam, carrying upon its upper face a guide of the contour of a finished heel.

Claim.—The cam-plate G grooved upon its lower side, the guide-plate M, the knife J, screw-rod K, spring L, hinged arm H, and hook-pin N, in combination with the gears E D, shafts C F, crank B, swiveled clutch Q, and hand-screw O, substantially as herein shown and described.

140,421.—*Hoisting Apparatus.*—DAVID KNOWLES, Philadelphia, Pa. Application filed May 8, 1873.

Cam-wheel attached to the shaft of the hoisting-drum and operating in unison with friction-rollers within a hollow pulley or case, which is controlled by means of a weighted lever and brake-straps applied to the periphery. When the weighted lever is raised and retained in a horizontal position the brake-strap is loose from the pulley, allowing it to revolve freely with the shaft. When the end of the lever is depressed the brake-strap is tightened on the pulley, which checks the motion of the pulley and causes the friction rollers or balls to leave the sockets and pass around the curved recesses until they jam sufficiently tight against the rim of the case to hold and prevent the cam-wheel and shaft from turning.

Claim.—1. In combination with the pulley E and brake-strap G, the cam-wheel A, composed of the arms a, a^1, and a^2, the extremities of which are provided with recesses to accommodate the friction rollers or balls C C C, which operate to bind within the pulley and arrest the motion of the shaft, when the brake-strap is tightened on the pulley, substantially as herein shown and described.

2. In combination with the hoisting rope and drum proper of a hoisting apparatus, the supplementary drum L and counter-balance K', arranged to carry and guide the hoisting-rope, to prevent wear and chafing of the same, substantially in the manner as herein set forth and shown.

140,422.—*Die for Enlarging and Sizing Plain Finger-Rings.*—GEORGE KREMENTZ, Newark, N. J. Application filed April 12, 1873.

The ring is placed in an annular cavity in the stationary die, and inside of this cavity the die is open. A tapering plunger is

passed through the ring and hole in the die, and is pressed into the ring, which enlarges the ring on the inside by condensing the metal.

Claim.—The die B, having hole b^1 and concavity b^2, combined with a tapering plunger, C, to size rings, in the manner described.

140,423.—*Die for Manufacturing Plain Finger-Rings.*—GEORGE KREMENTZ, Newark, N. J. Application filed April 12, 1873.

A thin washer is struck up by one pair of dies, leaving both the upper and lower sides slightly rounded; it is then placed in the cavity of another die, where a plunger comes down and turns the upper side of the washer inward; the article is then inverted in the same die to bring both sides of the opening to the same size.

Claim.—The pairs of dies B C and D E, for forming a jointless ring, A^3, from a solid ring-plate, A, substantially as herein shown and described.

140,424.—*Die for Making Watch-Case Caps and Backs.*—SILAS C. LEWIS, Brooklyn, N. Y. Application filed March 29, 1873.

Claim.—The die A B, having circular concavity *a* and central convexity *b*, as and for the purpose described.

140,425.—*Stamp for Crushing Ores.*—JAMES M. MCFARLAND, Golden City, Col. Ter. Application filed May 31, 1873.

The stamps consist of bars provided with stamp-heads, and slide through slots in a central cylinder. During a portion of the revolution of the central cylinder the stamp has a triturating action on the ore, but when the bar gains a vertical position it will slide in the cylinder and strike a blow. The ore fed into one end of the cylinder is moved to the other by a spiral rib, being discharged through perforations upon a series of sieves, which return the coarser particles to the feed-end of the cylinder.

Claim.—1. The mode of operating stamps by a revolving cylinder in which a series of stamps are arranged in radial mortises, substantially as specified.

2. The combination, with a series of stamps and an operating-cylinder, as described, of a revolving case inclosing the stamps and holding the ore to be crushed, substantially as specified.

3. The said revolving ore-holder, having spiral ribs or corrugations, in combination with the stamps for passing the ore along toward the discharge as the crushing progresses, substantially as specified.

4. The combination, with the rotating case and ore-holder, of the screens K L, arranged substantially as specified.

140,426.—*Glazier's Tool.*—SAMUEL G. MONCE, Bristol, Conn. Application filed December 1, 1870.

Putty-knife and glass-cutter attached to opposite ends of a common handle.

Claim.—As a new article of manufacture, the improved glazier's tool herein shown and described, which consists of a rolling steel glass-cutter and a putty-knife united in one common tool, substantially as specified.

140,427.—*Portable and Adjustable Hoisting Apparatus.*—GEORGE A. MYERS, Williamsburg, N. Y. Application filed May 31, 1873.

Claim.—The clamps B, one or more, the ratchet-wheel M, and the double pawl N, or their equivalents, in combination with the frame, drum, and gearing of a hoisting apparatus, to adapt said apparatus to be detachably and adjustably attached to the stanchions of a storehouse, substantially as herein shown and described.

140,428.—*Piano-Action.*—EDWARD G. NEWMAN and PETER ANDERSON, New York, N. Y. Application filed April 24, 1873.

Claim.—1. The hammer-butt I provided with the elongated end *f*, acting against a back-check, K, placed on the key L, to check the rebound of the hammer J, constructed substantially as shown and described.

2. The set-screw *e*, in combination with the hammer-butt I and damper-lever G, arranged to operate as specified.

3. The guide-pin *g*, in combination with the hammer-butt I, and with the slot *h* in the fly-arm N, as and for the purpose specified.

4. In combination with the slotted fly N, hammer-butt I, and guide-pin *g*, the lever R, constructed and arranged to operate substantially as described.

5. The arrangement shown, of the fly O directly on the key L, the set-screw *k* at the upper end of the fly-arm N, the hammer-butt I, its elongated end *f*, and the back-check K, with relation to each other, substantially as specified.

140,429.—*Tooth-Brush.*—JAMES D. O'DONOGHUE and WILLIAM O'DONOGHUE, New York, N. Y. Application filed May 31, 1873.

On the end of the handle of an ordinary tooth-brush is arranged a convex brush for cleansing the teeth on the inside.

Claim.—A tooth-brush, C, arranged in relation to its handle, as herein shown and described.

140,430.—*Staple for Securing the Ends of Barrel-Hoops.*—HARRISON OSBORN, Richmond, assignor of one-half his right to SAMUEL WATSON, Indianapolis, Ind. Application filed June 20, 1873.

The staple is formed with four prongs, which are driven through both parts of the hoop and clinched upon the inside.

Claim.—The staples constructed substantially as shown and described, for the purposes and uses indicated.

140,431.—*Shirt-Bosom.*—JOHN PAGAN, Yonkers, N. Y. Application filed May 17, 1873.

Claim.—1. The method of re-enforcing the single web between the plaits of a shirt-bosom by means of narrow plaits formed of the cloth of which the wide plaits are made, and by overlapping the edges of the wide plaits, substantially in the manner described.

2. The plaits C, E, A, B, and G, formed of the web composing the upper side of the bosom, substantially as specified.

3. The plaits L, A', J, and K, formed of the web composing the under side of the bosom, substantially as specified.

140,432.—*Corn-Planter.*—EDWARD PARMENTIER, Clifton, Ill. Application filed January 25, 1873.

A rectangular frame on a pair of running wheels; in front of it, loosely hinged thereto, is another one with seed-boxes, spouts, and openers; on the latter, to limit adjustably their depth, are runners. A lateral seed-slide is worked, through a lever, by a cam on disk attached to the axle-tree. There is loose on the axle-tree, of the full diameter of, and on the outside face of, each wheel a land-marking arm, adjustable in any position by a clamp-screw.

Claim.—1. The arrangement of the springs D, levers E, rods G, and angle-levers H, with the tongue I, frame F, and clutches C, that connect the drive-wheels A with the axle B, to throw the said drive-wheels out of gear with said axle by raising the furrowing and dropping devices from the ground, substantially as herein shown and described.

2. A furrower, R, adjustable in slot of drag S and opening of standard T, as and for the purpose described.

3. The combination of the flanged or grooved rings *a'*, adjustable bars A', and set-screws B', with the drive-wheels A, substantially as herein shown and described, and for the purpose set forth.

140,433.—*Street-Railway Switch.*—JOHN E. PATTISON, New Orleans, La. Application filed May 5, 1873.

An improvement in the class of street railway switches, which are operated by driving the animal to the right or left upon a platform. The descent of one platform is transmitted through a semicircular rod resting upon a pulley to cause a rise of the other platform, and at the same time, through a lever and link, to shift the switch-point.

Claim.—1. The reciprocating semicircular piston D, in combination with the oscillating platforms C arranged in boxes B, and operated by the weight of the draft animals, forked post *b*, or supporting band E, switch-levers *d d'*, and casing A, substantially as and for the purposes described.

2. The vertical lever *d* having pronged head *e*, applied to piston D around post *b*, to limit motion of piston, substantially as specified.

3. Boxes B, having perforated bottoms for passage of piston-rod D and platforms C, as described.

140,434.—*Plow.*—LEVIN B. RICHARDSON, Carrollton, Ill. Application filed May 31, 1873.

For rolling down weeds, stubble, &c., so that they may be turned under.

Claim.—1. The roller F, bent bar G, bent or looped bar H, draft-bar I, and adjustable brace-bar J, constructed and arranged in connection with each other, substantially as herein shown and described, to adapt them for attachment to a plow, as and for the purpose set forth.

2. The combination of the guard K with the roller F, the bent bar G, the bent or looped bar H, the draft-bar I, and the adjustable brace-bar J, substantially as herein shown and described, and for the purpose set forth.

140,435.—*Washing-Machine.*—WILLIAM M. ROWLAND, Tyler, Tex. Application filed May 26, 1873.

Is constructed with its box in ordinary form, having on its bottom, pivoted at one end, a bed of octagonal rolls, with its upper end connected by cords passing over rolls attached to a set of rolls working in connection and under a corrugated roll journaled in the box. The cords are attached to pivoted levers, having at or near their center a box for weights to hold the rollers in contact when in use. The upper set is pivoted at one end to allow it to be turned over.

Claim.—In a self-regulating washing-machine, the fluted cylinder C, in combination with the curved-face wash-board B, constructed with the octagonal rollers *b' b'*, the cords *d d*, the pulley-roller D, the rack E, and weight-box F, all constructed and arranged as and for the purpose described.

140,436.—*Type.*—WILLIAM SHAW, Hollister, Cal. Application filed January 30, 1873.

The head is cut away at one side and provided with a notch to permit the introduction and engagement of a hook to remove the type from a line.

Claim.—As a new article of manufacture, type cast with the upper portion of the body narrower than the remainder, and containing a notch, *c*, substantially as and for the purpose described.

140,437.—*Cultivator.*—MATTHEW P. SIMPSON, Pana, and JOSEPH P. ELLACOTT, Shelbyville, assignors to THE SHELBYVILLE MANUFACTURING COMPANY, Shelbyville, Ill. Application filed May 16, 1873.

The draw-heads are formed in two parts so as to be capable of vertical adjustment to regulate the depth of the plows. The plates by which the plow-beams are connected to the draw-heads are made concave and laterally slotted to receive the fastening-bolts, so that the beams may be turned to the right or left, and thus cause the outer or inner plows to run the deepest, as may be desired.

Claim.—1. The combination of the draw-heads *f*, grooves or recesses f^2, bars or rods f^3, and connecting-pieces f^7, substantially as shown and described.

2. In combination, the draw-head *f*, grooves or recesses f^2, bars or rods f^3, connecting-piece f^7, plates g^1, and convex surfaces g^2, substantially as specified.

3. The plates g^1, formed with concave surfaces g^3, in combination with the convex surfaces g^2, substantially as described.

4. The combination of the draw-head *f* provided with the grooves f^2 and slot f^6 with the slotted bar *a*, bars f^3, connecting-piece f^7, concave plates g^1, convex surfaces g^2, gangs *g*, when constructed, arranged, and operating substantially as described, and for the purpose set forth.

140,438.—*Sewing-Machine.*—EDWIN D. SMITH, New York, N. Y. Application filed May 10, 1873.

A screw is fitted to a branch of the arm and the head-plate in which the needle slides, the head at that place being severed from the arm, and, by means of this screw, the needle-bar and its needle may be adjusted to work harmoniously with the shuttle. The lever for raising the presser is pivoted on this screw.

Claim.—1. The head cast together with the branches of the arm and separated from the lower branch to obtain the adjusting movement of the head, substantially as specified.

2. The presser-lever F pivoted on the adjusting-screw G between the lower branch and head, as and for the purpose described.

140,439.—*Well-Bucket.*—CHARLES F. SITES, Cincinnati, Ohio. Application filed May 24, 1873.

To the metallic cylinder of the bucket is secured a wooden bottom by means of head and flange. The top or upper rim of the bucket is provided with metallic buffers cast with slots, which embrace the top.

Claim.—As a new article of manufacture, a tilting bucket, composed, essentially, of the metal cylinder A, wooden bottom B, and the metal buffers C, all constructed and arranged substantially as specified.

140,440.—*Thrashing-Machine.*—FREDERICK R. SUTTON and WILLIAM O. SUTTON, Wellington, Ill. Application filed March 29, 1873.

A peculiar mode of attaching and detaching the beater-blades to the cylinder.

Claim.—1. The combination, with the cylinder and concave of a thrashing-machine, of crushing-rollers D C and an endless carrier, E, substantially as described.

2. The adjustable blades of the beaters secured to the arms of the cylinder by extensions S, hook-shaped angle-bars U, clips W, and hook-bolts X, as described.

140,441.—*Saw-Set.*—GUSTAF SWENSON, Hackensack, N. J. Application filed April 12, 1873.

The bars E F clamp the saw-blade just before the dies N are operated to set the teeth, and are opened after the setting is complete. The machine is then moved forward by the hook V the distance of two teeth, when the saw is again clamped and two more teeth set.

Claim.—1. The combination of the plates B C, bar or flange D, adjustable bar E, movable bar F, plate H, pin *h'*, cam-wheel J, levers P, crank-shaft K, crank L, and punches N with each other, substantially as herein shown and described.

2. The combination of the levers P and pins *p'* with the cam-wheel J, plates B C H, bars E F, and punches N, substantially as herein shown and described.

3. The combination of the cam-wheel S, connecting-bar T, elbow-lever U, and hook-rod V with the shaft K of the cam-wheel J, levers P, the plates B C H, bars E F, and punches N, substantially as herein shown and described.

140,442.—*Dog for Circular-Saw Mills.*—JAMES TABER, Rockford, Mich. Application filed April 26, 1873.

The dogs are made vertically as well as horizontally adjustable with relation to the setting-jacks of the head-blocks.

Claim.—1. The combination of the plate B, block F, dogs G, keeper H, connecting-bars I, and lever J with each other and with the standard A, substantially as herein shown and described.

2. The combination of the connecting-bar L, block M, and lever O with the block F, dogs G, and plate B, substantially as herein shown and described.

3. The combination of the rack-bar C, lever-pawl D, and spring E with the plate B and its attachments, substantially as herein shown and described.

4. The spring K, in combination with the lever J and plate B, substantially as herein shown and described.

140,443.—*Apparatus for Treating Cane-Juice.*—GEORGE R. TAYLOR, Thibodeaux, La. Application filed March 29, 1873.

The cane-juice to be treated is trapped in at a point below the drip-shelves and trapped out at the base of the arched part of the apparatus, so that no gases escape from the apparatus.

Claim.—1. The fan-wheel F and spraying-wheel G I, arranged as specified, to be rotated together on the shaft *a* by means described, and thus cause the supply or current of gas admitted through pipe E to be proportional to the amount of juice raised by the wheel.

2. The shelves I I, alternated and inclined, as shown, to cause the cane-juice to flow from one to the other, spaces being provided for admission of gas and circulation thereof beneath each shelf, as shown and described.

3. The rotating spraying-wheel G I and the series of absorbing-shelves I, all arranged to operate as specified.

140,444.—*Wash-Boiler.*—WILLIAM J. THOMAS, Frederick city, Md. Application filed May 31, 1873.

With a movable bottom having openings covered on its under side by valves, pivoted on one side or edge, the other resting upon projections formed by an inverted T-plate which governs the flow of water. Side pipes are attached to each end of the boiler for the discharge of water upon the clothing, which is held from contact with the bottom by angular strips attached to it over the openings.

Claim.—The combination of the bent stripe E, downwardly-projecting flanged plates F, the T-plate H I, and the hinged plates J with the false bottom D and the tubes C, substantially as herein shown and described.

140,445.—*Reciprocating Churn.*—WILLIAM M. THOMPSON and JOHN L. MAHURIN, Rockfield, Ind. Application filed March 22, 1873.

A vertical dasher-shaft having two fixed perforated dashers reciprocates through two perforated dashers which are attached to side pieces sliding in grooves within the churn. The fixed and sliding dashers alternate. The former imparts motion to the latter.

Claim.—The four parallel perforated dashers *d d* and *d' d'*, the former moving with bar *f*, and the latter surrounding said bar *f* but moving only with the guide-bars *b b*, as and for the purpose described.

140,446.—*Door-Spring.*—ALEXANDER TITTMAN, Evansville, Ind. Application filed May 20, 1873.

A casting or bed-plate provided with a dovetailed tapering groove is attached to the door-frame, near its upper end. A metallic frame carrying a coiled spring held by a central rod fits by wedge-shaped connection in the bed-plate, serving at the same time as the upper hinge of the door, and the wire ends or extensions of the spring extend horizontally outward on opposite sides of the door, bearing against the same, this construction permitting the door to swing both ways, while the action of the spring is equally operated in either direction.

Claim.—1. The spring H attached in the metallic frame E, and having its ends operating on opposite sides of a door, B, hinged to said frame, substantially as and for the purposes herein set forth.

2. The combination of the casting D having dovetailed tapering groove, the frame E fitting in said groove, the spring H, and hinge-bar G, with the door B, all constructed and arranged substantially as and for the purposes herein set forth.

140,447.—*Boot-Blacking Kit.*—SOMERS VAN GILDER, Knoxville, Tenn. Application filed June 7, 1873.

A box of blacking is secured to the back of the brush, and the handle of the daubing-brush fitted in its form to the handle and held by loops, can be detached at will for use.

Claim.—A boot-blacking kit, comprising the polishing-brush, daubing-brush, and the blacking-box, or the two brushes only, contained in one article, the daubing-brush being detachably connected to the handle of the polishing-brush, all substantially as specified.

140,448.—*Naval Store-Room or Coach Lamp.*—JOSEPH J. WALTON, New York, N. Y. Application filed March 12, 1873.

The ordinary store-room or coach lantern is provided with a central perforation in the bottom plate, and has arms for the attachment of a candlestick. The lantern may be used with the ordinary lamp or the candlestick shown, and the candlestick may be used separate from the lantern.

Claim.—The bottom B having central perforation, flange *e*, bars I, and hooks *f* with no device attached to the top of the bottom B to allow the lamp or lantern A to be used with the tube C and its attachments for a candle, or the tube C and attachments to be removed from the lamp and used by itself, and the lamp or lantern to be used with the ordinary oil-lamp, as desired, as and for the purpose specified.

140,449.—*Hinge.*—JAMES W. WOOD, Conshohocken, Pa. Application filed May 5, 1873.

One wing or leaf of an ordinary butt-hinge is provided with a supplementary leaf or flange, cast or otherwise formed thereon. A metallic socket of proper configuration is mortised into the jamb, and in this socket the flange or supporting-leaf slides, and is adjusted in any desired position by two set-screws, this construction allowing double adjustability, both vertical and lateral, merely by the loosening or tightening of the set-screws.

Claim.—A butt-hinge having extension D, held by a set-screw or other fastening at any point of adjustment in a socket, E, and applied to a door, B, and jamb A, as and for the purpose described.

140,450.—*Piano-Tuning Key.*—ALEXANDER H. AFFLECK, Marshallville, Ga. Application filed April 11, 1873.

Special construction of parts in a tuning-hammer, the handle of which, by pressure of a thumb-button, will turn without carrying the stem with it.

Claim.—The presser H, lever F, spring G, detent E, and pinion C, combined with a key, B, and all constructed and arranged as and for the purpose described.

140,451.—*Drill and Bit-Stock.*—CHARLES H. AMIDON, Miller's Falls, Mass. Application filed October 31, 1872.

This may be used by hand or in a vise, and can be removed from the handle P by unscrewing the sleeve O, by which the hinged journal-box *e* is retained around the stock-shank J. The jaws A A' will adapt themselves to any shape of the bit-shank.

Claim.—1. An adjustable socket formed by and between two sets of jaws, A A A' A', independently pivoted, base to base, to the head B, and actuated by the means described or their equivalents.

2. The separate sets of jaws A A A' A', independently pivoted, base to base, to the head B, combined with a sleeve, D, hav-

ing a rectilinear movement on the spline groove *b*, and the sleeve C having a circular advancing motion on the screw-thread to actuate the said jaws, in the manner described.

3. The spindle H, with the quill I and loose screw-socket G, combined with the hollow coupler-sleeve E fitted over said spindle and quill, and engaging with said screw-socket to connect the cap F with the brace, as set forth.

4. The sleeve spindle O combined with the jointed shank Q *o o*, as described, so as to be readily detachable, as set forth.

5. The combination of the pinion L on the shank J, intermediate double gear-wheel N, and pinion M on the spindle K, carrying the bit-head B, substantially as and for the purpose shown and described.

6. The frame S constructed in the manner described, with a rest, *f*, for the cap F, combined with an adjustable feeding-device, U V, so that the whole may be secured in a common vise, and operated in the manner described.

140,452.—*Manufacture of Artificial Fuel.*—DAVID BARKER, Northfleet, England. Application filed May 16, 1873.

Claim.—1. The manufacture of my improved fuel by treating carbonaceous substances and combining with them the materials required to give the fuel cohesion, substantially as hereinbefore set forth and described.

2. The use of the solution of sulphate of alumina or of chloride of alumina in combination with carbonaceous matters prepared substantially in the manner and for the purposes above set forth.

140,453.—*Sofa-Bedstead.*—JACOB BEIERSDORF, Chicago, Ill. Application filed May 7, 1873.

A hinged pillow-guard is attached to the upper part of the pillow-frame, which is detachably connected with the foot of the unfolded sofa-bedstead.

Claim.—The frame B provided with the folding pillow-guard *b*, in combination with the hinged folding sofa-bedstead, as described.

140,454.—*Combined Stove-Pipe Shelf and Drum.*—THOMAS BLADON, Oak Harbor, Ohio, assignor of one-half his right to JOHN C. METZGER, same place. Application filed March 25, 1873.

A direct or indirect draft through the drum is obtained by adjusting suitable dampers. In its front top, under a hooded projection, is a dampered aperture to carry off the fumes of cooking. Small vessels can be placed on the flat top of the drum.

Claim.—1. In combination with the drum shown, the openings *h*, damper H, and hood I, substantially as and for the purpose set forth.

2. The combined stove-pipe shelf, heating-drum, and ventilator as a whole, when its several parts are constructed and arranged to operate substantially as and for the purpose shown.

140,455.—*Connection for Wrought-Iron Beams and Columns.*—ADOLPHUS BONZANO, Phœnixville, assignor to CLARK, REEVES & CO., Philadelphia, Pa. Application filed April 26, 1872.

Beams and columns are united by plates or bars, which, passing through the columns, are bolted to the flanges of the column-bars, and are connected to the web of the beam by splicing-plates.

Claim.—The combination described of wrought-iron columns, beams, and splicing-bars.

140,456.—*Roller-Press for Polishing Photographs.*—NELSON S. BOWDISH, Richfield Springs, N. Y. Application filed March 5, 1873.

Claim.—The stationary polished bed, in combination with the rollers *g* and *e*, carriage *d*, and adjusting mechanism, substantially as and for the purposes set forth.

140,457.—*Coffin-Plate.*—GEORGE BRADBROOK, Taunton, Mass., assignor to REED & BARTON, same place. Application filed May 8, 1873.

Claim.—The coffin-plate A, having circumjacent flange *a* at the bottom, and body *a'* tapered toward the top, combined with a detachable border, B, beveled on the under side *b*, in the manner and for the purpose described.

140,458.—*Inclined Way for Building Levees.*—JOHN BRADFORD, Wilmington, Del. Application filed May 19, 1873.

A portable jointed track-way for building levees, in connection with a dumping-car. The inclined portion of the track is supported by an adjustable prop, L. The car is drawn up by a rope passing over a pulley-block at the upper end of the track, and the load is discharged by its own weight, when a spring-catch, which holds the dumping-body from turning, comes in contact with a diagonal cam-block placed at the upper end of the track.

Claim.—1. A machine or apparatus for making mud banks and repairing breaches in the same, consisting of a portable track, made in horizontal and inclined sections, adjustable substantially as set forth.

2. The movable or shifting track C jointed at *c*, and having the oblique block or stationary cam F, or equivalent, and pulley head-block G, as set forth.

3. In combination with the truck and tilting body, the spring-catch, for the purpose set forth.

4. The truck K, arranged for operation on the bank, in combination with the track B, as set forth.

5. In combination with the track B, the shifting adjustable support L.

6. In combination with the automatic dumping-car D, having the spring-catch E, the oblique block or stationary cam F, for the purpose set forth.

140,459.—*Sliding or Extension Chandelier.*—JAMES BRANNEN, Philadelphia, Pa. Application filed March 27, 1873.

The sliding pipe moves upon a stationary supply-pipe, which is packed at its lower end. Gas for supply of side burners is kept from contact with the slide by a division-pipe, concentric with the slide and with extension casing. Two friction-wheels bear against the slide, one of which is hung eccentrically, and is governed by a cord and spring.

Claim.—1. The combination, with the sliding pipe C, of the eccentric or eccentrics I^1, the latter being so constructed and arranged that it will, by frictional contact or pressure upon the surface of said pipe, prevent it from being lowered until the pressure is withdrawn, substantially as specified.

2. The stationary pipe D, having the adjustable packing E on its lower end, in combination with the nut *e* and the sliding pipe C, substantially as and for the purpose specified.

3. The combination, with the extension chandelier having the adjustable pipe C, central tube D, and casing-pipe A, of the partition-pipe B, located between the adjustable and casing pipes so as to include the former, substantially as shown and described.

4. The combination with the extension chandelier having the adjustable pipe C, central tube D, and casing-pipe A, of the partition-pipe B, having its ends threaded, as shown, and thereby so secured to the body F and cap *a* that it may be readily removed and replaced without injury to the chandelier, substantially as and for the purpose specified.

140,460.—*Subsoil-Plow.*—GREEN B. BRIMINGHAM, Trenton, Tenn. Application filed November 9, 1872.

Claim.—1. The subsoiler, as described, having the diamond-shaped point G, raised neck H, and scoop-shaped wings I, substantially as described and shown.

2. The slotted and removable bar Q in combination with the guiding-frame T, having a removable and clamping bolt Y, and united with the plow-standard by a detachable arm, substantially as shown and described.

3. The clamp O, wrench P, and set-screw *h*, in combination with the standard L and removable bolt M, constructed and arranged substantially as and for the purpose herein specified.

140,461.—*Apparatus and Process for Extracting Saccharine Matter from Sugar-Cane.*—MARIUS S. BRINGIER, Ascension parish, La. Application filed June 24, 1873.

The sugar-cane is cut into small fibers or chips and falls into a drying-cylinder, through which it passes and falls into digesters, through which it passes back and forth with a stream of water passing in the opposite direction. It is finally squeezed dry by rollers.

Claim.—1. The process herein described of extracting the saccharine from sugar-cane and other vegetable substances, the same consisting in, first, thinly slicing said substances, then heating or drying them, and then subjecting them to the action of a current of water, either hot or cold, caused to move in a direction opposite to that in which the slices or shavings of said cane or other substance are moved through the washing apparatus, substantially as shown and set forth.

2. The combination of the heating or drying chamber with the displacement apparatus, consisting of a series of vessels connected together, substantially as described, and provided with feed screws or worms, or their equivalents, whereby the material fed from the drying-chamber is caused to pass in one direction through the apparatus, to meet water passing through the same in an opposite direction, as and for the purposes set forth.

3. In combination with the heating or drying chamber, the cutting apparatus or feed-hopper, arranged and operating to cut the cane into slices and deliver it to the drying-chamber, as shown and described.

4. The combination, with the heating-chamber, of a blower or air-forcing apparatus, arranged to discharge air into said chamber, substantially as and for the purposes set forth.

5. The herein-described displacement apparatus, consisting of two oppositely-arranged series of upright or inclined vessels or receptacles connected by horizontal cylinders or channels, in combination with rotary feed-screws or their equivalents, in the said cylinders, and elevators or their equivalents in the said vessels, under the arrangement and for operation substantially as shown and set forth.

6. In combination with the displacement apparatus, the endless apron for carrying off the exhausted sliced cane or other substance, the rollers for pressing the water from the same, and the gutter or trough for catching said water and conveying back to the displacement apparatus, as shown and described.

140,462.—*Water-Feed for Boilers.*—HOWARD C. BRISTOL, East China, Mich., assignor to himself, WILLIAM D. HART, and JOHN CLARK, Jr., same place. Application filed March 17, 1873.

Two pipes of different lengths connect with the steam-pipe of the pump. They are enlarged at the lower ends, forming on each a seat for a ball-float valve, which is confined in a cage. The rising and falling water closes and opens the pipes.

Claim.—The combination of the main pipe B with pipes B^1 B^2, of unequal lengths, having valve-seats *d* and cages *e e*, adapted to hold the float-valve C, as described.

140,463.—*Trace-Buckle.*—THOMAS BROWNLEE, Fairbury, Ill. Application filed May 21, 1873.

The buckle is made in two rectangular sections, one of which slides within the other. The top is hinged near its center, and has a pin or stud on its under side. The strap is adjustable by elevating the hinged portion.

Claim.—The sliding section B having a hinged front end, C, carrying a pin, *c*, and provided with grooves *f f*, in combination with the section A, its guides *b b*, and with or without the flanges *c c* and shoulder *g*, substantially as described, for the purpose set forth.

140,464.—*Machine for Cutting Sugar into Blocks.*—PETER O. BRUNJES and ALBERT BENNECKENDORF, Hoboken, N. J. Application filed February 20, 1873.

The difference in the diameter of the saws prevents the breaking of the blocks, which would occur at the saw next to the bottom of the incisions were the second saw to strike the block before the first had passed through.

Claim.—1. The combination of two or more cutting-off saws with sawing mechanism arranged to cut the incisions the required depth for two or more pieces, substantially as described.

2. The said cutting off saws, arranged in differential sizes, as described, to cut the parallelopipeds successively, as specified.

140,465.—*Tar and Petroleum Burner.*—JAMES BURNS, London, Canada. Application filed May 8, 1873.

Perfect combustion of infinitely small particles of tar and steam is effected by means of an atomizer provided with a tar-passage, steam-passage, and nozzle-bore, in which the tar and steam unite, the latter equal, or nearly so, to the two others in point of capacity, and also being of uniform diameter throughout.

Claim.—The atomizer for burning tar or petroleum, comprising a tar-passage, *t*, a steam-passage, *s*, and a nozzle bore, *n*, in which these unite, the latter being equal, or nearly equal, in capacity to the two passages, and of uniform diameter throughout, and of suitable relative length, as herein described, for the objects set forth.

140,466.—*Compressed-Air Heating Apparatus.*—HENRY BUSHNELL, New Haven, Conn. Application filed March 12, 1873.

Combined with a reservoir and pump for forcing air are any number of registers or openings, and between the reservoir and the registers is a pressure-valve, so adjusted that when the air shall have been compressed to a certain degree it will force open the valve and allow the heated air to escape through the registers into the space to be warmed. The reservoir C may be filled with water, to be heated by the compressed air in its passage through the tubes *a*, and the steam thus generated will pass to the radiator L.

Claim.—1. In combination with a suitable reservoir within which to compress the air, the conductors or pipes D, more or less in number, leading to their respective registers E, with a pressure-valve, G, arranged between the said registers and reservoir, substantially as specified.

2. In combination with a steam-generator having a series of tubes through which compressed air is forced as a means for generating steam, the radiators L, more or less in number, having pipes leading thereto from the said generator for heating purposes, substantially as set forth.

140,467.—*Governor for Engines.*—EDWARD BUSS, Buckau Magdeburg, Prussia, assignor to ARNOLD BUDENBERG, Manchester, England. Application filed March 22, 1872.

The throttle-valve is attached by a forked lever to a sliding collar on the governor-spindle, which is driven by a pulley. To said collar peculiarly-twisted arms carrying the weights are attached by eye-studs, the arms interlocking as closely as possible on opposite sides. Two sockets branching from the arms serve as a support for the lower barrel-shaped weights. As the speed increases or decreases the upper pendulum-weights swing outward and the lower ones rise, thus regulating the speed of the engine.

Claim.—The combination of the pendulum-support D and arms E, with the double-weighted pendulums F and G, when arranged, mounted, and operating substantially as and for the purpose described.

140,468.—*Chain-Propeller for Vessels.*—THOMAS W. CARTER, New Orleans, La. Application filed April 17, 1873.

A chain-propeller having the chains at the sides of the boat and revolving around the cabins, the sides of which are so constructed as to afford supports for the shafts or axes of the paddles.

Claim.—The combination, with the hull of the boat A, having its deck so constructed as to form troughs upon its lower side, of the structures or cabins C C, having their sides supplied with flanges, substantially as and for the purpose specified.

140,469.—*Apparatus for Leaching and Concentrating Bark Extracts.*—PHILETUS M. CHURCH, Sault de Ste. Marie, Mich., assignor to himself and PHILETUS S. CHURCH, same place. Application filed April 2, 1873.

The grates which support the bark are hinged at their inner ends, the outer ends resting upon girts on a sliding frame so that they may be dumped to empty the leach. The evaporator is of semi-cylindrical form, the ends resting in wooden cradles. An oscillating shaft carries a wooden blade having agitating-blocks secured thereon. Each time it rises carries a portion of the liquid with it, which spreads over its entire surface in a thin film exposed to the atmosphere.

Claim.—1. The leach-tank A, constructed substantially as herein described, and provided with the hinged sectional grates B, the slides *e e*, girts *f f*, and screws *g g*, arranged and operating substantially as and for the purpose set forth.

2. The construction and arrangement of the evaporating-trough C, heads D secured to the cradles E by the tie-rods *i*, the oscillating shaft F carrying a blade, G, with the agitating-blocks G' secured thereto, substantially as and for the purpose set forth.

140,470.—*Wash-Boiler.*—MICHAEL J. CLAPPER, Holland, Mich. Application filed April 21, 1873.

Is constructed in ordinary form, with a grate at or near its bottom, with end conductors with a cross-section open at its ends to receive the water from the conductors, having perforations for the distribution of water over the clothes being washed.

Claim.—A wash-boiler with a grate, A, near the bottom, double ends B B with slots C C, a perforated conductor, D, arranged substantially as described.

140,471.—*Truss-Bridge.*—THOMAS C. CLARKE, Philadelphia, and ADOLPHUS BONZANO and JOHN GRIFFEN, Phœnixville, assignors to CLARKE, REEVES & CO., Philadelphia, Pa. Application filed June 16, 1873.

Light posts are substituted for heavy ones in truss-frames for bridges, and they are grouped together to form towers, each one of which is stiffened by horizontal and vertical diagonal braces, and all the towers are connected together by cross-ties and horizontal and vertical diagonal braces. The transverse beams supporting the roadway are suspended at their ends from the centers of the opposite towers.

Claim.—1. A truss-frame bridge in which the posts are combined to form towers, as set forth.

2. A truss-frame bridge in which the transverse beams for supporting the roadway are suspended to the frames in the manner described.

140,472.—*Manufacture of India-Rubber Rings.*—WILLIAM H. COLLINS and CHARLES K. LONGDEN, Prospect, Conn. Application filed June 4, 1873.

Consists in forming the rings from a thin tube of gum, rolling the gum from one end of the tube toward the other until the requisite diameter of the body of the ring is obtained; then vulcanizing or otherwise curing the gum.

Claim.—The process herein described for manufacture of rings from India rubber or similar gums.

140,473.—*Elevator.*—CHARLES W. COLLYER, Marblehead, Mass., assignor to himself and CHADWELL TUCKER, same place. Application filed May 23, 1873.

A lever-bar on the bottom of the car, provided with friction-rolls at each end, is held in position by a spring which forces the ends into notches cut at given distances into guide-rails in the hatch-way, and is released by a lever, to be again arrested at the next landing; also, fixed pinions, which engage with a rack-bar on the car and one on each landing-door, serving to close automatically the said doors.

Claim.—1. In combination with the car and hoist-way, the lever-bar *f*, lever *k*, rails *c*, and notches *d d*, operating to arrest the falling or descending car, substantially as described.

2. In combination with the car *b* and landing-door, the door-rack *n*, sliding car-rack *o*, and pinions *m*, operating substantially as described.

140,474.—*Harness-Fastening.*—ENOCH COVERT, Farmer Village, N. Y. Application filed December 26, 1872.

The ring which secures the breeching to the braces has points which assist in securing it to the leather.

Claim.—The metallic loop or ring A, provided with raised points *a a*, and used substantially as and for the purposes herein set forth.

140,475.—*Hames-Fastening.*—ENOCH COVERT, Farmer Village, N. Y. Application filed December 7, 1872.

The hooks which secure the ends of the hames are secured together by a strap and buckle.

Claim.—The sheet-metal hook D, attached to the cross-bar of the buckle C, in combination with the strap B having the sheet-metal hook D riveted to its end, all used as a hame-fastener, as set forth.

140,476.—*Loom-Shedding Mechanism.*—GEORGE CROMPTON, Worcester, Mass. Application filed November 2, 1872.

Claim.—1. The three armed harness-levers having their vertical arms connected with hooked jacks moved by the lifting and depressing and pattern mechanism, and notched, as shown and described, so that the harness-cording may be extended at option, either from two opposite horizontal arms of the same lever, or from one of said arms and the vertical arm of the same lever, as and for the purpose described.

2. The combination of the harness-levers provided with a vertical and horizontal arm, the harness-cording, horizontal jacks, lifter, depresser, and evener bars, and pattern chain or cylinder, when constructed and arranged to operate as shown and described.

140,477.—*Pencil-Case.*—ALONZO T. CROSS, Providence, R. I. Application filed February 3, 1873.

The shank, carrying at one end the pencil, has, at its opposite end, a watch-key, and is provided on one side with a stud fitting into a slot in the end of the case to hold the watch-key rigid.

Claim.—1. The improved pencil-case having a watch-key and the pencil arranged on opposite ends of a separate piece, which is inserted and held for use in the open end of the sheath or case, substantially as shown and described.

2. The friction-collar R, substantially as and for the purpose specified.

140,478.—*Pen-Holder.*—ALONZO T. CROSS, Providence, R. I. Application filed February 3, 1873.

Claim.—The improved pen-case in which, besides the sliding pen-holder, a watch-key and a tooth-pick are combined in a separate piece, *f*, and held for use in the tubular end of the case, substantially as shown and described.

140,479.—*Automatic Gate.*—GEORGE C. CRUM, Barr's Store, Ill. Application filed May 14, 1873.

The hub or wheel of the approaching vehicle strikes a lever at the side of the way, which, through an upright shaft and connecting-rod, operates a vibratory lever pivoted to the top of the

gate-post, and having arms extending downwardly on each side of the gate, the arms being connected at their lower ends by an inclined rod which acts upon the latch as the arms are moved back and forth to operate the gate.

Claim.—1. The vibratory lever F provided with arms *f f*, connected at the lower end by a cross-bar, *f'*, inclined on its subjacent face, and arranged to operate the latch of the gate, as and for the purpose described.

2. A lever, F, pivoted on top of post, and provided with arms *f f* to turn the gate on its hinges, in combination with shafts E E having arms *e e* and connected with said lever by straps G G, as and for the purpose set forth.

140,480.—*Gang-Plow.*—MARSHALL S. CURTISS, Bradford, Ill. Application filed November 13, 1872.

A device for tilting the plows to accommodate them to sidelling ground.

Claim.—The plate B provided with teeth or cogs *k*, and pivoted to axle A, in combination with lever B B, and transverse arms *f f* of rod *b* having transverse arms *d* arranged in guides *e e* of beams C C, the whole constructed to operate substantially as set forth.

140,481.—*Device for Locking a Series of Drawers.*—WILLIAM F. DALY, Peru, Ind., assignor of one-half his right to EDWIN D. OLIN, same place. Application filed June 3, 1873.

To the side of the case containing the drawers is attached an upright bar which extends nearly to the top of the case, where it is encircled by a spiral spring. The bar has notches in which engage spring-catches attached to the several drawers. At a point near the center of the case, vertically, is placed a plate, through the center of which extends the shank of a tumbler that engages with and operates the vertical bar. Said shank receives the key which moves the tumbler.

Claim.—In a device for locking a series of drawers, the combination of the notched bar A, spring B, plate C, tumblers D D', and spring-catch E E', the parts being constructed and arranged substantially as and for the purpose set forth.

140,482.—*Means of Attaching the Fore End Stock to Gun-Barrels.*—JOHN DEELEY and JAMES S. EDGE, Jr., Yardley, England. Application filed June 20, 1873.

Claim.—The combination, with the fore end and the barrel or barrels of small-arms, of a spring-catch, carried by the fore end, and arranged and operated to engage with, and to be disengaged from, a lump or its equivalent on the barrel or barrels, substantially as and for the purposes herein shown and described.

140,483.—*Sad-Iron.*—WILSON P. DODSON, Philadelphia, Pa. Application filed June 2, 1873.

The sad-iron is open at the top to admit a heater, and the handle is rigidly attached at the ends of the iron.

Claim.—The shell A open at the top to receive a heater, B, and provided with a handle rigidly attached thereto, for use as a sad-iron, substantially as described.

140,484.—*Cultivator.*—JOHN W. DOUD, Ward's Corner, Iowa. Application filed September 21, 1872.

The frame is supported on two wheels, the main beam being diagonal to the axle-tree. The plows are attached to the diagonal beam. The upper end of the standards are clamped to a segmental arch in such a manner that a strong pressure against the share will release the gripe, thus allowing the share to move backward, and thus prevent breakage.

Claim.—In a cultivator, the bent adjustable plate K and bolt L, as described, in combination with the pivoted shovel-standard H and arched bars J, secured to and rising above the drag-bars *c*, as specified.

140,485.—*Elevating-Machine.*—GEORGE A. DUPUIS, Detroit, Mich. Application filed April 5, 1873.

A frame secured to the ground having within it two pulleys or drums, and another frame designed to be set on the floor above, successively, immediately above the ground-frame, and likewise provided with two drums. Around these drums are ropes to which two elevating-platforms are attached, and so arranged that when one platform is at the top of the frame the other is at the bottom, and the weight of a man descending on one platform carries the building material on the other to the required height.

Claim.—1. The combination of the frames A C, pulleys or drums B D, platforms E, ropes *d d'*, guide-ropes A, guide-pulleys *h*, drums and cranks *m*, tightener-drums *h'*, ratchet and pawl *g*, and brake H, when the parts are constructed and arranged to operate substantially as and for the purposes described.

2. The hooks F, provided with bails *c*, in combination with the hooks *b* of the platforms E, for the purposes specified.

140,486.—*Seal-Lock.*—GEORGE R. DUNN, Newark, N. J. Application filed June 19, 1873.

The sliding hasp is held in the locked position by a sheet-metal sealing-key, which passes through openings in the case and hasp. The key is provided with shoulders that engage with corresponding shoulders arranged in the hasp, so that when the key is inserted within the openings it cannot be removed without breaking off the enlarged end or head.

Claim.—The key D provided with the shoulders *d* and *d'*, in combination with the opening *a* within the casing A, and the opening *c''* provided with the shoulders *c'''* within the hasp C, substantially as and for the purpose specified.

140,487.—*Printing-Telegraph.*—THOMAS A. EDISON, Newark, N. J., assignor to THE GOLD AND STOCK TELEGRAPH COMPANY, New York, N. Y. Application filed February 18, 1873.

Relay *m* closes circuit to printing-magnet, which turns type-wheel one step, and, by break-wheel A, breaks circuit 3 of *m*, which, in turn, breaks circuit 2 of *f*, the armature of which, being drawn back, turns type and break wheels another step, closing circuit 3, *m*, and *f*, thus automatically making and breaking each other's circuits until *h* is stopped by the depression of a key. Printing-magnet *w* thrown in during pause by spring *u* through a relay.

Claim.—1. The combination of the type-wheel, pallet-wheel, circuit-wheel *h*, and pallets with the circuits 2 and 3 and electro-magnets *m* and *f*, substantially as set forth, for automatically opening and closing the respective circuits and rotating the type-wheels, as set forth.

2. The printing-circuit closed by the spring *u* of the pallet-lever when the circuits 2 and 3 are broken, and the movement of the type-wheel arrested by the depression of a finger-key, in combination with the pallets that are moved by the spring and close the type-wheel circuit when the finger-key is released, substantially as set forth.

140,488.—*Printing-Telegraph.*—THOMAS A. EDISON, Newark, N. J., assignor to THE GOLD AND STOCK TELEGRAPH COMPANY, New York, N. Y. Application filed May 16, 1873.

Break-wheel *o* connected to motive train by devices of first claim, so that when former is stopped latter runs on. Main governor-shaft started in right direction by pawl m^2. Stroke of printing-armature adjusted by screws passing through it and resting on magnet-cores. Double set of circuit-closing points attached to printing-circuit closes on end of type-wheel armature-lever for certainty of contact.

Claim.—1. The circuit-breaking wheel *o* actuated by the wheel h^4, in combination with the pawl 15, ratchet-wheel *k*, arms *m*, and range of finger-key bars *b'*, substantially as and for the purposes set forth.

2. The switch-block *t*, circuit-springs 21 23 24 25 and their connections, substantially as set forth, in combination with the circuit-closer *o*, line-connections and type-wheel magnets d^1, substantially as set forth.

3. The starting mechanism, consisting of the pawl m^6 and ratchet-wheel m^5, in combination with the governor and magnetic motor, substantially as set forth.

4. The screws c^2 applied to the armature of the printing-magnet, for the purposes set forth.

5. The stop-pawl s^1, in combination with the type-wheel, wedge-acting pallets, and ratchet-wheel, for the purposes set forth.

6. The double pairs of spring circuit-closing points 20 and 35, one pair set to come into contact before the other pair, for the purposes set forth.

140,489.—*Circuit for Printing-Telegraph.*—THOMAS A. EDISON, Newark, N. J., assignor to THE GOLD AND STOCK TELEGRAPH COMPANY, New York, N. Y. Application filed February 18, 1873.

Two relays in main-line circuit, central printing and type wheel circuits, form one local battery, the relays having polarized armatures and being so wound that one armature is attracted while the other is repelled. One or the other brought into action by reversal of current.

Claim.—Two polarized electro-magnets in a main circuit, in combination with two local circuit-connections to the magnets of a printing-instrument, and a mechanism for opening and closing the main circuit and reversing the polarity of the current, substantially as and for the purposes set forth.

140,490.—*Boot-Tree.*—ORSON V. ELLIOTT, Mansfield, Pa. Application filed May 28, 1873.

The notched collar and pawl enable the operator to adjust the stretching device, as may be required, and to hold the tree firmly in position for the finishing process.

Claim.—The boot-tree D D', provided with the screw-shaft B having wedge-shaped nut G, said screw-shaft fitting in a socket in the base A, in combination with the notched collar *a* and pawl I, all arranged for operation as and for the purpose specified.

140,491.—*Thrashing-Machine.*—JOHN ELLIS and NATHAN HOFFMAN, East Coventry, and JAMES LEE, Pottstown, Pa. Application filed May 9, 1873.

A thrashing-cylinder, with fans attached to the ends, communicating with a dust-conveyer which extends forward over the feed-table and conveys the dust through air-passages into casings on each side, the fans forcing the same into and through the main flue in the lower part of the frame.

Claim.—1. The fan-blades *d d* with ears *e e* attached to the ends of the thrashing-cylinder, and leaving spaces between said cylinder and the fans, all substantially as and for the purposes herein set forth.

2. The combination, in the dust-conveyer G, of the passages *n n*, fan-casings *p p*, side flues *r r*, and main or bottom flue H, all substantially as and for the purposes herein set forth.

3. The combination, with the flues *r r* of the dust-conveyer, of the valves *s s*, ball *t*, rod *v*, spring *w*, and nut *x*, substantially as and for the purposes herein set forth.

140,492.—*Bed-Bottom.*—DAVID FRANKFODER, Wakarusa, Ind., assignor to himself and GEORGE W. STALEY, same place. Application filed May 17, 1873.

Transverse rods, with eyes for the slats, are placed at the head and foot. Over these rods the bail of the spring is hooked. At the head is a bolster-frame operated by an independent bolster-prop.

Claim.—1. The arrangement of the rod C, provided with eyes *b*, with relation to the springs B for supporting the slats D, as shown and set forth.

2. The combination, with the frame A, springs B, rods C, and slats D, of the bolster-frame E E^1 E^2, links *d*, rod *e*, radius-rods *f*, bolster-prop F, pawls F', and rod *g*, substantially as and for the purpose set forth.

140,493.—*Corn-Planter.*—JESSE P. FULGHUM and L. LOVELL LAWRENCE, Dublin, Ind., assignors to WAYNE AGRICULTURAL COMPANY, same place. Application filed May 26, 1873.

The invention relates to planters which deliver their seed by a horizontally-rotating perforated disk, and comprises—first, a device for cutting off surplus seed and insuring the discharge of that which is to be dropped; and, second, a device to facilitate the introduction, removal, and adjustment of the cut-off brush.

Claim.—1. In the described combination with horizontally-revolving seed-disk D *d d'*, the vertically-revolving spider Q, formed and operating as set forth.

2. The combination of the plate J *j f*, curved ribs K K', and swinging door or flap N, together with the lugs *n' n''* and apertures P P', whereby said door is rendered capable of being detached from the hopper for the insertion of a brush, M, as herein explained.

140,494.—*Plate for Vulcanizing Belting, Hose, &c.*—DENNIS C. GATELY, Newtown, Conn. Application filed June 25, 1873.

Heretofore the steam-tables and tops of molds for long articles have been made by joining sections with open ends. The difficulty has been to close the joints so no steam would come through the joints to touch the article. In this case each section is a separate chamber with steam connection.

Claim.—A vulcanizing-plate consisting of two or more sections, each section forming a distinct and separate jacket having a distinct and independent steam-supply as shown and set forth.

140,495.—*Saw Attachment.*—JOHN GIGLIN, Boston, assignor to himself and HIRAM K. HINES, East Boston, Mass. Application filed May 7, 1873.

One end of an elastic strap is made fast to some stationary point, the opposite end being attached to one extremity of a cross-cut saw, at the other end of which is the operator.

Claim.—As a new manufacture, the elastic band or spring B, the connections *c d*, the saw A, and handle *e*, combined and arranged substantially in manner and to operate as described, the whole constituting an automatic and manual power apparatus or mechanism for cutting off piles, as specified.

140,496.—*Envelope.*—LOUIS GIEBRICH, Ottumwa, Iowa, assignor to KAROLINA GIEBRICH and JOHN EBRACHER, same place. Application filed May 10, 1873.

An envelope having two pockets is provided with narrow gummed tags on its flaps, which are inserted into angular slits cut in the back of the envelope.

Claim.—A safety-envelope, having the lap *i* cut in the body of the envelope to fit the tag *b* of the flap *a*, and provided with the back tag arranged to pass through a suitable slit in the face of the envelope, or through the bend of the flap, substantially as specified.

140,497.—*Bee-Hive.*—DEMUS L. GROVER, Groton, N. Y. Application filed May 10, 1873.

A hive having on two sides interior perforated walls and space between them and the outer walls; also, sheltered apertures in the outer walls and a removable honey-board resting upon the inner walls and having a gauze or perforated center part.

Claim.—The perforated linings B B, arranged along opposite sides of the interior of the hive, with sheltered ventilating-openings in said sides, and the honey-board with perforated shield, all substantially as and for the purposes specified.

140,498.—*Metallic Arch for Tunnels, &c.*—JOSIAH GROVES, Ellicott City, Md. Application filed May 31, 1873.

A metallic arch for tunnels, &c., composed of flanged sections connected together by bolts and resting upon flanged sectional side walls of the same material. The flanges of the arch overlap the joint to exclude moisture, and the radial flanges are of dovetail form to assist in retaining cement in the recesses.

Claims.—1. An arch composed of cast-iron sections, provided with overlapping flanges 8, which rest upon the top of the raised flanges 7, and serve to support the sections in position without the aid of bolts, and to prevent leakage, substantially as shown and described.

2. The side walls, consisting of iron sections provided with the shoulder 4 and flanges 5 6, substantially as set forth.

3. The inwardly-beveled flanges 7 2', in combination with the cast-iron sections, substantially as specified.

140,499.—*Closing Hatchways.*—EDWARD M. HACKETT, New York, N. Y. Application filed June 19, 1873.

As the elevator-car rises and falls a pin projecting therefrom engages a screw-shaped cam-groove attached to a vertical-journaled shaft carrying a horizontal arm, which raises and supports the hinged doors to close the opening after the passage of the car.

Claim.—The combination, with a hinged or a sliding door, the elevator C, and pin *c*, of a vertically-journaled shaft, E, spirally-grooved half-tubes F F, and arm *e*, the latter working beneath and forming a partial support for the door, and all arranged to operate in the manner and for the purpose specified.

140,500.—*Combination Lock.*—PHIDELLO W. HALL, Calvert, Tex. Application filed June 20, 1873.

A lock adapted to be used also as a latch. A pin is arranged to pass through the disk-tumblers and hold them in position, so that the bolt may be used as a latch. The said pin may also be passed through a hole in the bolt when it is desired to hold the latter in the locked position.

Claim.—1. The combination of the bolt B, disks G H, pin J, and plate K, whereby the disks may be secured when the bolt is used as a latch, or the disks and bolt secured when desired to lock the bolt, substantially as described.

2. The combination of the bolt B having lugs or projections *a a*, disks F G H, constructed as described, and secured to their respective spindles by set-screws *c c*, safety-pin J, plate K, spindles F^1 G^1, and knobs F^2 G^2, the whole constructed, arranged, and operating as described, and for the purposes set forth.

140,501.—*Cigar-Molding.*—JOHN THOMAS HENNAMAN, Baltimore, Md. Application filed May 24, 1873.

For applying the wrappers to molded filler-bunches and finishing the point, an adjustable apron is employed, fastened at its ends to a table, and passing around a roller which is free at one end, and which moves from end to end of the table, rolling the "bunch" in a bight of the apron on either side of the roller. Near the ends of the table are depressions for permitting the bunch to be inserted, and centrally on one edge of the table is arranged a gage-plate for gaging the wrapper and for supporting the same for gumming.

Claim.—1. The combination, with the apron I, of a roller, F, supported above the table without any connection from below the latter on that side on which the point of the cigar is formed, the whole arranged as herein described, to wrap a cigar while its head or point projects beyond the table and apron in convenient position for manipulation by the operator during the rolling process.

2. The combination of the roller F, the apron I adapted to form a bight on either side of said roller, and the cavities M M', all arranged substantially as herein described, for the purpose of wrapping right or left hand cigars by a movement in either direction.

3. The gage-plate H, in combination with a table, roller, and apron, constructed, arranged, and operating substantially as herein specified, for the purposes stated.

140,502.—*Hydraulic Hoisting Apparatus.*—PHILIP HINKLE, San Francisco, Cal. Application filed May 23, 1873.

The cylinders are mounted upon wheels and reciprocate upon fixed hollow piston-rods. To a cross-head fastened to the cylinders a rope or chain is attached, passing over suitable pulleys and fastened to the top of the car. The hollow piston-rods communicate by a pipe with a reservoir above the hoist-way, so that for lifting the empty cage or light loads the water can be re-used.

Claim.—1. One or more horizontal cylinders, C C, mounted upon wheels D D, and arranged to reciprocate upon the hollow piston-rods F F, substantially as and for the purpose above described.

2. The traveling horizontal cylinders C C, in combination with the fixed hollow piston-rods F F and perforated piston-head A, substantially as and for the purpose above described.

3. The fixed hollow piston-rods F F with their perforated piston-heads A, in combination with the three-way cocks *e*, the plug of which has an end delivery into the hollow piston-rods, substantially as and for the purpose above described.

4. In combination with the cage and traveling cylinders with their fixed pistons A or equivalent device, the upright pipe or pipes *r* and tank or tanks S, substantially as described, for the purpose specified.

5. The traveling cylinders C C with their centrally-pivoted pull-bar *i*, in combination with the cord, rope, or chain *j* and pulleys *k*, for the purpose specified.

6. The guide-timbers A A of an elevator-frame having the groove *c* and inside recess *b*, in combination with the H-shaped cramp-arms V and lever-bar W, substantially as and for the purpose above described.

140,503.—*Automatic Rope-Shipper.*—JOSEPH HOFFMAN, Waterbury, Conn. Application filed May 6, 1873.

To imitate a girl skipping a rope.

Claim.—1. The doll or figure E, made of superior weight below, and freely pendent at its hands, by or on the wrist-pins *b b'* of the revolving cranks C C', in combination with the clock-work B, substantially as specified.

2. The skipping-bow G, in combination with revolving cranks C C' and the figure E, of superior weight below, and pendent by its hands from or through the wrist-pins *b b'* of the cranks, essentially as herein described.

140,504.—*Railroad-Car Basket.*—JOHN F. HUDSON, East Cambridge, Mass. Application filed March 15, 1873.

A fin is formed by compressing the lower portion of the metallic tube, and the wires are passed through holes punched in this fin.

Claim.—A cross-support for the wires or bottom of a car-basket constructed from a metallic tube, a portion of which is compressed longitudinally to form a fin to sustain the basket-bottom, substantially as shown and described.

140,505.—*Sulky-Plow.*—DAVID W. HUGHES, Mexico, Mo. Application filed October 12, 1872.

The tongue is attached to a transverse bar which rises above and extends beyond the near wheel, so that the tongue may be in line with and directly above the plow-beam. The bar also supports the driver's seat. The rear of the plow-beam is adjustably supported by chain Z and lever K.

Claim.—1. In a wheel-plow, the transverse bar D, constructed and arranged and used to support the driver's seat E' and tongue C, in the manner substantially as described.

2. The bar H', braces I, beam A, plow-beam F', lever K, and chain Z, combined substantially as and for the purpose set forth.

140,506.—*Combined Wall-Protector and Towel-Rack.*—JOHN F. HUMMEL, Cincinnati, Ohio. Application filed June 9, 1873.

Suspended from the back of the cornice is an oil-cloth covered by a lace curtain. On the front of it is a towel-roll held by brackets. At each end is pivoted arms cut from the body of it, which may be turned out for use.

Claim.—A combined wall-protector and towel-rack, consisting of the supporting-bracket A, for attachment either of a curtain, H, or screen I, said bracket being provided with two pivoted and horizontally-swinging arms, B B' C C', and also with the fixed horizontal rail, rack, or bar, G, when adapted to be employed in the manner herein described, and for the purpose set forth.

140,507.—*Tailor's Measure.*—JONES AMASA JOHNSTON, Montreal, Canada. Application filed March 6, 1873.

Claim.—The square A with straight edge B and strap C, constructed substantially as described, whereby the datum lines F and G are applied to the figure, as set forth.

140,508.—*Fruit-Jar.*—AMANDA T. JONES, Clinton, Wis. Application filed June 10, 1873.

The cover has a central opening within which is a packing-shelf, and on the inside of the rim of the cover are segments which fit to flat faces on a flange, and serve to steady the cover. The hooked ends of a clamp, made with an opening in the middle and curved outward and downward from this opening, forming cams with straight edges, pass over the flattened faces of the lower flange, and when turned pass under the flange, securing the cover to the jar. The packing is held in place by a cap-plate, whose hooked ends engage with the curvature of the clamp. The plate is prevented from slipping by the straight edges of the clamp.

Claim.—1. A secondary flange, B, above the clamp-flange C, having the flat faces or recesses *b*, substantially as specified.

2. A concave-convex cover having the internal segments or swells *a* within its rim, substantially as specified.

3. The annular packing-shelf *g* within the central opening *e*, substantially as specified.

4. A clamping-bar, open in its middle portion, and provided with the outward and downward cam-curves *z*, substantially as specified.

5. A clamping-bar, open in its middle portion, and provided with the outward and downward cam-curves *z*, terminating in straight edges *u*, substantially as specified.

6. A cap, H, concave in form, and provided with the downwardly-hooked ends *n*, substantially as specified.

7. The combination of the double-flanged jar, the concave-convex and centrally-perforated cover, the packings *h* and *k*, the clamping-bar E, the cams *z*, and the hooked cap-plate H, substantially as specified.

140,509.—*Rotary Blower.*—RICHARD F. KNOX, San Francisco, Cal., assignor to PALMER, KNOX & CO., same place. Application filed December 30, 1872.

The ends of the case are constructed with removable sections, so that the interior of the apparatus can be repaired without taking the entire case apart.

Claim.—A blower constructed with the ends of the casing having removable sections, substantially as described.

140,510.—*Ribbon-Case.*—JOSEPH K. LANDIS, York township, Sandusky county, Ohio. Application filed February 15, 1873.

Is constructed polygonal in form, pivoted at its center to revolve, having a series of compartments to receive shafts, with cranks outside, over which the ribbons, &c., are wound, and the end passed through slits formed in the outer face or side of each compartment for exhibition and sale of them.

Claim.—A revolving ribbon-case, C, composed of a series of compartments, D, each provided with slits *b*, and the crank-shafts F having hooks *a*, substantially as shown and described.

140,511.—*Fruit-Packer.*—MARY E. LEWIS, Mansfield, Ohio. Application filed April 29, 1873.

The nut, which is arranged upon the upright threaded standard, is provided with curved arms, the ends of which extend downward, and are provided at such lower ends with screw-threads, upon which the pressers are operated.

Claim.—The table A, standard B, burr C, arms D, and pressers E, arranged and operated substantially as shown.

140,512.—*Fire-Extinguisher.*—CHARLES LIPPINCOTT and JAMES PATTERSON, Philadelphia, Pa. Application filed February 15, 1873.

Curved arms, arranged to fit the back of the person carrying the extinguisher, are secured to the exterior of the cylinder, thereby preventing any lateral movement.

Claim.—The curved arms H on the exterior of the apparatus, for the purpose specified.

140,513.—*Horse Hay-Rake.*—LYMAN LITCHFIELD and J. SPENCER CORBIN, Gouverneur, N. Y. Application filed June 6, 1873.

The tooth-thimble has an upwardly and rearwardly projecting hook which spans, and, by means of levers, controls the position of the teeth.

Claim.—1. The combination, with lifting-bar L fastened on holder J, and a wheel, B, connected with the latter by pivoted straps, of the foot-pin E and hand-lever device A C, operated simultaneously, as and for the purpose described.

2. A disk-wheel, B, having ratchet-teeth placed at intervals on the periphery with a smooth space between them, combined with the pawl I to operate the rake-lifting mechanism, as and for the purpose set forth.

3. The tooth-head K, consisting of sleeve *k* and standard k^2 attached together by arms k^1, as specified.

140,514.—*Windmill.*—GILES MANIE, Dixon, Ill. Application filed April 8, 1873.

Two castings with semicircular projections provided with ears, and with bolt-holes drilled through them, by means of which they are fastened together, making a circular aperture to receive a sleeve. This sleeve has shoulders formed on its upper and the under side of the aperture formed by the two castings. The sleeve receives the pumping-rod and the shifting-rod. This shifting-rod has shoulders formed to rest on either side of the sleeve, thus securely holding the pumping-rod in position, without the use of bolts or pins. The fans are also connected without the use of bolts or pins, by means of forked castings, grooved on their under sides, and provided with slot bolt-holes to receive the radial arms of the wheel.

Claim.—1. The castings C C^1, having semicircular projections C^2, ears C^3, bolt-holes C^4, and bolt C^5, in combination with the sleeve D, having shoulders D^1 D^2, hole D^3, forming a device for holding the shifting-rod and pitman or pumping rod of a windmill, substantially as described and set forth.

2. The sleeve D, provided with shoulders D^1 D^2, and a hole, D^3, in combination with the shifting-rod F having shoulders F^1 F^2 formed thereon, and locking or holding in position the pitman or pumping rod E, substantially as described and set forth.

3. The forked castings G, formed with journals G^1, knobs or projections G^2, and bolt-holes G^3, in combination with the fan-shafts I, provided with castings H, substantially as shown and described.

4. The casting M, formed in two parts M^1 M^2, projections M^3 M^4, forming a fork, and provided with bearings, in combination with the block N, journals N', and hole O^3 for the reception of the threaded ends O^2 of the brace or connecting-rods O, substantially as and for the purposes described and set forth.

5. In combination with the fan-shafts and connecting-rods and the bosses Z' A^5, connected as described, the levers L, provided at one end with forks L^2 and projections *l*, the opposite ends l^3 of such levers L passing through a mortise, A^4, in the hollow shaft A, and being connected, within such shaft A, with the upper end of the shifting-rod F, substantially as and for the purposes specified.

6. The combination of the boss A^5, flange A^3, levers L, forks L^2, main brace A^1, mortise A^4, hollow shaft A, shifting-rod F, pitman E, sleeve D, castings C C^3, and projections C^3, substantially as shown and described.

140,515.—*Molasses-Pitcher.*—EDWARD B. MANNING, West Meriden, Conn., assignor to MANNING, BOWMAN & CO., same place. Application filed March 1, 1873.

The pitcher and pouring-spout are made from the same material and in one piece. The cover has a flange projection downward on the inside. There is also an upward-projecting flange in the drip-channel, and a socket on the body of the pitcher for the handle to be attached to.

Claim.—1. In a molasses-cup having a central spout, B, and a surrounding return-channel for the drip, the cover D, provided with a flange, *c*, upon the inside, substantially as and for the purpose specified.

2. In a molasses-cup having a central spout, B, and a surrounding return-channel for the drip, the channel formed by the auxiliary flange *f*, substantially as and for the purpose described.

3. In a molasses-cup, the body of which is glass or similar material, and the neck and cover of metal, the socket E formed upon the body of the cup, and a metallic handle, F, constructed with an arm, *n*, to enter the said socket, the upper end of the handle attached to the metal neck, substantially as set forth.

140,516.—*Revolving Fire-Arm.*—JOHN M. MARLIN, New Haven, Conn. Application filed May 10, 1873.

The arbor upon which the hammer revolves is provided with a slot for holding the pawl-spring and a head for holding the hammer in place when the side plate is removed.

Claim.—The arbor C, provided with a head having a slot therein, whereby the pawl-spring and the hammer are secured, as herein set forth.

140,517.—*Bottle-Stopper.*—THOMAS J. MAYALL, Boston, Mass. Application filed July 18, 1873.

The elastic stopper is compressed laterally by a cam-lever after being inserted in the bottle, and the lever locked while in a vertical position by a spring-bolt entering a socket in the bottom of the lever, and unlocked by a key when it is desired to withdraw the cork from the bottle.

Claim.—The herein-described expansible cork or stopper, in which the lever for drawing together the heads of the cork to laterally spread the rubber or other expansible body held between them is combined with a locking device arranged to lock said lever when the latter is in the position it occupies when the cork is expanded, as herein shown and set forth.

140,518.—*Nursing-Bottle.*—THOMAS J. MAYALL, Boston, Mass. Application filed June 20, 1873.

A single stopper of wood or suitable material is turned out so as to afford a projection at each end for attaching a rubber tube, and two shoulders for holding a rubber sleeve which is slipped over the body of the stopper to pack it tight in the neck of the bottle.

Claim.—The herein-described stopper for nursing-bottles, consisting of a main body or portion formed of one piece of wood or other suitable material with top and bottom knobs for attachment of the flexible suction-tubes, a head by which the stopper can be readily handled, and a central cylindrical stem terminating in two shoulders, upon which stem is sprung a rubber sleeve clasping said stem and confined between said shoulders and constituting the stopper proper to fit the neck of the bottle, as shown and set forth.

140,519.—*Vulcanizing Rubber Belting, &c.*—THOMAS J. MAYALL, Boston, Mass. Application filed June 21, 1873.

The molds which are to form the article are attached to the steam-table and pressure-plate by means of screws and clamps, so that they may be adjusted and the upper half of the mold-lifter is lifted with the pressure-plate.

Claim.—1. In a vulcanizing-press, the combination, with the top and bottom heating jackets or plates, of removable and adjustable top and bottom mold-plates, or molds proper, and followers, attached, respectively, to the said top and bottom jackets, substantially as and for the purposes described.

2. The combination, with the steam jackets or plates provided at their ends with horizontal ledges or flanges, as described, of mold-plates, or molds proper, and followers, provided at their ends with ears holding set or binding screws, which catch under said ledges or flanges, as and for the purposes shown and set forth.

140,520.—*Apparatus for Preserving Wood.*—HENRY G. MCGONEGAL, Washington, D. C. Application filed May 20, 1873.

Consists in chutes or hoppers so arranged as to readily conduct the wood to and from a cylinder, the cylinder being mounted upon trunnions or supports so that it may be easily tilted to receive and discharge the charge of wood.

Claim.—A treating-tank, for Kyanizing or Burnettising or treating wood with chemicals to prevent decay, mounted on trunnions and capable of being tilted, as described, and for the purposes set forth.

2. The combination of a treating-tank with a chute or chutes, as described, and for the purposes set forth.

3. A treating-tank, as described, when mounted upon a vertical axis or support, by which it may be swung around to any desired point, as described, and for the purposes set forth.

140,521.—*Device for Releasing Horses from Carts.*—GEORGE H. MEIER, Cincinnati, Ohio. Application filed May 22, 1873.

The thills are divided near the body, the outer ends being secured by means of prongs on a rock-shaft engaging with a fastening-bar. The rock-shaft being turned releases the outer thills.

Claim.—In combination with the axle B *b b'*, the divided shafts D D' *d d'* E E', straps F F' *f f'*, staples G G', rock-shaft H *h h'* J, and retaining devices K *k* L, or their mechanical equivalents, for the object herein described.

140,522.—*Carpet-Stretcher.*—A. FORD MICHAEL and H. N. DUNCAN, Lockport, N. Y. Application filed April 14, 1873.

A carpet-stretcher constructed in the ordinary form of a card with its teeth, with a handle pivoted on the back of it by which it can be adjusted to different angles for convenience in the use of it, and for attaching the handle.

Claim.—The back *a* with pivoted handle *b*, strips *a*, and wire-points *c*, substantially as shown and described.

140,523.—*Hot-Air Furnaces.*—GEORGE H. MILLER, Leavenworth, Kans. Application filed May 31, 1873.

The radial chambers, through which the products of combustion pass, are so located over the dome of the furnace that the central chamber with which they connect is axially above said dome and is heated by it. In this central chamber, the movable exit-pipe, being vertically adjustable, acts as a damper. The basket-grate rests upon cleats or flanges. Its grated dumping bottom is supported by the handle journaled in the rear plate and in supports near the front of the ash-pit.

Claim.—1. A radiator having the radial chambers H and the central chamber L axially arranged over the center of the fire-pot, substantially as specified.

2. The radiator, having air-tubes M passing through its radial chambers H, smoke-inlets at the ends of said chambers, the central vertical smoke-outlet pipe, and the tubular damper or extension tube, substantially as specified.

3. The combination, with a radiator having a central smoke-pipe, of a fire-pot dome axially arranged below said radiator and the tubes G, connecting the base of said dome with the radial chambers of said radiator, substantially as specified.

4. The combination, with a removable or sliding basket-grate and a connected rotating or dumping grate, of the operating-rod and the removable journal-seat bracket, substantially as specified.

5. The horizontally-sliding or removable basket-grate and the removable rotating or dumping-bottom grate journaled at the rear of said basket-grate, and at the front of the ash-pit, substantially as specified.

6. The combination, with a radiator having chambers H, the central chamber L, and a vertical smoke-pipe, of the vertical cylindrical damper-tube sliding in said smoke-pipe, and long enough to extend to the floor of said radiator, substantially as specified.

140,524.—*Hydraulic Air-Compressing Apparatus.*—CHARLES MOORE, Jersey City, N. J., assignor of part interest to CHARLES BARCHLEY and GEORGE SOMMER, same place. Application filed May 13, 1873.

Water is alternately introduced and discharged by means of a main valve, operated by an auxiliary valve, the latter being controlled by a float which rises and falls with the water, causing the air to be alternately admitted and discharged under pressure through suitable valves.

Claim.—The combination, with the air-compressing water chamber or tank A, provided with upper air-inlet and outlet valves, of the free or independent main water-valve E and supplementary water-valve F, controlled by a float within the tank, and arranged for operation in relation with passages to keep up an automatic action of the apparatus, substantially as specified.

140,525.—*Carpet-Beater.*—WILLIAM G. MOWRY and CONRAD PULIS, New York, N. Y. Application filed May 24, 1873.

Beaters are arranged over an elastic supporting-bed and turn on a common shaft, and are exposed to the action of a spring and cam. The tails of the beaters are bifurcated. The elastic bed consists of a series of spiral springs in rails, and connected by cords.

Claim.—1. The recoil prong *f* on the rear end of the arm of a beater, B, in combination with a cam, *d*, and spring, *b*, constructed and operating substantially in the manner set forth.

2. The elastic bed C, constructed of spiral springs *g* arranged in pairs, and connected by cords or pieces of webbing, in combination with beaters B, revolving brush D, and feed-rollers *k l*, substantially as shown and described.

140,526.—*Iron Window-Shutter.*—SAMUEL B. MUNSON, Jr., Chicago, Ill. Application filed July 10, 1873.

Claim.—A window or door-shutter composed of corrugated plates combined together to form a series of vertical passages open at each end, when the upper ends of such passages communicate by means of lateral openings with the external air, substantially as and for the purpose specified.

140,527.—*Garbage-Tub.*—SAMUEL B. MUNSON, Jr., Chicago, Ill. Application filed June 6, 1873.

A tub of corrugated-metal sides, wooden and metallic bottom, secured by upper and lower hoops.

Claim.—As a new article of manufacture, the hereinbefore-described garbage-tub A, constructed of or from corrugated sheet metal, provided with the metal bands B and C, wooden bottom D, metal bottom *d*, and handles F, substantially as and for the purpose specified.

140,528.—*Key for Piano-Fortes, Organs, &c.*—ELIAS P. NEEDHAM, New York, N. Y. Application filed May 2, 1873.

Claim.—A key for organs, piano-fortes, and other musical instruments, having its upper front edge rounded off, and a veneer extending from its top continuously over such rounded edge and down its front, essentially as and for the purpose herein set forth.

140,529.—*Liquid-Cooler.*—JAMES R. NEIL, Wolcottville, Conn. Application filed May 20, 1873.

The cooling-vessel, which is set in a tub of water, is made of casings *a*, the lower ends of which are united to form an annular chamber, and the upper ends made flaring and supporting a perforated plate for directing the liquid down the sides of the casing. An annular cover or open trough is placed over the plate, and the liquid is introduced through one pipe and withdrawn through another.

Claim.—The cooling apparatus composed of the casings *a* and *b*, united together near the bottom, and formed with their upper portion flaring, in combination with the perforated plate *c* that directs the liquid to be cooled, so that it runs upon the flaring portions of such casings, as and for the purposes set forth.

140,530.—*Compound for Coating Wood and other Articles to Render them Acid-Proof.*—ROBERT NEWELL, Philadelphia, Pa., assignor to R. NEWELL & SON, same place. Application filed July 21, 1873.

1. Paraffine and wax are placed in any suitable vessel and melted or fused. 2. Resin, Burgundy pitch, and asphaltum are also placed in a suitable vessel and melted or fused. Preparations Nos. 1 and 2, in a heated state, are well incorporated with each other, after which time it is ready for use.

Claim.—The herein-described composition for the purpose described, when compounded of the ingredients in the manner and about the proportions as set forth.

140,531.—*Snap-Hook.*—OLIVER B. NORTH, New Haven, Conn., assignor to O. B. NORTH & CO., same place. Application filed May 13, 1873.

The conical chamber allows the hook and loop to be cast in their permanent positions and readily withdraw from the mold.

Claim.—In a snap-hook having the hook A and loop B in the relative position to each other, as described, a conical chamber formed in the head to receive the conical spring, the tongue E constructed with the ear F and stud *d*, the said parts being united by means of the said stud, substantially as set forth.

140,532.—*Pigeon-Trap.*—WILBUR F. PARKER, Meriden, Conn. Application filed May 23, 1873.

By projections upon the inside of the lids the plunger gives them a more vigorous throw. The plunger is prevented from shooting too far by a stop device.

Claim.—1. In a trap consisting of the hinged sides C, and a follower, E, the projection H upon the inner surface of the said sides, substantially as and for the purpose specified.

2. In a trap consisting of the hinged side C, with the projections H and follower E, a stop, L, arranged in connection with the said follower, so as to arrest the upward movement of the follower at a certain defined point, substantially as described.

140,533.—*Process of Preparing Wall-Paper.*—ARCHIBALD W. PAULL, Wheeling, W. Va. Application filed January 23, 1873.

The designs, enlarged or reduced in scale to accommodate the height of ceilings of different apartments, are photographed directly upon the wall-paper.

Claim.—The process of preparing wall-papers, substantially as above described.

140,534.—*Dumping-Car.*—JAMES G. PAYSON, Foxborough, Mass. Application filed June 14, 1873.

The dumping-boxes are moved outwardly and dumped over the edges of the truck. The elevations on the elevated portions of the tracks are designed to check the speed in dumping.

Claim.—1. The partly-horizontal and partly-curved tracks C' D, secured on the end walls of the bed-section A, in combination

with the bearing-rollers E, arranged at the rear of the dumping-section, substantially as specified.

2. The brake-protuberances Z, arranged on the convex portions C' of the tracks, in combination with the rollers E, substantially as and for the purpose specified.

3. The combination, with the tracks C' D and pinions E, of the guards U, substantially as specified.

4. The combination, with the tail-board latch *n*, of the cam N and arm J, having a suitable lifting-lug, L, substantially as specified.

5. The combination, with the dumping-section B', having a shaft, F, with end rollers, of the bed-section A, having the dumping-tracks C' D, substantially as specified.

140,535.—*Jigger for Separating Ore.*—WILLIAM H. PLUMB, Paterson, N. J., assignor to JOSEPH A. STERLING, New York, N. Y. Application filed May 6, 1873.

The adjustable ring is lowered upon the grate, the ore admitted through the funnel, and the grate vibrated. The ore adjusts itself according to gravity, after which the ring is raised a little and again fixed to vibrate with the grate. This permits the heavy matter to escape at the opening between the grate and ring into the conical receptacle while the lighter particles pass over the upper edge of the ring into the outer tub.

Claim.—1. The ore-separator, containing the reciprocating grate E in conjunction with the vertically-adjustable ring H, which ring is arranged above and nearly in line with the rim of the grate, substantially as and for the purpose specified.

2. The combination of the ring H, having the outwardly and downwardly projecting flange *d*, with the lower stationary funnel G, and the grate E, as and for the purpose set forth.

3. The yoke I connected by the nut J with the stem D of the grate, and serving to support the adjustable ring H, as set forth.

4. The tub or outer vessel A, receiving the water-supply at or near its middle and discharging the same from the top, and embracing the reciprocating grate E and adjustable ring H and stationary funnel G, as and for the purpose specified.

140,536.—*Circuit for Electric Railroad Signals.*—FRANK L. POPE, Elizabeth, N. J. Application filed May 15, 1873.

Combines with one battery several signal-stations, each having its own signal, magnets, and circuit-closers. Branch circuit from one station to station in rear reverses signal at rear station simultaneously with display of signal at forward station.

Claim.—1. The battery B, in combination with the positive and negative conductors C and Z, two or more electro-magnets, M M^1 M^2, for actuating or causing to be actuated visual or audible signals, and two or more circuit-closers, a a^1 a^2, placed at intervals along the line of a railroad, substantially as and for the purpose specified.

2. The battery B, in combination with the positive and negative conductors C and Z, two or more electro-magnets *m* m^1 m^2, for releasing or reversing visual or audible signals, and two or more circuit-closers, a^0 a^1, placed at intervals along the line of a railroad, substantially as and for the purpose specified.

3. The combination of the battery B, conductors C and Z, circuit-closer *a*, and electro-magnet M, for actuating a visual or audible signal, with the circuit-closer a^1, wires 5, 7, and 8, and electro-magnet *m*, for reversing, releasing, or stopping said signal, substantially as specified.

140,537.—*Shirt-Bosom Support.*—ISAAC M. POST, Philadelphia, Pa. Application filed November 9, 1872.

A wire-gauze frame, to be worn under the linen bosom to keep it in shape.

Claim.—As a new article of manufacture, the shirt bosom or shield, constructed of wire-gauze, as and for the purpose herein described.

140,538.—*Dress-Shield.*—ISAAC M. POST, Philadelphia, Pa. Application filed April 1, 1873.

A shield to protect the dress at the arm-pits.

Claim.—As a new article of manufacture, the wire-gauze dress-shield, constructed as shown and described.

140,539.—*Speaking-Tube.*—ANDREW RANKIN, Philadelphia, Pa. Application filed February 27, 1873.

The hinged cover of the mouth-piece of a speaking-tube is cast with two interior recesses, into which, two perforated disks being compressed, the whistle is formed.

Claim.—The combination, in a mouth-piece for speaking-tubes, of the recessed lid B, its shoulders *x x*, opening *q*, and perforated plates *n n*, all constructed and arranged as set forth.

140,540.—*Bed-Bottom.*—CLINTON VAN BUREN REEDER, San José, Cal. Application filed May 3, 1873.

A box, braced by cross-bars, incloses the springs, which are linked together, braced in the center, and hooked to staples on the inner sides of the box or frame.

Claim.—The bed-bottom herein described, consisting of the box-frame A, having the staples *b'*, the braced cross-bars B, and the double-conical spiral springs C, connected together and to the frame at both ends and middle by the hooks *a* and *b*, which hold the springs mainly in an upright position, as shown and described.

140,541.—*Ventilator and Cinder and Dust Guard for Car-Windows.*—OREN C. RIFE, North Manchester, Ind. Application filed April 26, 1873.

Fenders provided with deflectors and connected by an adjustable rod change the courses of the air-currents away from the open window. The crevices between the fenders and window are covered by angular ribs to prevent leakage.

Claim.—1. The combination of the plate B having angular rib B', the sockets *b*, and the fender C having the deflectors *c' c*, substantially as specified.

2. In a deflector for railroad cars, the plate B, having at each end the lugs *b' b'* for the reception of a pivot-rod of a fender, and the sockets *b* provided with rubber, substantially as and for the purposes set forth.

3. The fender C constructed with the deflectors *c c'*, substantially as specified, and for the purpose mentioned.

140,542.—*Typographical Printing-Plate.*—JOHN L. RINGWALT, Philadelphia, Pa. Application filed May 9, 1873.

Claim.—1. The within-described process of making plates for typographical printing—that is to say, drawing on a varnished and scored plate with resisting-varnish the picture to be produced, and then subjecting the plate to the action of acid, as set forth.

2. A typographical printing-plate on which the pictorial effect has been produced by drawing on a varnished and scored plate with resisting-varnish and subjecting the plate to the action of acid, as set forth.

140,543.—*Fire-Place.*—WILLIAM D. ROSS, New Philadelphia, Ohio. Application filed April 3, 1873.

The products of combustion may pass either laterally around the oven or directly through the flue in the center to the place of exit.

Claim.—1. The arrangement of the passages J J, flues *e e*, chamber *i*, and exit-pipe I, substantially as shown and described.

2. The combination of the casing A B, fire-place C, side passages J J, flues E E, chamber *i*, oven E, damper *d*, flue H, and pipe I, all constructed as described.

140,544.—*Water-Wheel.*—NORMAN C. ROBERTS, Waterville, N. Y. Application filed April 12, 1873.

The construction and novel arrangement of the wheel and curb or fore-bay so that the wheel can be placed either side upward, constituting it an under-draft or over-draft wheel, as may be desired.

Claim.—1. The concave or dish-shaped water-guide E having the peripheral portion F inclined to correspond with the angle of the bucket of the wheel secured on the inner wall, and extending outward, leaving a continuous opening, *h'*, between its outer edge and the edge of the outer wall, substantially as specified.

2. The combination, with the water-guide E having a central opening, A, larger in diameter than the shaft *m*, of the shaft and the removable shouldered step *k*, substantially as specified.

3. The wheel, consisting of the upper plate H having the convex center and the annular concavity near its circumference merging into the inclined edge *s*, the lower conical annular plate I parallel with the part *s* of the upper plate and the upwardly and inwardly inclined curved partitions *n*, substantially as specified.

4. The combination, with the concave water-guide E having a free edge, *g*, of the wheel having the buckets inclined at an angle corresponding to the angle of the water-guide, and the fore-bay having a rising helical bottom, an inner scroll-shaped wall, and an outer circular wall, of different heights, substantially as specified.

5. The gate, consisting of the shaft N, the cylinder-plate T, and the sector-shaped arms U, substantially as specified.

6. The combination of a gate having arms extending from the operating-shaft across the spout to the closing plate T, with the spout recessed in its top and bottom and in each side, substantially as specified.

140,545.—*Car-Coupling.*—SILAS ROGERS, London, England, assignor of one-half his right to JOHN COATSWORTH, same place. Application filed September 14, 1872.

The bolt F, when it is thrust between the rear ends of the coupling-hooks, allows them to be forced back by the projecting links until they reach the slots in said links; they are then thrown into the slots by the springs E. The hooks, being squared on one side of their rear ends, are held against the draft by the bolt F. Uncoupling is effected by withdrawing the bolt, when the hooks are free to be drawn forward.

Claim.—In combination with the hook or hooks D, working in connection with the springs E, the bolt F, and the links C, the rock-shaft A, levers I, and slotted arm or wheel G, all constructed and arranged substantially as set forth.

140,546.—*Wash-Boiler Attachment.*—ISABELLA C. SCHRAMM, Des Moines, Iowa. Application filed November 15, 1872.

A sheet-metal plate is made to conform to the shape of a wash-boiler; the central part is depressed, and perforated bars extend across the depression; feet are attached to the under side.

Claim.—A washing device, composed of the plate A A with fixed feet *a a*, and a depressed perforated center, and a series of bars, 1 2 3 4, over the depressed part, substantially as described, and for the purposes specified.

140,547.—*Music-Stand.*—OSCAR SCHULZE, St. Louis, Mo. Application filed June 4, 1873.

The standard is constructed on the "lazy-tongs" principle, and, by extending it, the base is expanded and the book-rest is opened.

Claim.—The combination of expanding base A B C, extension-standard composed of bars *d*, and automatically-opening book-rest frame E F H I, substantially as set forth.

140,548.—*Hand-Trunk and Hat-Box.*—QUINCY A. SCOTT, Pittsburg, Pa. Application filed June 4, 1873.

An elliptical-shaped hand-trunk has a hat-box in one end and a separate compartment in the other for wearing apparel. The annular space between the hat-box and the outer portion or covering of the trunk is arranged for the reception of linen, &c.

Claim.—1. A combined hand-trunk and hat-box, provided at one end with the main compartment C, and at the other end with the separate hat compartment or box D, substantially as described.

2. A hand-trunk provided with a main compartment, C, the separate hat compartment or box D and the annular compartment D^1 outside of and surrounding the hat-box, as described.

3. In a combined hand-trunk and hat-box, A, the compartments C D D^1 D^2, arranged substantially as described.

140,549.—*Cut-Off and Regulating-Cock for Gas.*—CHARLES E. SEAL, Winchester, Va., assignor of one-half his right to EDWIN F. BROOKS, Baltimore, Md. Application filed May 23, 1873.

A valve which is held to its seat by means of a spiral spring is operated from any part of a building by a bell-crank-lever, to the upper extremity of which is attached a dog, serving to hold the valve at any desired distance from its seat by operating into notches in a ratchet-wheel thereto attached.

Claim.—The valve B having stem *b'*, valve-chamber A, and connecting-rod L, combined with the lever G and ratchet and pawl mechanism I H *h'*, arranged as and for the purpose described.

140,550.—*Cooking-Range.*—NATHANIEL M. SIMONDS, St. Louis, Mo. Application filed April 16, 1873.

A pipe or chamber, open at both ends, extends from one side of the range over the fire-chamber and to the opposite side. On its upper part the top plates of the range rest; in its lower side, over the fire, are openings to allow air to flow in to aid combustion.

Claim.—1. The bearing-bar F, extending the whole length of the range, and having interior passage or air-flue *f*, to allow a current or currents of air to pass therethrough, substantially as and for the purpose set forth.

2. In combination with hollow bearing-bar F, the orifices *f''* and deflector G, arranged substantially as set forth.

3. The combination of the longitudinal hollow bearing-bar F and top plates, made in two portions, H H', receiving support at the middle upon the bearing-bar, substantially as set forth.

140,551.—*Wheel-Plow.*—HENRY M. SKINNER, Rockford, Ill., assignor to CHESTER C. BRIGGS and ABRAHAM L. ENOCH. Application filed March 29, 1873.

The plow is mounted upon two wheels. The forward end of the beam is controlled by a self-locking lever fulcrumed upon the tongue, and the rear end of the beam is raised by a lever mounted upon the axle-tree. One of the wheels is adjustable in height.

Claim.—1. The self-tilting plow-beam and hinged tongue, in combination with the tilting locking-lever I, operating substantially as described.

2. The combination of evener M with the forward end of the tilting plow-beam, and with the pivoted tongue, by means of the chain N, as and for the purpose described.

3. The angular stub axle-plate A^1, made adjustable on the axle-bar, as and for the purpose set forth.

4. The adjustable colter-standard R, in combination with the adjustable supporting-plates *s* provided with slots with knife-edge pivot-bearings *s'* formed on them, as described.

140,552.—*Wheel for Vehicles.*—GEORGE W. SMITH, Darlington, Wis. Application filed July 11, 1872.

One of the hub-shells is fixed on the conical end of the box, and the other is adjustable on the cylindrical end.

Claim.—The axle-sleeve A, the periphery of which forms the frustum of a cone from the spokes outward and a cylinder from the spokes inward, in combination with the hollow collars C C' having corresponding bearing-surfaces, and vertical spoke-bearing surface having the rim c^1 and nut c^2, substantially as shown and described.

140,553.—*Stove-Pipe Thimble.*—HENRY SMITH, Southington, Conn., assignor to himself and PECK, STOW & WILCOX COMPANY, same place. Application filed February 14, 1873.

The interior face of the thimble is corrugated, and the projections thereof impinge upon the stove-pipe and hold it in place, and in the spaces between the pipe and the inside of the thimble air circulates. The thimble is divided into two parts so that it can be easily packed for shipping.

Claim.—1. The thimble A, corrugated as described, whereby a single wall performs a double office, substantially as specified.

2. And in combination with the subject-matter of claim 1, the register C *b*, substantially as and for the purpose described.

3. The longitudinal halves *d d* of the thimble A, when arranged so as to be detached and nested together for packing, substantially as described.

140,554.—*Wire-Gage.*—HENRY SMITH, Southington, Conn. Application filed January 27, 1873.

A disk having a spiral or snail-like contour is pivoted to an overhanging index or caliper arm, so as to give a varying distance between such arm and the circumference of the disk as it is rotated. A series of radial graduations on the disk serves to indicate the space or distance at each point of rotation.

Claim.—1. The improved caliper herein shown, consisting of the cam-plate A and its arm B, relatively arranged substantially as and for the purpose described.

2. In combination with the subject-matter of claim 1, the index *c* and a scale, substantially as and for the purpose described.

140,555.—*Check-Hook.*—AUSTIN V. M. SPRAGUE, Rochester, N. Y. Application filed April 8, 1873.

Claim.—The spring C arranged within the hook B and having a curvature, *a*, corresponding thereto, so as to leave a space, *b*, for the check-rein, said spring being provided at its free end with an upwardly-projecting curve, *c*, for the purpose of guiding the rein into the hook, substantially as described.

140,556.—*Bale-Tie.*—WILLIAM C. STIFF, Birmingham, England. Application filed June 11, 1873.

Claim.—A loop or eye for bands or hoops for baling cotton or other substances, substantially such as herein described and illustrated in Figs. 7, 14, 15, 16 of the accompanying drawing, said loop or eye being formed from a portion of the band, or from a separate piece, bent and fashioned in the manner shown and set forth.

140,557.—*Ruffler for Sewing-Machines.*—MARSHALL J. STOLL, Middletown, Conn. Application filed June 4, 1873.

The serrated surface on the sliding bar has four motions as an ordinary feeding device, and will ruffle a piece of material passing over the separator, and the usual feeding device of the machine will ruffle a second piece under the separator.

Claim.—As an attachment for under-feed sewing-machines, the supporting-plate A having the sliding bar D arranged thereon, and the said bar provided with serrations or other feeding-surface *a*, and receiving a combined up and down forward-and-back movement from the needle-arm through the lever E in connection with the said needle-bar, and combined with the separator C.

140,558.—*Washing-Machine.*—LYMAN H. STROBRIDGE, Naples, N. Y. Application filed May 6, 1873.

Is constructed with a connecting-rod to the rubber by a pivot in each side, operating in a curve in the rod, and extending to its connection, which is passed through spiral springs and connected to the cross-bar at the top. On the outer part of the rod is the handle, held by a turn in the rod, which is constructed from one piece or rod by bending. To the uprights connected with the rubber are attached loops, by which it may be suspended or raised from the lower bed of rolls.

Claim.—1. The combined spring push-rods B B and oscillating arms C C, formed of one continuous rod or piece of wire, in combination with rubber A and vibrating arms D D, substantially as set forth.

2. The combined spring push-rods B B and oscillating arms C C, arranged so as to have a pivotal connection with the rubber A and with the slotted ends of the vibrating arms D D, in combination with the stop-pins *d* and *e e*, the whole constructed and arranged substantially as and for the purpose set forth.

3. The wire-holders J J, having a pivotal connection with the standards G G, in combination with one or more headed pins, *n n*, attached to the sides of the box, substantially as set forth.

140,559.—*Manufacture of Superphosphate of Lime.*—BENJAMIN TANNER, New Brighton, England. Application filed July 20, 1871.

Phosphate of lime is made into a solution by the use of hydrochloric or phosphoric acid or mixtures thereof, and so continues until dried. The chloride of sodium and calcium produced is decomposed into sulphate or oxalate of lime, or otherwise utilized. The sulphuric acid is added to, and acts upon, chloride of calcium. The sulphate of lime thereby formed is separated from the liquor, which subsequently yields superphosphate.

Claim.—The process for production of superphosphate of lime, consisting of the several steps in their order of succession, substantially as described.

140,560.—*Detached-Lever Escapement.*—SILAS B. TERRY, Waterbury, Conn., assignor to THE TERRY CLOCK COMPANY, same place. Application filed December 20, 1872.

The arm or lever attached to the escapement-pallets consists of a thin plate with a bent fork or crotch at its extremity, and placed at right angles to the plane of the balance-wheel, so as to be elastic toward the balance-staff, while rigid enough laterally to transmit the oscillations of the pallet-arms. Two recessed stops receive and hold the said elastic lever at each side in position to receive in its fork the free pin of the balance-wheel.

Claim.—In combination with the detached lever N, made elastic, and its axis of vibration at right angles to the axis of the balance, and the balance E, the stops P and P', constructed and arranged to arrest and hold the said lever before the balance has completed its movement in either direction, substantially as described.

140,561.—*Pipe-Wrench.*—GEORGE WARSOP, Queen's Road, Nottingham, England, assignor to JAMES B. WAYNE, Detroit, Mich. Application filed February 3, 1873.

The lever is formed with a hook at one end, and is transversely slotted at the base of the hook to receive an adjustable serrated jaw which slides in the slot at a right angle with the lever.

Claim.—A pipe-wrench having the hook-headed lever A *a'* provided with the slot *a*, and the serrated jaw B *b*, and set-screw *c*, constructed substantially as herein shown and described.

140,562.—*Corn-Planter.*—ZACHARIAH D. WATERS, Brookville, Md. Application filed May 20, 1873.

A rectangular frame carries the furrow-openers and the seed-box, which has a seed-slide in the bottom. The seed-slide is moved outwardly by means of pins upon one of the wheels operating a lever, a weighted arm moving it to its original position for receiving seed.

Claim.—1. The combination of the disk *a* on the off wheel, pins *b'*, swinging arm A, slotted link *c*, as coacting devices for rocking the bar B, provided with a standard, *i*, and weights C and *s*, each constructed and all arranged substantially as shown and described.

2. The combination of the dropper L, having the mouth *l'*, and the India-rubber spring K, seated in the corn-box D, constructed and arranged substantially as and for the purpose described and set forth.

3. The combination of the dropper L, having the mouth *l'*, and

the said India-rubber buffer W, constructed and arranged substantially as shown and described, for the purpose set forth.

4. The combination of the dropper L, link I, corn-box D, and rocking bar B, substantially as and for the purpose above set forth.

5. The combination of the crooked lever I, the spring-catch *n'*, lever F, link P, beam E, and standard E', each constructed and all arranged substantially as and for the purpose set forth.

140,563.—*Harrow.*—GEORGE WATT, Richmond, Va. Application filed May 16, 1873.

Claim.—A harrow, pulverizer, or cultivator composed of the spaced bars A A B and a series of chains, E, connected by loop-links F, and held in position by cross-bars D D, as described.

140,564.—*Caster-Bottle.*—AUGUST WEBER, Newark, N. J. Application filed May 14, 1873.

The bottle has a screw-cap, through which passes a plunger-rod actuated by a spring. In the bottom of the bottle is a cylinder with a nipple, through which the sauce is ejected.

Claim.—The bottle *a*, screw-cap *c*, rod *d*, spring *i* and piston *h*, in combination with the cylinder *s* and nipple *r*, as and for the purposes set forth.

140,565.—*Drop-Light for Chandeliers.*—NAPOLEON W. WILLIAMS, Philadelphia, Pa., assignor to WILLIAM C. BAKER, same place. Application filed April 3, 1873.

A ball upon the end of sliding pipe receives the rubber connection-tube. The clamping device consists of a slotted curved spring to which dogs are pivoted. These dogs have plane faces to bear against the faces of the polygonal sliding pipe.

Claim.—1. A friction-clamp to hold sliding tube F, consisting of a curved plate-spring having a dog pivoted in each end thereof, as and for the purpose described.

2. The dogs that act upon the slide F, made with plane faces A A, as and for the purpose set forth.

140,566.—*Mop, Wringer, and Scrubber Combined.*—WILLIAM R. WINTER, Cedar Falls, Iowa. Application filed May 10, 1873.

A triangular frame with two rollers at the front; to the first is attached a mop-cloth; behind the rollers is a pan; and in the rear of that a brush.

Claim.—The combination of the mop roller E, wringer-roller E', water-pan D, and scrubbing-brush C, substantially as specified.

140,567.—*Die for Making Sheet-Lead.*—NELSON YORK, Boston, Mass. Application filed March 26, 1873.

The die-plate has a linear slot of length and breadth equal to the width and thickness desired of the sheet to be made, and may be in one piece, or of two pieces joined longitudinally, but so, in either case, as to be confined in the recess of the block by wedges at the sides.

Claim.—1. The combination of a slotted and recessed die-holder with a linearly-slotted die-blank, each relatively constructed from end to end for the die-blank to be wedged in the recess of die-block, substantially as herein described, for the purpose specified.

2. In combination with a slotted and recessed die-holder, constructed as described, a die-blank made in two parts, from end to end, and otherwise constructed and adapted to secure a slot through the same, substantially as set forth.

REISSUE PATENTS.

5,468.—*Machine for Dressing Tiles.*—GEORGE BARNEY, Swanton, Vt., and VALENTINE G. HARNEY, Charles City, Iowa.—Patent No. 107,435, dated September 20, 1870. Application filed March 15, 1873.

Above a horizontal revolving dressing-disk are arranged the horizontally and vertically operating frames, with a device for clamping the tile while dressing the sides or squaring the edges thereof. A device for feeding sand and water to the disk is also arranged in such a manner that it discharges the same upon the disk at a point near its center.

Claim.—1. In a tile-dressing machine, the combination of an adjustable weight with a frame having an up-and-down movement, and containing a mechanism for clutching the tile edgewise, substantially as described.

2. The combination, with the rotary grinding-disk A, of the horizontally-moving frame F, and the vertically-moving frame I, the frames F and I being arranged for holding the tile to be acted upon by the disk, all substantially as specified.

3. The combination, with the frame I, of the shaft M, crank L, link K, and weighted lever O, arranged for moving the frame I vertically, substantially as specified.

4. The combination, with the vertical holder S on the frame I, of a clamping-bar, T, and clamping-head, and a presser, the clamping-head and presser being provided with friction-rollers to admit of the adjustment of the stone when being clamped up to the vertical support S, substantially as specified.

5. The arrangement of the bar S for adjustment at its upper end relatively with the bed A, substantially in the manner described.

6. The arrangement of the presser U for adjustment on the diagonal bar V, substantially as specified.

7. The combination, with the angle-plate *a b*, of the roller *f* and spring *e*, substantially as specified.

8. The combination, with the bar T made adjustable as to length, and with the angle-plate *a b*, of the roller *f*, spring *e*, and plate *d*, substantially as specified.

9. The combination, with the block U, of the roller *g*, substantially as specified.

10. The combination, with the rollers *g* and block U, of the yoke *h*, springs *k* and *l*, all substantially as specified.

11. The combination, with the disk A, of the disk *n*, spindle *p*, clamping-bars *s''*, spring-handle *t*, and ratchet-bar *w*, substantially as specified.

12. The adjustable connection of the clamping-bars *s''* with the lever *t*, by means of the pins *w²* and the spring *y*, substantially as specified.

13. The feeding-trough A' having the adjustable oblique hinged bottom and water-trough, all arranged for operation substantially as specified.

5,469.—*Ornamented Pencil-Case.*—EPHRAIM S. JOHNSON, Jersey City, N. J.—Patent No. 121,627, dated December 5, 1871; reissue No. 5,134, dated November 5, 1872. Application filed March 25, 1873.

The barrel of a pencil is ornamented with stripe of mother-of-pearl secured by cement.

Claim.—A pencil-case ornamented with longitudinal slabs of mother-of-pearl or other ornamental material secured to the surface of a metallic tube, *a*, as herein shown and described.

5,470.—*Upright Piano.*—G. C. MANNER, New York, N. Y.—Patent No. 97,943, dated December 14, 1869. Application filed January 8, 1879.

The strings are inclined from the upper front to the bottom of the frame rearward. The action is arranged in front and sounds the strings near their upper portion. The sound-board is bowed forward toward the strings, and the frame is firmly constructed to resist their tension.

Claim.—1. In an upright piano having its strings inclined downward from the upper front to the rear, arranged above and below the key-board and in front of the sounding-board, the hammers C placed near the upper end of said strings and pivoted back of the striking-point of said hammers, substantially as and for the purpose set forth.

2. The supporting-beams D, placed so that their ends occupy points between the front and rear sides of the top and bottom pieces, substantially as and for the object explained.

3. The frame E, provided with the concave rabbet *e''*, for the purpose of giving the sounding-board a bellying form, substantially as and for the object specified.

5,471.—*Apparatus for the Manufacture of Pasteboard.*—HENRY L. PALMER, Stillwater, N. Y., assignor to EDWARD W. O'NEILL and MAURICE FITZGIBBONS.—Patent No. 87,350, dated March 2, 1869; reissue No. 4,951, dated June 18, 1872. Application filed December 20, 1872.

A web of thin paper is led between rolls C and D, receiving paste from the former, which is in contact with a roll running in a paste-vat, and, thus coated, joins a web conducted directly through the machine, being combined therewith between two pressing-rolls, from which it is carried forward upon an endless apron under a drying cylinder to and between knives, which cut it into sheets.

Claim.—1. The combination of paste-reservoir A, paste-roller B, paste-distributing roller C, pressing-rollers D and L, with drying-cylinder H, substantially as and for the uses and purposes above described.

2. The combination of paste-reservoir A, paste-roller B, paste-distributing roller C, pressing-rollers D and L, drying-cylinder H, with cutting-knives K and K', substantially as and for the uses and purposes above described.

5,472.—*Wood-Screw Machine.*—CYRUS B. F. TINGLEY, Pawtucket, R. I., assignor to WILLIAM H. HASKELL.—Patent No. 123,307, dated January 30, 1872. Application filed June 2, 1873.

The die A^6 threads the body of the blank. Cutter-block d^2, pivoted to and moving with the die-stock, carries on one side two cutters for pointing the blank as they are drawn beneath it, and upon the other side one cutter for finishing the point when moving in the opposite direction—the tool-stock being tilted in opposite directions alternately by the lever F, whose extremity passes alternately underneath and over the loose cam-block *g* lying within a slot, f^1, in a stationary plate, G.

Claim.—1. The combination, substantially as described, in a screw-cutting machine, of the threading-dies A^5 with a vibrating tool-holder, d^2, furnished with threading-tools *d d'*, and a finishing tool or tools, *i*, when such tools are arranged to act alternately as the screw advances or retreats through the dies in cutting and dressing the thread upon the point, as herein set forth.

2. The automatic rising and falling cam *g*, in combination with the plate G having the slot *f* and the enlarged space f^1, for the purpose of guiding the tool-post of a machine for threading gimlet-pointed screws, substantially as specified.

3. In a screw-threading machine, the combination, with the plate or bracket G having the slot *f* and beveled enlargement f^1, of the cam-block *g*, vibrating tool-holder, and arm F, substantially as specified.

5,473.—*Railway Frog.*—JOSEPH WOOD, Red Bank, N. J., assignor of one-half interest to E. R. BENNETT.—Patent No. 34,022, dated December 24, 1861. Application filed March 31, 1873.

The curved wings of the frog are moved by the flange of the wheel so as to accommodate the line upon which the wheel is traveling. The side rails rest upon a metallic plate, to which the point is riveted. A metallic block is placed between the rails of the point to give them rigidity.

Claim.—1. A railroad frog having wings *k* and *l* connected to each other, and constructed so that such wings are moved automatically by the flanges of the wheels when passing through it, substantially as shown and described.

2. A railroad frog with the point *n* riveted to a plate, substantially as described.

3. A railroad frog having a plate, *o*, upon which the side rails rest, and to which the point *n* is riveted.

4. The bolt *m* passing through the point *n* and fastened to the frog-bars *k* and *l*, substantially as shown and described.

5. A railroad frog with a block, *p*, placed between the rails of the point and secured thereto, substantially as and for the purposes shown and described.

5,474.—*Manufacture of Sheet Iron.*—W. DEWEES WOOD, McKeesport, Pa.—Patent No. 137,585, dated April 8, 1873. Application filed June 18, 1873.

Claim.—In the process of finishing sheet-iron, the combination of the following steps: First, coating the sheets separately with a mixture of graphite, or other carbonaceous matter ground in oil; second, rolling and annealing; and third, hammering in packs while cold, substantially as set forth.

5,475.—*Hand-Nailer for Lasting Boots and Shoes.*—WILLIAM E. FISCHER, Boston, assignor, by mesne assignments, to CHARLES H THANK, Lynn, and FRANCIS GOULD, Boston, Mass.—Patent No. 90,650, dated June 1, 1869. Application filed June 14, 1873.

The cylinder, in descending, first brings the stationary cutter between the end nail or tooth and the next adjacent one of the nail-blank, and then forces the lever against the feed-spring or pawl, carrying it back into position to again feed forward. The continued descent of the cylinder separates the nail, when the driver forces it into its place.

Claim.—1. The combination of a stationary cutter, a sliding nail-blank holder, and a sliding nail-driver, when arranged to operate substantially as described.

2. A machine for cutting and driving nails, in which the nail-blank is composed of a series of shank forming teeth, united at top, each tooth being severed from the blank, (to be driven,) substantially as described.

3. The feed-spring or spring-pawl, operating to present the end of the nail-blank to the action of the cutter, substantially as described.

4. The nail blank, formed of metal, and having a head-forming bar, *p*, from which project the tapering shank-forming teeth *o*.

5,476.—*Apparatus for Transmitting Motion.*—ALBERT H. KENNEDY, Brunswick, assignor, by mesne assignments, to J. M. SEGUR, Akron, Ohio.—Patent No. 52,293, dated January 30, 1866; reissue No. 2,615, dated May 14, 1867. Application filed June 13, 1873.

A large wheel turned by a crank, a band therefrom turning a pulley at a distance, the pulley being journaled at the end of a shaft, within the bisected arm of which shaft the large wheel is journaled, a rear extension of which arm is held by a coiled spring beneath, so that the pulley may rise or fall. To the shaft of this pulley is attached a coiled metallic shaft, which is the medium for transmitting power, being yielding so as to act when measurably bowed, and extensible so that the instrument at its end may be applied to different parts of the object upon which it is to act.

Claim.—1. In a machine or apparatus for transmitting power for operating mechanical implements directed by hand, a flexible shaft, composed of a spirally-coiled wire, operating in a rotating or torsional movement, and having one end attached to the operating mechanism, while the other end is free to move in any direction at the will of the operator, substantially as set forth.

2. In a machine for transmitting power for operating mechanical implements directed by hand, the combination of the stand A, hinged extended arm C C', pulleys B and E with belt or cord, and spring D, substantially as described.

3. The combination of the coiled-wire shaft G, pulleys B and E with belt and cord, and arm C.

4. The machine herein described, consisting of an upright stand with vertical arms supporting a shaft operated by a crank or its equivalent, and embracing a driving-wheel or pulley for imparting motion to a smaller pulley, in combination with an arm hinged to the said shaft, and extending in opposite directions therefrom, and having said smaller pulley carried on its longer end, which pulley communicates with a coiled-wire flexible shaft, and also having a spring connected to its shorter end for holding it in position, substantially as described.

5,477.—*Machine for Shearing Sheep.*—ALBERT H. KENNEDY, Brunswick, assignor, by mesne assignments, to J. M. SEGUR, Akron, Ohio.—Patent No. 59,293, dated January 30, 1866; reissue No. 2,615, dated May 14, 1867.—Division B. Application filed June 13, 1873.

A tool to be operated by the apparatus No. 5,476, and constituting a shearing-instrument, which may be described as a coarse comb with shear-edged teeth, a cutting-blade reciprocating upon these teeth so as to act with them in excising the hair or wool standing between said teeth, this blade being operated at the rear of the comb-like tool, through a wrist-wheel and a slotted lever, from the coiled power-transmitting apparatus herein referred to.

Claim.—The cutting instrument or shears composed of the fingers K, blade J, slotted lever I, and wrist-wheel H *c*, in combination with the coiled-wire shafts G and the operating mechanism, substantially as and for the purpose set forth.

5,478.—*Umbrella-Runner.*—OREN M. SMITH, Philadelphia, Pa.—Patent No. 116,767, dated July 4, 1871. Application filed May 20, 1873.

Claim.—1. The disk A, having a flange, *d*, and radial arms *b* formed with partly straight and partly tapering sides, with intervening slots of similar character, the tapering ends of said arms being bent inwardly at an acute angle, as shown in Fig. 5 of the drawing, the whole constructed and constituting a device of the particular form described and shown, for the purpose set forth.

2. The head of an umbrella runner or notch, composed of two metal disks cut, bent, and secured to a tube, substantially in the manner described.

INDEX OF INVENTIONS PATENTED JULY 1, 1873.

	Class No.	Whole No.
Acid proof, compound for coating wood, &c, to render them, R. Newell	35	140,530
Air, apparatus for cooling, F. D. Kingan	58	140,375
Air compressing apparatus, hydraulic, C. Moore	12	140,534
Anemometer, electrical, F. S. Baldwin	101	140,340
Atmosphere, apparatus for moistening the, J. G. Garland	167	140,410
Bag machine, N. Biedinger	100	140,342
Bale tie, W. C. Saff	7	140,556
Bark extracts, apparatus for leaching and concentrating, P. M. Church	167	140,409
Barrel hoops, staple for securing the ends of, H. Ogborn	40	140,430
Barrel transporter, J. Griffing	79	140,364
Beams and columns, connection for wrought iron, A. Bonzano	4	140,455
Bed bottom, D. Frankfoder	62	140,492
Bed bottom, E. W. Quincy	62	140,367
Bed bottom, C. V. B. Reeder	62	140 540
Bedstead, sofa, J. Beiersdorf	62	140,453
Bee hive, D. L. Grover	9	140,497
Bee keepers, protecting mask for, L. C. Huff	9	140,417
Belt fastener, A. Hyde	23	140,419
Belting, &c., vulcanizing rubber, T. J. Mayall	84	140,519
Belting, hose, &c., plate for vulcanizing, D. C. Gately	81	140,494
Bench, joiner's work, H. White	29	140,394
Blower, rotary, R. F. Knox	12	140,509
Boiler attachment, wash, I. C. Schramm	136	140,546
Boiler, wash, A. Becker	136	140,398
Boiler, wash, M. J. Clapper	136	140,479
Boiler, wash, W. J. Thomas	136	140,444
Boilers, water feeder for, H. C. Bristol	118	140,462
Bolt and rivet cutter, Cone and Polder	100	140 605
Book support, R. B. Hindle	146	140 399
Boot b'acking kit S Van Glider	16	140,447
Boot tree, O. V. Elliott	16	140,490
Bout and shoe nailer, Blake and Libby	16	140,400
Boots and shoes, hand nailer for lasting, W. E. Fischer, (reissue)	16	5,475
Boring bit, S. Hipkins	29	140,370
Bottle, caster, A. Weber	84	140,564
Bottle, nursing, T. J. Mayall	156	140,518
Bottle stopper, T. J. Mayall	1	140,517
Bottles, cap or cover for, J. G. Chillingworth	1	140,346
Bridge, truss, Clarke, Bonzano, and Griffen	21	140,471
Brush, tooth, T. D. and W. O'Donoghue	161	140,429
Bucket, well, C. F. Stites	118	140 439
Buckle, trace, T. Brownlee	72	140,463
Buggies, shifting top for, R. C. Diehl	31	140 351
Burner, tar and petroleum, J. Burns	149	140 465
Cane juice, apparatus for treating, G. C. Taylor	155	140,443
Car basket, railroad, J. F. Hudson	121	140,504
Car brake, railroad, G. W. Crowe	152	140,349
Car coupling, S. Rogers	122	140,545
Car, dumping, J. G. Payson	31	140,534
Car wheel, A. Atwood	123	140,339
Car windows, ventilator and cinder and dust guard for, O. C. Rife	166	140 541
Card grinding machine, T. C. Kirkham	28	140,376
Carpet beater, Mowry and Pulis	62	140,525
Carpet stretcher, Michael and Duncan	62	140,528
Chair and step ladder, combined, B. F. Green	62	140,363
Chandelier drop light, R. Cornelius	64	140,347
Chandelier drop light, R. Cornelius	64	140,348
Chandelier drop light, N. W. Williams	64	140,565
Chandelier, sliding or extension, J. Brannen	64	140,430
Churn, reciprocating, Thompson and Mahurin	45	140,445
Cigar machine, J. T. Hennaman	160	140,501
Clothes wringer, Brooks and Hartzell	91	140,344
Cock, compression, E. Allt	148	140,337
Coffin plate, G. Brabrook	139	140,457
Cooler, liquid, J. R. Neil	58	140,589
Cotton gin, B. D. Gullett	41	140,365
Cultivator, J. W. Doud	43	140,484
Cultivator, Elwood and Pitcher	43	140,353
Cultivator, Simpson and Ellacott	43	140,447
Dash board bag, S. Hipkins	31	140,416
Drawers, device for locking a series of, W. F. Daly	92	140,481
Dress protector, A. Herrmann	38	140 415
Dress shield, I. M. Post	38	140 538
Drill and bit stock, C. H. Amidon	29	140,451
Drills, guide and core barrel for revolving rock, G. Frisbee	124	140,357
Edge tools, hardening, L. W. Stuart	49	140,300
Elevating machine, G. A. Dupuis	79	140,4e5
Elevator, C. W. Collyer	78	140,473
Engine governor, E. Bnes	69	140,467
Engine governor, J. Heady	69	140,414
Engine, rotary steam, Leaver and Wock	150	140,378
Envelope, L. Gliebrick	146	140,496
Fire arm, revolving, J. M. Marlin	123	140,516
Fire extinguisher, Lippincott and Patterson	35	140,512
Fire place, W. R. Robb	154	140,543

Floor, fire proof tile, W. L. Drake	4	140,359
Fruit packer, M. E. Lewis	63	140,511
Fuel, manufacture of artificial, D. Barker	61	140,452
Funnel, W. B. Crother	167	140,350
Furnace, hot air, G. H. Miller	154	140,523
Gas, cut off and regulating cock for, C. E. Seal	64	140 549
Gas engine blower, J. H Bean	12	140 397
Gate, automatic, G. C. Crum	52	140 479
Glazier's tool, S. G. Monce	68	140,426
Gun barrels, attaching the fore end stock to, Deeley and Edge	55	140,482
Hame fastening, E. Covert	72	140,475
Harness fastening E. Covert	72	140,474
Harness pad, M. W. Pond	72	140,364
Harness pad, M. W. Pond	72	140,365
Harrow, A. C. Carnes	73	140 403
Harrow, G. Watt	73	140,563
Harvester and thrasher combined, J. H. Adamson	74	140,396
Hat steaming apparatus, C. W. Banta	76	140,341
Hatchways, closing, E. M. Hackett	30	140 499
Heating apparatus, compressed air, H. Bushnell	154	140 6?
Heel trimming machine, E. U. Jones	16	140 420
Hinge, J. W. Wood	24	140,449
Hoisting apparatus, D. Knowles	79	140 421
Hoisting apparatus, hydraulic, P. Hinkle	79	140,502
Hoisting apparatus, portable and adjustable	79	140,497
Hook, check, A. V. M. Spragne	72	140 555
Hook, snap, O. B. North	23	140,53?
Horses from carts, releasing, G. H. Meier	31	140,521
Hose coupling, J. W. Kennedy	167	140 374
Hubs to axles, attaching, O. F. Shepard	31	140,389
India rubber rings, manufacture of, Collins and Longden	84	140,472
Iron chips, &c., for remelting, preparing, A. Povey	85	140,383
Iron, manufacture of sheet, W. D. Wood, (reissue)	136	5,474
Jar, fruit, A. T. Jones	58	140,508
Kiln, brick, D. Blocher	10	140,343
Ladder, step, C. Frizell	30	140,358
Lamp, naval store room or coach, J. J. Walton	90	140,448
Lead die for making sheet, N. York	125	140,567
Leather working tool, J. S. Alexander	92	140,336
Levees, inclined way for building, J. Bradford	82	140,458
Lever escapement, detached, S. B. Terry	36	140,560
Lime, manufacture of superphosphate of, M. Tanner	96	140,559
Lock, combination, P. W. Hall	93	140,500
Lock for doors, &c., T. Kromer	93	140,577
Lock, seal, G. R Dunn	93	140,486
Log turner, J. W. Pool	130	140,3?6
Loom shedding mechanism, G. Crompton	95	140,496
Mallet, S. M. Willis	29	140 395
Mask for bee keepers, protecting, L. C. Huff	9	140 417
Medical compound, A. Fuqua	98	140,408
Mop, wringer, and scrubber combined, W. R. Winter	92	140,566
Motion, apparatus for transmitting, A. H. Kennedy, (reissue)	67	5,476
Motor, rotary fluid, H. Q. Hawley	118	140,367
Music stand, O. Schulze	146	140,547
Neck tie fastener, J. A. Hard	38	140,412
Offal and manufacturing gas, treating, J. Turner	96	140,391
Oil tool extractor, Beckley and Lawrence	124	140,345
Ore crushing stamp, J. M. McFarland	3	140,425
Ore, jigger for separating, W. H. Plumb	3	140,535
Organ stop action, reed, I. T. Packard	106	140,381
Paper machines, belt guide for, R Hutton	108	140,418
Paper, preparing wall, A. W. Paull	109	140,533
Pasteboard, manufacture of, H. L. Palmer, (reissue)	108	5,471
Pen holder, A. T. Cross	146	140,478
Pencil case, A. T. Cross	146	140,477
Pencil case, ornamented, E. S. Johnson, (reissue)	146	5,469
Photographs, roller press for polishing, N. S. Bowdish	111	140,456
Piano actions, Newman and Anderson	112	140 428
Piano-fortes, organs, &c., key for, E. P. Needham	112	140,528
Piano tuning key, A. H. Affleck	112	140,450
Piano, upright, G. C Manner, (reissue)	112	5,470
Pitcher, molasses, E B. Manning	88	140,515
Planter, corn, Fulghum and Lawrence	133	140,493
Planter, corn, E. Parmentier	133	140,532
Planter, corn, Z D. Waters	133	140,562
Plow, L. R. Richardson	114	140,434
Plow gang, M. S Curtiss	114	140,460
Plow handles, machinery for making, A. B. Farquhar	173	140,355
Plow, subsoil, G. B. Brimingham	114	140,460
Plow, sulky, D. W. Hughes	114	140 505
Plow, wheel, H. M Skinner	114	140 551
Printers' galley, side stick for, R. B. Hendle	117	140,368
Printing plate, typographical, J. L. Ringwalt	117	140,542
Propeller for vessels, chain, T. W. Carter	139	140,4 8
Pruning shears, J. G Rogers	63	140 388
Railroad frog, J. Wood, (reissue)	120	5,473
Railroad signals, circuit for electric, F. L. Pope	50	140,536
Railroad switch, street, J. E. Pattison	120	140,433
Railroad tie, iron, C. W. Gulick	120	140,411
Rake, horse hay, Litchfield and Corbin	77	140,513
Range, cooking, M. M. Simons	154	140,550
Ribbon case, J. K. Landis	54	140,510
Rings, die for enlarging and sizing plain finger, G. Kremonts	86	140,422
Rings, die for manufacturing plain finger, G. Kremonts	86	140,423
Roofing composition, Haight and Gladding	126	140,366
Rope skipper, automatic, J. Hoffman	143	140,563
Sad iron, W. P. Dodson	91	140,483
Saw attachment, J. Giblin	130	140,495
Saw filing machine, W. B. Bissell	13?	140,399
Saw mills dog for circular, J. Taber	131	140,442
saw set G. Swenson	131	140 441
Scraper, rotary hog, R. Fyfe	25	140,409
Screw machine, wood, C. B. F. Tingley, (reissue)	171	5,472
sewing machine, E. D. Smith	134	140 438
Sewing machine, cloth holder, L. A. Dupré	134	140 406
Sewing machine ruffler, M. J. Stoll	134	140,557
Sewing machine table and chair combined, L. N. B. Gray	134	140,362
Shearing sheep, machine for, A. H. Kennedy, (reissue)	144	5 477
Shirt bosom, J. Pagan	38	140,431
Shirt bosom support and shoulder brace combined, S. F. Long	38	140,379
Shirt bosom supporter, G. F. Johnson	38	140,373
shirt bosom supporter, L M. Post	38	140 537
Shutter, iron window, S. B. Munson, Jr	24	140,526
Smoking tube, A. Gedies	160	140 360
Speaking tube, A. Rankin	158	140,539
Spike extractor, A. F. Jackson	29	140,371
Spring, door, A. Tittman	24	140,446
Stalk cutter, B. R. Harness	73	140 413
Stove pipe shelf and drum, combined, T. Bladon	154	140,454
Stove pipe thimble, H. Smith	154	140 553
Stove platform, W. Westlake	154	140,393
Stove, reservoir cooking, Fales and Seabury	154	140,354
Sugar cane, extracting saccharine matter from, M. S. Bringier	155	140,461
Sugar into blocks, machine for cutting, Brunjes and Benneckendorf	155	150,464
Sugar stirrer, maple, F. B Graves	155	140,361
Table, extension W. Valentin	63	140 392
Table, ironing, Frankenfield and Kichline	91	140 356
Tailor's measure, J. A. Johnston	34	140,507
Tassel, G E. Jenkins	17	140,372
Telegraph, printing, T. A. Edison	50	140,487
Telegraph, printing, T. A. Edison	50	140,488
Telegraphs, circuit for printing, T. A. Edison	50	140,489
Thill coupling, A. J. Patterson	31	140,382
Thrashing machine, Ellis, Hoffman, and Lee	159	140,491
Thrashing machine, F. R. and W. O. Sutton	159	140,440
tiles, machine for dressing, G. and V. G. Barney, (reissue)	153	5,468
Toy, L. Bryan	143	140,402
Toy money box, R. Frisbie	143	140,358
Trap, pig on, W. F. Parker	143	140,532
Trunk and hat box, hand, Q. A. Scott	164	140,548
Trunk fastener, J Arnold	162	140,338
Tub, garbage, S. B. Munson Jr	68	140,527
Tunnels, &c., metallic arch for, J. Groves	82	140,498
Type, W. Shaw	164	140,436
Umbrella runner, O. M. Smith, (reissue)	165	5,478
Valve, stop, G. W. Eddy	152	140 407
Vehicle wheel, G. W. Smith	31	140,552
Ventilator and cinder and dust guard for car windows, O. C. Rife	166	140,541
Vise, D. S. Coe	100	140,404
Vulcanizing rubber belting, &c., T. J. Mayall	84	140,519
Wall protector and towel rack combined, J. F. Hummel	62	140,506
Washing machine, S. Martin	91	140,380
Washing machine, W. M. Rowland	91	140,435
Washing machine, L. H. Strobridge	91	140,558
Watch case caps and backs, die for making, S. C. Lewis	36	140,424
Water wheel, O. J. Bollinger	168	140,401
Water wheel, N. C. Roberts	168	140,544
Windmill, G. Mabie	118	140 514
Wire cage, H. Smith	97	140,554
Wood, apparatus for preserving, H. G. McGonegal	35	140,530
Wood, &c., to render them acid proof, compound for coating, R. Newell	35	140 530
Wrench, pipe, G. Warsop	100	140,561

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED JULY 1, 1873.

Adamson, J. H., Combined harvester and thrasher	140,396
Affleck, A. H , Piano tuning key	140,450
Alexander, J. S., Leather working tool	140,336
Allt, E., Compression cock	140 317
Ames, G, assignee	140,390
Amidon, C. H., Drill and bit stock	140 451
Anderson and Newman	140 428
Arn ld, J., Trunk fastener	140,338
Atwood, A., Car wheel	140,339
Barchler, C., assignee	140,524
Baker, W. C., assignee	140 565
Baldwin, F. S., Electrical anemometer	140 340
Banta, C. W., Apparatus for steaming hats	140,341
Barker, D., Manufacturing artificial feel	140,452
Barney, G. and V. G , Machine for dressing tiles, (reissue)	5 468
Bean, J. H., Blower for gas engines	140,397
Becker, A., Wash boiler	140,398
Beiersdorf, J., Sofa bedstead	140,453
Benneckendorf and Brunjes	140,464
Bennett, E. E., assignee, (reissue)	5,473
Biedinger, N., Bag machine	140,342
Bissell, W. B., Saw filing machine	140,399
Bladon, T., Combined stove pipe shelf and drum	140,454
Blake, L. R., and A. S. Libby, Nailing boots and shoes	140,400
Blocher, D., Brick kiln	140,343
Bollinger, O. J., Water wheel	140,401
Bonzano, A., Connection for wrought iron beams and columns	140,455
Bonzano, Griffen, and Clarke	140,471
Bowdish, N. S., Roller press for polishing photographs	140,456
Brabrook, G., Coffin plate	140,457
Bradford, J., Inclined way for building levees	140 458
Brannen, J., Sliding or extension chandelier	140,459
Briggs, C. C., assignee	140 551
Brimingham, G. B., Subsoil plow	140,460
Bringier, M. S., Extracting saccharine matter from sugar cane	140,461
Bristol, H. C., Water feed for boilers	140,462
Brooks, E. F., assignee	140,549
Brooks, W. P., and J. D. Hartford, Clothes wringer	140,344
Brownlee, T., Trace buckle	140,463
Brunjes, P. O., and A. Benneckendorf, Cutting sugar into blocks	140,464
Bryan, L., Toy	140,402
Buckley, S., and P. H. Lawrence, Oil tool extractor	140 345
Budenberg, A., assignee	140,467
Burns, J., Tar and petroleum burner	140,465
Bushnell, H., Compressed air heating apparatus	140,466
Buss, E., Governor for engines	140,467
Carnes, A. C., Harrow	140,403

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 31, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks) 6,500
SEWING-MACHINES and attachments 2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes 4,000
PRINTING; including presses, type, and printers' furniture. 2,500
CARRIAGE-WHEELS; including hubs, spokes, tires, and axles 1,200
FELTING and HATS; including caps, bonnets, flock, &c. 1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments) 1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs 1,400
CARRIAGES and WAGONS; (excepting wheels, hubs, and axles) (in progress.)

BOUND VOLUMES OF PATENTS.

The Office is now prepared to furnish to subscribers the monthly volumes of patents at $125.00 per annum, bound in half-sheep.

In these volumes the specifications are in full, the type of the same size as the printed patents and records; the drawings are in full, but are one-half the size (linear) of those attached to the patents and bound up for record; the illustrations are four on a page, but *fac-similes* of the originals, with the headings and signatures.

The volumes are the same size as the patents and the OFFICIAL GAZETTE, and have an average of 800 pages of specifications, 260 of drawings; total of each volume about 1,060 pages. They commenced with the issue of July 2, 1872, being the successors in this form of the weekly volumes of patents published under the joint resolution of Congress, passed January 11, 1871, which discontinued the publication of the illustrated annual report of the Commissioner of Patents, and provided for the publication in lieu thereof of complete copies of the specifications and drawings of patents issued subsequently to June 30, 1869. Under this resolution the volumes were to be placed for free public inspection in the capital of each State and Territory of the United States, and in the clerk's office of certain of the federal courts. The Commissioner is also authorized by the resolution to "furnish a complete set of such specifications and drawings to any public library which will pay for binding the same into volumes to correspond with those in the Patent Office, and for the transportation of the same, and which shall also provide proper custody for the same, with convenient access for the public thereto, under such regulations as the Commissioner shall deem reasonable."

After filling the requisition as provided above, a surplus remains which the Commissioner now offers at the rate of $125.00 per annum—say, 1,060 pages per month: 9,600 pages of specifications, 3,120 pages of drawings—12,720 pages.

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 4.—NO. 2. TUESDAY, JULY 8, 1873. PRICE { $6,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1873 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—SOUTHERN DISTRICT OF OHIO.

[It is evident from the remarks made by the learned judge in the two following decisions that they are addressed exclusively to those who are familiar with the circumstances of the two cases, and they will be found almost unintelligible to others. It has only been with great difficulty that some of the points determined have been eliminated so as to be embraced in the syllabus, and others it has been found impracticable to understand sufficiently for that purpose.]

P. H. AND F. M. ROOTS *vs.* WILLIAM G. HYNDMAN.

A patent for a rotary blower-case, of which the interior and certain specified parts are rendered true by means of plaster of Paris, "or its described equivalent," and which describes as an equivalent a material capable of being made plastic when applied, and becoming hard in a suitable time, is infringed by the use of litharge and glycerine for the same purpose.

The novelty of the device is not impeached because a pump was before known lined with molten metal.

Nor because others have, by means somewhat similar, made the abutments in such a machine true, those not being specified in the claims.

A claim for "a rotary blowing-case having concave arcs, in combination with end plates arranged so as to admit of the abutments being introduced or removed without requiring the case to be taken apart," held to mean so much of the case as incloses the operative parts, and that it was infringed by a case cast in two parts, of which one included only the legs and such portions as performed none of the functions of the machine, and on removing it the abutments could be introduced or removed.

[*James Moore*, counsel for complainants.
Wood & Boyd, counsel for respondent.]

In an action for injunction to restrain infringement of reissued letters patent, granted P. H. & F. M. Roots, for cases for rotary blowers, dated July 27, 1869, wherein the inventors were complainants and William G. Hyndman respondent, in the United States Circuit Court for the Southern District of Ohio, before Justice Swayne and Judges Emmons and Swing, the following opinion, upon final hearing, was delivered June 11, 1873:

The four claims of the patent which were in controversy are as follows:

"1. A rotary blower-case, the interior of which is rendered true and accurate by means of plaster of Paris, or its described equivalent, applied substantially as described.

"2. A rotary blower-case, the ends or heads of which are rendered true and accurate by means of plaster of Paris, or its described equivalent, applied substantially as described.

"3. A rotary blower-case, the concaves or arcs of circles of which are rendered true and accurate by the use of plaster of Paris, or its described equivalent, applied substantially as described.

"4. A rotary blower-case having concave arcs B B, in combination with end plates I I, arranged so as to admit of the abutments being introduced or removed without requiring the case to taken apart, substantially as set forth."

EMMONS, *J.*:

What is said is much influenced by the course of the argument, and more intended to meet the objections of defendant than as a full consideration of the case.

An independent treatment of the patent would assume a more brief and somewhat different form.

The first three claims are for a rotary blower-case, the interior of which is rendered true by means of plaster of Paris, or its described equivalent, applied substantially as described.

The difference between the three need not be noticed.

The described equivalent, we think, includes the material used by the defendant. The patent speaks of "plaster of Paris or other similar substance," and again of "plaster of Paris, hydraulic cement, or other material having the properties above referred to." These "similar substances," with "properties above referred to," are understood to mean the property of being rendered plastic for the purpose of application in the described mode, and of "hardening" or "ceasing to be plastic" in such conditions and in such time as accomplishes the purpose desired. It does not refer to the chemical constituents of the material. They are indifferent to the objects aimed at, and cannot be supposed to have been in the mind of the patentee.

Nor do we think the description of the mode in which

the substance is to harden, "by the evaporation or fixation of its water," confines complainants to substances which are hardened in that way only. The words already referred to—"that is, ceases to be plastic"—immediately follow, and enlarge the meaning. And whether there is or not some evaporation or fixation of water in the process of hardening litharge and glycerine, we do not deem it necessary to determine. Little aid is given us for such a judgment in this record. We should say such effect was in some degree involved, if necessary for this judgment. But it is not rested upon such an assumption. The adoption of any plastic material which will harden in the conditions described, which may be applied as described, for the precise purposes described, and accomplishing all the results described, we hold, under our construction of these three claims, will infringe them. An improvement in the material itself, and a patent for that, is a different matter. But the substances used by the defendant we do not think had even the merit of novelty in this department of the arts. It would seem to have been described as a cement and filling long before employed by the defendant. This, however, is unimportant, save as slightly influencing such a construction of the claim as would protect it from so obvious a substitute.

A mechanic who could not, so far as this feature is concerned, line defendant's machine, with complainants' models and specifications before him, and the knowledge which familiar publications afforded him of the properties of glycerine and litharge, would hardly be entitled to be called such. We think the case clearly within the familiar rule which makes the use of a readily-adopted and well-known substitute an infringement.

The Evans pump lined with molten metal does not antedate for many reasons. In the arts it is not known as a plastic material. It is incapable of application in the mode described, and cannot, by the same or even analogous instrumentalities, make true the machines in controversy.

The evidence of Overton fails to show the use of a plastic material, applied as described in complainants' patent, in such mode as to avoid the necessity of boring and planing iron cases. It affords only an illustration of how long the mechanical world will stand with all the elements of a great improvement in its hands, placing them in almost the conditions demanded for its realization and yet stop just short of the desired end. Overton manifestly did not know of, or in the least approximate the idea of saving the great labor of planing cast-iron head plates or boring cylinders. He went on doing both. We cannot take time to criticise his somewhat extraordinary testimony. It must, however, be understood and some of its literalisms limited by the leading fact that he never employed the complainants' discovery for the purposes or in the manner described, and which are the obvious and best, if not the only ones an intelligent mechanic would employ the moment the idea was suggested. It might be doubtful whether a man had the complainants' idea if there was no proof on the subject at all; but when you show that he is engaged in the very department of production where it is most important; see him with the means in his hands to employ it if he knew how; and for years manufacturing in a different mode, with less accuracy and at greater expense, then, upon any principle of action, this is conclusive that this one man at least did not possess the idea. Overton placed his fans so near the arcs as to render complainants' process impossible. The most he could do was to use a brush, and he swears he is sure he never in that mode put upon his arcs more than one-eighth of an inch. It is most manifest even such thickness was never in that way applied. Plumbago and varnish in such mixture as to render smoothly from a brush would require many applications to assume such a thickness. Besides, in cross-answer thirty-one, this witness concedes it was the experimental substances only he put on with a brush. He says the invariable material used upon all marketed machines was plumbago and varnish, and adds: "It was the other substances I applied with a brush." Substantially his knowledge and use of plastic materials was confined to truing the abutments and reaping the accidental benefits by way of lubrication of such portions as flew off from them by centrifugal motion.

The views expressed in reference to the direct use by Overton of plastic material to true the cylinders and end plates sufficiently answer the other somewhat closely-related position, that its use for the abutments only was so near in principle as to constitute a prior use. That the one did not suggest the other in fact, in the circumstances of the case, is considered sufficient evidence that it was so unlike in principle as not to antedate the first three claims.

The testimony of Williams very properly has been but little pressed. The use of a heated substance with a syringe bears little resemblance to either the mode or the material of complainants.

The fourth claim is more difficult of construction, so as to include defendant's machines. We all agree, however, that an application of that liberality which should be adopted for the protection of what is believed to be a meritorious and useful invention, one never before used and industriously sought to be infringed since, will extend it to include what defendant has done. It would not be difficult to show he uses what complainants really invented—the shortened arcs and all their benefits; the labor is to bring it within the claim which so prominently speaks of an arrangement permitting the removal of the abutments without taking the case apart. The argument submitted turns upon what we shall include in this word *case*. The legal answer to this is that which the patent by its words and necessary implications gives. That tells us the case, the thing which it has discovered, may be cast in one piece; is to have its arcs slightly more than one-fourth of a circle; that these are to be on one side of the axis; and the head-pieces correspondingly shortened and located. This is the device which *may* be so cast as to enable the abutments to be removed without taking apart these shortened arcs and these shortened end plates. Just this the defendant has so cast. All which he takes off without separation is described, and no more.

This patent does not assert as a necessary condition that the arcs shall be cast in one piece. It enumerates among the benefits this capacity as a result only of the invention. But it also as distinctly asserts that "in our large blowers we do *not* cast the case in a single piece."

It is not said, nor do we think it implied, that the small ones *must* be so made. It is not true that if not so constructed the essential character of the invention is omitted. A machine in all respects like the complainants', with the exception of a useless division of the shortened arcs by casting them in two pieces, would be an infringement without any doubt whatever. The leading idea is the apparently simple, when once pointed out, but wholly novel and useful fact, that a blower is more efficient when its arcs are but a little more than a quarter of a circle than when made in the mode universally employed before by carrying them uselessly down far below the axis of the shaft. Material was thus wasted; the manufacture and truing of the interior was more difficult in whatever mode it was done; the machine was far less effective, and produced counter-currents at and narrowed the air-feed; and was less readily repaired and more easily got out of order. These benefits are not necessary to the support of the patent, but they illustrate its principle; and when clearly perceived as resulting from the invention, impose on the court the duty of avoiding if possible an interpretation which will hand them all over to an infringer because he has cast the blower-case in *one piece*, and the *frame or standard* upon which it rests in another. Substantially, and within the spirit of the claim, these are what the defendant divides. He does so without taking his case apart. That remains intact still, substantially as complainants describe it. The patent declares that to remove them the journal-boxing must come off. Besides this, all that the defendant removes is an inconsiderable portion of the head-piece so readily and without a particle of invention attached to the standard as not to take it out of the domain of infringement. All the rest of the severed part is as independent of the case or arcs as are the legs on which it stands. It was conceded that to take complainants' device with it shortened arcs and enlarged opening so as to secure all its benefits, severing only its legs, would be a manifest infringement. They would be no part of the case. If so a line must be drawn somewhere. That can be intelligently done only by making it include all which perform any function; all which may rightfully be called a part of the arcs and case, as distinguished from standard table or support. Here what defendant removes performs no office in the operation of blowing. It is added solely to produce a formal diversity. No additional pistons are added. It would be useless to do so, as complainants' discovery shows.

That the slot arrangement cannot be considered as indispensable by the terms of the specification, would seem clear from the fact that it declares the cases are sometimes to be made in two pieces. When so made, then such an arrangement is impossible, or at least it would be so utterly useless as not to be contemplated by the patent. This consideration is quite conclusive, that when the fourth claim demands an arrangement which will allow the abutments to be removed without taking the case apart, it means such a taking apart only as would divide the operative parts of the machine, leaving such a separation as defendant makes within the meaning of the claim. This reading is necessary in order to save in any degree that part of the patent which refers to making the cases in separate parts. What is meant when all is read together is simply this: When the machines are small I cast case, table or standard, and legs all together. If large, so as to render this too cumbersome, I cast them in two or more pieces, making the division just as the defendant has made his.

We have carefully read defendant's original and supplemental briefs, and see nothing which modifies these views.

[*Delivered April* 16, 1873.]

THE UNION PAPER-BAG CO. *vs.* NIXON & CO.

A specification is not fatally defective because it does not mention such modifications as practical use would readily suggest in order to render the machine efficient, such as employing a weight or a spring, or changing the dimensions of the parts.

Nor because it does not mention a cam on the main shaft, and the arms and connecting-rod, which are all necessary to give the proper reciprocating movement to the pasting-rollers on a paper-bag machine, they being devices which any mechanic would introduce of his own accord.

Nor because the office of giving motion to the pasting-rollers is attributed to another cam on the shaft, which is incapable of performing it, since any mechanic would know that another cam is necessary for the purpose, as well as its form, and where it should be placed.

Drawings of the bags indicated in the patent of a paper bag machine by which they are produced may be annexed to a reissue of the patent, although they were not to the original.

Because other United States Courts have decided that certain words constitute under the circumstances a claim to a principle, they are not necessarily to be so construed in all cases.

Claims which can be construed to embrace meritorious combinations and devices will not be construed to embrace a principle, and to be therefore void, though they are capable of being so interpreted.

Where the bar on which the tube is supported in a paper-bag machine has the lower side extended beyond the upper, so that the lower side of the tube will be cut off with a lap to form the bottom of the bag, a claim for a combination of several of the devices employed, which enumerates among the rest "machinery for cutting the tube slantwise, as specified, while it is on the former or holder, and machinery for pasting or cementing the said tube near its front end, and bending or lapping the end of the tube on the cemented part so as to form the bottom of the bag," was held to embrace the extension of the lower side of the bar.

Such a claim is infringed by the use of such a supporting-bar, although turned upside down, and made with its rear end smaller than the rest, and without the cutting edges or the rollers that carry forward and paste the paper.

A claim for "arranging the pitch-line of the feeding-gear in, or about in, the prolongation of the axis of the shaft of its crank, whereby we obtain intermittent and variable motions of the paper, as described," held to be a combination claim, and to include the roller which works in the supporting-bar and the devices for carrying forward the paper, and giving it tension while it is severed, though they are not specified.

A patent for making the frame of a paper-bag machine adjustable upon its bed by means of a slot and screw, is infringed by making the frame so heavy as to be held in place by its weight.

A claim for creasing-rollers in a paper-bag machine, in combination with other devices, is infringed by rounded bars or hooks working in a similar combination with the same effect.

An alternative claim to only one or the other of two things, but to neither positively, is void; but a claim to each of two things, whichever is used, is valid.

[*James Moore*, respondent's counsel.]

EMMONS, *J.*:

It is due to counsel and the court to say that while examining this case we have been unable personally to

peruse either the briefs or the record. Wholly unaccustomed to labor through the reading of others, and unable to make the memoranda which long habit renders a necessity, we have found it impossible to dictate with anything like satisfaction even the outlines of conclusions. These circumstances forbid all attempts to verify by citations the legal conclusions we announce. It must be apparent that in these circumstances we must have less confidence in the general result.

The objection that the specifications of the Rice patent are so imperfect that a working machine could not be made from them, has given us much trouble. Various criticisms of the experts, which assert the impracticability of the described machine, without certain readily-perceived additions, are not among those which have created doubt. The necessity for a spring, a weight, a slight difference of mere dimensions, or other quite obvious modifications which practical use may suggest to make the machine more efficient, would not render invalid otherwise sufficient specifications; certainly not if it would work without them. Here, however, an important device, without which it could not operate at all, is wholly omitted. An intelligent assistant and expert are unable to find it in either the specifications or the photo-lithographic copies of the Patent Office drawings. To this precise defect the complainant's counsel directed the attention of neither of his expert witnesses, nor has he referred to it in argument. It is rested upon the general unreasoned assertion of Renwick & Morgan, that from the specifications and drawings they could make an operative machine.

Four cams on the main shaft are indispensable. Stated in the order in which they occur, the first moves the presser-bar; the second the pasting-knife; the third gives the reciprocating motion to the pasting-rollers and the devices connected with them; and the fourth, the severing-blade. That which is required to give this motion to the pasting-rollers is wholly omitted. This error is accompanied by another, which refers to the cam which moves the presser-bar, as the one which is to perform the function of that which is not described at all. Such an office by it is impossible; another cam on the main shaft for this purpose is necessary. The specifications and drawings are to a scale. The exact reciprocating movement required for these bottom pasting-rolls and accompanying devices is given, and the location of the cam on the main shaft to impart it is in no degree doubtful. A hundred intelligent mechanics would all, necessarily, from data given, locate it in the same place. Its shape and dimensions result from mathematical calculations, well understood by all educated mechanics. The arms and connecting-rod, in order to enable it to perform its office, are among the most familiar devices, and we cannot agree with the experts who have sworn so pointedly that invention would be necessary to supply the omitted features. There is no other instrumentality, except this cam, arms, and connecting-rod, which would suggest themselves to a builder by which this omission could be supplied. They are so common and obvious they would be inserted by a mechanic as readily as a driver would put the fourth wheel on the naked axle of his coach.

It is objected that the reissue of the Rice patent is void because it contains new matter. Four drawings, representing bags to be manufactured by the machine, which did not accompany the original patent, are referred to as bringing the case within the rule. These forms were clearly *indicated* by the original specification, and may be legally added to the drawings of the reissue.

It was presented in this connection in the brief, and, therefore, somewhat out of order, we have referred to the objection that the original patent was for a machine and the reissue for a principle, and therefore void. It is of no consequence, so far as this question is concerned, that the original patent is different; it may illustrate the argument, but is of no other consequence. Our judgment upon other points with sufficient fullness shows that we do not consider any of the claims in the latter subject to such an objection. That they *may* be so construed, without violence to language, is clear. That some judgments of authority have so rendered nearly equivalent words is conceded. It is a mere matter of construction. Did the solicitor *intend* to make a void or a lawful claim? The decisions leave this to be decided in view of the art, the character of the machine, the entire specifications, drawings, and claims. Few cases constitute precedents for others. Because in a particular case other tribunals, co-ordinate or appellate, have decided that certain words, when used in connection with their accompanying incidents, did impart a claim for a result or principle, another tribunal should not treat these judgments as setting up formulas in all circumstances involving a similar meaning. They assert no such rule. All go upon a full critical review of the accompanying facts in reference to which they have been used, excluding the idea that other courts are not to perform the same duty. Words identical should be rendered as diversely as the conditions in which they are employed demand, in order not to defeat the fairly-presumed intention of those who use them. Applying to these claims the rules of interpretation applicable to all other instruments, we do not think that construction necessary which renders them void. Being capable of a different reading, and these being in fact a novel meritorious set of combinations and devices for the accomplishment of a result to which they *may* be referred, we understand it to be a duty to give them such a reference.

It is said the first claim of the Rice patent is for the machine, technically so-called, and demanding for its validity the novelty of all its parts. It is held to be a combination claim.

It is conceded that if the second claim is for a supporting-bar, with its end distended and shaped so as to enable the oblique cut to sever the tube and form a lap for the bottom of the bag, then it is not antedated. That we so construe it will more fully appear hereafter. It is only when held to be a former, without more, that there is any claim it is not novel. This objection is not sustained.

The third claim of the Rice patent, it is alleged, is also antedated. If it is construed to include only the eccentric spur-wheel and its fellows on the side of the machine, and the shaft connected therewith, then it was suggested to Pettee by Morgan, and taken from Willis' Principles of Mechanism, p. 256. It is, however, a combination claim, including the roller which works in the supporting-bar, and the devices more immediately concerned in carrying forward the paper and giving it tension while it is severed. So construed, it is not claimed to be old.

It is also argued in this connection that as Rice knew this eccentric cog-wheel was old, it avoids his whole patent. This objection is disposed of by our construction of the claim. It is not for the mechanism he knew to be old. The fourth claim has been abandoned by the complainants.

The first claim of the Rice patent, as construed, is not infringed by the Morgan machine. It is unnecessary to refer to other features than the omission of the intermittent feed motion and the substitution of the revolving instead of reciprocating knife.

That the second claim of the Rice patent is not infringed, has been argued with great pertinacity and extended discussion. Were we considering the case in much more fortunate circumstances, all its details could not be dealt with. In the present unfortunate condition but little more than conclusions can be stated.

This claim is for the bar only, *not* for the *former* or any of the pulleys and other devices which in the accidents of its association in the Rice machine are mechanically connected with it. It does not form the tube, and, what is unnecessary for the purposes of this judgment to say, no part here claimed even aids in doing so. Decrease the size of the bar over the forming device to that of the defendant's, and the tube will still be formed; and if not no such property in the bar is claimed. It is for a bar *around* which a tube may be formed, and *not* for one which will form it. Nor is this mere literalism. Four leading features are required. First, that it be sustained in place at a point so far removed from the forming device, no matter what that may be, as to enable the paper to be gradually bent into a tube, that the connection with the bed or table which sustains it in place shall be on the same side of the bar where the side lap of the tube is formed and pasted, so that the forward movement of the material may meet with no obstruction upon the top, along which it proceeds; that this point of support, which sustains it in place, shall be in the rear of the locality where the tube is completed by being united and pasted; and it must also have an end of sufficient size to distend the tube for severing, so as to form the lap for the bottom of the bag. These conditions are all found in the defendants' bar, and all the others in every machine before us. They are all necessary to enable a tube to be formed *around* it, to travel unobstructedly its whole length while being formed on its passage by other collateral devices, and, arriving at the distended end, to be severed without waste, to form the desired lap. The essence inheres in the conditions which give it this capacity. The contrivances to accomplish it are as ingenious as they have been beneficial to the public. Turning the bars upside down upon a bed or table, making its dimensions from the head backward smaller, omitting the cutting-edges, and the other alterations by the defendants, do not escape infringement. The side guides on the Morgan machine, the rollers that work by the side of the bar instead of through it, the rollers in the Rice bar, the fact that by its weight or spring it presses these rollers on others beneath them, to pinch, carry forward, and paste the paper, we do not consider as included in this claim. It reaches in no way to these devices intended to perform collateral functions. The bar around which a tube may be formed and so held in place with its tube-distending end, and in connection with which it may without waste be severed in a direction to create a lap, is all which is claimed. Just such a bar, literally, the defendants use. The patent would enable them to make it. The seeming differences all depend upon the other and collateral devices for pasting, forming, carrying forward, and completing the bag. Remove all these from both bars, and with the wholly immaterial diversity of lessened dimensions in the rear of the all-important head, it is identical in function, form, and mode of operation.

It is admitted that while the defendants used what is called the Rice machine, they infringed the first, second, and third claims of that patent.

There is much proof to show that the Pettee patent is antedated. With some hesitation we overrule the objection as to all the claims, save the eighth and ninth.

The defendants' testimony to show want of novelty in the first, second, third, and fourth claims is very strong. Without a description of the machinery, the relation of the parties, the transfers of title, the condition and interest of each witness at the time he testifies, and a multitude of circumstances which we cannot reproduce, a minute analysis of the testimony would be unintelligible. That which annexes all these devices to the Morgan machine early in September, 1860, is the most formidable. There is much quite as positive in character to show that they were all on the Armstrong machine when Pettee was introduced to it, before the date of his own invention. Much of the conflict might naturally result from imperfect memory, while other portions, on one side or the other, are undeniably corrupt.

Substantially, and without exact accuracy, the history out of which this part of the contest springs is as follows:

The condition of the art in 1860 materially affects this question of fact. In the latter part of August in that year Morgan, being the assignee of the Rice patent, worked in Philadelphia a machine like his model, and which was an improvement of the former by the addition of the revolving knife. For *this* he obtained a patent in 1863, without making any claim to these devices. Armstrong, the other person alleged to have invented them at the same time and at the same place, was working a machine, and, as we think, without them. It severed the tube with the lap, but had no apparatus for pasting and finishing the bottom of the bag. September 1, in that year, he made a contract with Pettee to add machinery for that purpose, and to share with him any patent which might be procured for their joint invention. He then had pending an application for a patent in which no right is asserted to anything contained in these claims. He was entitled to one-half of the Pettee patent, which does claim them, and, we infer, promoted its procurement. We have not examined the proof in this regard, but it was conceded at the bar that he took a license under it. We assume, also, he participated in and reaped a part of the benefit of its transfer to these complainants. Immediately after the date of the contract, September 1, 1860, Pettee entered upon the work of improving Armstrong's machine, and swears circumstantially that he added the devices in question. He alone, of all those

who are asserted to be the inventors, claimed and procured a patent for them. We conclude the facts are what all this public action by Morgan, Armstrong, and Pettee indicate, that each invented what he claimed, and was not the inventor of what he omitted to claim. Each knew of the action of the other. There is a large amount of most significant action in regard to this question since the granting of the patents. All of it is in harmony with our theory. The oaths of some of these parties, and the irrational explanations by which they attempt to account for passively resigning to another what they knew they were entitled to, are incredible.

In reference to the eighth and ninth claims of the Pettee patent, the respondents' testimony is full, that the pasting-knife and the other devices connected with it were used by Morgan before their adoption by Pettee. Nothing in the least contradicts this. We reluctantly hold that these two claims were antedated. We say reluctantly, because there is much which raises the supposition that if attention had been directed to these devices as pointedly as to those included in the first, second, third, and fourth claims, the result would have been the same. We may be mistaken, but there seems to be an implication in the argument that the plaintiff's evidence does include them. However this may be, the conclusions from the record as it is can but be as declared.

The first and second claims of the Pettee patent are infringed. It is argued by the defendants that they include only the slot and screw which fastens the bottom of the frame to the bed, and are not therefore infringed, unless some mechanical device is employed to effect that purpose. The defendants' frames are held in place by their own weight only. The essence of these two claims, and substantially of the first four, is the quality of adjustability. This is the subject of a patent, so far as it is embodied in practical instrumentalities to make it operative. The patentee will be protected from obvious modes, readily adopted without invention, for accomplishing the same end. A screw, a cord, weight, either laid upon or included in a heavier construction of the frames, or other obvious modes which would hold them in place while at work, and secure adjustability, would infringe the patent. They would cease to do so only when they accomplished it in a mode which requires such invention as to be the subject of a patent. The defendant has not escaped infringement by making his frames so heavy that they will lay in position without a slot and screw. He has so secured them to the table as to obtain adjustability within the meaning of these claims.

The third claim is for the combination of adjustable forming-rollers with a creasing pulley or pulleys. The defendants, in their industrious changes, in order to avail themselves of this feature of adjustability, have successively adopted different forms of creasing apparatus in combination with the guides or formers. We think them all infringements. The last resort, and that most earnestly defended, is two rounded bars or hooks suspended from a frame and adjustable with a slot and screw, by coming in contact with the paper at the same point, and having in all respects the same relations to the residue of the machine; they perform in the same mode the function of the creasing-rollers. The only imputed difference we are able to glean from the elaborate argument is that the *friction* from the bent bars is greater than that of the rollers. Various other immaterially-varied forms so pressed in contact with the moving paper as to crease it would also increase the friction. But it would be a blemish upon the law, which professes to protect useful improvements, if such substitutes, capable of selection by persons of ordinary intelligence, are not deemed invasions of an inventor's rights.

That the fourth claim is also infringed by these bent bars is involved in what is just said; that the adjustable pulleys did so is conceded. While the Morgan machine was worked with the single creasing pulley, it did not infringe this fourth claim for an adjustable one.

It is also said the third claim is void because in the alternative. An alternative claim is invalid only in those instances where it claims positively neither of several subjects, but is good if *all*, of many which are mentioned, are claimed, as one or the other are employed by an infringer. If it is said A or B is claimed, this asserts a right to neither; but to claim the one or the other, as either are used, with an assertion that it has been discovered, both are interchangeably available for specified purposes, is not an alternative claim within the case cited by defendants. Such is the third claim in this case.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

24,987.—*Fishing-Reels.*—Granted to WILLIAM BILLINGHURST, August 9, 1859. Hearing July 23, 1873.

25,005.—*Governor-Valves.*—Granted to BENAIAH FITTS, August 9, 1859. Hearing July 23, 1873.

25,014.—*Machines for Cutting Out Wooden Ware.*—Granted to GEORGE R. HAY, August 9, 1859. Hearing July 23, 1873.

25,015.—*Wood-Saw Frames.*—Granted to JAMES HAYNES, August 9, 1859; reissued August 25, 1863. Hearing July 23, 1873

25,017.—*Steam-Boilers.*—Granted to ROBERT HOOPER, August 9, 1859. Hearing July 23, 1873.

25,036.—*Post-Marking Stamps.*—Granted to MARCUS P. NORTON, August 9, 1859. Hearing July 23, 1873.

25,061.—*Elevator or Hoisting Apparatus for Hotels, &c.*—Granted to OLIS TUFTS, August 9, 1859. Hearing July 23, 1873.

25,071.—*Roof for Railroad Cars.*—Granted to A. P. WINSLOW, August 9, 1859; reissued August 8, 1865. Hearing July 23, 1873.

25,115.—*Self-Acting Wagon-Brakes.*—Granted to BENJAMIN S. HEALY, August 16, 1859. Hearing July 30, 1873.

25,148.—*Weighing-Scales.*—Granted to FRANCIS M. STRONG and THOMAS ROSS, August 16, 1859. Hearing July 30, 1873.

25,149.—*Blanks for Shoe-Pegging Machines.*—Granted to BENJAMIN F. STURTEVANT, August 16, 1859; reissued June 12, 1866. Hearing July 30, 1873.

25,153.—*Carding-Engines.*—Granted to SAMUEL WETHERED, August 16, 1859. Hearing July 30, 1873.

25,166.—*Iron Fences.*—Granted to JOHN B. WICKERSHAM and HENRY JANKINS, August 16, 1859. Hearing July 30, 1873.

25,167.—*Mode of Lighting Gas by Electricity.*—Granted to ARCHELAUS WILSON, August 16, 1859. Hearing July 30, 1873.

25,183.—*Nail-Machines.*—Granted to DANIEL DODGE, August 23, 1859. Application filed May 23, 1873. Hearing August 6, 1873.

25,191.—*Machines for Making Paper-Bags.*—Granted to WILLIAM GOODALE, August 23, 1859. Hearing August 6, 1873.

25,199.—*Feeding Paper to Printing-Presses.*—Granted to RICHARD M. HOE, August 23, 1859; reissued June 20, 1871. Hearing August 6, 1873.

25,235.—*Manufacture of Iron.*—Granted to BERNARD LAUTH, August 23, 1859. Application filed May 22, 1873. Hearing August 6, 1873.

25,237.—*Horizontal Wheels.*—Granted to ABRAHAM ANDREWS and HARRISON KALBACH, August 30, 1859. Application filed May 28, 1873. Hearing August 13, 1873.

25,239.—*Elastic Hose Tubing*, granted to JOHN C. BOYD, August 30, 1859. Application filed May 29, 1873. Hearing August 13, 1873.

25,309.—*Nail Machines*, granted to DANIEL DODGE, August 30, 1859. Application filed May 31, 1873. Hearing, August 13, 1873.

25,343.—*Boxes.*—Granted to EDWARD M. MANIGLE, September 6, 1859. Application filed June 5, 1873. Hearing August 20, 1873.

25,344.—*Machines for Wiring the Joints of Clothes Pins*, granted to ALVIN C. MASON, September 6, 1859. Application filed May 31, 1873. Hearing, August 20, 1873.

25,364.—*Watches.*—Granted to CHARLES E. JACOT, September 6, 1859. Hearing August 20, 1873.

25,373.—*Machines for Making Paper Boxes.*—Granted to SILAS B. TERRY, September 6, 1859; reissued May 17, 1870. Application filed June 5, 1873. Hearing August 20, 1873.

25,395.—*Heels for Boots and Shoes.*—Granted to SIMEON DODGE, Jr., and BENJAMIN POTTER, Jr., September 13, 1859. Application filed June 13, 1873. Hearing August 27, 1873.

25,434.—*Cotton-Scrapers.*—Granted to JONATHAN H. MITCHELL, September 13, 1859. Application filed June 10, 1873. Hearing August 27, 1873.

25,442.—*Boilers and Steamers.*—Granted to DANIEL R. PRINDLE, September 13, 1859. Application filed June 13, 1873. Hearing August 27, 1873.

25,443.—*Seeding-Machines.*—Granted to SILAS G. RANDALL, September 13, 1859; reissued May 25, 1869. Application filed June 11, 1873. Hearing August 27, 1873.

25,473.—*Scales.*—Granted to ANDREW TURNBULL, September 13, 1859. Application filed May 31, 1873. Hearing, August 27, 1873.

25,484.—*Grain-Separators.*—Granted to JONATHAN L. BOOTH, September 20, 1859; reissued September 25, 1860, and November 29, 1864. Application filed June 14, 1873. Hearing September 3, 1873.

25,488.—*Hydraulic Presses.*—Granted to M. H. CLARK, September 20, 1859. Application filed June 20, 1873. Hearing September 3, 1873.

25,499.—*Railroad-Car Seat.*—Granted to ELI WHEELER, September 20, 1859. Application filed June 17, 1873. Hearing September, 3, 1873.

25,506.—*Lamps.*—Granted to HALVOR HALVORSON, September 20, 1859; reissued June 6 and December 5, 1871. Application filed June 6, 1873. Hearing September 3, 1873.

25,508.—*Tailors Shears.*—Granted to ROCHUS HWINACH, September 20, 1859. Application filed June 20, 1873. Hearing September 3, 1873.

25,512.—*Bung-Hole Borer and Reamer.*—Granted to JOSIAH KERBY, September 20, 1859. Application filed June 19, 1873. Hearing September 3, 1873.

25,544.—*Try Cocks for Steam-Boilers.*—Granted to JOHN F. COOK, September 20, 1859. Application filed June 10, 1873. Hearing September 3, 1873.

25,565.—*Rolling-Mills.*—Granted to JOHN and GEORGE FRITZ, September 27, 1859. Application filed June 27, 1873. Hearing September 10, 1873.

25,569.—*Bedstead-Slats.*—Granted to TYLER HOWE, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,570.—*Mode of Arranging Couches in Railroad Cars.*—Granted to EDWARD C. KNIGHT, September 27, 1859. Application filed May 31, 1873. Hearing, September 10, 1873.

25,572.—*Molding Water-Traps.*—Granted to JAMES ALLEN LOWE, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,586.—*Burglar-Alarms.*—Granted to ABBOTT Q. ROSS, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,588.—*Steam Punching-Machines.*—Granted to JOHN SPARROW, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,640.—*Steam-Boilers.*—Granted to JOSEPH HARRISON, Jr., October 4, 1859. Application filed June 30, 1873. Hearing September 17, 1873.

25,662.—*Construction of Prisons.*—Granted to EDWIN MAY, October 4, 1859. Application filed June 23, 1873. Hearing September 17, 1873.

25,683.—*Hydrants.*—Granted to CHARLES L. STACY, October 4, 1859; reissued June 6, 1865. Application filed June 28, 1873. Hearing September 17, 1873.

25,726.—*Hand-Machine for Wiring Blind-Rods.*—Granted to BIRAM C. DAVIS, October 11, 1859. Application filed July 12, 1873. Hearing September 24, 1873.

25,747.—*Method of Combining Emery with Caoutchouc.*—Granted to THOMAS J. MAYALL, October 11, 1859. Application filed June 16, 1873. Hearing September 24, 1873.

25,767.—*Cutting and Penning Cubes.*—Granted to JOHN H. SHOTE, October 11, 1859. Application filed July 11, 1873. Hearing September 24, 1873.

25,796.—*Jacquard Machines.*—Granted to AVERY BARRETT, October 18, 1859. Application filed June 30, 1873. Hearing October 1, 1873.

25,814.—*Sleeping-Cars.*—Granted to JOHN DANNER, October 18, 1859. Application filed July 12, 1873. Hearing October 1, 1873.

25,843.—*Cultivators.*—Granted to THOMAS MCQUISTON, October 18, 1859; reissued May 16, 1871. Application filed July 11, 1873. Hearing October 1, 1873.

25,867.—*Machines for Covering Saddle-Trees.*—Granted to JOHN MACLURE, October 18, 1859. Application filed July 14, 1873. Hearing October 1, 1873.

26,243.—*Water-Closet Basins.*—Granted to WILLIAM BOCH, Sr., November 29, 1859. Application filed June 10, 1873. Hearing November 12, 1873.

27,539.—*Manufacture of Gun-Barrels.*—Granted to JAMES H. BURTON, March 20, 1860, and antedated to September 29, 1859; reissued December 26, 1871. Application filed July 1, 1873. Hearing September 10, 1873.

30,201.—*Apparatus for Freezing Liquids.*—Granted to FERDINAND PHILIPPE EDOUARD CARRÉ, October 2, 1860; reissued in two divisions February 18, 1873. Patented in France August 24, 1859. Application filed May 17, 1873. Hearing August 13, 1873.

EXTENSIONS GRANTED.

15,861.—*Improvement in Machines for Making Nuts*, granted to WILLIAM E. WARD, October 7, 1856; reissued January 1, 1867, numbered 2,434.

Claim.—1. The two punches arranged side by side, and operated, substantially as described, for punching the central hole, cutting off the blanks from the bar, and discharging the same, substantially as described, in combination with the two holes or dies, so that a hole is punched in the bar for another nut during the continued motion of the punch to discharge the nut which was cut off during the previous part of the same motion.

2. In combination with the punching and cutting mechanism, or either, and with the mandrel or its equivalent, for entering the central hole of the nut-blank, the employment of the spring-jaws or the equivalents thereof, for transferring the nut-blank from the die to the mandrel and there holding it until the mandrel enters the hole, substantially as described.

24,734.—*Improvement in Machines for Making Paper-Bags*, granted to WILLIAM GOODALE, July 12, 1859.

Claim.—1. Making the cutter, which cuts the paper from the roll or piece, of the form herein described, that in cutting off the paper it also cuts it to the required form to fold into a bag without further cutting out.

2. The attachment of the former F directly to the cutter to operate in combination therewith, and with a folding table, C, substantially as herein described.

3. The within-described mode of applying and arranging the paster *f* to operate in combination with the folding table C and former F.

4. The construction of the side lappers with angular ends *e e*, substantially as described, for the purpose of partly folding the bottom lap by the act of folding the sides of the bag.

5. The knock-off I, operating in combination with the former, substantially as and for the purpose described.

6. The vibrating frame J, with its rollers *i i*, operating in combination with the former and the knock-off, substantially as and for the purpose herein described.

7. The arrangement of the table, the cutter, the former, the side-lappers, the bottom-paster, the knock-off, and the vibrating frame J, to operate in relation to, and in combination with, each other, substantially as described.

24,748.—*Improvement in Paint-Cans*, granted to JOHN W. MASURY, July 12, 1859.

Claim.—The construction of a metallic can for hermetically sealing paints and other substances, having attached thereto a rim or ring of thin brass or other soft metal in such a manner that the top or cover may be removed by severing the said rim or ring of brass or other soft metal with a pen-knife or other sharp instrument, in the manner and for the purposes herein described and represented, or its equivalent.

24,755.—*Methods of Operating Windlasses*, granted to PETER PHILIP, July 12, 1859; reissued March 4, 1873, numbered 5,304.

Claim.—1. The sweep or horse lever B, when loosely attached in its bearing to the shaft or drum, for the purpose set forth.

2. The loose sweep B as combined horse and friction lever.

3. The combination of the loose sweep B, shaft A, drum A', arm *c*, and lever *D*, or equivalent adjusting attachments, substantially for the purpose set forth.

24,773.—*Improvement in Powder-Kegs*, granted to JAMES WILSON, CHARLES GREEN, and WILLIAM WILSON, Jr., July 12, 1859; reissued January 6, 1863, numbered 1,363; reissued December 7, 1869, numbered 3,757.

Claim.—1. The method of closing the ends of sheet-metal cans by means of a countersunk head or cap fitting within the

orifice to be closed, and provided with a flange, which rests upon the upright edges of the can around the orifice, and is formed, with said edges, into a lap-seam, against an external mandrel as a support, substantially as shown and set forth.

2. The flaring lap-seam, formed by the union of the flange of the countersunk head with the upright edges of the can surrounding the orifice to which said head is applied, substantially as and for the purposes shown and set forth.

3. A sheet-metal can, composed of flanged and countersunk heads, in combination with corrugated or bulging sides, the two being united by a lap-seam, formed as specified, and brought within the compass of the bulging sides, so that the seam or seams may be protected from injury, as herein set forth.

4. The formation of a groove or recess in the body of the can, parallel with the lap-seam, and adjoining the edge of the turned-down flange of the countersunk head or cap, as and for the purposes set forth.

5. A sheet-metal can, one or both ends of which are closed by means of a flanged and countersunk head or cap, applied and secured to the can in the manner substantially as shown and set forth.

24,773.—*Improvement in Hollow Augers*, granted to ARCALOUS WYCKOFF, July 12, 1859; reissued March 13, 1866, numbered 2,204.

Claim.—1. In an annular auger, in combination with a prime cutter, *a*, a transverse auxiliary cutter, *b*, carried back to the extremity of the stock, either longitudinally with the auger or obliquely toward the heels of the next preceding cutter.

2. In combination with the spiral flange B, beveling to a thin edge the cylinder at *d* in front of the base of the prime cutter, for the purpose of giving an outward direction to and carrying away the cuttings, substantially as set forth.

3. The mandrel for holding the nut-blank, in combination with the swaging surfaces by which the faces of the nut are formed, substantially as described.

4. In combination with the mandrel for holding the nut-blank, substantially as described, the hammers for hammering or swaging the edges of the nut, substantially as described.

5. The combination of the swaging surfaces, for forming the faces of the nut, with the hammers for forging the edges of the nut, substantially as specified, and for the purpose set forth.

[Extended by act of Congress, approved March 3, 1873.]

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date July 8, 1873.]

6,746.—*Advertising Frame.*—MORLEY M. BURNHAM and JOSEPH B. OAKS, Syracuse, N. Y. Application filed May 21, 1873.

6,747.—*Carpet.*—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place. Application filed June 30, 1873.

6,748.—*Carpet.*—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place. Application filed June 30, 1873.

6,749.—*Carpet.*—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place. Application filed June 30, 1873.

6,750.—*Carpet.*—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place. Application filed June 30, 1873.

6,751.—*Carpet.*—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place. Application filed June 30, 1873.

6,752.—*Carpet.*—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place. Application filed June 30, 1873.

6,753.—*Carpet.*—JOSEPH M. CHRISTIE, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place. Application filed June 30, 1873.

6,754.—*Carpet.*—JOSEPH M. CHRISTIE, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place. Application filed June 30, 1873.

6,755.—*Carpet.*—JOSEPH M. CHRISTIE, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place. Application filed June 30, 1873.

6,756.—*Carpet.*—JOSEPH M. CHRISTIE, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place. Application filed June 30, 1873.

6,757.—*Table Cutlery.*—JAMES D. FRARY, New Britain, Conn. Application filed April 10, 1873.

6,758.—*Carpet.*—HEINRICH F. GOETZE, Boston, Mass., assignor to THE ROXBURY CARPET COMPANY, same place. Application filed June 30, 1873.

6,759.—*Watch-Chain Charm.*—WILLIAM B. HAHN, Philadelphia, Pa. Application filed May 26, 1873.

6,760.—*Railway Station.*—JOHN W. HOYT, Springfield, Mass. Application filed December 24, 1872.

6,761.—*Printing-Type.*—ANDREW LITTLE, New York, N. Y. Application filed June 20, 1873.

6,762.—*Cemetery-Fences.*—THOMAS PITBLADDO, Brooklyn, N. Y. Application filed April 26, 1873.

6,763.—*Sword-Hilt and Scabbard.*—VIRGIL PRICE, Woodside, N. Y. Application filed March 27, 1873.

6,764.—*Bolt-Threading Machines.*—SALMON W. PUTNAM, Jr., Fitchburg, Mass. Application filed January 24, 1873.

6,765.—*Cemetery Fences and Gates.*—JAMES SHARKEY, Brooklyn, N. Y. Application filed May 3, 1873.

6,766.—*Shelf-Paper.*—SALI SIMON, New York, N. Y.—A. Application filed June 16, 1873.

6,768.—*Shelf-Paper.*—SALI SIMON, New York, N. Y.—C. Application filed June 16, 1873.

6,769.—*Printing-Types.*—RICHARD SMITH, Philadelphia, Pa., assignor to MACKELLAR, SMITHS & JORDAN, same place. Application filed June 16, 1873.

6,770.—*Phaeton-Bodies.*—GEORGE DELKER and CHARLES L. BLONDIN, Henderson, Ky. Application filed April 8, 1873.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date July 8, 1873.]

1,352.—*Packages Containing Cranberries.*—NATHANIEL H. BISHOP, Manahawken, N. J. Application filed June 27, 1873.

1,353.—*Railroad Greases.*—A. GUNNISON & Co., Cincinnati, Ohio. Application filed June 27, 1873.

1,354.—*Sugar-Cured Meats and Smoked Beef.*—GARDNER PHIPPS & Co., Cincinnati, Ohio. Application filed June 25, 1873.

1,355.—*Preserved, Canned, or Bottled Vegetables, Fruits, Pickles, Sauces, and Honey.*—SLEEPER, WELLS & ALDRICH, Burlington, N. J. Application filed June 12, 1873.

1,356.—*Perfumery.*—THOMAS E. JESKINS, Louisville, Ky. Application filed July 3, 1873.

1,357.—*Oil Cans or Packages.*—MEISSNER, ACKERMANN & Co., New York, N. Y. Application filed June 25, 1873.

1,358.—*Shirtings.*—JESSE L. MOSS, Jr., Westerly, R. I., and NATHAN F. MOSS, New York, N. Y. Application filed March 20, 1873.

1,359.—*Water-Gages for Steam-Boilers.*—TOMEY & SONS, Perth, Scotland. Application filed July 5, 1873.

1,360.—*Rough Bathing-Towels.*—THE STARK MILLS, Manchester, N. H. Application filed May 21, 1873.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date July 8, 1873.]

ORIGINAL PATENTS.

140,568.—*Railway-Car Journal-Box.*—RICHARD N. ALLEN, Pittsford, Vt. Application filed March 28, 1873.

The journal-bearing is made of alternate layers of pasteboard and sheet lead, and is secured within the box by means of fillets.

Claim.—1. In railroad journal-boxes, the filling A made of laminated paper and lead, substantially as and for the purpose set forth.

2. The combination of the laminated filling A and box B, constructed and arranged substantially as and for the purpose specified.

3. The filling A, in combination with the fillets C and box B arranged in relation to one another, substantially as and for the purpose set forth.

140,569.—*Mechanism for Making Counters for Boots and Shoes.*—EMERY ANDREWS, Welchville, Me. Application filed February 14, 1873.

Refers to the manufacture of counters or heel-stiffeners for boots and shoes, and of those especially which are made from "leather-board," and to that part of the manufacture which terminates in the production of the skived or beveled blank or flat counter. The improvements relate to cutting up leather-board or other stock into counters or counter-blanks, which are subsequently crimped or molded into form for use. The invention consists: First, in a peculiar process of manufacture; secondly, in two co-acting machines or a two-part apparatus to carry out this process.

Claim.—1. The process of cutting out counters by first slitting the sheets of stock into strips with beveled or ready-skived edges, and subsequently dividing these strips into finished counters with ready-skived straight-edges formed by the edges of the strips, substantially as herein set forth.

2. A series of oblique slitting and skiving knives, k k^2, arranged and operating substantially as herein described, for cutting sheets of leather-board or other stock into ready-skived strips without waste, as set forth.

3. The series of slitting and skiving knives k k^2, mounted in independent stocks H H^2, adjustable laterally, substantially as herein described, for the purpose set forth.

4. The supporting-bar E, with rails *y* on opposite sides, in combination with the removable and laterally-adjustable knife-stocks H H^2, for the purpose specified.

5. The cutting-blocks F F^2, arranged and operating substantially as described, in combination with oblique slitting-knives k k^2, for the purpose set forth.

6. The oblique slitting and skiving knives k k^2, constructed with retreating cutting-edges, as described, and combined with cutting-blocks F F^2, for the purpose specified.

7. The oblique slitting or slitting and skiving knives k k^2, beveled only on the upper side, in combination with stocks H H^2, having recesses 6 to co-operate therewith, as described, for the purpose set forth.

8. The combination of a series of slitting or slitting and skiving knives, k k^2, and a head, G, with fingers *f* arranged in the rear of the knives, so as to operate as herein set forth.

9. The gripers *u*, constructed and operating substantially as described, in combination with the fingers *f*, for the purpose specified.

10. The revolving knives k^4 in combination with the cutting-table T^2 and clamps I, operating as herein described, for severing parti-circular counters C from strips *z*, or for severing and skiving the same at one operation, as set forth.

11. The forms or patterns D and springs *n* in combination with the revolving knives k^4, for the purpose specified.

12. The combination of revolving knives k^4 with their stocks H^4, clamps I, forms D, springs *n*, and cams J J^2, operating as described, for the purpose set forth.

140,570.—*Machine for Sawing Laths.*—GEORGE P. APPLETON, Suncook, N. H. Application filed April 21, 1873.

The lath-bolt is passed through a series of feed-rolls above the saw-arbor and returned through another series below it, sawing a lath as it passes each way.

Claim.—1. A sawing-machine substantially as herein described, in which the saw is hung to cut on both sides of its arbor at the same time, or consecutively, the feed being from opposite directions, as and for the purposes specified.

2. In a sawing-machine the upper and lower auxiliary rolls E E′ F F′, in combination with the main rolls D D′, as and for the purposes specified.

140,571.—*Bed-Bottom.*—HARMON BENEDICT, Philadelphia, Pa. Application filed March 18, 1873.

Clasping plates or blocks are secured to the under side of the slats, which receive the end of the coiled spring, and to which the rigid end of the links are connected. The lower or flexible ends of the links are attached to the outer end of the lever-arms, and the inner end of the lever-arms are partially hinged together by an ogee finish.

Claim.—1. The combination of the links H H and springs C C with the slats A and A′, the links being flexible at their lower ends, and having a rigid connection at their upper ends by means of the blocks F F, substantially in the manner and for the purpose above described.

2. The connection of the levers B B at their inner ends by means of ogee projections *g*, substantially as and for the purpose set forth.

140,572.—*Carriage-Seat Fastener.*—MARCUS BROCKWAY, Jr., Angola, Ind. Application filed April 12, 1873.

A slot in the carriage-body is avoided, the sliding plate is protected, and the cam is arranged to operate independently of the carriage-frame.

Claim.—The plate B, having the shoulder *b*, in combination with the cover C having arm *a* and cam D, all constructed substantially as and for the purpose set forth.

140,573.—*Barrel-Stand and Keg-Holder.*—CHARLES N. CASE, Winchester, Ill. Application filed May 2, 1873.

The barrel-rest is pivoted to an oscillating platform, one end resting on a hinged prop when in position for supporting the barrel. At one end of the platform are pivoted bars, serving at times as handles for moving the support and as a pair of skids to roll the barrel over upon the rest.

Claim.—1. A barrel-support, composed of a frame, A, an elevated platform, C, provided with a suitable device for sustaining the barrel, and hinged to the frame, and a hinged graduated prop, D *d*, substantially as and for the purpose specified.

2. The combination of the frame A, hinged platform C, hinged prop D, and swiveling rest E, substantially as specified.

3. The combination of the platform C, bed-plate G having depressions *g*, and rest E provided with projecting knobs *f*, substantially as and for the purpose specified.

4. The combination of frame A, hinged platform C, swiveling rest E, hinged prop D, and hinged bars H, substantially as and for the purpose specified.

140,574.—*Railway Frog.*—THOMAS J. CLARK and GEORGE M. CLARK, Higganum, Conn. Application filed January 6, 1873.

Claim.—1. A railway frog having the extensions *d* beyond the ends of the frog proper, so that the rails may be lapped thereon, substantially as described, and for the purpose set forth.

2. A railway frog having extensions *d* connected by a bolt or truss, *e* running under the frog, substantially as described, and for the purpose set forth.

140,575.—*Cotton-Bale Tie.*—RUFUS W. COBB, Helena, Ala. Application filed June 7, 1873.

Claim.—A cotton-bale tie, consisting of the buckle and the slotted plate or keeper, combined with the hoop, as and for the purposes described.

140,576.—*Stove Foot Shoe.*—ALBERT D. COLES, Newark, N. J. Application filed December 7, 1872.

Improvement on his patent of December 3, 1872. The shoe has a rim all around it, and a flange at one side in which is a hole for a screw.

Claim.—The improved stove-foot shoe herein shown and described, consisting of the base-plate *c*, the rim *a* all around, and the holes *b*, all as set forth.

140,577.—*Means for Draining Basins.*—LEVI R. COMSTOCK, Philadelphia Pa. Application filed August 28, 1872.

The foul and stagnant water which settles in the hollows of basins, &c., is by this means elevated and caused to flow through a pipe to a place where a current exists strong enough to carry it away.

Claim.—For draining basins, the combination, with the elevator E, of the bent conducting-pipe C having its discharging end below the water and level with the river bottom, and its receiving end extended some distance above the water-surface, substantially as specified.

140,578.—*Step-Ladder.*—CHARLES FRIZELL, Boston, Mass. Application filed May 29, 1873.

The diagonal rods transmit the strain between the upper and lower members of the ladder-stile, giving increased strength with diminished weight after the manner of a truss.

Claim.—The diagonal rods *d*, in combination with bars *s s* and tie-rods *b*, substantially as and for the purposes specified.

140,579.—*Egg Carrier.*—GEORGE M. HUSTON, Zanesville, Ohio. Case A. Application filed October 17, 1872.

Three frames are placed one above another, the upper one being provided with pliable strands, interwoven, so as to make separate receptacles for the egg; the next frame with a canvas partition or floor for the eggs to rest upon; the bottom frame with a canvas partition to rest upon the eggs of the next series below.

Claim.—The egg-carrier herein described, composed of frames A, partitions B B′, and pliable strands C C, all constructed, arranged, and operating substantially as set forth and shown.

140,580.—*Egg Carrier.*—GEORGE M. HUSTON, Zanesville, Ohio. Case C. Application filed October 17, 1872.

Each narrow strip passes through the corresponding openings in all the wide partitions, binding them together to form receptacles for the eggs. The slots are formed in the central part of the partition, not reaching to the edge.

Claim.—The egg-carrier herein described, composed of continuous partition pieces A and C, when constructed and united in the manner substantially as set forth and shown.

140,581.—*Hand-Setting Watch.*—FLORENTINE A. JOHNS, Boston, Mass. Application filed April 21, 1871.

The thumb-pin for engaging the hand-setting gear operates a cam which preserves the hand-setting engagement until automatically released by the closing of the watch-case.

Claim.—The combination of the cam button G, having the recess *g* and point *i*, with the lever A′, having the point F, and the lever H having the point I, all these parts being arranged as specified.

140,582.—*Sheet-Metal Roofing.*—GEORGE F. LEONARD, Newport, Vt., assignor to himself and JOHN P. LINDSAY, New York, N. Y. Application filed November 26, 1872.

The metallic strips A A extend under the main sheets and lap over the upturned edges of the same in a fold, as shown. Tarred paper is inserted between. The transverse joints are formed in the same manner, except that the fold laps only one way, to facilitate the shedding of rain.

Claim.—1. The strips A A, formed as described, with the exposed edges projecting downwardly over the main body of the roofing, and the edges where they are secured to the sheathing being extended under the main body of the roofing, as hereinbefore set forth.

2. The combination of the strips A A, constructed as hereinbefore described, with the sheets D D turned upward at the edges, which are overlapped by the strips A A, as hereinbefore set forth.

3. The combination of the strips A A and D D, and the sheets of tarred paper or other packing *d d*, as hereinbefore set forth.

4. The combination of the strips A A and E E, constructed as hereinbefore set forth.

5. The combination of the strips A A and E E, and the slates F F, substantially as hereinbefore set forth.

140,583.—*Chain-Machine.*—FRANKLIN LEONARD, Cleveland, Ohio. Application filed April 25, 1873.

A rod of the proper length is bent into a U-shape by the former G carrying it between the arms B C. The ends are next scarfed in dies formed in the face of the hammer and anvil, after which they are lapped by the rollers on the arms K J bending them around the post. The welding is done on a curved rounded horn projecting from the anvil and a concave projection on the hammer.

Claim.—1. In link-machines, the vibrating arms B C having shoulders or rabbets A''', rollers *d*, as arranged in combination with the springs D and sliding bill G, operating conjointly substantially as and for the purpose set forth.

2. The horn C′ and corresponding section D′, constructed as described, in combination with the scarf dies or prints *b′* and *a″* of the block and hammer, co-operating substantially as and for the purpose described.

3. The arms J K and rollers E′ F′, as arranged in combination with the post or standard L, studs *w′*, constructed and operated in the manner substantially as described, and for the purpose set forth.

140,584.—*Sewing-Machine.*—JESSE B. LINCOLN and CHARLES F. CLOUGH, Providence, R. I. Application filed September 24, 1872.

The needle and presser bars are connected with the slide-bars by studs, the slide-bars work in grooves in the head of the machine, the oil for lubricating the slide-bars is caught in the receptacles, and oil is prevented from reaching the needle and presser-bars and the goods.

Claim.—1. The isolated needle-bar, as described, connected with a slide-bar, G, by studs or connections J, by means of which the needle and its thread are removed from liability to soil the work by the oil or fluid used to lubricate the same.

2. The isolated presser-bar, connected with its slide-bar by studs or their equivalents, for holding the fabric to be sewed without liability of soiling the same with the oil or fluid by which its working parts are lubricated.

3. The combination of the isolated needle-bar with a guide-bar and guides constructed substantially as described, to keep the lubricating-oil from the needle-bar, and to conduct any excess of the same into a receptacle provided for the purpose.

4. The oil-receptacle O, as described, and in combination with the head H, or its equivalent, substantially as and for the purpose specified.

140,585.—*Abdominal Supporter.*—MARY M. MERRILL, Boston, Mass. Application filed February 5, 1872.

A supporter is made to fit and support the abdomen by combining pieces cut with curved seams and furnishing them with coiled springs inserted in the form of the figure 8. The supporter is also furnished with an adjustable and detachable lining to protect the person from the wire spring and to permit of washing the device at will elastic straps secure the supporter in position upon the abdomen.

Claim.—A combined abdominal and spinal supporter consisting of the bodies A and B, made with curved longitudinal and transverse seams, and furnished both with coiled wire springs inserted in the forms shown, and with adjustable linings, the parts being secured together by elastic straps, all as and for the purposes shown.

140,586.—*Machine for Sewing Turned Shoes.*—THOMAS L. MULLER, Philadelphia, Pa. Application filed May 16, 1873.

The edge-guide acts as a presser against the outer edge of the sole and upper: is adjustable by means of its extension-piece, which engages a rack on the frame; and it holds the shoe down so that the rest and channel-opener are retained in the sole, and the rest and opener serve as supports each side of the needle for the shoe.

Claim.—1. The combination and arrangement of the rest K with the standard L by means of the screws *b b* and slots *a a*, to admit of the lateral adjustment of the rest when change is made in the length of the stitches, substantially as set forth.

2. The combination of the spring-catch N, notched stop O on the presser foot rod I, and the vertical rod P with the rock-shaft C', for holding the presser-foot down and releasing it, substantially as described.

3. The combination of the lever R, having the bevel-edge guide S on its front end and an extension-piece, R', the standard L, and rack U, for varying the height and forward or backward position of said guide S, substantially as and for the purpose set forth.

4. The combination of the stationary rest K, channel-opener H, and needle-bar F, when the latter is arranged between the rest and the channel-opener, and the opener has a lateral movement with the needle-bar, substantially in the manner and for the purpose set forth.

140,587.—*Spinning-Mule.*—MICHAEL MOFFATT, Watertown, Mass. Application filed April 28, 1873.

A locking mechanism to prevent the "counter-faller" being raised by the operator (to prevent the breakage of weak yarns) until the carriage has reached the limit of its outward run and the "faller" has been regularly depressed. The bolt is in the path of the curved arm on the "counter-faller" shaft until the faller is depressed, whereby the cam on the shaft of the latter swings the lever and withdraws the bolt, allowing the "counter-faller" to be raised.

Claim.—The faller-shaft B bearing the cam H and collar *h*, in combination with the counter-faller shaft C carrying the curved arm *g*, and the frame G carrying the spring-bolt *b*, the lever *c*, and arm *f*, substantially as and for the purpose set forth.

140,588.—*Metal Window-Sash.*—JOHN D. MORAN, New York, N. Y. Application filed September 21, 1872.

The head of the sash-box is made of lead, and is grooved for the reception of the iron bar or tang, which is soldered into it. To form ornamental sash, the lead bar has a thin sheet of metal drawn upon it by passing them together through a properly-shaped die.

Claim.—1. The construction of plated moldings or bars for windows by the method herein described—that is to say, by forming the body of the head, in the shape described, of lead, by forcing it through a die, A, drawing the plated cover on the lead bar in a draw-plate, and soldering the iron bar and lead bar together by placing the iron bar heated in a bath of solder in the groove of the lead bar, all substantially as specified.

2. The new article of manufacture, consisting of a plated molding or bar for show-windows, constructed by the method herein described.

3. A molding or bar for show-windows, consisting of the iron bar C and lead bar A, constructed and united substantially as specified.

140,589.—*Compound for Preventing Incrustation in Steam-Boilers.*—THEODOR E. PETERSEN, Copenhagen, Denmark. Application filed October 10, 1872.

Claim.—A compound for the prevention of boiler incrustations, composed of beef or other tallow or fat, double carbonic natron, or its equivalent, rye-flour, and water-glass, mixed substantially in the proportions and the manner specified.

140,590.—*Compound for Cleaning Gas-Retorts.*—WILLIAM L. PITKIN and CARLISLE J. GLEASON, Montpelier, Vt. Application filed June 19, 1873.

Claim.—1. The compound, composed of the ingredients in quantity and proportions substantially as and for the purpose described.

2. The combination of carbonate or bicarbonate of potash and soda, or any of its carbonates, with chloride of sodium and oil of turpentine, substantially as and for the purposes described.

3. The combination of any of the carbonates of potash with any of the carbonates of soda, substantially as and for the purpose described.

4. The combination or use of any of the carbonates of potash, and any of the carbonates of soda, with or without chloride of sodium, substantially as and for the purpose described.

140,591.—*Gas-Lighting Apparatus.*—ARTHUR POTTER, Philadelphia, Pa. Application filed December 12, 1872.

A small electro-magnet being arranged at each burner for controlling the electric spark, a rotating commutator provided with a rolling arm, and as many radial contact-strips as there are burners, and each in circuit therewith, serves to light the burners separately in rapid succession.

Claim.—1. The face or plate B of the commutator, divided into any number of contact pieces, *c*, in combination with an intermittent rotary contact-former, E, of any construction, for the purpose shown and described.

2. The contact-face B, contact-roller E, arm F, shaft D, toothed wheel J, armature and armature-lever H I, electro-magnets G, and the spring K, combined as shown and described.

140,592.—*Clothes-Wringer.*—CHARLES ROBINSON, Boston, Mass. Application filed January 3, 1873.

A clothes-wringer constructed with rolls, springs, crank, frame, &c., in ordinary form, to which, on each upright or end of the machine, is attached a lever resting upon the journals of the upper rolls, over which an India-rubber spring is secured to the upright which furnishes elasticity to the upper roll to admit the passing through between them of articles of uneven thickness.

Claim.—The pressure-levers D D and elastic stops E E, constructed and operating substantially as herein described, in combination with the bar or roller B of a wringer, for the purpose specified.

140,593.—*Water-Wheel.*—ISAAC S. ROLAND, Reading, Pa. Application filed February 27, 1873.

A supporting-frame, composed of four or more arms, radiating from a central portion, upon which is arranged an adjustable step on which the main shaft revolves. A circular plate is affixed to the lower part of the main shaft, the periphery of which is provided with a dished rim, upon which is affixed the lower portion of a series of spiral vanes, which form the buckets of the wheel. These spiral vanes on one side are constructed vertically to the plane of the surface of the circular plate, while their other side is formed at an angle and extends out beyond the periphery of the circular plate, and are curved on the upper sides.

Claim.—1. In combination with the shaft A, plate B, rim b^3, vanes *c*, plate c^1, plate *g*, and vanes *f*, the disk E, chamber *k*, flange *k'*, ring *h*, plate *i*, and annular gate *n*, when arranged and operating substantially as set forth.

2. An annular gate, *n*, operated within a chamber, *k*, and arranged between a series of buckets, c^2, and a series of chute-buckets, *f'*, substantially as described and set forth.

3. The disk E, chamber *k*, flange *k'*, ring *h*, plate *i*, in combination with the chute-buckets *f'*, plate *g*, annular gate *n*, when arranged and operating substantially as and for the purpose set forth.

140,594.—*Device for Preventing Cows from Kicking.*—HENRY J. SADLER and SOLOMON H. SPENCER, Mecca, Ohio. Application filed April 30, 1873.

A bar with hooks to clasp the leg of the animal above and below the hough, and a strap to bind the leg near the hough.

Claim.—A device for preventing cows from kicking, consisting of a strip of wood, *s*, or other inflexible material, having the hooks A at each end and the pliable clasp *f* near the middle, arranged and applied to the leg of an animal, substantially as specified.

140,595.—*Earth-Boring Machine.*—WILLIAM H. SALYER, Hamburg, Iowa, assignor of one-half his right to J. M. CAMPBELL and DANIEL RITCHEY. Application filed November 11, 1871.

The auger is rotated by the sweep, through which it slides vertically. When the auger is to be raised the upper section of the shaft is disconnected from the one below it and raised until its lower end is supported by the sling. The sweep is then adjusted on the shaft so as to engage with the stud-pin on the drum, and the hoisting-rope drawn tightly on the drum, which is then rotated by the sweep to raise the auger.

Claim.—1. In combination with the shaft U, the sling *f*, substantially as and for the purpose specified.

2. The combination of the sweep Y, shaft U, drum X, stud-pin *a*, rope *b*, and shaft G, substantially as specified.

140,596.—*Rock-Drill.*—HENRY C. SERGEANT, New York, N. Y. Application filed March 20, 1873.

The tripod, which is provided with adjustable legs, is arranged in such a manner that the cylinder can be adjusted at any angle, either vertically or horizontally. The cylinder is also provided with an elastic cushion, which is so constructed as to cushion the piston at each end of the stroke. A projection upon the piston-rod enters a spiral groove in the frame-work of drill, and thereby imparts motion to the valves.

Claim.—1. The base or tripod of cast-iron, with two upright pieces forming a jaw for holding the clamp F, in combination with the adjustable feet, operating substantially as shown and described.

2. The cone cast on the back B of a rock-drill, in combination with the casting F, made to receive the cone, and bolted together, substantially as shown and for the purpose described.

3. The reversible ends *b' b'*, in combination with the extended feed-screw D, so as to allow reversing and bolting together, as shown and described.

4. The combination of the crank, bevel-wheels, reversible ends, and feed-screw, operating substantially as described.

5. The arm K, working in between the flanges or collars, and having a reciprocating and oscillating motion, in combination with the stationary spiral incline L and arm M, for the purpose shown and described.

6. The elastic cushion and packing-box H, constructed and operated as shown and described.

7. The combination of the cylinder A, piston-rod, and elastic cushion H, arranged and operated substantially as shown and described.

140,597.—*Compound Blower.*—THOMAS SHAW, Philadelphia, Pa. Application filed May 23, 1873.

In a rotary blower, several series of alternate stationary and rotative wings are concentrically arranged, each series adding to the amount of compression effected by the preceding series.

Claim.—The combination of two or more alternating series of stationary and rotative wings, in the manner and for the purpose set forth.

140,598.—*Child's Carriage.*—GEORGE L. SHEPARD, Albany, N. Y., assignor of one-half his right to CHARLES C. GALLER, same place. Application filed March 24, 1873.

The body is suspended from the springs in such a manner that it will freely oscillate and remain always in the same plane independently of the running-gear.

Claim.—The body E, suspended by the links *a a* from the springs D D, so that it is capable of being oscillated independent of the running-gear, substantially as and for the purpose set forth.

140,599.—*Hand Peg-Cutter.*—PAUL SUMMITER, Marlborough, Mass. Application filed May 26, 1873.

Claim.—A removable cutter, B, in combination with a bifurcated shank, A, provided with grooves and with a tightening-screw, *c*, substantially as and for the purpose set forth.

140,600.—*Shaft-Coupling.*—EDWIN SWAIN, Chelmsford, Mass. Application filed September 12, 1872.

Two shells formed of annular disks with cylindrical rims, which cover the flanged coupling and its bolts, thereby producing a smooth and regular surface for belting.

Claim.—1. The combination, with the flanged couplings A, secured by bolts through the flanges, of the shells B B covering the bolts of the coupling, and secured substantially as described, the whole arranged substantially as and for the purposes specified.

2. The shells B B, formed of an annular disk with a cylindrical rim attached, in combination with the screws D D, as and for the purpose described.

140,601.—*Machine for Trimming and Burnishing Shoe-Soles.*—BENJAMIN J. TAYMAN, Philadelphia, Pa. Application filed February 12, 1873.

The jack-carriage is provided with both a sliding and rotative movement, that all portions of the sole-edge may be properly presented for the trimming and burnishing operations.

Claim.—1. The combination and arrangement of the slide G, spring H having a pin, *d*, and rim *a* having stops *b b* and holes *c c* for changing the motion of the carrying-plate F, substantially as described.

2. The combination of the spring N with the upright rod J and jointed piece L for holding the cutter-head in an elevated position, and holding it in connection with the shoe-sole, substantially as specified.

3. The arrangement of the scales Q and Q' with the slotted rest I for regulating the adjustment of the cutter-head and burnisher to suit different lengths of shoes, substantially as described.

4. The combination of the spring N' and yoke *q* with the swivel-heads T and T^2 for pressing the burnisher down upon the shoe-sole, thus dispensing with hand-pressure, the device in measure being regulated by the set-screw, substantially as described.

5. The eccentric journals *x'* of the burnisher-shaft R, in combination with the swinging boxes *x x* for giving a reciprocating movement to the burnisher, substantially as and for the purpose set forth.

6. The combination of the connecting-rod *n*, wrist-pins *o* and *o'*, shafts X' and Y, pulleys V, V^1, V^2, and V^3, and belts W and W', as arranged, to give a limited reversible rotary movement to the burnisher, substantially as set forth.

140,602.—*Turbine Water-Wheel.*—HENRY VAN DE WATER, Rochester, N. Y. Application filed September 28, 1872.

A circular gate is opened by moving it downwardly, and the water, when flowing into the wheel, flows over the upper edge of the gate under the inclined part of the wheel. When the gate is partially open the inflowing water is compressed into a solid mass, which tends to raise and free the wheel-shaft of friction. There is also a cutting device applied to the buckets, which is to remove obstructions.

Claim.—1. The gate P closing upward, arranged between the guides B and buckets C, and so constructed and applied in relation to grooves of the water-wheel casing that said grooves are entered and a tight joint formed at top and bottom of the gate when the gate is shut, substantially as described.

2. The ring *b* with its bottom surface forming regular or uninterrupted inclined continuations of the curved portions of the buckets of the hub, thus forming smooth flaring or funnel-shaped sluice-ways for the inflowing water, substantially as set forth.

3. The crowning or arched cap E, in combination with the inclined or flaring ring *b*, the same being applied as described and shown, whereby the ring is made to serve as an abutment for the cap E, substantially as described.

4. The cutting device *y*, applied to the buckets, so as to precede it in its path of motion and cut away any obstruction between it and the casing, substantially as described.

140,603.—*Feeding Mechanism for Sewing-Machines.*—WILLIAM WESTMORELAND and EDWIN WESTMORELAND, Nottingham, England, assignors of one-half their right to JOHN KENT, New York, N. Y. Application filed August 26, 1872.

The presser-foot engages and moves the material, and it is reciprocated in a bracket so pivoted as to have a universal movement. The bracket has a slotted collar through which works a rod provided with an adjustable incline or cam, and the rod and its cam may be turned so as to move the frame in any direction that the operator desires. The presser is held down by a spring carried by its operating-lever, and is raised by the end of the lever which engages a pin or the presser-shank.

Claim.—1. The combination of the T-shaped piece D, carried by the axle D', and the swinging bracket E carrying the presser-foot, substantially as and for the purpose hereinbefore set forth.

2. The combination of the spring H, stud H^1, lever H^2, pin H^3, bracket E, presser-foot E^1, and the cam provided with groove I, all arranged as shown and described.

3. The combination, with the feeding presser-foot and its bracket, pivoted as described, of the reciprocating adjustable rod F, springs F^1 and F^2, wedge-piece F^3, and slotted collar, all combined and operated as described.

140,604.—*Can-Opener.*—JOHN WOOD, New York, N. Y. Application filed June 11, 1873.

A frame rests upon the edges of the can-cover and carries a feeding-screw, upon the lower part of which is secured an arm which carries a cutter at each end, extending the one upward and the other downward. A reversal of this arm changes cutters and varies the size of the circle of metal cut out.

Claim.—The combination, with a supporting-frame, B, and a screw, F, of the reversible cutting-head E, provided with two cutters, as described, and for the purposes set forth.

140,605.—*Doll.*—HENRY C. WORK, Brooklyn, N. Y. Application filed November 19, 1872.

A multipedal wheel is pivoted at the knee, and is moved by friction as the figure is moved. The doll is represented as raising its dress enough at the side to show but one pair of feet at once.

Claim.—1. The multipedal wheel A, substantially as described, or the device for bringing successively into use several pairs of feet, which revolve on a common axis.

2. In connection with said wheel, the partly-lifted and partly-trailing skirt, substantially as specified.

140,606.—*Metallurgic Gas-Furnace.*—WILLIAM C. WREN, Brooklyn, N. Y. Application filed April 19, 1873.

The grate of the furnace is filled with brick to within six or eight inches of the arch, and the gas-pipe, with its central air-pipe, is introduced through the brick-work.

Claim.—1. The compound air and gas pipe herein described, made by arranging the air-blast pipe inside the gas-pipe, substantially as specified.

2. The arrangement of the air blast and gas-pipes, the former within and shorter than the latter, and provided with suitable regulating valves or cocks, as set forth.

140,607.—*Motor for Sewing-Machines.*—WILLIAM YOUKO, Baltimore, Md. Application filed April 9, 1873.

Claim.—1. The combination of coil or coils of springs with two spirally-grooved conical drums, or one spiral and one cylindrical drum, a cord or chain uniting them, and a train of wheels, through which the power of the springs may be transmitted to the mechanism to be driven by it.

2. The combination, with the above combinations, of a brake, formed of an elastic spring-bar, pressing upon the pulley-shaft of the machine.

3. The idle-wheel above described, when used in the motor for the purpose of reversing the movement of the winch, as above described.

140,608.—*Piston-Packing.*—CHARLES S. BARRY, Providence, R. I. Application filed May 10, 1873.

A case with valves to admit steam surrounds the piston; in it are placed the packing-rings with small break joint rings and a wedge-shaped ring to force the packing against the sides of the casing.

Claim.—1. The combination of the L-shaped ring D and cover E, inclosing the packing-rings K L, the joint-break rings *k l*, and the wedge-ring I, the spring H, the valves *f' g'*, the valve-seats F G, and the steam-ways *f g*, substantially as specified.

2. The combination of the wedge-expanding ring I, the packing-rings K L, and the joint-break rings *k l*, forming a universal piston-packing between the parallel bearings of a piston, when operated either by steam or by spring power, substantially as specified.

140,609.—*Needle-Cushion.*—WASHINGTON H. BIXLER, Easton, Pa. Application filed April 15, 1873.

Claim.—1. A needle-cushion, A, constructed for attachment to a thread-spool, substantially in the manner herein specified.

2. A needle-cushion, A, combined with a thread-spool, substantially as described, and for the purpose specified.

140,610.—*Letter File and Binder.*—ECKFORD BURLL and JOHN W. LILLEY, Columbus, Ohio, assignors to LOUIS SIEBERT and JOHN W. LILLEY, same place. Application filed February 27, 1873.

The index leaves and letters are strung on short needles *l* and secured by long needles *i* attached to the hinged-back frame. When this frame is swung back its needles and papers moved and supported upon them are cleared from the short needles, from which the remaining sheets may be detached.

Claim.—1. The disposition of needles of different lengths in a paper file and binder in a manner relative to each other and to the cross-bar E of the frame, and the cross-bar E of the end-gate, and to the other devices therewith connected, whereby individual papers or folios are detachable without deranging the remaining papers filed, substantially as set forth and described herein.

2. The combination and arrangement of the base C and metallic frames D E, the bracket-shaped sides *b b* and *c c*, the end-gate F, the gages *m*, *m*, *m*, and *m*, the needles *i i* and *l*, and the divider, Fig. 2, operating together substantially as and for the purpose herein shown.

140,611.—*Manufacture of Knitting-Machine Needles.*—JAMES H. BULLARD, Chicopee Falls, Mass., assignor of one-half his right to AMOS W. PAGE, same place. Application filed April 19, 1873.

The round wire is first bent at one end; the other end is then drawn out to the diameter required the sides flattened in dies, the point or small end set back, as seen in the drawing, and the point turned and latch inserted in the usual manner.

Claim.—The method herein described of making knitting-machine needles, namely, first, drawing the point; second, swaging the parallel sides; third, pressing the point and offsetting it in line with the back of the shank; and, fourth, finishing in the usual manner, substantially as specified.

140,612.—*Farm-Gate.*—MAHLON BURTLESS, Seneca Falls, N. Y. Application filed March 22, 1873.

To the gate, which slides and swings upon a frame hinged to the rear gate-post, is attached a short horizontal swinging latch-bar, which, upon being turned down, locks the gate in its closed position.

Claim.—The hinged latch M, arranged to operate in connection with the gate J and hinged frame G, substantially as herein shown and described.

140,613.—*Glove-Fastening.*—HORACE P. CARVER, Binghamton, N. Y. Application filed June 7, 1873.

A plate on one side of the glove has projections which support a pin longitudinally. A plate on the other side has coiled parallel springs. The pin catches between the springs and fastens the glove.

Claim.—1. The glove-fastening, consisting of pin-plate A, in connection with coiled spring-plate B, substantially as and for the purpose described.

2. The plate A having abutting parts *b b'*, which carry, longitudinally, pin *d*, as set forth.

3. The plate B with parallel coiled springs *c*, for the purpose described.

140,614.—*Extension Hat-Brim.*—I. IGNACIO CASSIANO, San Antonio, Tex.—Case A. Application filed March 29, 1873.

Into the crown of a hat is fitted a metallic ring to which radiating arms are fastened having branched arms pivoted to their extremities. To the edge of the brim is sewed an annular piece of cloth having an elastic cord fastened by metal clips to its outer edge, the clips being provided with sockets which fit upon the ends of the pivoted arms when the cloth is extended, or upon hooks when it is folded.

Claim.—1. The combination, with a hat, of a brim or sunshade, J, for extending beyond the permanent brim, also for folding back under it, substantially in the manner described.

2. The combination of the ring C, stationary arms D, adjustable arms G, and clips L with a hat and an extension brim, J, substantially as specified.

3. The combination of the elastic cord K with the extension brim and the clips L, substantially as specified.

4. The combination of the hooks O with the clips L, elastic cord, and the extension brim, substantially as specified.

140,615.—*Extension Hat-Brim.*—I. IGNACIO CASSIANO, San Antonio, Tex.—Case B. Application filed March 29, 1873.

An annular extension brim of cloth, sewed to the edge of the brim of a hat, is attached to folding arms which are mounted on sliding rods moving on sockets fastened to a metallic band fitting into the crown of the hat. The sliding arms are provided with spring-catches so that the brim may be more or less extended at pleasure, an elastic cord retaining the cloth in position.

Claim.—1. The combination of an extension-brim, E, and extension devices for varying the extension with the permanent brim of a hat, substantially as specified.

2. The folding extension-arms H, mounted on sliding extension-arms K, substantially as specified.

3. The combination of the elastic straps L with the extension-brim E and the sliding extension-arms K, substantially as specified.

140,616.—*Device for Manufacturing Jewelry-Bases.*—SHUBAEL COTTLE, New York, N. Y. Application filed March 24, 1873.

A former composed of five pieces is placed in a dish-shaped blank, and a die is brought down to turn the upper rim inward upon the former; the rim is then burnished to form square corners, and the former is removed piece by piece, after which the bottom of the article is punched out.

Claim.—The former B, consisting of a middle section, *b*, and several surrounding sections *b'*, in combination with a die, C D, burnisher F, and mandrel E, as and for the purpose described.

140,617.—*Padlock.*—HENRY ESSEX, Meadville, Pa. Application filed May 3, 1873.

The sliding staple is tapered at its inner end so as to force back the spring-bolts and allow the staple to be locked without the aid of a key. The grooves in the staple, for the reception of the bolts, are made of different widths to correspond with the different widths of the bolts, so that when the staple is pressed into the case the spring-bolts must enter their respective grooves.

Claim.—1. The combination of the sections A and B, the sliding staple C with inclined plane c^4, check D, recess *d*, bolts E E^1 E^2, removable partition-plates *g*, and spring G, substantially as specified.

2. The construction and arrangement of the grooves c^1 c^2 c^3, and sliding bolts E E^1 E^2, and the inclined plane c^4 on the sliding staple C, substantially as specified.

140,618.—*Screw-Post for Electrical Apparatus.*—STEPHEN DUDLEY FIELD, San Francisco, Cal. Application filed April 10, 1873.

Wire securely griped in hole *i* and between A and C.

Claim.—A binding-screw post for electrical purposes, composed of the base A, set-screw C, and screw-stem B having the perforation *i* in its base, substantially as and for the purpose above described.

140,619.—*Cake-Pan.*—JOHN B. FIRTH, Brooklyn, N. Y. Application filed May 24, 1873.

A cluster of cake-pans is connected to the frame by double-seaming the top of each pan thereto.

Claim.—The cluster of cake-pans B, connected to the frame A by the flanges *a'* and turned edges *b'*, as and for the purpose described.

140,620.—*Washing-Machine.*—WILLIAM K. FLIETSTRA, Holland, Mich. Application filed June 14, 1873.

A rectangular box pivoted at its center to uprights or frame, having on its bottom, suspended from its center, an adjustable weight to aid in giving it motion. The bottom sides and one end inside of it has beaters or ribs, and one end projecting plates with rounded edges, which gradually increase in height toward the end of the box.

Claim.—An improved washing-machine, formed of the frame A, box B, pivots C, ribs or cleats D, projecting plates E, cover F, and balanced weight I J K L, constructed and arranged, in connection with each other, substantially as herein shown and described.

140,621.—*Fire-Place.*—JOHN L. GARLINGTON, Snapping Shoals, Ga. Application filed April 19, 1873.

This grate has an inclined back provided with a sliding damper to regulate combustion and cause a better radiation of heat. By means of adjustable side plates the grate can be readily fitted into any chimney.

Claim.—1. The back extension-plate F with lateral strips *h'*, guide-rods *i*, and chimney-plate K, as described.

2. The top and bottom extension-plates C having slots *a*, in connection with damper D and side plates B, substantially as described.

3. The combination of the extension-plate F, lateral strips *h'*, guide-rods *i*, plate K, plates C having slots *a*, side plates B, and damper D, as shown and described.

140,622.—*Horse-Power.*—WILLIAM GILFILLAN, Speier, Minn. Application filed May 10, 1873.

Claim.—1. The arrangement and combination of the bed-wheel B, bed-frame A, revolving frame I, vertical wheels F F, pinion-wheels N N, bevel-wheels P P, pinion Q, bevel-wheel R, and pinion T, with their respective shafts and stands, substantially as shown and described.

2. The external and internal gear-wheels F, mounted on the cross-shaft G having its bearings in the frame H, in combination with the wheel B and pinions N, as and for the purpose specified.

140,623.—*Table Dish-Stand.*—FLORIAN GROSJEAN, New York, N. Y. Application filed June 21, 1873.

A stand of sheet or cast metal covered on its upper surface with an enamel of porcelain, and mounted in a frame.

Claim.—A dish stand or tray for the table, composed of a metal plate having its upper surface enameled with porcelain, and mounted in a metal, wood, or other frame, either with or without a backing of wood, and whether mounted on legs or not, substantially as specified.

140,624.—*Apparatus for Charging Gas-Retorts.*—ALONZO F. HAVENS, Brooklyn, N. Y. Application filed May 14, 1873.

Two leaves hinged together in the center form the bottom of the scoop. Arms attached to the hinges lift the center drawing in the edges of the leaves, allowing them to fold and deliver the charge toward the side or angles of the retort. The bottom, when in place, is supported by projecting pins and ledges on the main frame.

Claim.—1. The hinged folding bottom *s* and crank-arms upon the shaft *k*, in combination with the charger *c d*, substantially as set forth.

2. The frame *a* and ledge *u*, in combination with the hinged bottom and charger, the parts being constructed and operating substantially as set forth.

140,625.—*Washing-Machine.*—MOSES L. HAWKS, Kinderhook, Mich. Application filed June 14, 1873.

A large roll resting upon a bed of smaller ones, all corrugated. The two outer rolls of the bed have journals extending through the uprights of the frame, and rest upon a yoke suspended by a spring which passes over a block resting upon the journals of the large upper roll and attached to the yoke by a curved metallic holder. The holding-bar has a key fitted to slots in it, by which it may be adjusted to the size or form of the tub.

Claim.—1. The combination of the standards A, the cross-bar N, bed-piece B, the large roller C, the two stationary inner rollers E, the two movable outer rollers E, the half-bearings F, the rubber-band springs G, the cross-bars H, and the wires or rods I with each other, substantially as herein shown and described.

2. The combination of the cleat J, the slotted cross-bar K, the pin L and the cleats M with the ends of the bed-piece B of the machine, substantially as herein shown and described.

140,626.—*Cutter-Head for Molding.*—EDE H. HINNERS, New York, N. Y. Application filed December 14, 1872.

A molding cutter with a staggered saw to form the rabbet with a thin fillet.

Claim.—A cutter-head consisting of the molding-cutters B and staggered saw C, arranged on the cutter-head A to form a rabbet, D, separated from the molding by a narrow strip, E, substantially as represented in the drawing.

140,627.—*Button-Fastening.*—WILLIAM HOLLOWAY, Buffalo, N. Y. Application filed March 8, 1873.

A slotted concave spring-disk engages in a groove in the end of the shank of a button. The center of the slot is enlarged to embrace the shank.

Claim.—The combination of the concave spring-disk C, having a slot, *c*, and a slit, *c'*, extending therefrom to the edge or periphery of the disk, with the button A and shank B, all being constructed and operating substantially as described.

140,628.—*Blasting-Plug.*—JULIUS H. HOLSEY, Butler, Ga. Application filed April 16, 1873.

Blasting-plug made in segments, the rabbet jointed, and having a fuse-hole passing vertically through both parts so that a limited expansion may take place without escape of the gases generated at the time of the explosion.

Claim.—A sectional blasting-plug, rabbet-jointed at the meeting edges, substantially as specified, and rabbet-jointed across the top, as specified.

140,629.—*Combined Refrigerator and Soda-Water Apparatus.*—THOMAS W. JOHNSON, Fort Madison, Iowa. Application filed May 14, 1873.

The receptacle for the alkali-water, having a piston worked by a lever, is placed within an ice-chamber, and in the upper part of this chamber is a sirup-receptacle. Below the ice-chamber is a refrigerating-chamber.

Claim.—1. The combination of the ice-chamber C, the jar G for soda-water with its piston K, the refrigerator-chamber B, and sirup-receptacle T, as set forth.

2. The combination of the jar G for alkali-water with piston K for forcing it out, the ice-chamber C and the receptacles T arranged together and with faucets for use in forming soda-water, substantially as set forth.

140,630.—*Emery-Wheel.*—WILLIAM A. JOHNSTON, New York, N. Y. Application filed January 9, 1873.

Claim.—A corundum, emery, or other grinding or polishing wheel having a screw-thread formed in its eye or center, as shown and described.

140,631.—*Leather-Trimming Machine.*—SAMUEL H. JONES, East Albany, N. Y. Application filed August 26, 1872.

A curved cutter is attached to the needle-bar. A slide piece in the bed of the machine yields laterally upon the downward stroke of the needle-bar, permitting the cutter to pass down, and is closed by spring-pressure during the upward stroke.

Claim.—1. The combination of sliding plate H and spring S with the throat-piece, substantially as and for the purpose set forth.

2. The combination of the lateral-curved cutter G and needle-bar D with the throat-piece B provided with the sliding piece H and spring S, substantially as and for the purpose set forth.

140,632.—*Equalizing Attachment for Plows.*—DAVID H. KING and WILLIAM M. HULSE, Palmyra, Ill. Application filed March 29, 1873.

Claim.—1. The loop B, closed at both ends, and secured to the beam by the bolt C and clevis D, to hold the equalizing mechanism, in the manner described.

2. The combination, with the chains attached to a band, F, movable on an eccentric, E, of the guide-bar H, applied as and for the purpose set forth.

140,633.—*Machinery for Pebbling and Graining Wet Skins.*—NORMAN O. LOUSSBERRY, Wilmington, Del. Application filed April 12, 1873.

Claim.—In a machine for graining and pebbling skins, the arrangement, with or without the cover, of the two graining-rollers, turning in the same direction horizontally parallel with each other, as shown, so that the skin will gravitate into the space between said rollers, together with operating devices, substantially as specified.

140,634.—*Horse Hay-Rake.*—WATSON C. MARTINDALE, Philadelphia, Pa. Application filed May 10, 1873.

A rod arranged parallel with the axle, carrying a spur-pinion on each end, through which it receives motion from the supporting-wheel, has a pawl and ratchet near the center, by which the rod and rake-head is locked and revolved for discharging.

Claim.—The combination of the gear-wheels G, loose gear-wheels H, pawls and ratchet wheels J K, rod I, ratchet-wheel L, lever-pawl M, and inclined arm P, with the wheels E, hinged axle D, shafts A B C, curved teeth N, and straight teeth O, substantially as herein shown and described.

140,635.—*Knitting-Machine.*—GEORGE MERRILL, East Orange, N. J. Application filed May 13, 1873.

The machine is for the production of a knit fabric having incorporated with it a loose warp and weft thread. The warp-frame delivers longitudinal threads at an angle to and between the reciprocating needles. The weft-thread carrier moves inside the range-needles and delivers its thread across the warp and between them and the needles, and the locking thread guide delivers a thread which is knit into loops, and binds the warp and weft together.

Claim.—1. In combination with a series of reciprocating needles, arranged to operate as described, the frame F, or its equivalent, arranged to guide and deliver a series of warp-threads at an angle to the line of reciprocation of said needles between the needles, substantially as set forth.

2. Such frame or guide F, when made adjustable in relation to the needles, whereby the angle at which the warp-threads are presented to the needles may be varied, as set forth.

3. In combination with a series of reciprocating needles and a warp-frame or guide, arranged to deliver its threads at an angle to the line of reciprocation of said needles, a weft thread carrier, J, or its equivalent, said parts being arranged to operate in connection with each other, substantially as described.

4. The combination of a series of reciprocating needles a warp frame or guide, F, arranged to deliver its threads at an angle to the line of reciprocation of said needles, and a weft-thread guide, J, with a locking-thread guide, L, the said devices being arranged to operate in relation to each other, substantially as herein described.

5. The tubular shaft K, in combination with the thread-carrier L, arranged to move within the circle of needles, and deliver the thread in front of the needles, as set forth.

140,636.—*Combined Refrigerator and Beer-Cooler.*—GEORGE NUSS, New York, N. Y. Application filed June 21, 1873.

An inclined recess for the cask is above the ice-chamber whose ends are free of the sides of the casing, to permit the cold air to descend into the refrigerating chamber.

Claim.—The box A provided with a chamber, B, an ice chamber, D, and one or more downwardly-projecting recesses, G, substantially as herein shown and described, and for the purposes set forth.

140,637.—*Rock-Drill.*—GEORGE E. NUTTING and JOSEPH C. GITHENS, New York, N. Y., assignors to A. C. RAND, same place. Application filed June 30 1873.

The valve is operated by means of pistons, which are arranged upon the valve-stem, and they are so arranged as to discharge the steam that actuates them through the piston-head into the open air. A rotating device is also provided, in which the retaining-pawl is hung in a ring in such a manner that when the drill is prevented from turning the ring turns and carries with it the pawl, and thereby obviates the breaking of the drill.

Claim.—1. The combination, with the valve I, of pistons L and port N, constructed substantially as described, so as to exhaust the steam from the end of the steam-chest F into the main exhaust, or directly to the atmosphere, as shown.

2. The combination, with the piston of a steam rock-drill, of a rotating device, substantially such as is herein described, so that it may be held to its work by friction, and may yield should the drill-bit be prevented from turning.

3. The loose ring and adjustable stationary friction-strap and pawl and ratchet, or equivalent, with the piston of a rock-drill, substantially as herein shown and described.

4. An improved chuck for rock-drill bits, formed by dividing the hollow forward end of the piston-rod C longitudinally into three or more parts, and contracting said parts to hold the drill-bit by a strap or clip, open upon one or both sides, substantially as herein shown and described.

5. The valve mechanism, substantially as described, consisting of the piston-valves L, disks K, valve I, and ports N, as and for the purposes specified.

140,638.—*Door-Spring.*—CHARLES W. OLDHAM, Leipsic, Ind. Application filed May 24, 1873.

A cylinder is filled with liquid and furnished with a valved piston. The upper end of the piston-rod is connected to one end of an elbow-lever, which lever is operated by the opening of the door. An adjustable spring aids the drawing down of this lever. The resistance of the liquid to the piston with the closed valves prevents the slamming of the door.

Claim.—The valved piston B F, having two plates, of which the upper has a small and the lower a large aperture, and operating, in connection with the parts A C D E, to prevent the slamming of doors, in the manner described.

140,639.—*Mail-Bag Fastening.*—JOHN A. PAUL, Huntingdon, Pa., assignor of one-half his right to ANDREW B. BRUMBAUGH, same place. Application filed January 21, 1873.

The jaws of a bag-frame are made with flanges or projections on their outer sides, and a clasp or clamp, made either in one or two pieces, slides on the flanges and clamps both jaws. The clamp is notched on one side, and one of the jaws is correspondingly notched so that when the projections on the clamp are brought opposite the notches on the jaw the bag is readily opened.

Claim.—The jaws A and B, one of said jaws being notched, as described, in combination with one or more sliding notched clasps, all constructed and arranged to operate substantially as and for the purpose set forth.

140,640.—*Window Weather-Strip.*—GILES P. POTTER, Coventry, R. I. Application filed May 5, 1873.

Claim.—In combination with the sash B and grooved frame A the battens C right angled in cross-section and provided with the rubber strips D, as shown and described.

140,641.—*Washing-Machine.*—FRANCIS B. PRESTON, Fayette, Mo., assignor to himself and WILLIAM H. STAPLETON, same place. Application filed May 17, 1873.

In a box of usual form beaters are placed, acting one against the other by a rolling or rocking motion produced by the connecting-levers inside and out, by means of jointed arms and by an outside framed lever attached to a triangular-formed connection, to the lower point of which the outside lever is pivoted, and having an arm connecting with the cross-shaft. On the bottom of the box, at one end, is a raised part of it to give motion to the beater.

Claim.—The combination of the rocking beater C, sliding beater D, shaft E, levers F, connecting-rods G, rigid arms H, shaft I, rigid arms J, connecting-rods K, and brackets or arms L, with each other and with the box A, substantially as herein shown and described.

140,642.—*Medical Compound for Cholera.*—ANTOINE RACICOT, Troy, N. Y. Application filed March 21, 1873.

Tincture of sesquichloride of iron, tincture of capsicum, laudanum, tincture of camphor, sulphuric ether, tincture of cinnamon, tincture of pyrola.

Claim.—The compound composed of the above ingredients, in substantially the proportions set forth.

140,643.—*Pump.*—CHARLIE D. RATHBONE, Belpre, Ohio. Application filed November 16, 1872.

The ends of the glass bushing are formed with shoulders fitting into correspondingly-shaped recesses in the cylinder, forming a water-space so that the bush will be relieved of all strain due to the pressure of water by being surrounded by it.

Claim.—The bush C, having bead *a* on the outside of each end, as described, so that a water-jacket may be formed thereround, when placed in the cylinder, and any contraction of wood, which might break the glass, be prevented.

140,644.—*Nut-Lock.*—JOHN A. REED, Dunellen, N. J. Application filed February 8, 1873.

The blocking piece is punched out of the washer in the form shown, and turned in a different position to form the lock. The base is curved to facilitate the introduction beneath the nut.

Claim.—1. The foot-shaped blocking-piece with a curved base, 3, introduced within and opening in the washer and passed up behind one of the angles of the nut to prevent the same from unscrewing, as set forth.

2. The blocking-piece cut out of the metal of the washer, so as to be introduced into the opening in a different position and lock the nut, substantially as set forth.

140,645.—*Stitching-Gage for the Blind.*—WILLIAM H. RICHARDSON, Fort Smith, Ark. Application filed May 5, 1873.

A stitching-gage with an adjustable platform for holding the work, a slotted frame-plate, and a slide with a spring and pawl moving forward upon a ratchet-bar to give the required length for each stitch.

Claim.—An improved stitching-gage, formed of the bottom A, slotted front plate C, rear plate B, swiveled nut D, screw E, platform F, stationary bars G I, detachable ratchet bar H, slide J M, and spring-pawl K, constructed and operating in connection with each other, substantially as herein shown and described.

140,646.—*Invalid-Bedstead.*—JOHN ROBINSON, Madison Station, Miss. Application filed May 31, 1873.

Upon a right and left screw-rod nuts are placed. To the head-rest and to the nuts bars are pivoted, and when the screw-rod is revolved in the journals the nuts travel in either direction and elevate or depress the rest.

Claim.—The right and left screw-rod K, the nuts J, the rods or bars I, and the sockets H, in combination with the slats and side rails of a bedstead, substantially as herein shown and described.

140,647.—*Machine for Sawing Laths.*—ALEXANDER RODGERS, Muskegon, Mich. Application filed April 12, 1873.

The table and feed-rolls are placed at such an angle to the saws as to form lath having a rhomboidal section.

Claim.—1. The combination of the gang of differential saws B on a horizontal arbor, A, and the inclined feed-table C, substantially as specified.

2. The combination, with the differential saws B and inclined feed-table C, of a feed-roller having a tapered form, also a spiral rib, and arranged to confine the work to the guide, substantially as specified.

140,648.—*Seed-Planter.*—WILLIAM J. SAFFERY, Bremen, Ohio. Application filed March 15, 1873.

A triangular frame with handles. An opening plow in front at the apex with a surface-smoother; next, in rear, a seed-hopper and spout; then a carrying-wheel, with pins on its sides to actuate the seed-hopper slide and that of a guano-hopper behind; also, to raise intermittently a dragging-hoe, when a hill has been formed, over the seed.

Claim.—The combination, in a seeder, of a seeder in front, a guano-dropper in the rear, and an intermediate wheel, O, all arranged in the same vertical longitudinal plane with the furrow-opener G, as described, so that the seed may be slightly covered with soil by the wheel before the guano is dropped upon it, and all danger thereby removed of destroying the vitality of any of the seed.

140,649.—*Toy.*—JACOB SCHWENNESEN, Chicago, Ill., assignor to HANS PETER SCHWENNESEN, same place. Application filed December 3, 1872.

To imitate, by pressure of the finger, the evolutions and movements of a horizontal-bar gymnastic performer.

Claim.—A figure, G, suspended from a rock-shaft, C, and operated by means of the lever E, cord F, and spring D, substantially as and for the purposes set forth.

140,650.—*Sky-Light Bar.*—CHARLES SELLMAN, New York, N. Y. Application filed May 26, 1873.

Claim.—The main supporting-bar A, bent of symmetrical shape to form an upward-projecting part, *a*, inclined supports *b*, and inclined gutters *d*, substantially as described.

140,651.—*Washing-Machine.*—JACOB SHEFFLER, Deselm, Ill. Application filed June 7, 1873.

An ordinary tub having within it another with a corrugated bottom with openings, located upon wheels for its easy revolution, over which is a fluted roll pivoted to a frame attached to the side of it, having a handle by which its tension is controlled, and a crank to give it motion. On one side of the center is pivoted or hinged a curved arm, which passes through a flanged cylinder to control the direction of the clothes being washed.

Claim.—An improved washing-machine, formed of the corrugated and flanged bottom B E, the rollers or wheels C, the pivot D, the corrugated roller F, hinged frame G *g'*, crank H, flanged cylinder I, and curved arm J, constructed and operating in connection with each other and the tub A, substantially as herein shown and described, and for the purpose set forth.

140,652.—*Suspender.*—ABRAHAM SHENFIELD, New York, N. Y. Application filed May 23, 1873.

The front connecting-straps are made in one, and have three button-hole pieces, the middle one of which supports the middle and front part of the pantaloons.

Claim.—In combination with the suspender-straps *a a*, the connecting-straps *d* having three button-hole pieces, *e e f*, constructed as shown and described.

140,653.—*Apparatus for Making Vinegar and Aging Spirits.*—WILLIAM M. SKELTON, Greencastle, Ind. Application filed March 22, 1873.

Claim.—1. The combination, with the revolving feeder E, of the radially-channeled distributer D, substantially as specified.

2. The revolving feed-cup F, provided with the bent discharging spouts *n* and the cone *m*, adapted to be suspended upon a needle-pivot, substantially as specified.

140,654.—*Sewing-Machine.*—JOHN ALBERT SMITH, Columbus, Ohio. Application filed April 12, 1873.

The pin projects from the shuttle-carrier and is fitted loosely to a hole in rotating disk; and the pivoted link serves to maintain the carrier in an upright position as it moves.

Claim.—The combination of the disk A, shuttle-carrier B, pin E, and the rod F, said rod being jointed to the pin or shuttle-carrier and to the frame, all substantially as described.

140,655.—*Combined Scrubbing-Brush, Mop, and Wringer.*—JOHN D. SMITH, Sacramento, Cal. Application filed February 3, 1873.

The handle is attached to the brush by a staple extending nearly its length and to which the mop is connected. The handle, in its connection, is by a countersink in the staple, by which it may be turned to wring the mop by the aid of its cross-head, which slides upon the handle, and may be rigidly held by the set-screw when using the brush.

Claim.—The brush A, with its back rod *b* and handle C, in combination with the sliding and revolving handle E, having the set-screw *f* and cross-bar *g*, substantially as and for the purpose above described.

140,656.—*Fishing-Rod.*—WILLIAM M. SMITH, Reading, Pa., assignor of one-third his right to HENRY Z. ERMENTROUT, same place. Application filed May 17, 1873.

To prevent unjointing while in use set-screws are tapped into the outer band, which take into grooves upon the inner ferrule-point.

Claim.—1. The combination of the part A of a fishing-rod having ferrule B, collet D, and set-screws E, with the part A' having ferrule B' and extension C, substantially as and for the purpose described.

2. The outer ferrule B, having collet D with set-screws E and staple *b*, as set forth.

3. The inner ferrule B', with grooved, notched, or smooth extension C, substantially as described.

140,657.—*Sawing-Machine.*—HARRY M. STOW, Milan, Ohio. Application filed April 26, 1873.

The bar to which the saw is attached is suspended and reciprocates in two vertically-adjustable guides.

Claim.—1. The saw-bar B, having sliding front and stirrup chains *b* and *d*, as described.

2. The combination of levers F G with saw-bar B, by-rods *l l'*, arms *m m'*, and rope *p*, substantially as described.

140,658.—*Band-Cutter and Feeder for Threshing-Machines.*—JOSIAH SULLIVAN and JOHN MINES, Newark, Ind. Application filed May 3, 1873.

The knives so arranged as to propel the separated sheaves with an oblique front, thereby breaking joints between the succeeding sheaves.

Claim.—1. In a band-cutter for thrashing-machines, the cutter-shaft C having the curved cutters *c c*, arranged in progressive order, and operating in the manner set forth.

2. The combination and arrangement of the compensating feed-rake D with the straight rake-teeth *d*, and the cutter-shaft C with the curved cutters *c c*, arranged in progressive order, substantially as and for the purpose specified.

140,659.—*Clothes-Clamp.*—WILLIAM TUNSTILL, Brooklyn, N. Y. Application filed May 9, 1873.

Two jaws are recessed to receive a coil-spring, with two arms and a staple passing through the jaws and securing all in place.

Claim.—The clamp formed of the parts *a* and *b*, united by the wire *c*, in combination with the coil *e* having arms 4 4 that act as springs, which coil is in recesses within the clamp *a b*, and secured by the wire *c* passing through the same, as set forth.

140,660.—*Subsoil-Plow.*—AUGUSTUS L. P. VAIRIN, Ripley, Miss. Application filed April 19, 1873.

A slot is formed in the share having an enlarged portion at the rear for the passage of lugs formed on the rear of the standard. The standard, being moved forward so that the lugs engage with the share, is held in position by a key.

Claim.—The toe a^2, ribs or flanges a^3, lugs a^4, slot b^2, enlarged at its rear end, and the wedge-plug C, for securing the share B to the standard A, substantially as herein shown and described.

140,661.—*Transmitting Time-Movements to Distant Dials.*—HERMANN J. WENZEL, San Francisco, Cal. Application filed March 21, 1873.

Two inverted cups attached to a balanced arm or beam, which is oscillated by a clock-wheel or cam once in a minute, are thereby caused to be alternately raised and depressed in vessels containing liquid, so as to transmit pneumatic impulses through connected air-tubes to any desired point where a closed double-chambered vessel provided with a float and lever is arranged, so as to synchronously operate ratchet-wheels carrying indexes upon a suitable dial or dials.

Claim.—1. A cylinder or vessel, raised and lowered periodically by clock-work into and out of liquid contained in a vessel, in combination with the tube connecting to a distant vessel containing a float that actuates the mechanism of a dial in unison with the main clock mechanism, substantially as set forth.

2. The equalizing-vessels *h h'* connected by a tube, in combination with the cylinders *e e'*, vessels *f f'*, and tubes *g g'*, substantially as and for the purposes set forth.

140,662.—*Splint.*—ARA WHEAT, Canaan, N. H. Application filed June 7, 1873.

A swiveled exterior rod is connected with the upper hinged section. The foot-rest is attached to the lower hinged section by a sliding bar and screw extension-rod.

Claim.—1. The swivel I, extension-rod H, support J, nut K, and banding-strap N, combined with section A, substantially as specified.

2. The combination of the sections B and C D, sliding joint L, and extension-rod M, substantially as specified.

140,663.—*Railway Snow-Plow.*—WILLIS WHEELOCK, Decorah, Iowa, assignor of one-half his right to WILLIAM T. BAKER, same place. Application filed May 10, 1873.

The plow after being filled is backed out from the drift, and the rope connecting with the inner movable plow winds around the car axle and causes the snow to be discharged from the front.

Claim.—The shovel A B, supported on the truck C, and having the chilled shoes D, in combination with the inner sliding plow E, substantially as specified.

140,664.—*Music-Leaf Turner.*—GEORGE W. WHITE, Brooklyn, N. Y. Application filed May 10, 1873.

Two bell-cranks, having at their upper ends segmental gears, connect with two pinions upon the leaf-arm shaft. To the lower ends of said cranks finger-levers are attached, one to carry all the arms at once to the right, the other to carry them one by one to the left, the latter engaging with each arm consecutively by an upwardly-working spring-sleeve which always takes the lowest unturned arm.

Claim.—1. The combination of the arms A, wheels E and F, the pin J, the segmental bell-cranks L S, and their operating levers and springs, substantially as specified.

2. The combination of the sliding pin V, sleeve H, and spring I with the notched arms, substantially as specified.

3. The combination of rod d and bar *s* with sleeve H, spring I, and the mechanism for throwing the arms A to the side for engaging the leaves to be turned, substantially as specified.

4. The combination of spring-plates *g*, push-pins *h*, and arms A, substantially as specified.

140,665.—*Driven Well.*—ALPHONSO WILSON, Plainfield, N. J. Application filed May 5, 1873.

The water-section of a drive-well tube is cast of malleable iron with a conical point, contracting and expanding ring-sections, and a tubular top section, having its contracting sections perforated and covered with wire-gauze, and a screw-thread cut upon its tubular top section. The wire-gauze is so applied that it cannot be cut or torn off by stones or other obstructions while the tube is being driven.

Claim.—A water-section, A, of a drive-well tube, cast of malleable iron with a conical point, a^1, alternate contracting and expanding ring-sections a^2 a^3, and a tubular top section, a^4, and having its contracting sections a^2 perforated and covered with wire-gauze B, and a screw-thread cut upon its tubular top section a^4, substantially as herein shown and described.

140,666.—*Coach or Carriage.*—JOHN ALLGAIER, Philadelphia, Pa. Application filed December 17, 1872.

The windows are so arranged that they may fold inwardly and be thrown back or forward, as the case may be, with their respective sections of the top.

Claim.—1. The top part E having its sides, back, and top united with one another by hinges *f* and *g*, and with the bed part A by the hinges *b d*, as specified.

2. The side windows F hinged to swing or open inwardly against the back of the rear top part E, or inwardly against the front of the forward top part D, respectively, essentially as herein described.

3. The seat back or backs G hinged below to the fixed or bed portion of the vehicle, in combination with the inwardly swinging and opening windows F, substantially as specified.

140,667.—*Car-Coupling.*—BENJAMIN ATKINSON, Indianapolis, Ind. Application filed June 9, 1873.

The coupling-pin is raised automatically by projections on the link striking independent front wicket-plates in the draw-head and pushing them inward against a hinged back plate, which raises and lets fall the pin through the connecting-arms. The wickets open outward to uncouple when the pin is raised by hand.

Claim.—1. The independent wicket-sections F G, in combination with the lifting device D E, the pin B, and the link H having projections, essentially as described.

2. The combination of the hinged back plate D, arms E, pin B, with the front wicket-sections F G, and coupling-link having projections I, the several parts being constructed and arranged for joint operation substantially as described.

140,668.—*Artificial Marble.*—BINY AUGUSTE, Chicago, Ill., assignor of one-third his right to BENJAMIN GOTIA, same place. Application filed May 31, 1873.

Hydraulic lime, plaster, marble-dust or common sand, litharge, drawn from white lead, rock alum, linseed-oil, resin, paste of Flanders, (Colle de Flanders,) red litharge, and water.

Claim.—1. An artificial marble or stone, composed of the ingredients in and about the proportions substantially as specified.

2. In the manufacture of artificial marble and stone, the process substantially as herein specified.

140,669.—*Fare-Box.*—HENRY BARANGER, St. Louis, Mo. Application filed January 6, 1873.

Claim.—In combination with a fare-box with glass walls, and divided into two compartments by a tilting platform, as described, the lamps D and E, or either of them, and reflector F, so arranged that the said reflector will throw the rays of light from the lamp or lamps into both of said compartments through the glass walls thereof.

140,670.—*Cheese-Vat.*—DAVID F. BARCLAY, Elgin, Ill. Application filed April 26, 1873.

The series of pipes connecting the heater with the vat is provided with a series of sliding valves, which are opened and closed simultaneously by means of a rod connecting them, and above the pipes are arranged independent deflecting plates for evenly distributing the heated water.

Claim.—The combination of the heater B, pipes *a a a a*, simultaneously-sliding valves D D D D, ways D' D', rod E, and distributing-plates F F F F, all constructed and arranged to operate substantially as and for the purpose specified.

140,671.—*Horse Hay-Rake.*—JACOB H. BEAN, Macon, Ill. Application filed February 24, 1873.

Inclined forwardly-projecting teeth are pivoted in front of the axle. The part of the teeth in rear of the pivots enter mortises in the axle, so as to have vertical play.

Claim.—The combination of the head A, projecting-gudgeons B B', ground-wheels C C', hitching devices D D' *d d'*, arms E E', rollers *e e'*, pivoted teeth F *f* G H, and mortises *a*, for the purpose herein described.

140,672.—*Saw Gummer.*—WILLIAM G. BLACKLIDGE, Metamora, Ind., assignor of one-half to JAMES P. ALLEY, Cincinnati, Ohio. Application filed April 11, 1873.

The reamer is moved obliquely endwise while revolving by means of the screw G drawing the wedge-bar E through the frame A and across the blade of the saw.

Claim.—The combination of the reamer C, frame D, wedge E, screw G, gears H H', and cranks I I, all constructed and arranged as described, and operating in the frame A, substantially as and for the purposes herein set forth.

140,673.—*Manufacture of Steel for Boiler-Plates, &c.*—OGDEN BOLTON, Jr., Chartiers township, and JOHN PADDEN, Pittsburg, Pa. Application filed April 12, 1873.

Steel containing from three-tenths to four-tenths per cent. of carbon is brought to ingot or plate form of about one inch thick.

ness, the plates embedded in metallic or other suitable oxide, and subjected from one-half to two days to a cherry-red heat in a heating-furnace such as is used in the cementation process.

Claim.—The manufacture of homogeneous boiler-plate steel by bringing a hard or high steel to a uniformly low grade, through the agency of decarbonizing agents brought to bear on the same after pouring, and while in an unmelted state, substantially in the manner set forth.

140,674.—*Window-Screen.*—JOHN W. BOUGHTON, Philadelphia, Pa. Application filed June 26, 1873.

Claim.—The screen consisting of the two frames B B, constructed with the connecting-bars of one frame passing through one of the side pieces of the other frame, in combination with the netting E respectively secured to each frame, and operating in the manner and for the purpose set forth.

140,675.—*Harvester.*—ISAAC W. BRAGG, Kidder, Mo. Application filed May 31, 1872.

A reciprocating trough in rear of the cutters serves to even the butts of the cut grain. The platform after receiving a load slides backward, the falling grain being meanwhile supported upon an interposed rod. Arms sliding toward the center of the platform compress a gavel which is seized by grapples suspended from a crane and swung around to the rear of the machine and dropped.

Claim.—1. The combination of the horizontally-reciprocating table B, retreating at intervals from the cutters, cut-off supporting-bars Y' Y'', and oscillating trough Q', substantially as and for the purposes specified.

2. In combination with the reciprocating table B, the bundling-prongs S S', having a reciprocating motion across the face of the table, and operated substantially in the manner and for the purpose specified.

3. In combination with the bundling-table B S S', the vibrating arm V and carrying-fingers W W', connected and operating substantially in the manner and for the purpose specified.

4. In combination with the arm V and carrying-fingers W W', the rotating and vertically-sliding journal X y, bar m, lever Y y', rods Z, and cranks f f', the bar being connected to the driving mechanism, and the whole operated substantially in the manner and for the purpose described.

140,676.—*Fly-Wheel for Vehicles.*—GEORGE ABA BEICE, Townville, Pa. Application filed February 1, 1873.

The quadrant-plate and the anchor-piece are intended to be used in place of a head-block.

Claim.—The anchor or quadrant shaped plate C, having the arm c and arc-shaped slot H, in combination with the arc-shaped plate D, substantially as and for the purpose specified.

140,677.—*Treadle for Sewing-Machines.*—SAMUEL R. BUSHFIELD, Baltimore, Md., assignor to himself, ROBERT D. MORRISON, and JOHN H. WARNER. Application filed June 9, 1873.

Claim.—1. The combination of the stationary shaft B, rubber block C surrounding the shaft and extending above it, and the treadle A connected to the top part of the block, all substantially as and for the purposes herein set forth.

2. The combination of the stationary shaft B, block C, and the treadle A, rubber block D, and pitman E, all substantially as shown and described.

140,678.—*Sheet-Metal Seaming-Machine.*—GEORGE D. BROOKS, Baltimore, Md., assignor to himself and MARY C. BROOKS, same place. Application filed April 8, 1873.

The circular edges of the top and bottom of the body of the can are flared by the tapering dies. The top and bottom are placed within the flared ends and other dies are substituted, which turn the edge of each end of the body of the can over the top and bottom. The joints are then dipped in solder to make them air-tight. The dies are perforated to allow the escape of air, which prevents the displacement of the head.

Claim.—1. The combination of two tapered dies arranged in a machine having a suitable operative mechanism, as described, so that both the edges of can can be simultaneously flared.

2. A die, M, constructed with inside upward flange m, and applied as and for the purpose described.

3. The combination of two dies, N, flared or beveled on the inside and applied to turn over both edges of can simultaneously, the dies provided with holes therein, as and for the purpose described.

140,679.—*Soldering-Machine.*—WILLIAM D. BROOKS, Baltimore, Md., assignor to MARY C. BROOKS and GEORGE D. BROOKS, same place. Application filed May 20, 1873.

The cans are brought up on a carriage-truck or car so as to be centered by the cap-holder B, that first comes down, and so that the seam which is to be soldered shall come directly under the burners and the pipe E. The can then is revolved and is quickly heated, while the bit of solder that is cut off in tube E falls through the lower end thereof, and rests with one end on the can, being melted gradually as the can revolves.

Claim.—1. A circle of burners for a soldering apparatus, having the annular feed-pipe made in two parts, C C, closed at each end, and provided with coupling-pipes c c, which adapt them to be fitted specially on corresponding pipes a d of the reservoir, as described, so that the circle of burners may be readily enlarged or diminished with the increase or decrease in the size of cans.

2. The tube E, knife F, and feed-pawl L, combined in a soldering apparatus, to feed successive bits of soldering-wire, in the manner set forth.

3. The combination, with the lever G, of the shank f^1, the slide J, strap K, and the rod P, attached respectively to knife, feeding-pawl, and cock, to operate them simultaneously, in the manner described.

4. The water-jacket Q, applied about the tube E, as and for the purpose set forth.

140,680.—*Cutting-Board for Shoemakers, &c.*—CHARLES E. COOPER, Philadelphia, Pa. Application filed April 21, 1873.

A cutting-board composed of strips or blocks of wood with their grain-edges exposed or forming the cutting-surface, each block being grooved for the introduction of a tongue, which, when applied, its grain will be at right angles to the grain of the blocks.

Claim.—1. The interposed tongues C in combination with the blocks A of a cutting-board, substantially as and for the purpose set forth.

2. The blocks A with their grain forming the surfaces of the cutting-board, and the tongues C arranged with their grain extending at an angle to that of the blocks, when combined and operating substantially as and for the purpose set forth.

140,681.—*Method of Splitting Stone.*—PATRICK CROGHAN, Cockeysville, Md. Application filed May 27, 1873.

The holes are bored subjacently beyond the longitudinal middle line, and the side pieces are placed across such line, when the wedges are driven, and the force exerted thereby is applied to the inside of the stone instead of at the edges, as heretofore.

Claim.—The method herein described of splitting off blocks of stone, the same consisting in boring subjacently beyond the longitudinal middle line of the block, and placing the side pieces across said line, so as to cause the up-and-down pressure of the wedge to be exerted inside and not on the edge of the rock, substantially as set forth.

140,682.—*Loom-Shedding Mechanism.*—GEORGE CROMPTON, Worcester, Mass. Application filed November 8, 1872.

The horizontal hooked jack-bars have each at their inner ends two notches to which the two harness-cords are fastened, and pass through a guide and fulcrum-plate placed near the notches, then between the evener-bars, then over the pattern-cylinder, and then between the lifter and depresser bars. The stress of the harness-cording presses the free ends of the jack-levers down toward the cylinder, while the pins lift the ends to bring their hooks within the path of the lifter-bar.

Claim.—1. The hooked horizontal jack-bars having cording-notches h^2, and resting on the fulcrum-plate g^6, and arranged with respect to the lifter, depresser, and evener bars, and with their outer free ends lying over the pattern mechanism, substantially as shown and described.

2. In combination with such jack-bars and their cording-notches h^2, the lifter and depresser bars v z, evener-bars w j, fulcrum-plate g^4, harness-cording and pattern-chain or cylinder, and the mechanism that actuates the pattern mechanism and actuates and adjusts the lifter, depresser, and evener mechanism.

140,683.—*Mechanical Movement.*—JOHN DAUGHER, Cincinnati, Ohio. Application filed May 31, 1873.

To a crank, 1, is attached a pitman, 2, to the other end of which are pivoted two levers, 3 and 5; the first attached to a pivot-pin, 4, to which is also pivoted another lever, 8; the other secured to a lever, 6, pivoted on another pin, 7. The two levers 6 and 8, attached to pivot-pins, are connected by a cross-bar, 9, at one end of which is a connecting-rod, c, which imparts the reciprocating motion of these two levers to a pitman, c.

Claim.—A mechanical movement, in which the parts are arranged and combined substantially as shown and described.

140,684.—*Flock-Cleaning Machine.*—RICHARD H. DAWSON, Rockville, Conn. Application filed October 16, 1872.

The flocks from a cloth-napping machine are fed from an apron to the brush-cylinder, and loosened by contact with stationary combs. The fibers are deposited on a card-cylinder, while the teazle-points are carried off by the brush cylinder. The fibers are doffed by a brush-cylinder running against the teeth.

Claim.—1. The combination of the rotating brush-cylinder c^3 with the overlying stationary combs i^1 i^2 i^3, one or more, both constructed, arranged, and designed to operate substantially as described, for the purpose set forth.

2. The combination of the rotary brush-cylinder c^3, the overlying combs i^1 i^2 i^3, one or more, and the card-toothed cylinder k, all constructed, arranged, and designed to operate substantially as and for the purpose set forth.

3. The combination of the brush-cylinder c^3, the overlying combs i^1 i^2 i^3, one or more, the card-toothed cylinder k, and the brush-cylinder m, rotating in the same direction with the card-toothed cylinder, the whole constructed, arranged, and designed to operate substantially as and for the purpose set forth.

140,685.—*Cock.*—ALMOND S. DEVENDORF, Galesburg, Ill. Application filed October 12, 1872.

A pipe is provided with a two-way cock in its central portion, a hollow screw at one end, and a socket screw and cap at the other, constructed as described in the claim, whereby the device may be detached at will from the vessel without the escape of gas or liquid from the same.

Claim.—The cock A, having the internally-screw-threaded tube A' at one end and the externally-threaded tube A'' at the other, in combination with the flanged tap-piece D and removable cap E, substantially as and for the purpose specified.

140,686.—*Baker's Oven.*—DAVID DONALD, Williamsburg, Brooklyn, N. Y. Application filed April 9, 1873.

The products of combustion pass partly through orifices g at the right and left of the fire-chamber; thence partly through similar orifices in the side partitions, and partly around the rear of said partitions, to the rising flues H at the front; thence to and through the side flues I, above the baking-chamber, to the entrance of the central flue J at the rear; thence through said flue J to the exit-flue k at the front.

Claim.—The arrangement, substantially as herein shown and described, of the fire-place A, the flue E having side openings g g, the flues F F G G, the back side openings A A, the baking-chamber C, the vertical corner-flues or openings H H, the upper flues I I J, the side openings i i, and the outlet or chimney k.

140,687.—*Lamp-Burner.*—JOHN H. DOOLITTLE, Ansonia, Conn., assignor to WALLACE & SONS, same place. Application filed February 6, 1873.

The deflector is secured to the socket by a metallic brace having shoulders which bear upon the top of the air-distributer. The brace is riveted to the deflector, passes through the air-distributer, and the end is secured to the socket.

Claim.—In a lamp-burner, consisting of the socket A with the base C attached thereto, and the deflector D supported above the said base, the supporting-posts attached to the sockets below, extending up through the base to the deflector, and formed with projections or shoulders f to bear upon the base, and the deflector secured to the upper ends of the post, all substantially as set forth.

140,688.—*Scaffold.*—M. DINGUID DRAKE, Trenton, Ky. Application filed April 14, 1873.

A builder's scaffold capable of expansion in the several directions mentioned by means of the extensible beams, legs, arms, and braces.

Claim.—The combination of the extensible beams A', extensible legs B^1, extensible arms D', extensible supports and braces C^1 B^2, substantially as shown and described.

140,689.—*Show-Case.*—DAVID D. ELDER, Philadelphia, Pa. Application filed May 26, 1873.

The cover of the show-case extends beyond its axis, and the extension is weighted so as to assist in opening and closing the cover. The extension-piece is received, when tilted, in the portion of the show-case back of the longitudinal partition.

Claim.—The show-case A, having its cover B formed with an extension, D, beyond the axis of the cover, in combination with the weight F applied to said extension, and operating as herein set forth and for the purpose described.

140,690.—*Gearing.*—FRANK EMMERICH, New York, N. Y. Application filed June 5, 1873.

Claim.—The gear-wheels C D, constructed each of two or more toothed disks, the teeth of each pair being formed on the same pitch-line, but with different pitches, substantially as described.

140,691.—*Knitting-Machine.*—SAMUEL V. ESSICK, Alliance, assignor of two-thirds his right to GEORGE W. RAFF, Canton, and HENRY C. HEDGES, Mansfield, Ohio. Application filed November 14, 1872.

The needle has an upward and slightly forward movement to enter the loop thrown off from a hook by a pair of wringing-fingers, and a backward, downward, and slight sidewise movement for leaving the loop and forming and depositing a new one on a hook, a looper being dispensed with. A point on the end of the feed-bar enters between the hooks and feeds the comb along. The comb is carried by a turn-table which is locked to the head by one of a pair of vertical levers, which, when struck by a stop applied to the comb, is liberated from a notch in the head, and the turn-table turned slightly by a spring so as to bring a cam on its shaft into the path of vibrating lever by which it is swung half way around so as to bring the opposite row of hooks into operation.

Claim.—1. The combination, in a knitting-machine, of a single, solid, eye-pointed needle, carrying the yarn, and operating substantially as herein described, and a single comb, having two parallel rows of straight teeth, the points of which stand outward in opposite directions, substantially as herein set forth.

2. The combination, in a knitting-machine, of a single eye-pointed needle for carrying the yarn, a single comb, having two parallel rows of straight teeth, the points of which stand in opposite directions, and a swinging head, substantially as described, or its equivalent, for the purposes set forth.

3. The combination, with the needle h, the comb W, having two parallel rows of straight teeth, the points of which stand in opposite directions, and the swinging head, or its equivalent, of the movable stops s', for the purposes herein set forth.

4. The combination, with the needle h and the comb W, having two parallel rows of straight teeth, the points of which stand in opposite directions, of the claws b' and spring k, substantially as and for the purposes herein set forth.

5. The combination, with the needle h and the comb W, having two parallel rows of straight teeth, the points of which stand in opposite directions, of the tension device n substantially as and for the purposes herein set forth.

6. The combination, with the needle h and the comb W, having two parallel rows of straight teeth, the points of which stand in opposite directions, of the claws b', spring k, and tension device n, substantially as and for the purposes herein set forth.

7. The combination of the sliding cam Y, stud w', lever Z and cam A', all substantially as and for the purposes herein set forth.

8. The combination of the comb W, needle h, claws b', spring k, feed-bar s', lever Z, and double cam A', all substantially as and for the purposes herein set forth.

140,692.—*Apparatus for Raising Oil, &c., from Wells.*—HIRAM W. FAUCATT, Titusville, Pa. Application filed May 1, 1873.

A cylinder composed of two sections is inserted in the well. The ends of each section are closed by a partition dividing them into separate chambers. An air-tube connected with a double-acting air-pump is connected with each chamber. Supply-tubes with suitable valves are provided for each chamber, and a common delivery-tube with check-valves conducts the liquid from both. The supply of air from and to the pump is regulated by a four-way valve. Air is forced into the lower chamber at the same time it is exhausted from the upper chamber, and vice versa.

Claim.—1. In an apparatus for raising oil or other liquid from wells, the combination of a sectional pneumatic cylinder placed at or near the bottom of the well, pipes for creating a vacuum and pressure in the sections of the cylinder inlet-tubes, a common outlet-tube opening in the sections of the cylinder, a four-way valve for shifting the pressure and exhaust from one section to another, and a double-acting air-pump, as shown and described.

2. A cylinder, B, divided into compartments a b, and provided with inlet-tubes g h and their valves i, discharge-pipe C with valves j, and air-tubes e f connected with an air-pump, substantially as and for the purpose shown and described.

140,693.—*Self-Cleaning Tobacco-Cutter.*—WILLIAM J. FAUL, New York, N. Y. Application filed January 30, 1873.

The beveled edges of cutters revolve close to the projecting feed-mouth, and are cleaned by a curved knife arranged to press against them and an endless traveling brush kept wet.

Claim.—1. The combination, with the knives B B, of the scraper D, constructed and secured in place, as described, essentially as and for the purpose specified.

2. The cleaner E, composed of the endless apron of bristles, in combination with the knives B B, essentially as and for the purpose herein set forth.

140,694.—*Grass-Seed Attachment to Grain-Drills.*—JESSE P. FULGHUM, Dublin, Ind., assignor to himself and WAYNE AGRICULTURAL COMPANY. Application filed April 10, 1871.

A grass-seed hopper is attached to that of a grain-drill, and the seed-distributer receives its motion directly from the seeding-shaft, so that they work in concert. Provision is also made, by a change of gear, to change the speed of the grass-seed delivery.

Claim.—The combination of the feed-shafts C M, counter-shaft G, gearing E F and K L, jack-plate H, lick I, and bolt J, arranged and operating substantially as herein described, for the purpose specified.

140,695.—*Dough-Machine.*—OAKLEY B. FULLER, Newark, N. J. Application filed June 9, 1873.

A cylindrical vessel has supported within it a screw-propeller. In the bottom of the vessel, under the propeller, is a longitudinal opening, through which dough is forced into sheets when the propeller is put in motion.

Claim.—1. The combination of the propeller P, vessel C, and throat D, whether adjustable or not, as shown and described.

2. The combination of the holders or partitions A with the propeller P and vessel C, substantially as shown and described.

140,696.—*Meat-Chopper.*—OLIVER GARDNER, New York Mills, N. Y. Application filed June 4, 1873.

The chopping-knife is provided with a box through which steam or hot air is made to circulate to prevent the material adhering to the knife.

Claim.—The combination, with a chopping-blade, of a hot air or steam box, as and for the purpose set forth.

140,697.—*Glass Piston and its Packing for Pumps.*—ARTHUR E. GAY, Nashua, N. H. Application filed May 24, 1873.

The piston is a cylinder of glass, connected to the rod by cross-bars and a nut at the bottom. The packing is stationary and is held between the two sections of the pump-cylinder.

Claim.—In a pump, the glass-piston A and its packing E, cross-bars C D, pump-rod B, and nut d, substantially as specified.

140,698.—*Medical Compound or Liniment.*—DANIEL J. GISH, Hopkinsville, Ky., assignor of one-half his right to HARRY B. GARNER, same place. Application filed May 16, 1873.

Cayenne pepper, gum camphor, spirits turpentine. Mix and allow to digest, the vessel being shaken every day. The mixture is then strained or filtered. Whites of wild-goose or hens' eggs, acetic acid, oil sassafras.

Claim.—The within-described wild-goose liniment, consisting of the ingredients substantially as herein set forth.

140,699.—*Stave-Jointer.*—JAMES E. GREEN, St. Louis, Mo. Application filed June 11, 1873.

A pair of jointing-cutters are secured to a vertically-reciprocating frame so as to joint both edges of the stave at one operation.

Claim.—1. The holder B, operating cam and yoke C C', or their equivalent, in combination with the cutter-knives E, operating-cam and yoke F F', and shaft D, substantially as and for the purpose set forth.

2. The holder B with pivoted plate b, crank-shaft b'', pin b''', dogs H H', tappet or cam G', lever G, arm g', and shaft D, in combination with the arm I and spring I', as and for the purpose set forth.

3. The combination and arrangement of the holder B, frame B b' operated by cam and yoke C C', plate b, dogs H H', crank-shaft b'', pin b''', cam or tappet G', lever G, arm g', arm I, spring I', and shaft D, with the knives E, frame E', cam and yoke F F', and table A', as and for the purpose set forth.

140,700.—*Brake Mechanism.*—OTTO GRÜNINGER, New York, N. Y. Application filed June 11, 1873.

When the speed of the locomotive is to be checked steam is shut off, link-motion is reversed, and the piston pumps in through

the exhaust-port air and water, the former taken through a pipe leading from the atmosphere and connecting with the exhaust-pipe, the latter through pipe connecting with feed-water tank, into which the water and air are forced through a pipe leading from the steam-chest into said tank. In this manner the heat developed by pumping action is employed in raising the temperature of the water in the reservoir.

Claim.—1. The arrangement of a pipe leading from the exhaust-cavity of the steam-valve, or from the exhaust-port of the valve-chest of a compression or steam-cylinder, into a reservoir containing water, with a pipe leading from the steam-space of the valve-chest to said reservoir, so that when the cylinder is used as a brake it is prevented from becoming overheated by the water drawn in through said pipe and forced into said reservoir, substantially as described, for the purpose specified.

2. The combination of an air-pipe with a pipe from the exhaust-cavity of the steam-valve, or from the exhaust-port of the valve-chest of a compression or steam cylinder, into a reservoir containing water, and with a pipe leading from the steam-space of the valve-chest to said reservoir, for operation, in connection with a locomotive or stationary engine, substantially as described, for the purpose specified.

140,701.—*Separating Apparatus.*—GEORGE W. HATFIELD, Nashville, Tenn., assignor to himself and DIXIE OIL COMPANY, same place. Application filed March 28, 1873.

Arranged spirally upon a common shaft is a series of paddles or agitators which are continually lifting and transferring the fluid matter from one end to the other of a close boiler or mixing-chamber.

Claim.—The blades E, cup-shaped at the ends, flanged thereabove, placed spirally close together, and the end blade reversed, as and for the purpose set forth.

140,702.—*Bee-Hive.*—EDWARD E. HENEGAN, Downsville, Wis. Application filed April 23, 1873.

A large base-box and two upper boxes with inclined hinged floors which may be opened downward to throw all into one. These floors have central holes as communicating doors, the bee-entrance being into this base-box through a partitioned vestibule, in which is suspended a movable moth-frame. The two equal boxes have a space and connected slide doors between them, and communicating honey boxes above.

Claim.—1. The combination, with the boxes E E, slots F, slides L, doors M, and box A, of a honey-box, N, constructed and arranged substantially as and for the purpose set forth.

2. The under honey-box N, constructed as described, and provided with the moth-frame O, substantially as and for the purposes set forth.

140,703.—*Dumping-Wagon.*—JESSE HIGHFIELD, Centerville, Ind. Application filed May 23, 1873.

The bottom of the wagon is divided into two sections, which are hinged in the center, and connected by means of a cord to a windlass, by means of which the sections are raised and the load dumped.

Claim.—1. In combination with the folding bottom C D, the V-shaped supports E E and rollers *b b* in the edges of the wings C, as set forth.

2. The rollers *m m* arranged inside of the box B, as and for the purposes set forth.

3. The movable frame G, in combination with the sides B having the slots *d* and *e e*, substantially as and for the purpose set forth.

4. The combination, with the bottom C D, of the cords *f f*, lever I, windlass J, and hinged standards K K, as and for the purposes herein set forth.

140,704.—*Butter-Printing Machine.*—ABRAHAM F. HINES, Washington, D. C. Application filed June 7, 1873.

A matrix is fixed in position for perpendicular action, its base-plate being a top expansion of a follower and resting on the interior shoulder of the matrix. A segment of a spoke-wheel being removed the die attached to the upper end of the rim descends into the matrix, and a hammer on the lower end strikes the lower end of the follower and throws up the printed butter.

Claim.—The combination of the rim or levers B B, the die *f*, and delivery end *e*, all moving together and around a common center, *a*, with the mold *b* or *c* and follower C, as and for the purpose described and represented.

140,705.—*Thill-Holder.*—JOHN P. HISLEY, Syracuse, N. Y., assignor of one-half his right to HENRY L. DUGUID, same place. Application filed June 11, 1873.

Claim.—The loop A, cast in one piece, with guards *a a* forming a pocket at the point of the loop to hold the ends of the lining, and with projections *b b* at its lower part, substantially as and for the purpose described.

140,706.—*Cork-Extractor.*—CHARLES F. HUNT, Brooklyn, assignor to himself and EMIL P. EMMELUTH, Mount Vernon, N. Y. Application filed June 21, 1873.

Double-spring loops are attached to a slide that moves in the hollow handle of a cork-screw.

Claim.—The double-spring cork-extractor *f*, attached to the slide *d*, in combination with the hollow cork-screw handle *a* and thumb-piece *c*, as and for the purposes set forth.

140,707.—*Ridge-and-Furrow Sidewalk-Plate.*—THADDEUS HYATT, New York, N. Y. Application filed May 31, 1873.

Claim.—1. A ventilating corrugated pavement-plate, constructed with curved reflecting upper and lower surfaces, in which said surfaces and the ventilating-openings are relatively arranged to transmit the rays of light from above into the space beneath said plate, in the manner and for the purpose substantially as specified.

2. In combination with the ventilating-openings D, the cowls *d*, secured upon the sides of the ridges B, and extending outward over said openings, substantially as and for the purpose shown.

140,708.—*Ridge-and-Furrow Sidewalk-Plate.*—THADDEUS HYATT, Atchison, Kans. Application filed December 23, 1870.

Claim.—1. A ventilating corrugated pavement-plate, in which the corrugations in transverse section show a series of straight lines, substantially as and for the purpose specified.

2. A ventilating corrugated pavement-plate, A, in which the openings D, constructed in and through the walls *b*, have their upper and lower sides formed upon lines having an outward and downward inclination, substantially as and for the purpose shown.

140,709.—*Illuminating Vault-Cover.*—THADDEUS HYATT, Atchison, Kans. Application filed December 23, 1870.

Claim.—A corrugated illuminating pavement-plate, in which the lenses are placed wholly or in part within the sides of the ridges, substantially as and for the purpose specified.

140,710.—*Coupling for Earth-Auger Shafts.*—GEORGE W. IRWIN and THEODORE A. COX, Champaign county, Ill. Application filed January 2, 1873.

The slide H locks the coupling when the sections of the shaft are united, and by sliding it up the flange *i* can be withdrawn from the recess below the projection in the section *g* and the sections uncoupled.

Claim.—In couplings for earth-auger shafts, the combination of the flange *i* and the projection *g* with the slide H, substantially as and for the purpose hereinbefore set forth.

140,711.—*Carbureting Apparatus.*—THORWALDSEN JUDD and CHARLES H. PIERSON, Philadelphia, Pa., assignors to PHILADELPHIA GAS-MACHINE COMPANY, same place. Application filed February 7, 1873.

Claim.—1. In a carbureting apparatus, the air-wheel A thereof, driven by an air-blast or force which supplies the carbureter and is the motor to the machine.

2. The feed-wheel B and the air-wheel A, both driven alike by means of an air-blast or air-pressure motor, essentially as described.

3. The bent ends *e* of the conducting-tubes M, arranged to revolve in a vertical plane within a sealed chamber, N, as and to obtain the advantages described.

4. The sleeve S for the weight-cord, in combination with the spool R of the air-wheel shaft, as a means for putting the weight-propelling devices in and out of gear with the air-wheel shaft, to adapt the machine for use by either of two independent motors, as described.

5. The hand-lever T in combination with the separate sleeve S for the cord, as a means for putting the cord-sleeve in and out of gear, according as either the weight or air-blast motor is used, as described.

6. The gearing device W X Y Z for winding the weight, arranged to be put into gear to wind the weight without the attendant having to go into the vault, as described.

7. A carbureting apparatus having the air-wheel driven by an air-blast or weight motor, when these motors are employed to operate the carbureting apparatus independent of each other, as may be required.

140,712.—*Water-Cooler.*—WILLIAM S. KIMBALL, Philadelphia, Pa. Application filed May 26, 1873.

The filtering-block in a receiver is fitted on a tube communicating with the cooler, and the displaced air in the cooler passes through a pipe into the atmosphere.

Claim.—1. The filtering-block F in the receiver, and fitted on a tube communicating with the cooler, substantially as and for the purpose set forth.

2. The combination, with the cooler A, of the vessel B having the upwardly-projecting pipe C, and the filter F fitted on said pipe, substantially as and for the purpose set forth.

3. In combination with the cooler A, the pipe D of the vessel B, substantially as and for the purpose set forth.

4. The combination, with the cooler A, of the vessel B with pipe C, filter F, and pipe D, substantially as and for the purpose set forth.

140,713.—*Track-Lifter.*—GEORGE J. KENZEL, Knoxville, Tenn. Application filed June 14, 1873.

A shaft in the upper part of the frame, governed by ratchet wheel and pawl, is actuated by a lever or wrench working on a six-sided nut on the end of the shaft, which is provided with chains attached to heavy hook, which raises the rail. These chains are guided by a loose link attached to the hook, and sliding on a rod attached to the central part of the frame.

Claim.—1. The combination of the chains *d d* with hook G and guide-rod *n*, for the purposes set forth.

2. The combination of the frame A B C, shaft D, lever E, chains *d d*, hook G, guide-rod *n*, ratchet-wheel A, and pawl *f*, all constructed and arranged substantially as and for the purposes herein set forth.

140,714.—*Horse-Collar.*—OLIVIER LAFRENIERE, Brooklyn, N. Y. Application filed December 30, 1872.

A metallic flange is secured to the inside of the front of the collar, which serves the purpose of a rim.

Claim.—The metallic hames-retaining rim B applied to and connected with the body A of a horse-collar, substantially in the manner herein shown and described.

140,715.—*Plow-Clevis.*—WILLIAM LAHMAN, Wellsville, Ohio. Application filed April 3, 1873.

A spring-pin secures the clevis to the plow-beam.

Claim.—The U-shaped clevis-bar A, forming prongs *a a* having holes for the passage of the clevis-pin, and the lower prong provided with a countersunk recess, *b*, in combination with the headed pin B, provided with a spring, C, having a square shoulder and extended below the bottom of the lower clevis-prong, all as shown and described.

140,716.—*Plow.*—AUSTIN S. MANN, St. Louis, Mo. Application filed May 26, 1873.

The frame consists of three beams, the side ones being attached to the center one by a spring-clevis. Each beam carries a shovel. The handles are pivoted to a cross-beam secured to the center beam, and the handles being pivoted to this, and to the side beams, these can be moved out and in at pleasure.

Claim.—1. The combination of the elevated fixed cross-beam B' carried upon the rear standard of the center beam, adjustable side beams, lever-handles, and latches for locking the handles to the cross-beam B', substantially as and for the purpose specified.

2. The combination of the cross-beam B', the handles D D', the latches H, cross-beam C, and the adjustable beams G G, substantially as shown and described.

140,717.—*Drop-Hammer.*—JAMES MCGEORGE, Bellaire, Ohio. Application filed October 28, 1872.

The upper wheel, carrying the wrist-pin, has a portion of the periphery removed, and is revolved by the friction drive-wheel. The wrist-pin is made adjustable in a slot by means of a screw-bolt countersunk in the tread of the wheel. When operating, the drive-wheel, by its friction on the upper wheel, raises the wrist-pin until it has passed the vertical center, when, by reason of the removed portion coming opposite the drive-wheel, the friction ceases and the hammer drops, unless held suspended by a catch on the side of the wrist-pin wheel.

Claim.—1. In a drop-press, the combination of the wrist-pin wheel M, having a portion of its periphery flattened, as set forth, a drive-wheel, F, with plain periphery for communicating motion to said wrist-pin wheel, and a holding and tripping device operating in connection with said wrist-pin wheel, all substantially as described.

2. In combination with the wrist-pin wheel M, constructed and arranged as described, the stud T, upon the side of said wrist-pin wheel, and the weighted catch U, arranged as and for the purpose described.

3. In a drop-press in which the wrist-pin wheel is constructed and arranged to operate as herein described, the combination, with the shaft of said driven wrist-pin wheel M, of the yielding or spring journal-box K, to obtain the advantages herein described.

4. In a drop-press, the combination of the wrist-pin wheel M, constructed as described, the adjusting-screw Q, and the wrist-pin N, with the drive-wheel F, with plain periphery for communicating motion to said wrist-pin wheel, and a holding and tripping device operating in connection with said wrist-pin wheel, all substantially as described.

5. The combination in a drop-press of the driven wrist-pin wheel M, constructed and employed for the purpose described, the drive flat periphery wheel F, stud T, weighted catch U, spring journal-box, and hammer C, the several parts being constructed and arranged to operate substantially as herein set forth.

140,718.—*Cartridge Capping and Uncapping Device.*—GEORGE V. MCGRAW, Mankato, Minn., assignor to CHARLES PARKER, Meriden, Conn. Application filed June 4, 1873.

Claim.—In combination with a priming device for cartridge-shells, consisting of the base A and lever C provided with suitable means for supporting the shell to be primed, the post E having the spindle *d* in its head, and the lever C constructed with a cavity, *f*, over the said spindle, substantially as and for the purpose set forth.

140,719.—*Heater and Filter.*—LOUIS FELIX MEUNIER, Fives-Lille, France. Application filed January 9, 1873.

A heater and filter in the same vessel. Steam enters pipe A, passes through a perforated pipe, commingling with water entering pipe B, and down the central pipe to a spreader. The water thus heated passes up through two perforated disks, the space between which is filled with charcoal or other filtering material, and out pipe G.

Claim.—The vessel E, provided with a central vertical tube, L, and with perforated partitions N N around the said tube, the disk or spreader O at the bottom of the said tube, the inlet B, and the perforated steam-tube M within the said vertical tube L, to discharge steam into the water flowing into the said tube L, and the said vessel further provided with the outlet G, all constructed and operated substantially in the manner and for the purpose specified.

140,720.—*Car-Coupling.*—SPENCER MILLER, Holley, assignor of one-half his right to HUDSON MILLER, Bergen, N. Y. Application filed May 7, 1873.

A hook-head attached to an ordinary draw-head in such a manner that the hook-head may be turned out of the way when not needed.

Claim.—The hook-head B, having the hook *d* and bumper *f*, and attached to and combined with the draw-bar A, so as to be turned back for the connection of the ordinary link, as herein shown and described.

140,721.—*Manufacture of White Lead for Pigments.*—EDWARD MILNER, Springfield, Warrington, England. Application filed June 18, 1873.

Claim.—The manufacture of white lead or carbonate of lead by treating a mixture composed of litharge and chloride of ammonium, or of potassium, or of sodium, with carbonic-acid gas, either under pressure or in an open vessel, substantially as described.

140,722.—*Alphabet-Block.*—ELIZABETH H. MULDAUR, Dover, Del. Application filed April 28, 1873.

The slides are separated from the blocks, and the exercise for the child is the putting the right slide back.

Claim.—An alphabet or toy block having a picture on one or more of its faces, and provided with a groove and a removable slide bearing the name of the object represented by said picture, substantially as shown and described.

140,723.—*Carriage-Curtain Knob.*—CHARLES M. MUNSON, Greenfield, Mass. Application filed May 23, 1873.

To a tack or nail having a broad, finished head a collar and washer are applied.

Claim.—A carriage-curtain knob, composed of the tack or nail 1 having the finished head 2, collar 3, and washer 4, the parts being arranged and combined substantially as shown and described.

140,724.—*Cultivator.*—BENJAMIN F. MUSCHERT, Morrisville, Pa. Application filed December 7, 1872.

The cultivator has a fixed center shovel and two side shovels adjustable as to width by having their standards placed movably upon two cross rods or bars with screw-ends and adjusting-nuts, the whole held firmly in position by rigid braces.

Claim.—The combination, with the rods F F' and their adjusting-nuts and standards, of the rigid braces *b b*, and the beam D, as specified.

140,725.—*Portfolio.*—CHARLES W. PALMER, Cleveland, Ohio. Application filed June 16, 1873.

The folding-leaves of a portfolio have hinged flaps, which, when raised at right angles thereto, form supporting-shelves for the sheets.

Claim.—In combination with a portfolio, A A, the hinged shelves B B, substantially as shown and described, and for the purpose set forth.

140,726.—*Mode of Siding Boot-Legs.*—GEORGE C. PARKER, Worcester, Mass. Application filed June 17, 1873.

Claim.—The improved mode or process above described of siding boots, consisting of first sewing the side seams with a blank thread by machinery and then withdrawing it and inserting the permanent stitches by hand in the holes thus made, as and for the purposes described.

140,727.—*Nut-Tapping Machine.*—SALMON W. PUTNAM, Jr., Fitchburg, Mass. Application filed April 11, 1873.

Each of the arbors is inclosed by an eccentric sleeve, which can be turned by hand to throw the gears of the arbors in or out of connection with each other or with an auxiliary gear on a swinging pendant, and thus enable the machine to cut right or left hand threads, or both, at the same time.

Claim.—1. The combination, as specified, of the eccentric carrier L with the tapping-tool arbor, the head-stock A, driving-gear G, and pinion H, all being arranged as represented.

2. The combination of the auxiliary gear P and its slitted carrier or pendulous arm O with the two driving-gears E G and the eccentric carriers L L applied to the head-stock and the arbors of such gears, all being essentially as explained.

3. The tubular bushing N provided with the prismatic mortise or holder *d* and the hole *e* arranged in it, as described.

4. The combination of the bushing N, (so made or provided, viz., with the holder *d* and hole *e*,) the arbor D, and the clamp-screw *f*, all arranged and to operate together and with the tapping-tool, as represented.

140,728.—*Grave-Guard.*—AMOS RANK, Salem, Ohio. Application filed September 12, 1872.

A guard to support the sides of a grave-mound.

Claim.—1. The grave-guard, made of molded or cast material, and constructed with a socket or sockets for holding the head-stone or head and foot stones of the grave, substantially as and for the purpose specified.

2. The grave-guard made of molded or cast material, and constructed with holes or sockets for the reception of the posts of a fence or railing, substantially as and for the purpose specified.

140,729.—*Upright Steam-Boiler.*—GEORGE W. RAWSON, Cambridgeport, assignor to himself and MICHAEL HITTINGER, Somerville, Mass. Application filed December 18, 1872.

A central circulation-tube, connected by brace-rods to the upper and lower tube-sheets, assists in bracing the tube-sheets, as well as creating a circulation. The tubes are arranged so as to leave radial or diametric passages between them, with peep-holes in the sides of the boiler for observation and for removing accumulations on the crown-sheet.

Claim.—The circulation-tube G and the brace-rods H at its opposite ends, arranged within the water and steam chamber, or interior of the boiler, or with such and the superheating-dome E, and connected together and to the opposite ends of such boiler, all substantially as specified.

2. The tubular boiler having the diametric passages H' and spy-holes *s s* arranged between its tubes B and with respect to the crown-sheet of the fire-place, as set forth and represented.

140,730.—*Puddling-Furnace Door.*—JOHN S. REES, Phillipsburg, N. J. Application filed April 11, 1873.

The slotted adjustable guides bolted to the frame keep the door tight in any desired position, dispensing with the use of

lugs, pins, and bars now used. The stopper slides in dovetailed guides, and is held up by a spring while working the iron.

Claim.—1. The combination of the frame A, door B, and adjustable guides G G, substantially as and for the purposes herein set forth.

2. The combination of the door B, stopper H, and spring I, substantially as and for the purposes herein set forth.

140,731.—*Water-Meter.*—ALBION M. ROUSE, St. Louis, Mo. Application filed July 17, 1872.

A right-hand and left-hand propeller are arranged on the same shaft. In the induction-opening is a fixed deflector to throw equal quantities of water to each propeller.

Claim.—The combination of the fixed deflector G and right-hand and left-hand screw-propellers E E' on one shaft, C, to balance the water-pressure on the shaft, and cause a free rotation of the same, substantially as described.

140,732.—*Spoke-Polishing Machine.*—GEORGE L. ROUSE, Cincinnati, Ohio. Application filed February 21, 1873.

Spokes or similar articles are polished by a continuous sand-belt moving in a direction contrary to the rotation of the spoke, &c. Several articles are placed in the same frame, which are automatically moved to the sand-belt in succession.

Claim.—1. The recessed cups for holding the ends of the spokes, substantially as set forth.

2. The combination of the recessed cups for holding the ends of the spokes, the wheels L L L mounted at intervals on the periphery of the disks K' K', and the friction-wheel *m*, arranged and operating substantially as described.

3. The combination of revolving detent R, and the gear-wheel Q, provided with a notched disk *q* or its equivalent, substantially as described.

140,733.—*Corset-Spring.*—GEORGE O. SCHNELLER, Ansonia, Conn. Application filed April 16, 1873.

Claim.—1. The auxiliary leaf *b*, fastened at its lower end to the lower end of the main leaf by a rivet, *d*, and, at its upper end, by a rivet, *e*, to the main leaf near its upper end, as shown, so as to leave a free end to the said main leaf, substantially as described.

2. The clasp *f*, in combination with the main leaf and auxiliary leaf, when the said leaves are combined and fastened together by rivets *c d*, as herein shown and described, for the purpose specified.

140,734.—*Mold for Clay and Cement Pipes.*—JOSEPH SHARPE, Paterson, N. J. Application filed March 15, 1873.

Main and branch cores with central screws extending through their entire lengths, so that by turning the screw in each core the core will be forced out of the pipe.

Claim.—1. The screw D, fitted through a core, B, to connect the same with the mold-bottom C and allow its elevation out of the pipe, as described.

2. The branch-core E, provided with a screw, G, by which it is connected with the main core B, substantially as and for the purpose specified.

140,735.—*Plastic Composition for the Manufacture of Knobs and other Molded Articles.*—HENRY E. SHEPARD, New Haven, assignor to BRADLEY & HUBBARD, West Meriden, Conn. Application filed February 21, 1873.

Mica broken finely and mixed with shellac reduced to a liquid state until it assumes the consistency of putty; then rolls into any convenient form for molding, varnishing the surface with a shellac varnish, and placing in the dies, the material is pressed into any desired form.

Claim.—The composition herein described for the manufacture of articles, consisting of shellac and mica, prepared for molding, substantially as set forth.

140,736.—*Paper Box.*—GEORGE K. SNOW, Watertown, Mass. Application filed May 16, 1873.

Two blanks combined fold and paste together to form a box and cover with cylindrical interior and square exterior.

Claim.—1. As a new article of manufacture, the within-described blanks for the manufacture of boxes having a rectangular exterior and a cylindrical, oval, or polygonal interior, consisting of two pieces of material, one of which is a plain rectangular band, and the other cut to the outline shown in Fig. 1, and having cut therein the slits *h h* to separate the several flaps which form the sides or ends of the box and to form the radiating points *a a*, and with or without the lines *o p* embossed thereon to determine the folds, substantially as described.

2. A box having a square or rectangular exterior and an oval, polygonal, or cylindrical interior, when the body of the box or the body and cover complete are composed of two pieces of material formed and combined as set forth, and secured together by means of paste, gum, glue, or other suitable adhesive material, without the intervention of other stay or strengthening pieces to bind the parts together, substantially as described, for the purpose specified.

140,737.—*Electric Railway Signal.*—HENRY W. SPANG, Reading, Pa. Application filed April 12, 1872.

Circular signal-frame divided into two or more signals, and attached at center to shaft revolved by sector-rack on end of armature-lever.

Claim.—1. An electric railway signal which revolves on or around its center, and the face of which is divided into two or more signals, as shown.

2. The slotted armature-lever G, in combination with the slotted crank I and the adjustable crank-pin *e*, substantially as and for the purpose shown and described.

3. The toothed sector K, pinion L, shaft J, and the revolving signal N, substantially as and for the purpose shown and described.

4. The toothed sector K, pawl R, shaft Q, lever P, and the armature O, substantially as and for the purpose shown and described.

140,738.—*Harvester.*—GEORGE H. SPAULDING, Rockford, Ill. Application filed November 6, 1872.

An extension-board is arranged at the rear of the moving or apron platform, and is serrated to prevent the heads of the cut grain from moving faster than the stubble ends; the presser-frame is also serrated to prevent the grain from falling back while being elevated.

Claim.—1. A serrated extension board, placed at the rear of the horizontal apron, and designed to prevent the heads of the straw from traveling faster than the stubble ends, substantially as described.

2. The press-board *c h*, hung to the arm G, and attached only to the front side of the machine, in the manner described, and for the purpose of preventing the projecting heads of the straw from being obstructed while being elevated.

3. The press-board *c h*, serrated on its inner face for the purpose of preventing straw from falling while ascending the elevator, substantially as described.

4. The combination of the elevator-frame with the lever I, transporting-wheel H, band-wheel J, band K, tension-pulleys *k*, and elevator-roller E, arranged as described, for the purpose of raising and lowering the machine without slackening the band.

5. The vertical shaft O, having a foot-piece, P, and head-piece R, for the purpose of enabling the binder to guide the horse with his foot, substantially as specified.

140,739.—*Butter-Worker.*—PIERSON M. STACKHOUSE, Pineville, Pa. Application filed April 21, 1873.

An unyielding fluted roller journaled across the trough. The trough yields when the bulk of butter is large, inclining forward in the direction of grooves for the escape of the expressed water. Vertical grooves at the ends of the trough admit of the play of the trough upon the ends of clamps, which hold it laterally to the horizontal rack beneath the propelling-pinion.

Claim.—1. The combination of the vertically-yielding inclined trough B and the fluted roller H working in connection therewith, in the manner and for the purposes described.

2. The rack J, in connection with the rising and falling trough B, substantially as and for the purpose set forth.

3. The straps K, in combination with the rack J and yielding trough B, when applied and operating as set forth.

140,740.—*Traversing Cam for Card-Stripping Mechanisms.*—GUSTAVUS E. TAFT, Whitinsville, Mass., assignor to THE WHITIN MACHINE WORKS, same place. Application filed March 29, 1873.

An improvement on patent No. 126,367, and designed to produce a cam that may be turned backward, as is sometimes necessary. For this purpose it is provided with the second recess *g'* and the part *m*, which latter causes the rack-pin to enter the recess. To prevent a rack-pin entering this recess when the cam is moving forward, and preventing its proper operation, the part A is provided, which catches over a pin in advance of the cam and holds it forward until the recess passes the pin.

Claim.—The stripper-cam provided with the recess *g* and parts *m* and A, and being otherwise constructed, as shown and described, so as to enable it to have a forward and backward motion, essentially as herein specified.

140,741.—*Apparatus for Ventilating Ships and Heating Steam-Boilers.*—JOHN THOMAS, Middlesbrough, England. Application filed May 24, 1873.

A fan-blower is connected to the hull or stoke-hole of a vessel, by which means the foul air is extracted and forced into a jacket encircling the smoke-stack, when said air is heated and then conveyed to the furnace, where it is consumed, and assists in promoting combustion.

Claim.—1. The arrangement of the pipe or pipes G and D in combination with the fan F, or its equivalent, jacket A, distributing-pipes E E, and perforated bridge I, substantially as shown and described, for the purpose set forth.

2. The pipe H and valve *b*, in combination with the fan F, or its equivalent, jacket A, and distributing-pipes E E, substantially as set forth.

140,742.—*Brick-Machine.*—JOHN S. THOMAS, St. Louis, Mo. Application filed May 27, 1873.

A mold-cylinder containing plungers which move the distance of the thickness of a brick, the clay being pressed therein by a follower which, while pressing the clay, drives the plunger forward and expels the formed brick from the other side.

Claim.—1. The combination of the cylinder K, plungers I, and followers *g*, the plunger being actuated by the pressure of the incoming clay and controlled by stop-pins *i'*, substantially as and for the purpose set forth.

2. The combination of the cylinder K provided with the plungers I and the segment-rack *l* on the wheel L, arranged and operating substantially as and for the purpose set forth.

3. The combination of the cylinder K, spring-catch M, balance-wheel L, and lug *l'*, all arranged and operating substantially as set forth.

4. The combination of follower *g* box A, rollers P, and balance-wheel L provided with tooth *l'*, all arranged and operating substantially as and for the purpose set forth.

5. The combination of the mold-cylinder K, plunger I, box A, plunger G, and cams F, arranged and operating substantially as set forth.

140,473.—*Coal-Oil Stove.*—JAMES H. THORP, New York, N. Y. Application filed April 30, 1873.

Water-tubes surround the wick-tubes and obtain their supply of water from a tank upon one side of the stove. The chimneys are supported upon a perforated plate, and are held in place by a metallic ring.

Claim.—1. The water-chambers C and D, conducting-pipes E, and reservoir F, all combined and arranged to operate as described.

2. The chimney I, supported on the perforated guard-plate O, in combination with the rim or hoop N, substantially as and for the purposes specified.

140,744.—*Fire-Extinguisher.*—JONATHAN S. TIBBETS, Jeffersonville, Ind. Application filed May 31, 1873.

The acid-chamber is attached to the outside of the alkali-chamber, in which the gas is generated, and communicates with it by a passage which opens into a "diving-pipe." This latter prevents premature mixing of the acid and alkali by reason of the column of air it contains. By this construction the cocks may be dispensed with.

Claim.—1. The communicating pipe or passage between the acid-chamber and the generator of a fire-extinguisher, in combination with a diving-pipe which covers said passage where it opens into the generator, and, extending into the latter, operates in the manner specified.

2. The combination of the cylinder A, diving-pipe G, cocks C and D, respectively controlling the pipe or passage *a* and the equalizing-pipe J, and acid-cylinder B, all arranged and operating substantially as specified.

140,745.—*Tape-Measure.*—HENRY B. TYLER, West Meriden, Conn., assignor to BRADLEY & HUBBARD, same place. Application filed May 13, 1873.

A side plate within the case, having play upon the central pivot, is arranged to engage with projections upon the spring-drum so as to hold it in position, and when depressed by a thumb-piece to be disengaged and allow the tape to be wound upon the said drum.

Claim.—In a tape-measure having a drum, B, and a spring arranged within the said drum to wind the tape upon the said drum, the said drum provided with teeth or projections *b*, the plate D arranged between the drum and side of the case, and with a slot, *d*, so as to work radially on the axis *a* of the drum, and with a projection, *f*, therefrom, and a spring to cause the said projection *f* to engage the said teeth on the drum, combined with a projection extending outside the case, whereby the said plate may be operated, substantially as described.

140,746.—*Combined Cotton Chopper and Cultivator.*—JOSEPH B. UNDERWOOD, Fayetteville, N. C., assignor to EDMUND L. PEMBERTON, JOHN W. HINSDALE, and MRS. S. C. UNDERWOOD, same place. Application filed February 4, 1873.

The plows are mounted on a frame in the usual manner. The choppers consist of two sets of three knives each, radiating from the lower end of a vertical shaft, two of the knives on each being nearly in a line and the other at about 90°, thus leaving one-half of the circle free. They are caused to rotate in concert, thus leaving the hills of growing plants as they sweep around just beneath the ground. The shovels and sweep are interchangeable.

Claim.—1. The hinged U-shaped bar D combined with frame A, axle C, and draft-bar E, as and for the purpose described.

2. One or more sets of horizontal chopping-knives, K K K, arranged and applied horizontally, as and for the purpose set forth.

3. The standards J J' M combined and relatively arranged to receive plows and horizontal choppers, as and for the purpose described.

4. The loose pulley Q having notched side flange *q*, the disk R having notch *r'* and pawl *r*, the lever *s* and the rod T combined with shaft P, as and for the purpose set forth.

140,747.—*Joiner's Clamp.*—EDWARD A. WALKER, New Haven, Conn. Application filed March 26, 1873.

The movable bar is retained by a spring-ratchet pawl engaging with the rack in the side of the clamp-frame.

Claim.—As an article of manufacture, the herein-described joiners' clamp, consisting of the beam A with its head B, and the arm C with its screw D, the beam constructed with a channel, *a*, on its side, and a series of notches, *d*, combined with the pawl *b*, head F, and spring *f*, all constructed and arranged substantially as described.

140,748.—*Sealing Paint-Cans.*—JOHN F. WALTER, Jr., Brooklyn, N. Y. Application filed September 3, 1872.

Apply to the joint between the can and cover a coating of shellac varnish, wrap the can with a strip of paper saturated with the shellac, and coat with a second coating of shellac.

Claim.—A metallic can for paint and similar material, sealed or rendered air-tight by shellac varnish and a strip of paper or similar material applied in the manner specified.

140,749.—*Plow.*—LEWIS B. WHITE, Norfolk, Va., assignor to himself and SILAS R. WHITE, same place. Application filed April 9, 1873.

A slotted wedge is introduced between the beam and handles so that the latter may be firmly secured at any adjustment of the beam. The land-side is of the same form at both ends and sides, so as to be reversible.

Claim.—1. The combination, with beam and handles connected by an adjustable piece, D, of the slotted and adjustable wedge E, applied substantially as and for the purpose described.

2. A land-side for turn-plows, with two similar ends and two similar but reversed bottom flanges, constructed substantially as and for the purpose described.

140,750.—*Reed-Board for Organs.*—ALFRED W. WILCOX, New Haven, Conn. Application filed June 4, 1873.

The reed-cell has a resonant chamber immediately above and parallel with it, communicating therewith by an orifice near the mouth of the reed-cell.

Claim.—In combination with the reed-chamber C and its reed, the auxiliary chamber E opening directly into the reed-chamber near its outer end, substantially as and for the purpose set forth.

140,751.—*Mode of Changing the Speed in Machinery.*—WILLIAM H. WILSON, Easton, Md. Application filed June 24, 1873.

Two cone-pulleys are arranged with their bases adjacent or opposite each other upon one and the same shaft, the driving one being fast and the driven one being loose thereon. By means of the shifting belt or movable friction-gear the speed of the driven cone can be regulated at pleasure.

Claim.—In combination with the two cones A B on one and the same shaft, *a*, the cone A being fast and the cone B being loose thereon, the endless belt *b* or its substitute, the friction-wheels *g g'*, for transmitting power from the driving to the driven cone, at such regulated speed as may be required.

140,752.—*Portable Fence.*—THEODORE L. WISWELL, Olathe, Kans., assignor to RAY AMARA WISWELL, same place. Application filed April 5, 1873.

The rails of a panel are fastened to a batten at each end by a single pin so as to make a flexible attachment, adapting the fence to grades. The panels are united by links passing through the end battens and a rail, and through a triangular intermediate post, giving the zigzag direction to the panels. A key then tightens the whole. A lower key descends as a stake into the ground.

Claim.—1. A fence, composed of the rails A, triangular posts B, battens C, staples D, key E, and stake F, arranged as shown and described.

2. The stake F, combined with a staple, D, a post, and the rails A of a fence, as shown and described, for both securing said parts together and supporting them upright, as set forth.

140,753.—*Washing-Machine.*—GEORGE L. WITSIL, Beverly, N. J., assignor of one-half his right to THOMAS L. BATES, Philadelphia, Pa. Application filed June 16, 1873.

Two end pieces of triangular form, curved on their lower edges, have boards on their straight edges that are corrugated on their inner sides.

Claim.—1. A washing-board, having an internal chamber, the sides of which are corrugated, substantially as and for the purpose set forth.

2. The combination of the internally-corrugated sides B B, the rounded and beveled ends A A, and suitable handles for operating the same, substantially as and for the purpose specified.

140,754.—*Tenoning and Boring Machine.*—GEORGE WITTER, Sherrill's Mount, Iowa. Application filed April 17, 1873.

The machine, when used for tenoning, is secured upon the spoke of a carriage-wheel in such a manner as to bring the tenoning-tool in line with the spoke. For boring felloes a table is attached to the device and a boring-tool substituted for the one which tenons the spokes.

Claim.—The combination, with the bar A, arm E, frame G, shaft I, and auger N, of the slotted bar O, adjustable platform P, standard R with lever S, and the posts *t t*, all constructed and arranged substantially as and for the purposes herein set forth.

REISSUE PATENTS.

5,479.—*Toy.*—CORTLAND BALL, Augusta, Mich., assignor of one-half interest to THOMAS MARRIOTT.—Patent No. 139,365, dated April 29, 1873. Application filed May 27, 1873.

Claim.—A toy, composed of a hollow case of cylindrical or other form, provided with an eye at one end for the attachment of a cord, and having an opening or mouth in its side, substantially as set forth, for producing a warbling sound when said toy is whirled through the air, as described.

5,480.—*Design for End Frames of Car-Seats.*—GEORGE BUNTIN, Boston, Mass.—Design No. 2,609, dated April 2, 1867. Application filed April 25, 1873.

A general compound shape given to the casting.

Claim.—The design for the outer end frame of a car-seat, the design consisting in a cast-metal frame in which the bars *s s* have the outward curves from the bars *c g* and the inward curves toward each other, and the bars *f* curve inward under the seat and toward each other, substantially as described.

5,481.—*Mechanical Movement for Sewing-Machines, &c.*—EDWIN COWLES, Cleveland, Ohio, assignor, by mesne assignments, to EDWIN HOLMES, New York city.—Patent No. 103,647, dated June 7, 1870. Application filed May 26, 1873.

Rolling clutches are applied between many-sided hubs, and pulleys are applied loosely on the shaft of said hubs, operated by straps.

Claim.—1. A mechanical movement consisting of rolling clutches *a*, applied between many-sided hubs J, and pulleys which are applied loosely on the shaft of said hubs, substantially as described.

2. The stops or studs *b*, in combination with rollers *a* and hubs J, inclosed by pulleys, so as to operate substantially as described.

3. Offsets *f f* on the treadles E and E', arranged to receive the lower ends of the pulley-straps without having these straps crossed, as set forth.

4. The combination of two independent treadles, E E', and two clutch mechanisms, arranged to impart rotary motion to a fly-wheel, pulley, or shaft by alternate intermittent actions thereof, when each of said treadles is connected to both clutch mechanisms by two straps, belts, or other flexible connections, one end of both of which is secured to the toe end of a treadle, and the other ends of which are connected, one to each clutch mechanism, but upon opposite sides of the axis thereof, substantially as described.

5,482.—*Car-Frame.*—WILHELM GABRIEL VON STADEN, Strathroy, Canada.—Patent No. 131,725, dated September 24, 1872. Application filed May 24, 1873.

Each pair of posts and the connecting-bow are made of one piece of wood bent to the form shown.

Claim.—The posts and bow C C M formed in one piece of bent wood, secured at bottom to the sills A, and braced by longitudinal bars D, substantially as herein set forth.

5,483.—*Egg Stand and Boiler.*—EDWARD P. WOODS and DANIEL SHERWOOD, Lowell, Mass., assignors to themselves and CYRUS H. LATHAM.—Patent No. 70,769, dated November 12, 1867; reissue No. 5,270, dated February 4, 1873. Application filed June 17, 1873.

A ring forms the base; a wire in spiral form forms the sides. Standards support the base and sides, and a handle is formed by twisting several wires and separating at the lower part to form rings.

Claim.—The combination, with a stand or holder made of wire, of the compound twist A, substantially as described, for the purpose specified.

INDEX OF INVENTIONS PATENTED JULY 8, 1873.

	Class No.	Whole No.
Abdominal supporter, M. M. Merrill	156	140,585
Alphabet block, E. H. Muldaur	146	140,722
Auger shafts, coupling for earth, Irwin and Cox	51	140,710
Bag fastening, mail, J. A. Paul	102	140,639
Bale tie, cotton, R. W. Cobb	7	140,575
Barrel stand and keg holder, C. N. Cass	19	140,573
Bed bottom, H. Benedict	62	140,571
Bedstead, invalid, J. Robinson	62	140,646
Bee hive, E. E. Henegan	9	140,702
Blasting plug, J. H. Holsey	124	140,628
Blind, stitching gage for the, W. H. Richardson	146	140,645
Blower, compound, T. Shaw	12	140,597
Boiler plates, &c., manufacture of steel for, Bolton and Pedder	85	140,673
Boiler, upright steam, G. W. Rawson	148	140,729
Boilers, apparatus for ventilating ships and heating steam, J. Thomas	148	140,741
Boilers, compound for preventing incrustations in steam, T. E. Petersen	148	140,589
Boot legs, siding, G. C. Parker	16	140,726
Boots and shoes, mechanism for making counters for, E. Andrews	16	140,569
Boring machine, earth, W. H. Salyer	51	140,595
Brake mechanism, O. Gruninger	122	140,700
Brick machine, J. S. Thomas	20	140,742
Brush, mop, and wringer combined, scrubbing, J. D. Smith	22	140,655
Butter printing machine, A. F. Hines	45	140,704
Butter worker, P. M. Stackhouse	45	140,739
Button fastening, W. Holloway	23	140,627
Can opener, J. Wood	88	140,604
Cans, sealing paint, J. F. Walter, Jr.	107	140,748
Car coupling, B. Atkinson	122	140,667
Car coupling, S. Miller	122	140,720
Car frame, W. G. Von Staden, (reissue)	121	5,482
Car journal box, railway, R. N. Allen	122	140,568
Car seats, design for end frames of, G. Buntin, (reissue)	121	5,480
Carbureting apparatus, Judd and Pierson	27	140,711
Card stripping machines, traversing machine for, G. E. Taft	28	140,740
Carriage, child's, G. L. Shepard	31	140,598
Carriage curtain knob, C. M. Munson	31	140,723
Carriage seat fastener, M. Brockway, Jr.	31	140,572
Cartridge capping and uncapping device, G. V. McGraw	32	140,718
Chain machine, F. Leonard	60	140,583
Cheese vat, D. F. Barclay	45	140,670
Chopper and cultivator, cotton, J. B. Underwood	43	140,746
Clamp, joiner's, E. A. Walker	29	140,747
Clothes clamp, W. Tunstill	91	140,659
Clothes wringer, C. Robinson	91	140,592
Coach or carriage, J. Allgaier	31	140,666
Cock, A. S. Devendorf	167	140,685
Cooler, water, W. S. Kimball	58	140,712
Cork extractor, C. F. Hunt	88	140,706
Corset spring, G. O. Schneller	80	140,733
Cows from kicking, device for preventing, Sadler and Spencer	144	140,594
Cultivator, B. F. Muschert	43	140,724
Dish stand, table, F. Grosjean	88	140,623
Doll, H. C. Werk	143	140,605
Door spring, C. W. Oldham	24	140,638
Dough machine, O. B. Fuller	89	140,695
Draining basins, L. R. Comstock	167	140,577
Drill, rock, Nutting and Githens	124	140,637
Drill, rock, H. C. Sergeant	124	140,596
Drills, grass seed attachment to grain, J. P. Fulghum	133	140,694
Egg carrier, G. M. Huston	116	140,579
Egg carrier, G. M. Huston	116	140,580
Egg stand and boiler, Woods and Sherwood, (reissue)	88	5,483
Electrical apparatus, screw post for, S. D. Fields	50	140,618
Emery wheel, W. A. Johnston	70	140,630
Fare box, H. Baranger	146	140,669
Fence, portable, T. L. Wiswell	52	140,752
Fifth wheel for vehicles, G. A. Brice	31	140,676
File and binder, letter, Buell and Lilley	146	140,610
Fire extinguisher, J. S. Tibbets	35	140,744
Fire place, J. L. Garlington	154	140,621
Fishing rod, W. M. Smith	143	140,656
Flock cleaning machine, R. H. Dawson	78	140,684
Furnace door, puddling, J. S. Rees	85	140,730
Furnace, metallurgic gas, W. C. Wren	85	140,606
Gas lighting apparatus, A. Potter	64	140,591
Gas retorts, apparatus for charging, A. F. Haven	66	140,624
Gas retorts, compound for cleaning, Pitkin and Gleason	66	140,590
Gate, farm, M. Burtless	52	140,612
Gearing, F. Emmerich	67	140,690
Glove fastening, H. P. Carver	38	140,613
Grave guard, A. Rank	52	140,729
Hammer, drop, J. McGeorge	60	140,717
Harvester, I. W. Bragg	74	140,675
Harvester, G. H. Spaulding	74	140,738
Hat brim, extension, I. Y. Cassiano	76	140,614
Hat brim, extension, I. Y. Cassiano	76	140,615
Heater and filter, L. F. Meunier	149	140,719
Horse collar, O. Lafreniere	72	140,714
Horse power, W. Gilfillan	159	140,622
Jewelry bases, manufacturing, S. Cottle	86	140,616
Knitting machine, S. V. Esslck	89	140,691
Knitting machine, G. Merrill	89	140,635
Knitting machine needles, manufacture of, J. H. Bullard	89	140,611
Ladder, step, C. Frizell	30	140,578
Lamp burner, J. H. Doolittle	90	140,687
Lead for pigments, manufacture of white, E. Milner	107	140,721
Leather trimming machine, S. H. Jones	92	140,631
Loom shedding machine, G. Crompton	95	140,682
Marble, artificial, B. Auguste	153	140,668
Meat chopper, O. Gardner	25	140,696
Mechanical movement, J. Daguier	67	140,683
Medical compound, D. J. Gish	98	140,698
Medical compound, A. Racicot	98	140,642
Molding, cutter head for, E. H. Hinners	173	140,626
Music leaf turner, G. W. White	102	140,664
Needle cushion, W. H. Bixler	38	140,609
Nut lock, J. A. Reed	14	140,644
Nut tapping machine, S. W. Putnam	14	140,727
Oils, &c., from wells, apparatus for raising, H. W. Fancett	118	140,692
Organs, reed board for, A. W. Wilcox	106	140,750
Oven, baker's, D. Donald	6	140,686
Packing, piston, C. S. Barry	151	140,608
Padlock, H. Essex	93	140,617
Pan, cake, J. B. Firth	88	140,619
Paper box, G. K. Snow	109	140,736
Peg cutter, hand, P. Summiter	16	140,599
Pipes, mold for clay and cement, J. Sharpe	20	140,734
Planter, seed, W. J. Saffery	133	140,648
Plastic composition for the manufacture of knobs, &c., H. E. Shepard	24	140,735
Plow, A. S. Mann	114	140,716
Plow, L. B. White	114	140,749
Plow clevis, W. Lahman	114	140,715
Plow, subsoil, A. L. P. Valrin	114	140,660
Plows, equalizing attachment for, King and Hulse	114	140,632
Portfolio, C. W. Palmer	146	140,725
Pump, C. D. Rathbone	118	140,643
Pumps, glass piston and its packing for, A. E. Gay	118	140,697
Railway frog, T. J. and G. M. Clark	120	140,574
Railway signal, electric, H. W. Spang	50	140,737
Railway snow plow, W. Wheelock	122	140,663
Rake, horse hay, J. H. Bean	77	140 671
Rake, horse hay, W. C. Martindale	77	140,634
Refrigerator and beer cooler, G. Nuss	19	140,636
Refrigerator and soda water apparatus, combined, T. W. Johnson	58	140,629
Ridge and furrow side walk plate, T. Hyatt	110	140,707
Ridge and furrow side walk plate, T. Hyatt	110	140,708
Roofing, sheet metal, G. F. Leonard	126	140,582
Saponifying apparatus, G. W. Hatfield	26	140,701
Saw gummer, W. G. Blacklidge	131	140,672
Sawing laths, machine for, G. P. Appleton	174	140,570
Sawing laths, machine for, A. Rodgers	174	140,647
Sawing machine, H. M. Stow	130	140,657
Scaffold, M. D. Drake	30	140,688
Seaming machine, sheet metal, G. D. Brooks	136	140,678
Sewing machine, Lincoln and Clough	134	140,584
Sewing machine, J. A. Smith	134	140,654
Sewing machine motor, W. Young	134	140,607
Sewing machine treadle, S. B. Bushfield	134	140,677
Sewing machine, turned shoe, T. L. Miller	134	140,586
Sewing machines, feeding mechanism for, W. and E. Westmoreland	134	140,603

	Class No.	Whole No.
Sewing machines, &c., mechanical movement for, E. Cowles, (reissue)	134	5,481
Shaft coupling, E. Swain	87	140,609
Shoe soles, machine for trimming and burnishing, B. J. Tayman	16	140,601
Shoemakers, &c., cutting board for, C. E. Cooper	16	140,680
Show case, D. D. Elder	54	140,689
Skins, machinery for pebbling and graining wet, N. O. Lounsberry	92	140,633
Sky light bar, C. Sellman	30	140,650
Soldering machine, W. D. Brooks	136	140,679
Speed in machinery, changing the, W. H. Wilson	67	140,751
Spinning mule, M. Moffatt	142	140,587
Splint, A. Wheat	156	140,662
Spoke polishing machine, G. L. Rouse	31	140,732
Stave jointer, J. E. Green	40	140,699
Stone, splitting, P. Croghan	124	140,681
Stove foot shoe, A. D. Coles	154	140,576
Stove, coal oil, J. H. Thorp	65	140,743
Suspender, A. Shenfield	38	140,652
Tape measure, H. B. Tyler	97	140,745
Tenoning and boring machine, G. Witter	34	140,754
Thill holder, J. P. Hisley	72	140,705
Thrashing machines, band cutter and feeder for, Sullivan and Minke	59	140,658
Time movement to distant dials, transmitting, H. J. Wenzel	36	140,661
Tobacco cutter, self-cleaning, W. J. Faul	160	140,693
Toy, C. Ball, (reissue)	143	5,479
Toy, J. Schwennesen	143	140,649
Track lifter, G. J. Kinsel	79	140,713
Vault cover, illuminating, T. Hyatt	110	140,709
Vinegar and aging spirits, apparatus for making, W. M. Skelton	19	140,653
Wagon, dumping, J. Highfield	31	140,703
Washing machine, W. K. Flietstra	91	140,620
Washing machine, M. L. Hawke	91	140,625
Washing machine, F. B. Preston	91	140,641
Washing machine, J. Sheffler	91	140,651
Washing machine, G. L. Witsil	91	140,753
Watch, hand setting, F. A. Jones	36	140,581
Water meter, A. M. Rouse	167	140,731
Water wheel, I. S. Roland	168	140,593
Water wheel, turbine, H. Van De Water	168	140,602
Well, driven, A. Wilson	51	140,665
Window sash, metal, J. D. Moran	94	140,588
Window screen, J. W. Boughton	30	140,674
Window weather strip, G. P. Potter	30	140,640

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED JULY 8, 1873.

Allen, R. N., Railway car journal box	140,568
Alley, J. P., assignee	140,672
Allgaier, J., Coach or carriage	140,666
Andrews, E., Mechanism for making counters for boots and shoes	140,569
Appleton, G. P., Machine for sawing laths	140,570

Donald, D., Baker's oven	140,686
Doolittle, J. H., Lamp burner	140,687
Drake, M. D., Scaffold	140,688
Duguid, H. L., assignee	140,705
Elder, D. D., Show case	140,689
Emmeluth, E. P., assignee	140,706
Emmerich, F., Gearing	140,690
Ermentrout, H. Z., assignee	140,636
Essex, H., Padlock	140 617
Esslck, S. V., Knitting machine	140,691
Faucett, H. W., Apparatus for raising oil, &c., from wells	140,692
Faul, W. J., Self-cleaning tobacco cutter	140,693
Field, S. D., Screw post for electrical apparatus	140,618
Firth, J. B., Cake pan	140,619
Flietstra, W. K., Washing machine	140,620
Frizell, C., Step ladder	140,578
Fulghum, J. P., Grass seed attachment to grain drills	140,694
Fuller, O. B., Dough machine	140,695
Gardner, O., Meat chopper	140,696
Garlington, J. L., Fire place	140,621
Garner, H. B., assignee	140 698
Gay, A. E., Glass piston and its packing for pumps	140,697
Geller, C. C., assignee	140,598
Gilfillan, W., Horse power	140,622
Gish, D. J., Medical compound	140,698
Githens and Nutting	140,637
Gleason and Pitkin	140,590
Gotia, B., assignee	140,668
Green, J. E., Stave jointer	140,699
Grosjean, F., Table dish stand	140,623
Gruninger, O., Brake mechanism	140,700
Hatfield, G. W., Saponifying apparatus	140,701
Havens, A. F., Apparatus for charging gas retorts	140,624
Hawks, M. L., Washing machine	140,625
Hedges, H. C., assignee	140,691
Henegan, E. E., Bee hive	140,702
Highfield, J., Dumping wagon	140,703
Himes, A. F., Butter printing machine	140,704
Hinners, E. H., Cutter head for molding	140,626
Hinsdale, J. W., assignee	140,746
Hisley, J. P., Thill holder	140,705
Hittinger, M., assignee	140,729
Holloway, W., Button fastening	140,627
Holmes, E., assignee, (reissue)	5,481
Holsey, J. H., Blasting plug	140,698
Hulse and King	140,632
Hunt, C. F., Cork extractor	140,706
Huston, G. M., Egg carrier	140,579
Huston, G. M., Egg carrier	140,580
Hyatt, T., Ridge and furrow sidewalk plate	140,707
Hyatt, T., Ridge and furrow sidewalk plate	140,708

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 31, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks) 6,500
SEWING-MACHINES and attachments 2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes 4,000
PRINTING; including presses, type, and printers' furniture. 2,500
CARRIAGE-WHEELS; including hubs, spokes, tires, and axles 1,200
FELTING and HATS; including caps, bonnets, flock, &c. 1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments) 1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs 1,400
CARRIAGES and WAGONS; (excepting wheels, hubs, and axles) (in progress.)

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited and the invention therein described will become public property, as against the applicant therefor, unless he shall make a new application within two years from the date of notice of the original allowance.

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 4.—NO. 3. TUESDAY, JULY 15, 1873. PRICE { $6,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1873 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

COMMISSIONER'S DECISIONS.

ALOIS KOHLER.—*Appeal.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the application of Alois Kohler for patent for Design for* ROLLING SHUTTER-SLATS.—*Decided May* 17, 1873.]

A patent will not be granted for a design which is shown in the drawings annexed to a patent already issued for a machine, although the machine or design may either of them be used without the other.

Although the grantee of the machine patent is the applicant for the design patent, he should be denied in such a case.

If the patentee of a machine discloses in his specification his intention of obtaining a patent for the design shown in his drawings, it seems that he might then obtain such a patent.

The cases *ex parte* Bartholomew, Com'rs D., 1871, p. 298, and *ex parte* Collender, 2 Off. G., 360, commented on.

LEGGETT, *Commissioner:*

A patent was granted the applicant May 7, 1872, the drawing of which exhibited the design now claimed. That patent covered the construction of the opposite edges of a blind-slat, whereby a peculiar hinge-connection was formed. This construction was entirely concealed from view when the slats were united to form blinds. It was intended to perform a practical useful function, and was wholly independent of the exterior conformation of the slat shown, or of any other particular exterior design. It could be used as well with one design exhibited by the surface of the slat as another, and this fact was set forth in the specification of the patent in the following words: "A represents the slat made with any suitable molding, form, or design upon their broad faces." This is all of the specification of the patent that refers to the design. The patent does not protect it, of course, and cannot be reissued so as to protect it, because it is not subject-matter which a mechanical patent will protect. It is proper subject-matter for a design patent, and the construction of the hinge-connection is entirely distinct subject-matter, and was properly patented as a mechanical device.

In view of this state of facts, the Examiner and the Board of Examiners-in-Chief have refused the application, the Examiner holding that the patent of May 7, 1872, is a bar to the patent now sought, but the applicant continues his appeal, holding that, following the precedents set in the Bartholomew case (C. D., 1871, p. 298,) and the Collender case (OFF. GAZ., vol. 2, p. 360,) he is entitled to a patent.

In each of the cases cited the patent for the design was first obtained, and the mechanical patent subsequently applied for and allowed. In the present case the mechanical patent was first allowed, fully showing the design, and the design patent is now sought—sought upon drawings which are exact duplicates of those upon which the mechanical patent was granted. The cases are radically different. A design patent relates only to configuration and arrangement for esthetic effect. The mechanical patent is for practically useful mechanism. The design may be shown and described in the case pending without developing the mechanism upon which the patent was granted, but the mechanism could not have been described in accordance with the requirement of law without showing some design. Hence the design patent might have been first granted and afterward the mechanical, but not *vice versa*, for the mechanical is the greater and must include the right to use the design shown, unless it was previously patented, but the design is the less, and does not necessarily include the mechanism. It will be remembered that in this case the special mechanism and special design have no necessary connection, as either can be used without the other. But when the applicant applied for his mechanical patent he was obliged to show his invention in some form in his drawings and model. He chose to

adopt the identical form which he now seeks to cover by a design patent. If a valid patent could be given him, he could then say to the assignee of his former patent that said assignee shall not use the mechanical invention in the manner and form set forth, and fully described in that patent. The law certainly never contemplated the granting of patents that might thus come n conflict with each other. If the precedents quoted go that far, which I deny, then it is high time they were reversed.

If the applicant, at the time he applied for his mechanical patent, had at the same time applied for his design patent, and had put a clause in the specification of the mechanical application stating that the *design* shown was the subject of a pending application for design patent, I should not question his right to both patents, for then the purchaser of the mechanical patent would buy with notice, but having fully shown his design in the mechanical patent without notice of intention to claim it, he has barred himself from setting up any subsequent claim to it, and has dedicated it to, at least, any person who now does, or may hereafter, own the mechanical patent. It might be said that both of these patents will belong to the inventor, hence will not come in conflict; but as they may, by future contingencies, either with or without the patentees consent, fall into different hands and become antagonized, the Office must be guided by the same principles as if the existing patent had already been assigned. The cases relied upon as precedents have gone to the utmost verge of propriety, if not a little beyond. The intent has been to correct mistakes, the applicants having taken patents for designs when they should have taken mechanical patents.

The decision of the Board is affirmed and patent denied.

G. HIBBARD.—*Appeal.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the application of George Hibbard for* MANUFACTURE OF GRINDSTONES. *Decided July 2, 1873.*]

Stone has usually been quarried by sawing or cutting, or by splitting where the texture permitted and the stone was of little value, and it is a mere matter of judgment which mode shall be adopted.

It is not patentable, therefore, to sever grindstones from the quarry by sawing and then finish them by turning and eyeing them, instead of first splitting them out as usual.

A grindstone produced by such new process is not distinguishable from one manufactured in the usual way, nor patentable as a new article of manufacture.

LEGGETT, *Commissioner:*

Applicant sets out that heretofore grindstones have been made by cutting or splitting out slabs of suitable size and turning and eyeing them; that this process is wasteful of material when employed to make grindstones of certain kinds of stone of suitable quality for the purpose, in which the stratification is irregular and the grain or rift is diagonal to the beds or natural partings of the rock; and that, therefore, he proposes to saw slabs out of blocks of such stone, and afterward turn and eye them in the usual manner. He claims the process of manufacturing grindstones by "*sawing*," turning, and eyeing them, and also the grindstone thus produced as a new article of manufacture.

He proceeds to saw his stone in the same way that stones are ordinarily sawed, and obviously for the same purpose, viz., to save material. Both splitting and sawing stone for all uses are universally practiced. Where stone is to be employed of which the grain is regular, and the material abundant and capable of being readily split, that plan of working it is adopted, because it is most convenient and economical. But when stone is to be used which is valuable or not easily split it is sawed. The judgment of the workman as to the better and more economical course to take in a given case is all that is required to direct him. Applicant has added nothing to the art, and his alleged process is barren of invention.

The grindstone he produces would obviously be the same when completed as if the slab had been originally split instead of sawed from the block. Whether it had been quarried by hand or by machinery would be a matter quite as likely to affect its character as an article of manufacture, and invest it with patentable novelty, as whether it had been split or sawed after quarrying. Neither process nor article possesses the faintest attribute of patentability.

The decision of the Board is affirmed.

J. M. STONE.—*Appeal.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the application of Joseph M. Stone for patent for* COUPLING.—*Decided July 2, 1873.*]

Where two devices, each of which has previously been used to effect a certain purpose, are combined to effect the same purpose, the combination is patentable if it is operative and new, even though it constitutes little or no improvement.

To secure together by bolts the two parts of a coupling which incloses and unites the ends of two shafts, and to place bands over the coupling which retain the bolts in their place, and give the whole a smooth exterior, while the connection is strengthened, is patentable, although the bolts and the bands have each been used before for the purpose of uniting the two shafts.

LEGGETT, *Commissioner:*

Applicant's invention consists of a coupling made in two parts to inclose the ends of two shafts to be secured together. Dowel-pins projecting from the interior of the coupling enter the ends of the shafts to prevent them from drawing apart, and a spline prevents the shaft from turning in the coupling. The two halves of the coupling are secured together by bolts, over which bands are placed which aid to keep the bolts in place, cover the bolt-holes, leaving a smooth exterior, and also strengthen the connection of the parts of the coupling.

Applicant claims the combination, with the two parts of the sleeve, of the bolt-head recesses and the band. The patents of S. A. Smith and P. W. Reinshager have been cited, but neither of these patents shows the combination claimed. One has not the bands, and the other has not the bolts and their recesses. The two cannot be united to make an answer to the claim. One alone must be sufficient for the purpose, or else both must fail. A comparison of the merits of applicant's device and either of the patented ones is not required. The question is not how much improvement he has made upon either of them, or in fact whether he has *practically* made any, provided his combination is *operative* and is new. Its comparative *practical* utility and merits are for the public to determine.

The decision of the Board is reversed.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—SOUTHERN DISTRICT OF NEW YORK.

JOHN W. MASURY *vs.* WILLIAM ANDERSON AND FREDERICK O. PIERCE.

[*In Equity, before Blatchford, J.—May 6, 1873.*]

A patent for a paint-can, the top piece of which is extended and united to the sides by a disk-ring of brass, and which can be opened readily by cutting through the brass, is not void for want of novelty, because milk-cans have been known with their sides carried up and united to the top by a tube-ring of lead, capable of being easily severed for the same purpose.

Nor on account of cans, for holding potash, made of tagger's iron, nor of such cans made with heads and bottoms of tin not intended to be opened by cutting.

Cans for holding paint, with one end made wholly of thin tin, which could be easily cut through, held to be an infringement.

[*W. Howard Wait*, complainant's solicitor.
George Harding, defendant's solicitor.]

BLATCHFORD, *J.:*

This suit is founded upon the same letters patent upon which the suit of the same plaintiff against Daniel F. Tiemann and others was brought. (8 *Blatchf. C. C. R.* 436.) The opinion in that case describes the invention and sets out the specification and claim. It also states, at length, the value and use of the patented can.

In this suit the infringement charged in the bill is the same as in that suit, namely, "That the defendants have made and caused to be made, for their use, cans embodying the patented invention, and have vended paints and colors put up in cans so constructed." The defendants are shown to have sold cans containing paints made liquid with oil, put up by them in such cans.

The answer in this suit sets up the defense of want of novelty in the invention, as did the answer in the former suit, but adduces, to support such defense, matters not set up in that suit. It avers, among other things, that the plaintiff's invention is described in Letters Patent No. 11,892, granted in England to Jules Jean Baptiste Martin de Lignac, and dated October 7, 1847. In the specification of the Lignac patent, which was enrolled April 3, 1848, the following language is all that is material to this case: "The concentrated milk is then, as quickly as possible, to be filled into vessels made of plate tin, or other suitable material, which will allow of being closed hermetically, and also allow of being treated by heat, as hereinafter explained. The vessels I prefer for this purpose are cylinders, such as are shown at Fig. 5, and in order that the upper end or cover may be readily removed by the simple act of cutting, I prefer that lead should be used all around, *i. e.*, as is shown by the drawing. These vessels, being filled quite full with concentrated milk, are allowed to stand for twenty-four hours, when the vessels are soldered all around, so as to hermetically close them." An exhibit, introduced in evidence by the defendants as being constructed in accordance with such description, is a cylindrical can, made of ordinary sheet tin some five inches in depth and four inches in diameter, one end of which is composed of a circular-shaped piece of tin, formed with a flange something less than a quarter of an inch deep, turned down at the outer circumference of such end. The lower edge of such flange is connected with the outer wall or side of the can by a band of sheet lead, a little over one-half of an inch wide, encircling the circumference of the can, the lower part of the band being soldered to the top of the wall or side of the can, and the upper part of the band being soldered to the lower edge of such flange, so as to leave a width of lead of about one-quarter of an inch between the upper edge of the wall or side of the can and the lower edge of the flange and allow the lead to be penetrated and cut in such width around the circumference of the can, and thus the top or end of the can to be separated from the body of the can. This arrangement differs from the plaintiff's invention. The latter consists in placing in one end of the can, and adjacent to the edge of the wall or side of the can, a rim or ring of thin brass or other soft metal, such rim or ring thus forming part of the end of the can. It is shown, by the evidence, that lead is a much more difficult metal to solder than thin brass, owing to the fact that especial preparation is required in order to enable the solder to adhere to the lead, and that the lead is liable to melt when the soldering-iron is brought in contact with it in the process of soldering; and that for these reasons it would take a workman a much longer time to manufacture a given number of cans, constructed according to the Lignac specification with a lead band, than it would to make the same number of cans constructed in the same form, but with a brass band in the place of one of lead. It is also shown that the use of thin brass instead of lead, in such form of can, admits of a neater and more perfect finish. Independently of this, the testimony shows that the plaintiff's can presents several advantages over the Lignac can. First, the plaintiff's can, in the size and number of the pieces of which it is composed, and in the labor of preparing them and putting them into the form of, and securing them together as a can, does not differ materially from the simplest form of can used; while in the Lignac can the band of lead constitutes a separate and additional piece, requiring additional labor in preparing it and inserting it in the can, and the seams cannot be soldered by machinery as in the plaintiff's can; second, in the plaintiff's can the force necessary to cut the metal in the end of the can can be applied in an oblique or vertical direction, and is not required to be applied laterally, as in the Lignac can. The former mode of cutting affords a freer passage to the knife, for the reason that it causes the lips of the opening to spread in different directions, while in cutting the lead band in the Lignac can, by lateral pressure, both lips of the opening are forced inward, and they, in turn, bind upon and obstruct the passage of the knife-blade, so as to render the process of cutting more difficult. Third, cutting one end, with the can standing on the other end, permits the can to be filled to its entire capacity, while in the case of the Lignac can, if it be filled above the center line of the inserted band, the contents will run out in the process of cutting through the band.

If the Lignac can be an improvement on the ordinary hermetically-sealed can, these advantages make the plaintiff's can a material improvement on the Lignac can; and the advantages thus shown to result from changing the position of the soft or thin metal from the side to the end are sufficient, in my opinion, to sustain the patent as against the Lignac can.

The defendants prove that the plaintiff made cans in the form of the Lignac can, but having in place of the band of lead a band of brass, and that he placed on such cans labels claiming them to be within his patent. It is urged that, by reason of this, the plaintiff is estopped from denying that the Lignac can is the equivalent of his invention. But this view is not tenable. The rights of the plaintiff depend upon the claim in his patent, according to its proper construction, and not upon what he may erroneously suppose it covers. If at one time he insists upon too much and at another on too little, he does not thereby work any prejudice to the rights actually secured to him. The evidence shows that a can constructed according to the Lignac patent does not accomplish the end sought by it, and is not a can which can be easily opened; and that even when the plaintiff substituted in it a brass band for one of lead, his customers who used it found it more convenient to open the can by cutting out the hard top by the use of a hammer and a knife than to do so by cutting through the brass band. Although the inventor of the Lignac can had the general idea of enabling a can to be opened by cutting more easily through a softer or a thinner metal, while the body of the can should have the strength of the harder or thicker metal, he did not embody his idea in a form which was practically of any substantial utility, and the means he adoped were substantially different from those adopted by the plaintiff.

The defendants also introduce in evidence, on the question of novelty, a can made wholly of tagger's iron —that is, sheet-iron rolled so thin as to be easily cut by a pocket-knife—and claim that similar cans had been used by the Pennsylvania Salt Manufacturing Company, for putting up caustic alkali, for some years prior to the date of the plaintiff's patent. These cans were filled by pouring in the alkali in a molten state, and it solidified on becoming cold. The only reason given for using tagger's iron, by the witnesses who testify to the use of those cans, are, that when tin was used, the heat the cans were subjected to caused the tin to melt, and that iron was less expensive than tin. It also appears that, previously to July, 1857, while tagger's iron was used for the sides, sheet-tin was used for the bottom and top, showing that the original use of tagger's iron was with no purpose to facilitate the opening of the cans. One witness testifies that the company put up the alkali in broken pieces in cans made wholly of tagger's iron, but he does not state that they did so previous to the date of the plaintiff's patent, or that he knew of its being put up in that condition in such cans prior to such date. The defendants, at the hearing, asked leave to put in further proof on the question whether the tagger's iron was used with a design to facilitate the opening of the cans, and on the question whether it was practicable to open the cans, when filled with the alkali, by cutting out the top, leave was given to both parties to put in further proofs on those points. The defendants, however, failed to avail themselves of the leave so granted, but the plaintiff has furnished evidence which conclusively puts to rest all pretensions in favor of such can. He has produced, in evidence, sheet-iron cans containing caustic alkali of the manufacture of said company, the same being put up by said company in such cans, and sold by it, together with the circulars in which the cans were enveloped when sold. These cans are made of sheet-iron not capable of being easily cut with a knife; and their contents consist of a solid mass of alkali, apparently conforming in shape to the capacity of the can. But the circular furnishes conclusive evidence against the claim set up in behalf of this can in the directions it gives for opening the cans, which directions are in these words: "Break up one box of the saponifier into fragments, by striking upon the sides of the box;" and again: "Knock off either end of a pound box of concentrated lye." Moreover, on the whole testimony, it is doubtful whether the tagger's iron actually used by the company before the date of the plaintiff's invention was so thin as to be capable of being cut to facilitate the opening of the can. It is, therefore, not shown that the use of tagger's iron, in the manufacture of such cans by said company, was a prior use of the plaintiff's invention.

The defendants admit, by stipulation, that they have made and used, for putting up paints and colors, and vending paints and colors put up therein, "cans with one end made wholly of thin tin, which can be easily cut at the outer edge of such end." The plaintiff claims such can to be an infringement of his patent. In the view I take of the patent, if one end of the can is made wholly of thin tin, and thereby the location of the thin or soft metal in such end is secured at the only part of the end where, by the patent, it is required to be, or where it is essential it should be, namely, at the part of the end nearest its outer edge, it is not material whether the metal in the other parts of the end be thick or thin, so far as the plaintiff's invention is concerned. The use of a plain end of thin metal secures what the patent is designed to accomplish, and in the mode specified in it, by enabling the end to be removed by cutting it out near its outer edge with a knife, while the body of the can may be made of a thicker metal and thus strong, and the thinness of the metal left thin to be cut does not interfere with the safe handling and transportation of the can.

There must be a decree for the plaintiff for a perpetual injunction, and an account of profits, with costs.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

25,115.—*Self-Acting Wagon-Brake.*—Granted to BENJAMIN S. HEALY, August 16, 1859. Hearing July 30, 1873.

25,148.—*Weighing-Scales.*—Granted to FRANCIS M. STRONG and THOMAS ROSS, August 16, 1859. Hearing July 30, 1873.

25,149.—*Blanks for Shoe-Pegging Machines.*—Granted to BENJAMIN F. STURTEVANT, August 16, 1859; reissued June 12, 1866. Hearing July 30, 1873.

25,153.—*Carding-Engines.*—Granted to SAMUEL WETHERED, August 16, 1859. Hearing July 30, 1873.

25,166.—*Iron Fences.*—Granted to JOHN B. WICKERSHAM and HENRY JENKINS, August 16, 1859. Hearing July 30, 1873.

25,167.—*Mode of Lighting Gas by Electricity.*—Granted to ARCHELAUS WILSON, August 16, 1859. Hearing July 30, 1873.

25,183.—*Nail-Machine.*—Granted to DANIEL DODGE, August 23, 1859. Application filed May 23, 1873. Hearing August 6, 1873.

25,191.—*Machines for Making Paper-Bags.*—Granted to WILLIAM GOODALE, August 23, 1859. Hearing August 6, 1873.

25,199.—*Feeding Paper to Printing-Presses.*—Granted to RICHARD M. HOE, August 23, 1859; reissued June 20, 1871. Hearing August 6, 1873.

25,235.—*Manufacture of Iron.*—Granted to BERNARD LAUTH, August 23, 1859. Application filed May 22, 1873. Hearing August 6, 1873.

25,237.—*Horizontal Wheels.*—Granted to ABRAHAM ANDREWS and HARRISON KALBACH, August 30, 1859. Application filed May 22, 1873. Hearing August 13, 1873.

25,239.—*Elastic Hose Tubing*, granted to JOHN C. BOYD, August 30, 1859. Application filed May 29, 1873. Hearing August 13, 1873.

25,309.—*Nail Machines*, granted to DANIEL DODGE, August 30, 1859. Application filed May 31, 1873. Hearing, August 13, 1873.

25,343.—*Stoves.*—Granted to EDWARD M. MANGLE, September 6, 1859. Application filed June 5, 1873. Hearing August 20, 1873.

25,344.—*Machines for Wiring the Joints of Clothes Pins*, granted to ALVIN C. MASON, September 6, 1859. Application filed May 31, 1873. Hearing, August 20, 1873.

25,364.—*Watches.*—Granted to CHARLES E. JACOT, September 6, 1859. Hearing August 20, 1873.

25,373.—*Machines for Making Paper Boxes.*—Granted to SILAS B. TERRY, September 6, 1859; reissued May 17, 1870. Application filed June 5, 1873. Hearing August 20, 1873.

25,395.—*Heels for Boots and Shoes.*—Granted to SIMEON DODGE, Jr., and BENJAMIN POTTER, Jr., September 13, 1859. Application filed June 13, 1873. Hearing August 27, 1873.

25,434.—*Cotton-Scrapers.*—Granted to JONATHAN H. MITCHELL, September 13, 1859. Application filed June 10, 1873. Hearing August 27, 1873.

25,442.—*Boilers and Steamers.*—Granted to DANIEL R. PRINDLE, September 13, 1859. Application filed June 13, 1873. Hearing August 27, 1873.

25,443.—*Seeding-Machines.*—Granted to SILAS G. RANDALL, September 13, 1859; reissued May 25, 1869. Application filed June 11, 1873. Hearing August 27, 1873.

25,473.—*Scales.*—Granted to ANDREW TURNBULL, September 13, 1859. Application filed May 31, 1873. Hearing, August 27, 1873.

25,484.—*Grain-Separators.*—Granted to JONATHAN L. BOOTH, September 20, 1859; reissued September 25, 1860, and November 29, 1864. Application filed June 14, 1873. Hearing September 3, 1873.

25,488.—*Hydraulic Presses.*—Granted to M. H. CLARK, September 20, 1859. Application filed June 20, 1873. Hearing September 3, 1873.

25,499.—*Railroad-Car Seat.*—Granted to ELI WHEELER, September 20, 1859. Application filed June 17, 1873. Hearing September, 3, 1873.

25,506.—*Lamps.*—Granted to HALVOR HALVORSON, September 20, 1859; reissued June 6 and December 5, 1871. Application filed June 6, 1873. Hearing September 3, 1873.

25,508.—*Tailors Shears.*—Granted to ROCHUS HEINISCH, September 20, 1859. Application filed June 20, 1873. Hearing September 3, 1873.

25,512.—*Bung-Hole Borer and Reamer.*—Granted to JOSIAH KIRBY, September 20, 1859. Application filed June 19, 1873. Hearing September 3, 1873.

25,544.—*Try-Cocks for Steam-Boilers.*—Granted to JOHN F. COOK, September 20, 1859. Application filed June 10, 1873. Hearing September 3, 1873.

25,565.—*Rolling-Mills.*—Granted to JOHN and GEORGE FRITZ, September 27, 1859. Application filed June 27, 1873. Hearing September 10, 1873.

25,569.—*Bedstead-Slats.*—Granted to TYLER HOWE, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,570.—*Mode of Arranging Couches in Railroad Cars.*—Granted to EDWARD C. KNIGHT, September 27, 1859. Application filed May 31, 1873. Hearing, September 10, 1873.

25,572.—*Molding Water-Traps.*—Granted to JAMES ALLEN LOWE, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,586.—*Burglar-Alarms.*—Granted to ABBOTT O. ROSS, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,588.—*Steam Punching-Machines.*—Granted to JOHN SPARROW, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,640.—*Steam-Boilers.*—Granted to JOSEPH HARRISON, Jr., October 4, 1859. Application filed June 30, 1873. Hearing September 17, 1873.

25,662.—*Construction of Prisons.*—Granted to EDWIN MAY, October 4, 1859. Application filed June 23, 1873. Hearing September 17, 1873.

25,673.—*Machines for Lasting Boots and Shoes.*—Granted to JAMES PUSHTON, October 4, 1859; reissued January 6, 1863. Application filed July 5, 1873. Hearing September 17, 1873.

25,683.—*Hydrants.*—Granted to CHARLES L. STACY, October 4, 1859; reissued June 6, 1865. Application filed June 26, 1873. Hearing September 17, 1873.

25,692.—*Sewing-Machines.*—Granted to KASIMIR VOGEL, October 4, 1859; reissued November 1, 1864. Application filed July 5, 1873. Hearing September 17, 1873.

25,701.—*Skeleton Skirt.*—Granted to JAMES DRAPER, October 4, 1859; reissued August 1, 1865. Application filed July 2, 1873. Hearing September 17, 1873.

25,726.—*Hand-Machine for Wiring Blind-Rods.*—Granted to BIRAM C. DAVIS, October 11, 1859. Application filed July 12, 1873. Hearing September 24, 1873.

25,733.—*Double-Friction Couplings.*—Granted to JOSHUA HENDY, October 11, 1859; reissued March 25, 1873. Application filed July 7, 1873. Hearing September 24, 1873.

25,747.—*Method of Combining Emery with Caoutchouc.*—Granted to THOMAS J. MAYALL, October 11, 1859. Application filed June 16, 1873. Hearing September 24, 1873.

25,767.—*Cutting and Panning Cakes.*—Granted to JOHN H. SHROTE, October 11, 1859. Application filed July 11, 1873. Hearing September 24, 1873.

25,784.—*Mode of Manufacturing Barrels, &c.*—Granted to GEORGE W. BARKER, October 11, 1859. Application filed July 8, 1873. Hearing September 24, 1873.

25,796.—*Jacquard Machines.*—Granted to AVERY BARBETT, October 18, 1859. Application filed June 30, 1873. Hearing October 1, 1873.

25,797.—*Harvesters.*—Granted to EPHRAIM BALL, October 18, 1859. Application filed July 18, 1873. Hearing October 1, 1873.

25,807.—*Hem-Folders.*—Granted to LEVERETT CLARK, October 18, 1859. Application filed July 19, 1873. Hearing October 1, 1873.

25,814.—*Sleeping-Cars.*—Granted to JOHN DANNER, October 18, 1859. Application filed July 12, 1873. Hearing October 1, 1873.

25,843.—*Cultivators.*—Granted to THOMAS MCQUISTON, October 18, 1859; reissued May 16, 1871. Application filed July 11, 1873. Hearing October 1, 1873.

25,862.—*Weeding-Hoes.*—Granted to JAMES M. ADAMS, October 18, 1859. Application filed July 18, 1873. Hearing October 1, 1873.

25,867.—*Machines for Covering Saddle-Trees.*—Granted to JOHN MACLURE, October 18, 1859. Application filed July 14, 1873. Hearing October 1, 1873.

26,243.—*Water-Closet Basins.*—Granted to WILLIAM BOCH, Sr., November 29, 1859. Application filed June 10, 1873. Hearing November 12, 1873.

27,539.—*Manufacture of Gun-Barrels.*—Granted to JAMES H. BURTON, March 20, 1860, and antedated to September 29, 1859; reissued December 26, 1871. Application filed July 1, 1873. Hearing September 10, 1873.

30,201.—*Apparatus for Freezing Liquids.*—Granted to FERDINAND PHILIPPE EDOUARD CARRÉ, October 2, 1860; reissued in two divisions February 18, 1873. Patented in France August 24, 1859. Application filed May 17, 1873. Hearing August 13, 1873.

EXTENSIONS GRANTED.

24,838.—*Improvement in Pumping-Engines*, granted to HENRY R. WORTHINGTON, July 19, 1859.

Claim.—1. The combination, herein set forth and exhibited of two direct-acting pumping-engines, propelled by steam or other fluid, so arranged as that each engine shall actuate the inlet and outlet valves governing the motive power of the other, thereby insuring the constant action of at least one pump-piston upon the water and relieving the action of the pump from shocks and concussions.

2. The arrangement, herein shown, of two distinct systems of levers adapted to the steam and exhaust valves of each engine, the one system to be operated upon for producing motion and for determining the duration of the repose of the piston at the termination of the stroke, the other for bringing the pistons to a state of rest, all substantially as herein explained and set forth.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date July 15, 1873.]

6,771.—*Burial-Casket.*—BENJAMIN F. HEIMBACH, Allentown, Pa. Application filed April 25, 1873.

6,772.—*Burial-Case.*—BENJAMIN F. HEIMBACH, Allentown, Pa. Application filed April 25, 1873.

6,773.—*Jewelry-Box.*—EDWARD C. MOORE, Yonkers, assignor to TIFFANY & Co., New York, N. Y. Application filed June 14, 1873.

6,774.—*Fan.*—JAMES T. BRUNDAGE, Niagara Falls, N. Y. Application filed June 18, 1873.

6,775.—*Drawer-Pull.*—OTTO F. FOGELSTRAND, Kensington, Conn., assignor to HART, BLIVEN & MEAD MANUFACTURING COMPANY, same place. Application filed June 30, 1873.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date July 15, 1873.]

1,361.—*Licorice-Paste.*—DANIEL V. ARGUIMBAU, New York, N. Y. Application filed June 26, 1873.

1,362.—*Quill-Bobbins.*—DAVID BASS, Jr., Woonsocket, R. I. Application filed June 27, 1873.

1,363.—*Roasted Coffee.*—DILWORTH BROTHERS, Pittsburg, Pa. Application filed June 13, 1873.

1,364.—*Casks and Other Packages of Whisky.*—HOWE & HUBBELL, Cincinnati, Ohio. Application filed June 26, 1873.

1,365.—*Cigars, Cheroots, and Cigarettes.*—FRANCIS S. KINNEY, New York, N. Y. Application filed June 21, 1873.

1,366.—*Saddle-Trees.*—S. E. TOMPKINS & Co., Sing Sing, N. Y. Application filed May 17, 1873.

1,367.—*Razors and Cutlery.*—FRIEDMANN & LAUTERJUNG, New York, N. Y. Application filed April 26, 1873.

1,368.—*Varnish.*—LEWIS L. MANDEL, New York, N. Y. Application filed June 28, 1873.

1,369.—*Globules for Homœopathic Medicines.*—SMITH & PARKS, Cincinnati, Ohio. Application filed July 5, 1873.

1,370.—*Cylinder-Stoves.*—SOUTHARD, ROBERTSON & Co., New York, N. Y. Application filed June 28, 1873.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date July 15, 1873.]

ORIGINAL PATENTS.

140,755.—*Drip-Cup for Candles.*—DAVID M. AYER, Lawrence, Mass., assignor to EDGAR W. AYER, same place. Application filed May 19, 1873.

The drip-cup is provided with a central perforation to admit the candle, and has springs attached for adjustment upon the candle or candlestick.

Claim.—The reservoir 4, provided with springs 5, adapted for the use of different-sized candles, and for adjustment near the top of the candle independent of the candlesticks, substantially as shown and described.

140,756.—*Earth-Auger.*—GEORGE H. BAISLEY and GEORGE WILSON, Hamilton, Mo.; said BAISLEY assignor of his right to ISAAC V. SPLAWN. Application filed March 7, 1873.

A two-part auger of ordinary construction, the valve of which is regulated in the extent of its aperture by the adjustable stop *l*.

Claim.—The movable or adjustable stop *l*, in combination with the auger *a* and valve *e*, when so arranged as to regulate the distance to which the valve shall open, substantially as shown and described.

140,757.—*Adjustable Spinning-Ring.*—JOSEPH B. BANCROFT, Hopedale, Mass. Application filed June 2, 1873.

By removing the ring from its socket and turning the screws in its shank, its position in the socket and with reference to the spindle is governed.

Claim.—The spinning-frame ring, (whether having a stationary or reversible race,) provided with two or any other suitable number of adjusting-screws, *a*, arranged in its shank, in the manner and to operate in connection with the socket in the ring-rail, substantially as specified, for effecting or to aid in effecting adjustment of the ring into concentricity with the spindle.

140,758.—*Ironing-Board.*—EZRA BASSETT, Topeka, Kans. Application filed June 14, 1873.

An ironing-board rests on cleats that project beyond each end. Near the head and foot of the board are swinging clamps to hold the shirt when being ironed.

Claim.—1. The shirt-bosom holder, stretcher, and ironing-board, consisting of the board A *a a*, clamps or head and foot pieces B *b' b*, hinged or otherwise attached to the board A, all constructed, arranged, and operating substantially as and for the purposes set forth and described.

2. The clamp B, so shaped as to conform to the neck of the shirt, when the same is swung upon the hinges *b*, and is thereby made to pass over the extremity of the board A and rest upon the cleat *a*, substantially as and for the purposes described.

140,759.—*Treating Bessemer Steel and other Metals to Anneal them for Punching, &c.*—GEORGE W. BILLINGS, Chicago, Ill. Application filed June 25, 1873.

Steam is employed to render steel or iron the more easily to be punched, drilled, upset, &c.

Claim.—1. The herein-described application, in the process of annealing steel and iron, of the use of steam, applied either directly to the article or by heating the same by placing it in a heater heated by steam, substantially as set forth.

2. The herein-described apparatus for annealing steel wire, &c., consisting of the cylinder A, tube B, and chamber, substantially in the manner as described, and for the purpose specified.

140,760.—*Railway-Rail Joint.*—JAMES BISHOP, Owego, N. Y. Application filed June 19, 1873.

The joint is supported by two fish-plates placed on the sides of the rails, united by a bolt or rivet swaged into oblong dovetailed recesses in the plates, the bolt passing through slots formed in the web of the rails at the ends. The rails are thus firmly clamped laterally, and supported vertically against displacement by concussion of the wheels.

Claim.—In combination with the rails A A', slotted as shown, the bevel-slotted clamps B B' and swaged key C, substantially as shown, and for the purposes described.

140,761.—*Manufacture of Iron and Steel.*—OGDEN BOLTON, Jr., and JOHN PEDDER, Pittsburg, Pa. Application filed March 11, 1873.

If the sponge contain much foreign matter, such as silica, alumina, &c., flux is added to the sponge in the base, and the mold and contents when heated are subjected to compression to squeeze out the foreign matter, and the compressed sponge then used in a steel-melting furnace, crucible, or puddling-furnace.

Claim.—The method herein described of manufacturing iron or steel from "sponge" by the inclosure of the sponge in molds or tubes, and covering said molds with a coating of clay or clay and black-lead, substantially as set forth.

140,762.—*Manufacture of Steel Plates.*—OGDEN BOLTON, Jr., Pittsburg, Pa. Application filed March 7, 1873.

Claim.—1. The method described of casting an ingot of steel with a recess or recesses, substantially as set forth.

2. The method described of manufacturing soft-steel plates, substantially as specified.

140,763.—*Miter-Machine.*—DANIEL BULL, Amboy, Ill.; assignor to himself and JAMES H. HOLMES, same place. Application filed May 16, 1873.

The guides are made adjustable horizontally by the series of holes, and vertically by screws.

Claim.—A miter-machine constructed as described, with the slotted shafts A B working through the holes *a'* and *a n* in the base W, and connected by the sliding arm *b*, and having the adjusting-screws *a b'* and *e e'*, all constructed and arranged substantially as and for the purpose described.

140,764.—*Lamp.*—JAMES M. CLARK, Lancaster, Pa., assignor to FRANKLIN L. CLARK, same place. Application filed April 12, 1873.

A regulating device is connected with a system of burners. An overflow-receptacle is connected with the regulating-chamber in such manner as to prevent too great an elevation of oil at the burners.

Claim.—1. The regulating-valve 5 operated by a nut, 8, through the medium of a rod, 6, inclosed in a pipe, 7 in combination with the nozzle 4, regulating-chamber 9, conducting-pipe 12, and separate air-pipe 10, all arranged to operate as herein described, for the purposes set forth.

2. The overflow-receptacle 21, in combination with the reservoir 1, supply-chamber 9, and pipe 22, substantially as and for the purposes set forth.

3. The combined apparatus, consisting of the reservoir 1, chamber 9, valve 5, feeding-plug 11, overflow-receptacle 21, connecting-pipes 22, 12, 13, and burners 14, all arranged to operate as specified.

140,765.—*Toy Automaton.*—ROBERT J. CLAY, New York, N. Y. Application filed June 14, 1872.

A music-box barrel is geared to the handle of a wounded soldier or other figure, to imitate a street-organ operator.

Claim.—1. The combination, with the barrel *i*, of the gears *g h*, the crank *d*, and the arm *b* of the automaton, substantially as specified.

2. The combination of the cranked shoulder-joint spindle *c* with the head of the automaton, fitted so as to be capable of turning the arm *b* and the crank *d*, set in motion by the organ, essentially as herein set forth.

140,766.—*Cotton-Bale Tie.*—FREDERIC COOK, New Orleans, La. Application filed June 26, 1868.

Claim.—1. The cotton-tie, made as shown and described, on the band or on a separate piece riveted on.

2. The side cut or notch in the band to receive the looped end sidewise.

3. The notched edge, so arranged that when the looped end enters it the looped end laps over a double thickness of the band and holds the beat end in position by the expansive force of the bale.

4. The raised lip *J* in the band.

140,767.—*Feeding Mechanism for Rock-Drills.*—JOHN DOTY, Buffalo, N. Y. Application filed May 3, 1873.

The feed-box is provided with a lever and a feed-catch or qualifier, to each of which is connected a coiled spring. When the projection on the sliding rod raises up the lever it is depressed by the coiled spring, and thus operates the drill-bit which is connected with the lever.

Claim.—1. The combination of the coiled spring *e*, qualifier C, pin *f*, and slot *g*, arranged and operating substantially as described.

2. The qualifier C with its pin *f*, constructed substantially as described, for the purpose specified.

3. The lever B and qualifier C, in combination with the coiled springs *b e* and projection D, arranged and operating substantially as herein described.

140,768.—*Eye-Wash.*—RANSOM C. FISHER, Belleville, N. Y. Application filed October 5, 1872.

Soft water, green tea, sugar of lead, white vitriol, and camphor gum dissolved in alcohol.

Claim.—A compound, composed of the ingredients, substantially in the proportions and for the purposes set forth.

140,769.—*Dish-Heater.*—SAMUEL S. FITCH, New York, N. Y. Application filed May 7, 1873.

Claim.—The new article of manufacture, or dish-heater, as described, composed of the guard-plate the legs, and the box, provided or for use with the heating block or blocks, all being arranged and constructed and for use, substantially as specified.

140,770.—*Railway Switch.*—ALFRED C. GARRATT, Boston, Mass. Application filed December 2, 1872.

The switch is shifted by turning the crank-handle of the vertical cam-shaft, the shaft being returned to position by a coiled spring which surrounds it. A thumb-spring latch engages the crank when returned, and locks it and the switch from accidental displacement.

Claim.—The vertical shaft *g*, provided with the spring *p*, crank *g'* at its upper end, and cam or cranks *f* at its lower end, the latter connected with the track by the rod *e*, in combination with the frame *h*, slotted arm *m*, and spring or latch *o*, all arranged and operating substantially as described.

140,771.—*Fountain-Pen.*—JOHN GOODYEAR, Groton, N. Y. Application filed May 27, 1873.

A tube provided with plugs near each end, through holes in which passes the valve-rod, is pointed at one end and has a brush for regulating the flow of the ink through the point and a rubber cap at the opposite end.

Claim.—1. A fountain-pen, constructed of a tube, A C, tapering to a point, with a brush, E, and valves B *b b'* arranged in said tube, by which to regulate the flow of ink to the point, all constructed, arranged, and operating substantially as and for the purposes described.

2. The combination of the valve-rod B, plugs *c*, tube A, and perforated brush E, all arranged and operating substantially as and for the purposes described.

3. The fountain-pen constructed of tubes A C *c*, valve-rod B *b b'*, plugs *c*, pen-holder D *d*, brush E *e*, rubber cap F, all constructed and arranged substantially as and for the purposes described.

140,772.—*Iron Roof-Truss.*—ABRAHAM GOTTLIEB, Chicago, Ill. Application filed January 24, 1873.

The two chords are connected to each other by struts, ties, and braces, and to the end post, in the manner shown, with the object of subjecting the top chord to compressive strain only, and the bottom chord to tensile strain only, thus relieving the walls from lateral thrust, while obviating the use of the ordinary tie-rod.

Claim.—1. The combination of an arched bottom chord and the top chord composed of two equal inclined beams without the use of a tie-rod, in the manner and of the construction as described and shown.

2. The construction of the lower arched chord of an internally-arched roof-truss, with the inner members made of short link-bars *b''*, or riveted flat bars in their place, and the outer ones of continuous channel or angle bars *b'* to form the curves, as shown and set forth.

3. The employment of the end posts F in a roof-truss to transmit the weight of the roof to the walls, as shown and set forth.

140,773.—*Animal-Trap and Seed-Safe Combined.*—SAMUEL V. GREER, Rocky Hill Station, Ky. Application filed April 19, 1873.

Utilizing a valuable and specially attractive winter-bait to protect itself.

Claim.—The seed-safe A, provided with the openings G, Q, and W, and the movable seed-case C and D, the latter having the opening E covered with wire-cloth F, in combination with the box R and rat-trap H, composed of the box I, wall N, drop J, plates L M, weight O, and spring P, substantially as hereinbefore set forth.

140,774.—*Journal-Box Lining.*—STUART GWYNN, New York, N. Y., assignor to THE AMERICAN METALINE COMPANY, same place. Application filed June 28, 1873.

Claim.—The composition denominated metaline, incorporated with wire-cloth, substantially as and for the purpose specified.

140,775.—*Journal-Box Lining.*—STUART GWYNN, New York, N. Y., assignor to THE AMERICAN METALINE COMPANY, same place. Application filed June 28, 1873.

Claim.—The composition denominated metaline, incorporated with perforated metal sheets, substantially as and for the purpose specified.

140,776.—*Barrel-Making Machine.*—HIRAM PORTER HALL, Akron, N. Y. Application filed January 22, 1873.

The staves are taken from a hopper, arranged within a ring in the proper form for a barrel, and held in position until a hoop is driven on.

Claim.—1. In a barrel-machine, the circular holder B, provided with the rims U, substantially as and for the purpose herein described.

2. In a barrel-machine, the combination of the spring-lifts *i*, traveling-hooks *t t'*, upper and lower guides *c k*, and circular holders B, all constructed and operating substantially as and for the purpose specified.

3. In a barrel-machine, the combination, with the circular holders B and the rims U, of the spring-rollers *w w*, arranged and operating substantially as and for the purpose described.

4. The traveling-hooks *t t'* running on the guides *u*, constructed and operating substantially in the manner and for the purpose hereinbefore specified.

5. The machine, consisting of the frame A, one side hinged and made adjustable, the circular holders B B', the holding-guides *a a'* setting in grooves *b*, the guides C *k*, the lifts *i i*, rock-shaft I, arm J, traveling-hooks *t t'*, cutters K K', and spring-roller *w*, all constructed and operated substantially in the manner and for the purpose specified.

140,777.—*Combined Water-Cooler and Show-Case.*—PETER J. HANOUR, Buffalo, N. Y. Application filed June 19, 1873.

A revolving case has concentric shelves and is provided with a water-cooler the top of which is formed by a drip-cup having a perforated cover. The drip-water from the faucet falls on a grate and passes into a drawer, from whence it is emptied.

Claim.—1. The combination, with the revolving sample-case C, having concentric steps or shelves D, of a water cooler or filter, A, substantially as shown and described.

2. The combination, with a revolving sample-case, C, and a water-cooler, of a drip-cup, A', having a perforated cover, *a'*, the said drip-cup forming the cover of the water-cooler, substantially as shown and described.

3. The combination, with a revolving sample-case, C, having concentric steps or shelves D and a water-cooler, A, of a cock or faucet, F, arranged at or near the periphery of the lower shelf, as and for the purpose described.

4. In combination with a revolving sample-case, C, having concentric steps or shelves D, a water-cooler and filter, A, and a cock or faucet, F, of a drip cup or drawer, G, having a perforated or grated surface, *f*, over or above it, substantially as and for the purpose set forth.

140,778.—*Abdominal Supporter.*—ELIZA J. HARDING, St. Louis, Mo. Application filed December 6, 1872.

The part of the supporter which passes over the posterior regions is furnished with a novel arrangement of elastic gores to insure a proper fit.

Claim.—The arrangement of the posterior brace B, designed wider at bottom than top, extending and supporting the entire loins, and having top and side goring *b'*, to operate as and for the purpose set forth.

140,779.—*Dumping-Car.*—JOHN HUGHES, New Berne, N. C. Application filed March 12, 1873.

The angular casings around the axles of the dumping-box prevent the lodgment of the material to be dumped.

Claim.—1. In a dumping-car, the angular shields or casings G arranged around the axles, substantially as specified.

2. In a dumping-car, the combination of brakes H having slots A to engage with the wheels E, set-screws passing through the slots and the lever J, operating substantially as specified.

140,780.—*Screw-Cutting Machine.*—GILBERT B. JAYCOX, Hartford, and ALLEN WEBSTER, Farmington, Conn. Application filed November 18, 1872.

The shaft is provided with two pairs of wings, which, as it is reciprocated, engage pins in the oppositely-rotating pulleys, causing the shaft to rotate alternately in opposite directions. The shaft is reciprocated by a half-nut that engages its screw-thread on the shaft, so that it raises a weight, which, by its gravity, finally throws the shaft endwise, thereby changing the clutches.

Claim.—1. The combination of the rotary and longitudinally-reciprocating shaft b^3 provided with the clutch-arms and the nut-piece *f*, the contrarily-rotating clutch-pulleys *c d*, and the ball-lever s^3, actuated from the nut *f*, the whole constructed, arranged, and designed for operation and use, substantially as described.

2. The combination of the feeding-trough A with the wings *e*, constructed and arranged as described, for the purpose set forth.

140,781.—*Car-Starter.*—THOMAS W. JOHNSTON, Chicago, Ill. Application filed March 27, 1873.

A coiled spring inclosed within a case, in combination with a ratchet and beveled wheel, is secured to a lever which is pivoted to the truck in such a manner that, by moving it to the left, the beveled wheel engages with a beveled wheel secured to the axle, by means of which the spring is tightly coiled in stopping the car. When the lever is turned to the right the spring expends its force in propelling the car forward.

Claim.—The pivoted lever C having attached thereto the case E with inclosed spring, ratchet-wheel F, gear-wheel B, and spring-pawl G, in combination with the wheels D D rigidly affixed to the axle A, and stop *b*, as described, for the purpose set forth.

140,782.—*Ink for Stamping Purposes.*—JOHANN B. FEINDOLIN JUD, New York, N. Y. Application filed May 31, 1873.

Red aniline, citric acid, mucilage, glycerine, acetic acid.

Claim.—A stamping-ink, compounded and prepared of the herein-named ingredients, substantially in the proportions and for the purpose hereinbefore set forth.

140,783.—*Window Sash and Frame.*—DONALD MCKAY, Chicago, Ill. Application filed March 5, 1873.

The window-sash and its frame is made in such a manner that weather-strips need not be employed, and wind, dust, rain, &c., cannot enter the window when the sash is closed.

Claim.—The grooved window-frame B, provided with the beveled and grooved sill C, and with the removable and grooved separating-ribs D D arranged in the vertical grooves of the frame B, in combination with a double sash, each part of which is constructed to match the other, and provided with vertical ribs arranged to ride in the grooves of the ribs D D, the lower sash being also constructed to match the sill, and the upper one to match the top of the window-frame, substantially as and for the purposes specified.

140,784.—*Hose-Reel.*—THOMAS J. MAYALL, Boston, Mass. Application filed June 24, 1873.

Claim.—1. The revolving reel for hose, constructed and arranged substantially as herein described, whereby the hose may be wound upon the same in a volute or scroll, each layer or fold of which is supported separately therein without contact with the other layers or folds, substantially as and for the purposes shown and set forth.

2. The combination of the two sets of radial arms, connected by a center-stem constituting the axis of the reel, as described, with detachable rollers or cross-pins fitting and held in inclined slots or open bearings in said arms, under the arrangement and for operation substantially as shown and described.

140,785.—*Lemon-Squeezer.*—JOHN H. MEAD, New York, N. Y. Application filed June 23, 1873.

A socket-die is attached to a hinged lever. The sleeved die has a separate removable perforated bottom and a single aperture in the bottom. The whole secured to a box or frame.

Claim.—The combination of the die G, having a conical bottom, *e*, and central aperture *i*, with the removable perforated bottom A and the die F attached to the hinged lever E, all mounted upon the frame or case C, as and for the purpose specified.

140,786.—*Hoisting-Machine.*—PETER W. MELLEN, St. Louis, Mo. Application filed April 2, 1873.

The pivoted shaft, upon which the brake is secured, is operated by means of a screw-shaft, which is rotated by means of a rope passing over a pulley upon such shaft. The counter-balance weight is arranged in vertical slides upon the side of the hatchway, and it is secured to the platform-rope by a pulley or a hanger on said rope, which has free horizontal movement on a slide-rod or bail secured to the top of said weight.

Claim.—1. In combination with the check-rope *k*, pulley L, screw-shaft K, lever I, and shoe J, the pivoted nut *i'*, enabling positive movement to be imparted to the brake in both directions.

2. The combination of the rope B, hanger H A, bail or slide-rod *d'*, and weight D, all substantially as and for the purpose set forth.

3. The combination of the platform-rope B, drums C C', hanger H A, bail *d'*, and weight D, all arranged substantially as and for the purpose set forth.

140,787.—*Sewing-Machine.*—THOMAS L. MELONE, Mount Gilead, Ohio. Application filed May 16, 1872.

The serrated feeding-block is carried by a spring-bar, and is operated by lever K, which first strikes the incline on the feeding-block and raises it, and then engages the lug and moves it horizontally. On the return movement of the lever the spring-bar lowers the block from the cloth, and the block is then carried back as the lever strikes the opposite lug. The lever is operated by a lug on the shuttle carrying arm secured to the vertical shaft.

Claim.—1. The balance-wheel E constructed with a central cavity, F, and arranged as described, to inclose the crank B and slotted yoke C, so as to conceal and shield the same.

2. The standard Y, supporting the arm W, and constructed with the cavity V^2 V^3, and internal pendent bearing U, the driving-shaft A constructed with a crank, B, the wrist of which is oval in form, and the balance-wheel E having a cavity, F, to inclose said crank, when all are combined, and operate substantially as herein described, for the purpose set forth.

3. The feed-bar working in suitable guides and constructed with lugs S S^2 and an incline, Z, between the same, the friction-spring T, and the lever K provided with a yoke and set-screw, when combined and operating together as and for the purposes described.

140,788.—*Stove-Pipe Shelf.*—WILLIAM PATTERSON, Oneonta, N. Y. Application filed December 6, 1872.

Connected or attached to an ordinary stove-pipe by means of a wire passed around it. The holding device for the shelves is constructed with a surface fitted to the pipe, and a supporting-ring and braced projection, having on its under side a pin projecting downward, to which the shelves are attached when in use, and are held in a horizontal position by the supporting-ring.

Claim.—The arrangement and combination of the supports A A, shelves S S, and wire W, substantially as shown and described.

140,789.—*Manufacture of Soap.*—FRANCIS M. PLEINS, Dubuque, Iowa. Application filed June 19, 1873.

Claim.—1. The process of making hard soap in which rosin enters as a material in one charge, and without using muriate of soda, and commencing my process with dissolving and partly or wholly saponifying the rosin with carbonate of soda, and retaining the glycerine in it.

2. The compounding of three mixtures used in the soap to improve the same, substantially as described.

140,790.—*Electric Railroad Signal Apparatus.*—FRANK L. POPE, Elizabeth, N. J. Application filed October 24, 1872.

Secondary or tell-tale signal automatically set at the signaling-station by the primary signal, both signal mechanisms being in the same circuit. Secondary signal, actuated by a "duplex magnet," circuit through one branch, going directly to battery or ground, and through other branch to primary signal; primary signal at conclusion of setting cuts a resistance in or out of its branch of circuit, destroying equilibrium of magnets at secondary station.

Claim.—1. The arrangement, substantially as herein described, of the electro-magnet M and armature *m*, in combination with a circuit changer, N, so that the movement of said armature will cause a variation in the strength of the electric current, in the circuit which includes or operates said electro-magnet, by means of which the movement of the said armature and its attachments may be indicated or recorded at any point in the said circuit.

2. The combination of primary signal and a secondary signal or indicator, included in or operated by one and the same electrical circuit, when the movements of the latter are dependent upon and controlled by the movements of the former, substantially as herein specified.

3. The combination of the electro-magnets C and E, together with their armature or armatures, and the electro-magnet M, circuit-changer N, and rheostat R^1, or its equivalent, substantially as herein specified.

4. The combination of the electro-magnet M and its armature with the circuit-changer N or T and rheostat R^1, or its equivalent, substantially as herein specified.

140,791.—*Cotton-Gin.*—MERRILL E. PRATT, Plattville, Ala. Application filed May 13, 1873.

Revolving plates are let into recesses on opposite interior sides of the cotton-box to diminish friction.

Claim.—A cotton-box provided with the revolving plates E let into its heads or sides, substantially as shown, said plates operating as and for the purpose set forth.

140,792.—*Apparatus for Cooling Storage-Rooms.*—JOHN RING, St. Louis, Mo. Application filed May 5, 1873.

The lower chamber is cooled by air driven through tubes arranged between timbers, and covered with water from the ice placed on the timbers to keep it from contact with the water. A tube carries off any excess of water.

Claim.—In combination with the chamber B, the cooling apparatus, consisting of the ice-chamber or tank A, having ice-supporting timbers D arranged between the coils of the serpentine pipe F, and provided with the overflow-pipe E, located above the level of the top of the pipe F, and below the level of the top of the timbers D, so that the pipe F is kept immersed in the cold water dripping from the ice as it melts, while the ice is kept from contact with the water, and thereby prevented from melting too rapidly, all as herein shown and described.

140,793.—*Molasses-Pitcher.*—DANIEL C. RIPLEY, Pittsburg, Pa. Application filed March 29, 1873.

A molasses-pitcher with a saucer-shaped base to catch the drip from the spout; all made of glass.

Claim.—A glass molasses-pitcher provided with a saucer-shaped base, c, substantially as and for the purposes described.

140,794.—*Wheel or Pulley for Band-Saws.*—JOHN A. ROCHE and GERAIT V. ORTON, Chicago, Ill. Application filed March 17, 1873.

Cork is substituted for the wood commonly used for producing the required elasticity.

Claim.—1. The use of cork for wheel-rims for band-saws, for the purposes set forth.

2. The construction of the cork rim *d* in combination with the hoop *c* and the band *a*.

3. The combination of the cork rim *d*, the hoop *c*, the band *a* with the arms and hub of a wheel used for the purpose set forth.

140,795.—*Pump-Plunger and Pump.*—NATHANIEL P. SHELDON, San Francisco, Cal., assignor to HENRY H. WELCH, same place. Application filed June 2, 1873.

The cylinder and plunger are held in the well-pipe by rods and a head-piece, which is made to fit as closely as is practicable to the pipe of the well, and is provided with a packing to prevent the passage of water between the head-piece and the well-pipe. The water is discharged through the hollow rod that is attached to the plunger.

Claim.—1. In combination with the cylinder P, plunger A, and hollow rod E, the head-piece H and rods I I, for holding the cylinder in the well, pipe or tube L, the whole being constructed and arranged to operate substantially as described.

2. The head-piece H, provided with a stuffing-box, M, for the hollow rod E and a hub, to connect it to the head of the cylinder P, substantially as described.

140,796.—*Reciprocating Churn.*—MOSES W. STAPLES, Richmond, Va. Application filed March 19, 1873.

A reciprocating or swinging churn of semi-cylindrical form, its outer upper portion rising above a central opening; an interior bottom segment divided off by a perforated floor held between two abutments; an outer case affording space for a cooling or non-conducting material, through which the buttermilk may pass after the butter has formed.

Claim.—The suspended vessel A having spaces *e e*, arranged as described, and provided with a perforated plate, *b*, and ribs *f*, for the purpose set forth.

140,797.—*Water-Closet.*—JOHN H. STEVENS, Cambridge, Mass. Application filed May 29, 1873.

The tilting-pan of a water-closet is connected by a series of levers to the door, so that the opening and closing of the door insure the proper condition of the pan.

Claim.—1. The combination of the door I of a retiring-closet with the tilting-pan A of a commode located therein by means of a system of lever connections, substantially as described.

2. The convertible bell-crank or hinge connection H, composed of the members *a c* and clamping device *b*, in combination with the door I and the lever connection, to tilt the pan A, substantially as described.

140,798.—*Toy Money-Box.*—THOMAS A. TAYLOR, Salem, Mass., assignor of one-half his right to GEORGE M. WHIPPLE and A. AUGUSTUS SMITH, same place. Application filed April 24, 1873.

Having a secret lock with a drop-catch, so as to be opened in but one position.

Claim.—A toy money-box having the plates B and C arranged to slide one up on another, and provided interchangeably with the cell D and notch E, for the reception of a loose disk, *f*, the inner plate C having an aperture, A, all said parts being constructed and combined for operation substantially in the manner and for the purpose described.

140,799.—*Construction of Doors.*—WINAND W.-J. TOUSSAINT, Boston, Mass. Application filed May 14, 1873.

Claim.—A molding, extending through from one side of a door to the other side, and provided with a groove at its inner surface for the reception of the panel which it incloses, or with one or more grooves or projections for holding another molding, and provided with one or more grooves or projections at its outer surface for securing it to the door, each portion of the molding being formed of a single piece, or of two or more pieces previously united, substantially as and for the purpose set forth.

140,800.—*Knitting-Machine.*—OTHNIEL F. TRIPP, Battle Creek, Mich. Application filed April 8, 1873.

For enabling the needles to be lowered in their grooves when desired, so that their butts will not be engaged by the cams. The front end of the lever rests on the bar, in the front of the bed, as a fulcrum, and its rear end is split and spread out so that, when elevated, its sides catch over shoulders in the grooves. It has an arm that catches over a rearward extension of the needle so as to draw the latter down when the lever is depressed.

Claim.—The bed A, provided with the bar E, or its equivalent, and transverse slots S, in combination with the spring-lever C and the needle having the extension N, all constructed substantially as and for the purpose hereinbefore set forth.

140,801.—*Refining Petroleum.*—SAMUEL VAN SYCKEL, Titusville, Pa., assignor to himself and GIBBS, STERRETT & CO., same place. Application filed March 10, 1873.

Draws off such gases and lighter vapors from the oil at any suitable point between the well and tank, and conducts them to the engine-furnace, where they are usefully employed as fuel.

Claim.—1. A steam or air ejector arranged at any desired point in the gas-pipe *c*, such pipe leading to the fire from the oil-passages at any desired point between the well and tank or between the tank and fire, substantially as set forth.

2. In combination with a pipe for supplying air or steam to the oil while in its passage from the well to the tank, and a pipe, *c*, for carrying the gases and vapors over to the fire, a refrigerating or cooling apparatus applied to some part of the gas and vapor conductor, substantially in the manner and for the purposes set forth.

140,802.—*Cylinder for Lining Wooden Pumps.*—RICHMOND W. WHEELER, Bushnell, Ill. Application filed April 26, 1873.

A porcelain-lined iron cylinder is provided with a wedge-shaped flange, which permits the lining to be driven into the stock, the wood behind the flange being afterward compressed.

Claim.—The cylinder *d*, as shown, with a wedge-shaped ring, *a*, as and for the purpose set forth.

140,803.—*Machine for Cutting Off Pegs in Boots and Shoes.*—AMOS WHITTEMORE, Cambridgeport, Mass. Application filed May 27, 1873.

The cutter-stock, shaped somewhat like the sole of a shoe, has two circular recesses formed in its upper surface for receiving two rotary cutters, which revolve in opposite directions, and is also provided with serrated faces at its ends for removing the nails or pegs from the toe or heel of the shoe. The cutting-edges are set flush with the bolts, which hold them in position; also with the surfaces which surround or inclose them, thus protecting the leather while the ends of the nails or pegs are removed.

Claim.—1. Two rotary peg-cutters, revolving and cutting in opposite directions, applied to a cutter-stock, substantially as and for the purpose set forth.

2. The flanged guard *r* applied beneath one of the cutters and working in a groove which is beneath the other cutter, for the purpose described.

3. The cutters *c* and their spur-wheels recessed into the sole of the stock A, flush with the edges thereof, and also flush with the heads of the bolts c^1 c^2, substantially as described.

4. The fixed serrated cutter *s*, combined with the rotary cutter *c* and stock A, substantially as and for the purposes described.

140,804.—*Harvester.*—ELGIN M. AWREY, Caistor, Smithville Post-Office, Canada. Application filed May 10, 1873.

A cog-wheel and pulley, by which the finger-bar is elevated, is driven by a loose pinion on the main axle, and is connected to said axle by a ratchet, which is automatically released when the finger-bar has been elevated.

Claim.—1. The combination of the wheel F G H, pawl I, chain J, loose gear-wheel K, clutch L, lever M, and spring N with each other and with the axle and frame-work of a reaper or mower, substantially as herein shown and described.

2. The combination of the adjustable block O, head-screw P, and stop Q with the wheel F G H, pawl I, chain J, loose gear-wheel K, clutch L, lever M, and spring N, substantially as herein shown and described.

3. The combination of the inclined projection *g* with the wheel F G H and gear-wheel K, substantially as herein shown and described.

140,805.—*Car-Coupling.*—EZEKIEL W. BARKER, Portland, Me., assignor of one-half his right to CYRUS S. CLARK, same place. Application filed January 30, 1873.

The entering link striking the head of the plate forces it from the notch in the pin, which falls, and with it the coupling-pin.

Claim.—The combination, in a draw-head having a flaring mouth or entrance, as shown, and projection *l* of the spring *b*, plate *e* provided with heads *f g* and slot *d*, the vertical bar *c* having the notch *h* and carrying on its upper end the arms *i n*, or the device shown at A, as herein shown and set forth, and operating as described.

140,806.—*Tobacco-Transplanter.*—CLEMENT E. BATES, South Deerfield, Mass. Application filed April 12, 1873.

The body of the machine consists of a hollow cylinder provided with handles, by which the machine is operated. The opening blades penetrate the soil while closed, and the plant is dropped root foremost, and as the openers are caused to expand scrapers sweep around and press the soil upon the roots.

Claim.—1. In a transplanter, the combination of opening-plates H with horizontally-rotating wheels F, substantially as and for the purpose specified.

2. In a transplanter, the combination of covering-paddles J and wheels G with blades H and wheels F, all operating as specified.

3. The levers L N, belts or chains I K, wheels G, paddles J, wheels F, and blades H, combined and operating substantially as described.

140,807.—*Egg-Carrier.*—JOHN A. BEAN, California, Mo. Application filed May 24, 1873.

The packing-box is provided with projections to separate it from the adjacent box. The tiers of cells have sections of cells attached to the sides, which act as springs to prevent concussion.

Claim.—1. A packing-box for eggs, having projections C D, as and for the purpose specified.

2. The tiers F of cells provided with springs G at the sides, and arranged with the case and with the separating plates and cushions, substantially as specified.

140,808.—*Water-Elevator.*—SILVESTER BENNETT, New Orleans, La. Application filed May 10, 1873.

The combination, with a spiral flange, of the cone and case, the former diverging more rapidly toward the top than the latter, so that as the diameter of the case increases upwardly the distance between cone and case correspondingly decreases, thereby preserving the same transverse area in the water-passage from bottom to top.

Claim.—The combination, with a spiral flange, F, of the cone D and case A, the former diverging more rapidly toward the top than the latter, so that as the diameter of the case increases upwardly the distance between cone and case correspondingly decreases, thereby preserving the same transverse area in the water-passage from bottom to top, as set forth.

140,809.—*Knitting-Machine.*—CORNELIUS CALLAHAN, Chelsea, Mass., assignor to himself and EDWIN E. SIBLEY, same place. Application filed June 20, 1873.

For producing a knit fabric having a loose weft-thread laid between the loops. Alternate needles are bent either inward or outward near their upper ends, so that by impinging against projections on the needle-cylinder they will, as they rise, be divided into two lines to receive the weft between them, and will return to line at the knitting-point by their bent parts passing under the projections or by being pushed outward by striking the top of the cylinder. There is a stop-motion, consisting mainly of a wheel surrounding the needle-cylinder and carrying pawls, each connected to a drop-rod suspended on a thread, the wheel being stationary and the machine operating until a thread breaks, when a pawl is lowered into engagement with a ratchet-wheel carried around with the needle-cylinder. Both wheels then move together to throw out a clutch and stop the machine.

Claim.—1. A needle for knitting-machines having an angular or bent portion, 22, below the pivot of the latch, and in that part of the needle which traverses through the loop, whereby the needles may be brought into and out of line without stretching the loops, substantially as and for the purpose set forth.

2. In combination with a series of needles, constructed substantially as described, the needle-cylinder C having alternate straight and cut-under grooves for their reception, substantially as set forth.

3. The ring L provided with pawls and drop-rods for operating the shipper by which the driving-pulley is thrown into and out of action, substantially as described.

4. The ring L, connected with the shipper and provided with a series of pawls engaging with a rotating ratchet-wheel connected with or forming a part of the needle-cylinder, in combination with the rods f^1, by which the pawls are operated on the breakage of a thread, substantially as described.

5. In combination with the ring L for actuating the shipper, the relieving-stop Q operating substantially in the manner and for the purpose set forth.

6. The drop-rods f^1 supported by the threads and passing directly down through openings g^1, in combination with the pawls and ratchet to operate the stop mechanism, substantially as set forth.

7. The drop-rods f^1 with their hooks 30, in combination with the slotted thread-guides a^1, b^1, all constructed substantially as and for the purpose described.

8. The pawls 31 provided with arms A^1 sliding through eyes at the lower ends of the drop-rods f^1, substantially as and for the purpose set forth.

9. The independent pawls 31, each connected with a separate drop-rod and pivoted on studs projecting from the ring L, in combination with the ratchet-wheel M, operating substantially as and for the purpose described.

10. The adjustable drawing-rolls T U attached to a frame revolving with the needle-cylinder and actuated thereby, in combination with a support, A^2, for the spreader placed above the rolls, substantially as described.

140,810.—*Machine for Grinding Harvester-Knives.*—JAMES M. CONNEL, Newark, Ohio.—Case B. Application filed January 9, 1873.

The conical emery-wheel is supported on an arm, and gets its motion from the driving-wheel through intermediate pinions. The arm is supported by a rest on a standard.

Claim.—1. The rest *d* formed upon the standard B, substantially as and for the purposes herein set forth.

2. The combination, with the arm D and emery-wheel E, of the cogged driving-wheel C, intermediate pinion *a*, and pinion *b*, all arranged substantially as shown and described.

3. The frames or rests G G with adjustable end pieces *f f*, substantially as and for the purposes herein set forth.

4. The adjustable guide J arranged to hold the knife-bar, for the purposes herein set forth.

140,811.—*Machine for Grinding Harvester-Knives.*—JAMES M. CONNEL, Newark, Ohio.—Case A. Application filed January 9, 1873.

The emery-block of suitable form receives its motion from the driving-wheel through intermediate mechanism, which gives it a reciprocating movement. The block moving upon the knives properly placed produces the effect desired.

Claim.—1. In combination with the driving-wheel C, bolt *b*, and arm D, the slotted standard B having holes or perforations, as described, and the pins *d d*, substantially as and for the purposes herein set forth.

2. A beveled emery-block, G, provided with diagonal channels or serrations *i i*, in the manner herein described, so that the block will cut when moving in either direction, the dust carried off, and the knives kept cool, substantially as set forth.

3. In combination with an emery-block, G or G^1, the metal band I with head *m*, flange *n*, and set-screw *p*, constructed and arranged substantially as and for the purposes herein set forth.

4. The combination of the emery-block G or G^1, band I, pitman H, crank-shaft *f*, pinion E, arm D, and wheel C, all substantially as and for the purposes herein set forth.

5. The rest K, arranged as described, to support the arm D in proper position, for the purposes set forth.

6. The brace or guide L, arranged as described, one end being secured to the handle M on the arm D, and the other end slotted and connected by a screw, *s*, with a reciprocating emery-block, for the purposes herein set forth.

140,812.—*Washing-Machine.*—JOHN W. CONROY, Terry, Miss. Application filed May 24, 1873.

Is constructed with a corrugated cylinder and a jointed curved rubber, which, by connecting-bars, is attached to a cross-bar, from which a spring is attached to an adjustable pivot with a thumb-screw, from which, by a coil, it passes over a cross-bar supported by uprights secured to the ends of the box or tub.

Claim.—The combination of the jointed rubbing-board E, pivoted bars G, cross-bar H, adjusting-bolt I, spring J, and corrugated, fluted, or toothed cylinder C, with each other and with the box A, substantially as herein shown and described.

140,813.—*Printing-Press.*—CALVERT B. COTTRELL, Westerly, R. I. Application filed June 21, 1873.

The sliders have racks by which they are geared with pinions fast to the shaft, whose cog drives the bed, whereby the sliders are prevented from moving too great a distance from the center of the bed.

Claim.—The sliders, for the reciprocating bed of a printing-press, geared with the bed and the press-frame in such a manner that they will be prevented from overrunning or retrograding relatively to the bed while being free to perform their special function, substantially as specified.

140,814.—*Waste-Removing Device for Carding-Machines.*—GEORGE W. CRAMER, Darby, Pa. Application filed June 14, 1873.

An endless apron runs lengthwise of the burr-box and carries a brush, which sweeps the burrs and waste therefrom.

Claim.—The combination of a brush and an endless carrier with the burr-box of a carding-machine, substantially as specified.

140,815.—*Supplying Oil to Street-Lamps.*—RICHARD F. DE GUIRON, Jersey City, N. J. Application filed June 12, 1873.

The oil is raised to the burner of the street-lamp from a tank beneath the sidewalk by means of compressed air. The tank is provided with a nozzle, which serves as a filling-port and as a coupling for the air-pump.

Claim.—The combination, with a street-lamp post of common form, of the separate subterranean reservoir B, the supply-pipe C extending from the burner E down through the lamp-post nearly to the bottom of the reservoir, and the cock F connected with the top of the reservoir, the whole constructed and arranged, as herein specified, to admit of pouring oil into the reservoir at ordinary pressure, and subsequently forcing air into the reservoir above the oil with any necessary pressure, or as often as may be necessary in order to elevate and consume the whole quantity of oil.

140,816.—*Hog-Trap.*—AARON B. DE VORE, Talkington township, Sangamon county, Ill. Application filed May 31, 1873.

The sides of the crib converge toward the front, where a head-lock is arranged for securing the animal. The crib has a bottom inclining where the fore feet of the animal rest, to present a sure foot-hold. For smaller animals an interior auxiliary crib is employed.

Claim.—1. The crib, constructed and arranged as described, and provided with the inclined bottom G, and open space under the neck-rest A, substantially as specified.

2. The combination, with a crib such as herein described, of an interior auxiliary crib, substantially as specified.

140,817.—*Paint for Oil-Barrels, &c.*—WILLIAM L. ELKINS, Philadelphia, Pa. Application filed June 26, 1873.

Claim.—The oil-varnish, consisting of metallic or mineral oil paint, rosin, and benzine or turpentine, compounded substantially as and for the purposes specified.

140,818.—*Insect-Destroyer.*—JOHN A. FINNEY, Nashville, Ohio. Application filed September 21, 1872.

A long tight box is mounted upon traction-wheels, the axle-tree of which passes through the rear end of the box and forms one of a pair of crushing-rollers. An endless belt with transverse slots traverses the length of the box, the upper surface moving rearwardly. A reel is attached to one side of the box, and in its revolution brushes the insects from the plants and throws them upon the endless belt, from whence they are thrown between the crushing-rollers and destroyed.

Claim.—1. The carrier-belt H provided with cross-bars, the platform I, and the bottom-slotted hopper J, combined with roller K and axle B, as and for the purpose described.

2. The combination, with endless apron H and platform I, of the spring-guard L, arranged as and for the purpose described.

3. The combination of the spring-hammers U V and stop-bar W, with the reel N, substantially as herein shown and described, and for the purpose set forth.

140,819.—*Double-Acting Force-Pump.*—JOHN P. FLANDERS, Vergennes, assignor to himself, ELI B. HAYES, same place, and H. M. MITCHELL, Burlington, Vt. Application filed April 5, 1873.

Two twin double-acting force-pumps are arranged upon a bed-frame, and connecting with suction and discharge pipes so as to discharge into one chamber. The piston-barrel is in sections, divided longitudinally, with lap-joints at the edge, so that they can contract and expand by the pressure of the water.

Claim.—1. The arrangement of the cylinders A, bed-frame B, suction-pipes C D, discharge-pipes F G, discharge-box I, and the air-chamber, substantially as specified.

2. A sectional piston-barrel, contracted upon the piston for packing it by hydrostatic pressure, applied in the manner described.

140,820.—*Ditching-Machine.*—HYACINTHE GONELLAZ, Vermillionville, La.—Case B. Application filed May 31, 1873.

The rotating colters cut the earth, which is taken up by the bucket-wheel and delivered to the discharging-pan, from which it is discharged onto the side of the ditch.

Claim.—1. The combination of the rotating colters, the rotating bucket-wheel, and the discharging-pan, the colters being arranged in advance of the bucket-wheel, as described.

2. The combination, with the bucket-wheel of a ditching-machine, of a discharging-pan arranged on a crane so as to swing around and discharge at the side of the ditch, substantially as specified.

3. The combination of the stationary cutters H′ with rotating colters, arranged between them, substantially as specified.

4. The mode of operating the machine, and also moving it along the ground by the unwinding of a rope having the power applied to it from a roller mounted on the machine and connected with the operating parts so as to work them, the forward movement of the machine being controlled or checked by cutters H′, or other regulating apparatus, substantially as specified.

140,821.—*Dredging-Machine.*—HYACINTHE GONELLAZ, Vermillionville, La.—Case A. Application filed May 31, 1873.

The bucket-wheel and discharging-pan are arranged at the bow of the boat, so that the wheel revolves at right angles to the boat and delivers the earth to the pan, which carries it to the bank. The colters are arranged in front of the wheel, and are so inclined as to draw the boat forward at the same time that they loosen the earth.

Claim.—1. The combination, in a dredging-boat, of a bucket-wheel, C, and discharging-pan D, and their operating devices, arranged to discharge the earth dredged up laterally to the boat and onto the bank of a river or canal, substantially in the manner described.

2. The colters F, arranged on the front of the dredging-wheel, and inclined so as to pull the boat along by the act of cutting down the bank preparatory to the taking of it by the spoons.

140,822.—*Grain-Binder.*—JAMES F. GORDON, Rochester, N. Y. Application filed October 24, 1872.

The head of the wire twister is provided with a groove in which one end of a spring-arm is placed, said groove and arm passing the opening for the wire for the purpose of clearing the wire from the twisting-head in its backward movement.

Claim.—A wire twister-head, in combination with a clearer A, or its equivalent, arranged to operate conjointly, as and for the purposes set forth.

140,823.—*Grindstone.*—JAMES F. GREEN and SIDNEY H. GREEN, Haverstraw, N. Y.—Application filed May 5, 1873.

The crank-shaft is detachable. A bushing is cemented in the central aperture. The shaft is provided with a fixed collar having a recess for the reception of a screw, by means of which it is secured to the bushing.

Claim.—1. The side bushings B, having projecting teeth *a* and aperture *b*, for the purpose described.

2. The crank C, having flange D with recess *c*, to insert screws *d* and connect the crank with the bushings, as described.

140,824.—*Meat and Vegetable Cutter.*—JERRY R. HALL and CHARLES H. ELLIS, Salem, Ohio; said HALL assignor to said ELLIS. Application filed March 6, 1873.

The cutter-head is removable, and the knives are arranged so that they project near the rim of the hopper on opposite sides. The circular cutting-block is pierced transversely to permit circulation of air and prevent warping. The block and hopper are rotated by means of a bevel-gear underneath and ratchet-and-pawl mechanism operated from the main arm.

Claim.—1. The removable cutter-head H, in combination with the knives *d d* having their points arranged in opposite directions, for the purpose specified.

2. The cutting-block I, provided with holes *e f* and a hopper, substantially as and for the purpose specified.

3. The combination, in a meat and vegetable cutter, of a perforated cutting-block with a rotating mechanism, substantially such as described.

4. In a meat and vegetable cutter, the combination and arrangement of the crank *b*, pitman *a*, open arm G, cutter-head *c*, cutters *d*, and stanchion F, in the manner described.

140,825.—*Tassel for Canes and Umbrellas.*—WILLIAM HARNACK, New York, N. Y. Application filed May 5, 1873.

A cane or umbrella tassel made of paper in imitation of leather.

Claim.—As a new article of manufacture, the tassel, consisting of the slitted paper A, covered with water-proof and leather-colored varnish, and combined with the leather braid B, as and for the purpose described.

140,826.—*Weighing Attachment for Wagons.*—JACOB W. HILL, Jefferson, Iowa. Application filed March 1, 1873.

The bolsters are formed with V-grooves on top for receiving angular cross-pieces, by which the wagon-body is supported and by which it is lifted, through suitable levers, when it is desired to throw the weight upon the weighing-levers.

Claim.—The weighing attachment hereinbefore described, formed of the graduated beam O pivoted to a fixed support, P, on the reach, the convergent weighing-levers K having their fulcrums on bars L pivoted to hand-levers M, the false V-shaped bolsters H, and grooved and slotted bolsters B F, all arranged as shown and described, to operate as specified.

140,827.—*Last Block Fastener.*—DAVID HUARD, Ashland, Wis. Application filed May 10, 1873.

The fastener is attached to the heel portion of the last and hooks over a pin upon the instep-block, being locked in position by the shape of the slots, which permit it to slide back after catching the pin.

Claim.—The block-fastener C, having slotted recesses *a c*, pivoted by button *d* to block A, substantially as set forth.

140,828.—*Inhaler.*—CLIFTON D. HUNTER and ERASTUS S. WOODS, Marlborough, Mass. Application filed May 31, 1873.

A T-shaped tube is inserted in the cork, and has upon one end of the horizontal part a rubber tube and upon the other a valve opening outward, so that if the patient accidentally blows in the tube the air will pass out the valve, and thus not force up the liquid into the acid-bottle.

Claim.—The T-shaped tube, the under portion 10 of which enters the stopper, while the horizontal portion 11 has at one end the elastic tube C and at the other end a valve, all constructed and arranged substantially as and for the purpose described.

140,829.—*Rubber Shoe.*—LEWIS L. HYATT and JARED H. CANFIELD, New Brunswick, N. J. Application filed April 5, 1873.

A rubber shoe has its upper made of one piece, which is thick and strong at its junction with the sole and gradually lessening in thickness from the bottom upward.

Claim.—A one-piece rubber "upper" made thick at *a a* and thin at *b*, as and for the purpose described.

140,830.—*Hose-Coupling.*—SIMON INGERSOLL, Stamford, Conn. Application filed May 31, 1873.

Short sections of metallic tubes are coupled together by a screw-collar swiveled on to one of them. Each section is provided with a clamp composed of two semicircular parts, connected together by flanges and bolts, for clamping on hose to the metallic tubes by stud-pins, which prevent the hose from slipping off the tubes endwise.

Claim.—The combination, with the metal pipe-sections A B, coupled together as described, of the clamps D F G connected to them by ears and stud-pins, substantially as specified.

140,831.—*Railroad-Car Stove.*—WARREN S. JONES, Damariscotta Mills, Me. Application filed March 29, 1873.

Claim.—An improved railroad-car stove, formed of the bottom A, double top C D, double walls B G, partitions H H′ H″, collar S, doors E J L, and lock-pin N, said parts being constructed and arranged to operate, in connection with each other, substantially as herein shown and described.

140,832.—*Sharpening-Machine.*—JAMES P. KEALY and JOSEPH RIGNEY, Bridgeport, Conn. Application filed March 29, 1873.

The machine being adjusted to the lathe-center, is turned by the crank with one hand to revolve and traverse the grinder, and the worm is shifted from time to time by the other hand when it is required to change the feed-screw.

Claim.—The combination of a traversing lathe-center grinder, a frame adapted for being supported in the tool-post of a lathe, and an automatic feed-screw for traversing the grinder, the grinder and the feed-screw being actuated independently of the lathe, substantially as specified.

140,833.—*Tail-Coupling.*—CHARLES F. KIDDER, Millbury, Mass. Application filed April 21, 1873.

The thill-eye is held in connection with the shackle-bolt by the hinged brace which is held down on the rests, so that its concave end is pressed against the thill-eye by a bolt having an elongated head which engages between lugs on the bottom of the rests, and is tightened by a thumb-screw on the other end of the bolt.

Claim.—1. The combination, with the grooved supporting part A of the shackle, of the hinged shackle-brace D, holding-screw F, and bolt-head brace F′, substantially as and for the purposes set forth.

2. The combination of the peculiarly-constructed thumb-bolt F, having head-brace F′, with the shackle-brace D and slotted shank A, having lugs i^1 i^2 i^3, substantially as described, and for the purposes set forth.

3. The combination of the slotted eye *c* of the shaft-iron with the shackle-bolt E and hinged shackle-brace D, substantially as and for the purposes set forth.

140,834.—*Coupling for Gas and Water Mains.*—WELLS KILBURN, Napa, Cal. Application filed March 10, 1873.

Two eccentrics operating upon opposite sides of the coupling by straps passing around each of them, and over a pin upon the other part of the coupling, so that when the eccentrics are turned so as to draw on the straps it brings the parts closely and firmly together.

Claim.—A pipe-coupling, consisting of the cams or eccentrics F, with their straps H, together with the pins J, upon the two parts of the coupling, respectively, when constructed to operate substantially as and for the purpose herein described.

140,835.—*Pavement.*—WELLS KILBURN, Napa, Cal. Application filed March 24, 1873.

The blocks are formed of artificial stone, and have rabbets formed on their upper and lower faces, the sides of the lower portion being beveled, and they are so placed as to overlap each other for mutual support, a space being left between the upper edges to be filled with gravel. Where the pavement is to slope from the center to the curb, a central key-block, having both rabbets on its upper face, is used.

Claim.—1. The described pavement, composed of blocks having the rabbets B, beveled sides B^2, and space C between the blocks, as and for the purpose described.

2. The blocks or keys F, provided with double-surface rabbets B^2, substantially as and for the purpose specified.

140,836.—*Ladies' Gaiter-Shoe.*—HENRY C. LETSINGER, New York, N. Y., assignor to EDWIN C. BURT, same place. Application filed May 24, 1873.

Claim.—A lady's gaiter having the vamp made in one piece with one half quarter and seamed to the other half quarter, the seam commencing at the junction of the overlapping parts, and terminating in the shank between the heel and sole, as and for the purpose set forth.

140,837.—*Shaft-Furnace for Roasting Ores.*—THOMAS MCGLEW, Austin, Nev. Application filed April 9, 1873.

Combining, in a roasting and chloridizing furnace, the principles of the stack or upright furnace, and of the reverberatory furnace, so that the ore, in falling through the upright portion of the furnace, will come in contact with the heat and blast from one or more blast-furnaces situated at different points along its descent, and finally fall upon a hearth over which the combined heat and blast from all of the furnaces pass to the chimney of draft-flue. A blower is connected by pipes with each of the fire-places, and a cock or valve is connected with each of the pipes by which the air from the blower can be regulated.

Claim.—In an ore roasting and chloridizing furnace, the fire-places D E F on different horizontal planes, and with the draft arranged, as shown, so that it will strike and scatter the falling ore, in combination with the inclined passage-way H, blower J, hearth B, and chimney C, all constructed and arranged substantially as and for the purpose set forth.

140,838.—*Apparatus for Scraping Hogs.*—ORISON MCNEIL and PETER W. DALTON, Jersey City, N. J. Application filed March 1, 1873.

The hog is drawn, by a moving endless hooked chain, through a series of vertical and horizontal yielding blades with concave edges moving in ways secured to the upper part of the frame work, said chain being guided, by two grooved rollers at opposite ends of the frame-work, over small intermediate friction-rollers.

Claim.—The combination of the carrying-rollers K with the notched blade and the hooked chain, substantially as specified.

140,839.—*Fire-Proof Shutter.*—ISAAC S. METTLER, Jersey City, N. J. Application filed June 21, 1873.

The shutter is composed of hollow metallic sections open at the ends, which slide vertically. The open ends afford a free cir-

culation of air in case of fire, counterpart slots being formed in the casing for that purpose.

Claim.—1. A door or window shield or protector with openings I, by means of which a free circulation of air, laterally, is secured through the protector, substantially as shown and described.

2. A window or door protector constructed of sections formed of two or more sheets or plates of metal which are arranged to be raised and lowered vertically for the purpose described.

3. A window or door protector consisting of two or more sections having horizontal openings for the passage of air, whether such sections have a corrugated plate intervening or not.

140,840.—*Preparation of Solder for Sealing Oyster and Fruit Cans.*—EDMUND MORRIS, Burlington, N. J. Application filed December 3, 1872.

Claim.—A ring made of solder-wire, coated or supplied with resin, substantially as described, and for the purpose set forth.

140,841.—*Cotton-Press.*—JAMES P. PRIDGEON, Marion Court-House, S. C., assignor to J. P. PRIDGEON & Co., same place. Application filed May 10, 1873.

The follower is operated by means of levers which are arranged below and are connected at one end to the follower, while at the other end wheels are provided which run upon a suitable track. These levers are operated by means of a rope, which also assists in raising the follower.

Claim.—The combination, with the press-box and follower C provided with pulleys N, of the cords or ropes I, windlass H K, arms D, pulleys M O, rollers F F, and track or way S, all constructed and arranged as shown and described.

140,842.—*Pencil-Case.*—SAMUEL S. REMBERT, Memphis, Tenn. Application filed April 19, 1873.

A perforated septangular cap, carrying the days of the week, is adjustable upon the case which carries the days of the month. A case slides within the outer case, both carrying scales. The common lead-pencil is fitted within this compound case, and may project through the cap.

Claim.—1. The cap E, perforated as shown, in combination with the case B, said parts being inscribed with the letters and numbers indicating the days of the week and month respectively, as shown and described, for the purpose specified.

2. A pencil-case formed of the two parts A and B, one sliding in the other, and graduated to indicate inches and fractions of an inch, as described, to adapt it for use as an extension rule.

140,843.—*Heating-Stove.*—JACOB L. RING, Mt. Pulaski, Ill. Application filed March 29, 1873.

Claim.—The combination of combustion-chamber A, pipe D, hot-air chamber G having register at the top, the circumjacent drum F and exit-pipe I, constructed and relatively arranged as and for the purpose described.

140,844.—*Spike.*—GEORGE N. SANDERS and GEORGE N. SANDERS, Jr., New York, N. Y. Application filed April 8, 1873.

Claim.—The spike A B C D E, with the shoulder C, neck D, tail E, and bevel *f g*, substantially as described.

140,845.—*Cigar-Machine.*—SOCRATES SCHOLFIELD, Providence, R. I. Application filed April 14, 1873.

The passage for the tobacco to the sizing-chamber is made to expand and contract as the cutting and feeding proceeds, thus lessening the frictional resistance. One side of the sizing-chamber is formed in grooves corresponding to the grooves or bars of a hinged throat-plate.

Claim.—1. The throat or passage K, arranged to expand and contract in timely relation to the movement of the knife, substantially as described.

2. The transversely ribbed or grooved bar N, forming one side of the sizing-chamber, in combination with a grooved or barred throat-plate.

140,846.—*Cigar-Machine.*—SOCRATES SCHOLFIELD, Providence, R. I. Application filed January 2, 1873.

A series of rollers, partly upon fixed and partly upon movable supports, close around the cigar, rolling it into shape. A curved apron, acting concentrically with the movable rollers, moves forward through frictional contact with the rollers or heads carrying the cigar-bunch until the rollers are completely closed, when it falls back to its normal position and permits the cigar to drop out, when the rollers are again separated.

Claim.—1. The combination of the circumferentially-grooved roll B' with the ribs or bars *c' c' c'* o the movable apron E arranged to cover and uncover the space *e* when receiving the loose filler and discharging the bunch, substantially as described.

2. The apron E receiving a forward movement conjointly with the primary closing movement of the rolls, and also receiving an independent backward movement toward its normal or receiving position upon the complete closing of the rolls, substantially as described.

3. A frictional connection between the head A', or any of its attachments, and the apron E, operating to transmit a forward movement to the apron during the closing movement of the rolls, substantially as described.

140,847.—*Cigar-Trimmer.*—SOCRATES SCHOLFIELD, Providence, R. I. Application filed October 26, 1872.

An inclined bed, the lower part of which is a covered passage—receives the cigars, which roll down through the passage into buckets or grooves upon a revolving cylinder, in which the cigars are carried against a stationary jaw or knife, which trims the ends, a cam serving to adjust the cigar longitudinally.

Claim.—1. The combination of the moving jaw D with the stationary jaw E, and carrying-bucket *c*, operating substantially as described.

2. The cam K in combination with the jaws D and E, and bucket *c*, operating substantially as described.

3. The passage A, or its equivalent, in combination with the jaws D and E, and bucket *c*, substantially as described.

4. The guard I in combination with the passage A, or its equivalent, jaws D and E, and bucket *c*, operating substantially as described.

140,848.—*Machine for Making Cigar-Bunches.*—SOCRATES SCHOLFIELD, Providence, R. I. Application filed July 8, 1872.

The tobacco is thrown into a hopper having two transversely-barbed cylinders at its base. The hopper is vibrated by means of a crank-shaft and cam and a reacting spring, a cam combined with this mechanism serving to give a less frequent intermittent action to these rollers, which force the tobacco down, whence it is automatically carried horizontally and delivered into the sizing-chamber, previously to which it is stricken by a die which cuts off the filler, excising therefrom a portion of the ends. It is then automatically delivered from the sizing-chamber.

Claim.—1. The combination, in a cigar-bunching machine, of a primary feeding device, actuated by rigidly or positively operating mechanism, with a regulating mechanism for controlling the extent of such movement as desired, and a reciprocating yielding feeding mechanism, the whole operating substantially as herein specified.

2. The combination of a grated or barred chamber or passage, L, with a reciprocating yielding feeding device, substantially as and for the purpose described.

3. The combination of a knife or gate, U, passage L, feed-rolls C C, and vertically-vibrating or rocking hopper B, substantially as described.

4. A knife or gate, U, with the thickened end or ends for operating in the corresponding die *u*, substantially as and for the purpose specified.

5. The combination of the movable back *y* of the chamber Y with the rods *i i* and obstructing-bar *l* or its equivalent, operating to discharge the filler upon the backward movement of the chamber, substantially as described.

140,849.—*Cigar-Wrapping Machine.*—SOCRATES SCHOLFIELD, Providence, R. I. Application filed November 29, 1872.

The die which forms the tip of the cigar has a vibratory motion imparted to it in order to lessen friction and prevent injury to the wrapper. The forward movement of the plunger, which pushes the cigar into the head of the machine, is modified by a friction-joint to give the required pressure. A friction-clasp is employed in connection with the driving-power and the hand-crank to regulate the motion of the machine.

Claim.—1. A cluster of rolls, A A, in combination with a vibrating heading, B, arranged to operate upon the head of a cigar, substantially as described.

2. A plunger, F, arranged substantially as described, receiving an automatic movement through suitable mechanism, including a yielding friction-joint, thereby operating upon the cigar with a uniform pressure.

3. In combination with the opening and closing rolls of a cigar-machine, a cam, U, and sliding bar S, operating to move the plunger back in timely relation to the opening of the rolls, substantially as described.

4. In a cigar-wrapping machine, a friction-clamp, *s*, or its equivalent, when interposed between the driving-pulley F and the rolls A A, and also combined with a hand-crank, *m*, substantially as described.

140,850.—*Apparatus for Arranging Cigar-Fillers.*—SOCRATES SCHOLFIELD, Providence, R. I. Application filed October 26, 1872.

The tobacco is arranged upon separately-removable plates. A knife works through an upper slotted plate and between the lower plates, and divides the tobacco into "bunches" of the proper size for a cigar-filler, after which each section may be removed and its contents deposited upon the endless apron of a cigar-machine.

Claim.—1. A bed or flooring, composed of separately-removable plates D D, for the primary deposit and arrangement of cigar-filler tobacco, substantially as described.

2. The removable slotted plate E, in combination with a grooved or slotted bed, upon which the sheet or layer of tobacco is first formed and afterward divided into the proper sections or strips, substantially as described.

140,851.—*Mirror-Holder.*—WILLIAM SIMPSON, Berlin, Canada. Application filed March 1, 1873.

A wire-holder having a loop-apex, equal sides, and extensions provided with suitable ends for attachment to the sides of the frame.

Claim.—A wire-holder, B, having a loop-apex, *a*, equal sides *b b*, and extensions *d*, with end *e*, arranged and applicable as and for the purpose described.

140,852.—*Clamp.*—JOHN E. SINCLAIR, Worcester, Mass. Application filed November 11, 1872.

The clamping-jaw, composed of two arms and pivoted at *c*, is "set" upon the bar by means of a screw.

Claim.—The combination of the piece *a*, the movable piece *b*, the lever *c*, and the screw *d*, or their equivalents, by means of which the results described may be produced.

140,853.—*Miter-Box.*—GRENVILLE M. STEVENS, Portland, Me. Application filed March 5, 1873.

The saw-teeth, when the cut is about completed, impinge upon rotary disks of India rubber to protect the stock-board.

Claim.—1. The combination of the stock *a*, lever *d*, slot *e*, saw-guides *f f* and *g g*, spring-catch *i*, perforations *w w*, perpendicular guide *n*, disks *o o*, guide *p*, and stop *q*, in the manner and for the purposes as set forth.

2. The elastic rotary disks *o o*, when used in the manner and for the purposes as set forth.

140,854.—*Windmill.*—JOHN F. STEWART, Modesto, Cal. Application filed May 19, 1873.

A duplex or balanced wind-wheel so constructed that the action of the rudder-vane will turn the box and cause it to carry the wheels out of the wind as it increases in intensity. The weights bring the wheels back again when the wind lulls, thus providing a self-regulating windmill.

Claim.—A duplex or balanced self-regulating windmill, having the shaft *e*, wind-wheels F, transverse rudder-vane G, cords *t*, and weight *p*, all arranged and combined substantially as above described, and for the purposes set forth.

140,855.—*Combined Spade and Fork.*—HEBER STONE, Galveston, Tex. Application filed February 17, 1873.

A fork provided with a cover made in the form of a shovel, into which the fork is inserted when a shovel is desired.

Claim.—The sheath or pocket E, formed of sheet metal and provided with the hinged section *b* and projections *d*, whereby it is adapted to be applied and secured to a fork by means of a ring, *c*, as shown and described.

140,856.—*Bed-Bottom.*—JONATHAN V. TAYLOR, La Cygne, Kans. Application filed April 19, 1873.

There are two frames with levers pivoted to a central bolt and connected by longitudinal straps or webbing. Slotted brackets are fastened to the head and foot boards, in which pendent screws with nuts are placed for the adjustment of the frames.

Claim.—1. The two frames C D F D and B D F, connected by longitudinal straps G and pivoted at the ends on a common cross-bolt, A, so that the inclination of the bed-bottom, from head to foot, may be produced or changed in the manner described.

2. The slotted brackets K on bedstead, and the pendent screws J on bed-bottom combined, as described, with the nuts L to hold the head and foot at the desired relative adjustment.

140,857.—*Box-Scraper.*—ABRAHAM TESTER, Brooklyn, N. Y., assignor to himself and JOHN CUNNINGHAM, same place. Application filed November 16, 1872.

The blade of the scraper is braced by the rod and nuts.

Claim.—The combination of the rod *d* and nuts *f f* with the pivoted blade B of the scraper, as and for the purpose specified.

140,858.—*Adjustable Scaffold.*—JOHN S. TILLEY, West Troy, N. Y. Application filed June 7, 1873.

The trestle has a rising standard, vertically adjustable to different heights, for plasterers' use, and the top thereof has a pair of adjustable plates which can be arranged either vertically or horizontally, so as to sustain a plank edgewise or flatwise to form a platform, as may be desired. The legs fold up for portability.

Claim.—1. The combination of the vertically-adjustable standards, having the adjustable plates J with the trestles A B, substantially as specified.

2. The heads A and legs B jointed together and arranged in relation to the shoulders D and the ends of the legs, as described.

140,859.—*Roll for Cigar-Machines.*—DANIEL A. WIGHTMAN, East Greenwich, assignor to SOCRATES SCHOLFIELD, Providence, R. I. Application filed November 22, 1872.

A central shaft supports a flexible tube of greater diameter than the central portion of the shaft, by which form and arrangement the tube is made to conform to the shape of the cigar-bunch, the middle portion of the tube being forced to revolve eccentrically while the ends move concentrically with the shaft.

Claim.—1. A revolving shaft, A, in combination with a loose flexible covering, C, arranged to operate with a varying eccentricity in forming a cigar-bunch, substantially as described.

2. The combination of a friction-roll, B, with a flexible tubular covering, C, and revolving shaft A, substantially as described.

140,860.—*Machine for Making Cigar-Bunches.*—DANIEL A. WIGHTMAN, East Greenwich, assignor to SOCRATES SCHOLFIELD, Providence, R. I. Application filed July 8, 1872.

The tobacco, being placed in the hopper, is carried by revolving spurs into the channel H. A knife divides off the "bunch;" another knife divides the traveling layer of tobacco, controlling its forward movement as produced by the alternately and intermittingly acting spur-rollers. The sizing-chamber has a hinged lower jaw, which is opened to release the "bunch" by means of a projecting cam-slide. The feed-throat is formed wholly or partially of bars which have their bearings upon the shafts between the feed-disks.

Claim.—1. The feeding-rolls C^1 and C^2, or any equivalent feeding devices, in combination with a throat or passage, H, and knife or gate *j*, when the said feeding devices are controlled in their forward movements in such a manner that one of them will be caused to operate when the gate is raised, and the other when it is down, substantially as described.

2. The sizing-chamber I, with a hinged lower jaw, in combination with the arm *a*, pin *b*, and the cam-slide *c*, or their equivalent, operating substantially as described.

3. A throat or passage, H, when formed either on one or both sides by the bars *k k*, arranged between the spur-disks C C upon a shaft, *m*, substantially as described.

140,861.—*Machine for Making Cigar-Bunches.*—DANIEL A. WIGHTMAN, East Greenwich, assignor to SOCRATES SCHOLFIELD, Providence, R. I. Application filed November 21, 1872.

The tobacco-feeder is operated by a weight or spring which is wound up automatically by a cam movement.

Claim.—The combination of a sizing-chamber, D, knife F, throat or passage Y, and roll C with a ratchet movement, M N, operated by a spring or weight, substantially as described.

140,862.—*Barrel-Hoop.*—HENDERSON WILLARD, Grand Rapids, Mich. Application filed April 14, 1873.

The lock is made without shoulders, and after the ends are put together they are secured by nails or rivets.

Claim.—As an article of manufacture, a hoop with scallop-lock, substantially as shown and described.

140,863.—*Paper-File.*—JOHN F. WINTER, Brooklyn, N. Y. Application filed May 31, 1873.

The fold of the sheet is placed under one of the longitudinal strings and held in place by a loop or knot made with the tying-string.

Claim.—The paper-file consisting of piece A, having longitudinal strings B and binder-string C, and strings D and needle E, substantially as and for the purpose described.

140,864.—*Floor.*—LEVI S. WOOD, Marion, Iowa. Application filed May 31, 1873.

The tension-rod and breech-blocks are used in connection with the joists of a floor to give strength and rigidity.

Claim.—The bridging D and the rod C, in combination, substantially as and for the purposes described.

140,865.—*Treadle of Sewing-Machines.*—WILLIAM D. WOOD, Mount Sterling, Ohio, assignor to himself and JOHN CLAMBIDGE, same place. Application filed June 7, 1873.

The wheel is started by movement of the pedal and is prevented from running the wrong way.

Claim.—The combination, with the wheel A, of the bell-crank lever E, the pawl-lever B, provided with inclined plane G, and the pivoted pawl D, substantially as shown and described.

140,866.—*Medical Compound.*—THOMAS T. WRIGHT, Memphis, Tenn. Application filed June 13, 1873.

Apple brandy, loaf-sugar, black pepper, (pulverised,) gum camphor.

Claim.—A medicine composed of the ingredients above enumerated, mixed and compounded in about the proportions and manner herein specified, and for the purpose set forth.

140,867.—*Dial for Pressure-Gages.*—JOSEPH ASHTON, New York, N. Y. Application filed September 16, 1872.

The graduations or figures are marked on small plates, held in place on a circular recess or slot in the dial, so as to be capable of independent adjustment, to meet any changes in the indication of the instrument.

Claim.—1. The independently-adjustable plate B, showing figures, numerals, words, or letters, in combination with the dial A of the gage, for operation substantially as herein set forth.

2. The dial A, constructed with a curvilinear slot, *c*, and bridge-piece *d*, in combination with the adjustable plates B provided with studs *e*, substantially as shown and described, for the purpose specified.

140,868.—*Invalid-Chair.*—THOMAS ARMSTRONG, Sandwich, Ill. Application filed June 14, 1873.

To a suitable base, near its center, is hinged a seat, and to this is hinged the back. To the top of the back are pivoted levers and a rack for adjusting the back and seat, by arms and levers. The foot and leg rest are connected by levers and adjusted by the same rack.

Claim.—1. In an adjustable chair, the combination of the frame A, the bars D and B with the hinges *d* and *b*, the elongations D', the levers K, and the pins *b'*, constructed and arranged substantially as specified.

2. In an adjustable chair, the combination of the bars D B G, the hinges *d g*, the connecting-rods K L, and the supporting-arms O, constructed and arranged substantially as specified.

140,869.—*Sifter.*—ALFRED BANDELL, Williamsburg, N. Y. Application filed April 25, 1873.

The movable portion to which the sieve is attached is held in place by means of a lip secured to the stationary body opposite the operator, while the downwardly-inclined handle tends to hold down the other side when in operation.

Claim.—The body C having the segmental lip *b* and stops *c c*, in combination with the body A having the conical flange E, sieve B, flange *a*, and inclined handle D, substantially as described.

140,870.—*Summer Stove.*—WILLIAM A. BARLOW, Chicago, Ill. Application filed May 19, 1873.

Air enters the chamber near its top, passes downwardly and thence up through the bottomless fire-pot. The products of combustion pass out through a central flue extending up within the fire-pot. The bottom of the air-chamber is provided with openings and a shaker surrounding the central flue.

Claim.—1. The chamber D, provided with a damper, the central flue, and the registered or grated annular bottom G H, all combined to operate in the manner set forth.

2. In combination with the air-chamber D of the summer stove having the central draft-passage and the annular grated or registered bottom, the bottomless fire-pot I, substantially as shown and described.

3. In a summer stove, the chamber D and central escape-flue F, and annular grated or registered bottom, in combination with the escape-flue M C', substantially as shown and described.

140,871.—*Reciprocating Churn.*—ELIJAH BARNETT and GEORGE W. FENIMORE, Franklin, Tenn., assignors to WM. H. KIRKPATRICK, same place. Application filed December 13, 1872.

Action is given to the dasher-rod directly from the main shaft or intermediately from a supplemental shaft to change the speed of motion.

Claim.—The supplementary shaft L, gear N, rod K, and adjustable cross-bar M, arranged in relation to the main driving-shaft G, gear O, the dasher-shaft, and the guide-bar C, as shown and described.

140,872.—*Steam-Generator.*—ISAAC BARTON, Williamsport, Pa. Application filed March 24, 1873.

The boiler has two sets of tubes, the lower shorter than the upper in order that a chamber may be formed with a crown-sheet under the longer set of tubes. Drop circulating-tubes from the rear crown-sheet extend down into the combustion-chamber. The front crown-sheet is convex, leaning toward the rear, having a sediment blow-off pipe. The bridge-wall is hollow and communicates with the water-legs. A hot-air supply from the ash-pit is provided under the bridge-wall. The boiler is also provided with a front and back smoke-box.

Claim.—1. The combination of the double set of return-flues G L, the front and rear smoke-boxes K S, the fire-box B, the crown-sheet A, the water-legs or sides C, the back tube-sheet H, and the upper back crown-sheet I, when said sheets H and I and the other parts above named are arranged in relation with each other, substantially as specified.

2. The combination of the air-distributing box P with the hollow bridge-wall Q and water legs or sides C C, with which said bridge-wall connects, substantially as and for the purposes specified.

140,873.—*Band or Hoop Tie for Cotton-Bales.*—ELEAZAR J. BEARD, St. Louis, Mo. Application filed May 1, 1873.

Claim.—The bale-tie, formed by looping one end of the band into the recess *a* cut in the edge near the other end of the band, and locked by rivet a^2 near the recess, and rivet a^1 at the extreme end, substantially as shown and described.

140,874.—*Sewing-Machine Table.*—JOSEPH BENNOR, Philadelphia, Pa., assignor to NESBIT D. STOOPS and JOHN B. MYERS, same place.—Case A. Application filed May 9, 1873.

When the cover is used as an extension of the table-top the cover and top are connected at the top by fixed hooks and eyes, and at the bottom by a jointed arm and hook pivoted on the inner side of the cover and engaging with a pin on the table-leg. When not required for use this jointed arm is swung back under the cover.

Claim.—1. The combination of the hinged arm I, having a hook, J, bracket K, and spring M, with the frame D and cover B, substantially as and for the purpose set forth.

2. The combination of the extension hook J with the arm I, frame D, cover B, brackets E E, and hooks F F, substantially as and for the purpose above described.

3. The V-shaped stop *j* of the arm I, in combination with the grooves *k* and *k'* of the bracket K and spring M, as and for the purpose set forth.

140,875.—*Sewing-Machine Table.*—JOSEPH BENNOR, Philadelphia, Pa., assignor to NESBIT D. STOOPS and JOHN B. MYERS, same place.—Case B. Application filed May 9, 1873.

A bracket is hinged to the under side of the table and swings outward, and the head engages with the inner surface of the vertical side of the cover when it is used as an extension to the table. A spring-pin is connected with the hinged bracket and engages with the fixed support of said bracket.

Claim.—1. The swinging bracket C, in combination with the casting D and cover B, for holding the cover in its level connection with the table-top A, substantially in the manner above described.

2. The spring-pin E, in combination with the bracket C and casting D, substantially as and for the purpose set forth.

140,876.—*Sewing-Machine Table.*—JOSEPH BENNOR, Philadelphia, Pa., assignor to NESBIT D. STOOPS and JOHN B. MYERS, same place.—Case C. Application filed May 9, 1873.

The under side of the table is provided with swinging brackets having hooks and lugs, said hooks engaging with staples on the side of the detachable cover, when said cover is used as an extension of the table.

Claim.—The combination of the swinging brackets C C having hooks *c c* and lugs *d d*, top A, and cover B having staples E E, substantially in the manner and for the purpose above described.

140,877.—*Extension-Table for Sewing-Machines.*—JOSEPH BENNOR, Philadelphia, Pa., assignor to NESBIT D. STOOPS and JOHN B. MYERS, same place.—Case D. Application filed June 12, 1873.

Sliding and swinging brackets are arranged under the table top that engage with eye-plates attached to the side of the cover. The top of the table is provided with studs that enter slotted plates on the lower edge of the cover, and one of the studs has a vertical hole in which plays a drop-bolt.

Claim.—1. The swinging and sliding brackets I I, in combination with the holders J J and eye-plates H H and H' H', substantially in the manner and for the purpose above described.

2. The combination of the slotted plates C, C, and C' of the cover B with the studs D, D, and D' of the top A, the said studs having necks *d*, and the stud D' a vertical hole, *e*, in combination with the drop-bolt E, substantially in the manner and for the purpose set forth.

140,878.—*Device for Transferring Motion.*—WILLIAM H. BENSON, Waynesborough, Va. Application filed March 22, 1873.

When the shaft A is put in motion it will be communicated by the connecting-lever D to the shaft B, the rotation of the shafts being in opposite directions.

Claim.—The sliding lever D, slotted at *a* and *b*, in combination with the guide-pin *c* and the crank-arms A and B, substantially as specified.

140,879.—*Pneumatic Apparatus for Elevating Water.*—JAMES M. BLANCHARD and WILLIAM E. PRALL, Washington, D. C. Application filed June 9, 1873.

Two or more tanks having induction-valves are connected with a compresser by means of pipes having suitable valves, which are to be opened and closed automatically. As the air is forced into one of the tanks the water is expelled. The compressed air from this tank is then allowed to pass into the compressing-cylinder in the rear of its piston, so as to cause its force to act in the direction in which the piston is moving, and thus aid in transferring the air from one tank to the other.

Claim.—In an apparatus for raising and forcing water by pneumatic pressure, the combination of an air-compressing cylinder, two or more water-tanks, and suitable pipes and valves for conducting and controlling the movements of the air, the construction and arrangement of the parts being such that the reflex force of the compressed air is made to act alternately upon the opposite sides of the piston of the compressing-cylinder, and thus aid in its transfer from one of the water-tanks to the other, substantially in the manner and for the purpose set forth.

140,880.—*Reciprocating Churn.*—LEVI ISAAC BODENHAMER, Kernersville, N. C. Application filed January 10, 1873.

A perpendicular reciprocating churn having radial arms carrying vertical dash-boards at their extremities, and a deflecting concavo-convex disk beneath the lid.

Claim.—In combination with the churn A, the dasher B, consisting of the slats *a* and *b*, and having attached to the upper portion thereof, within the churn, the deflector *m*, all substantially as described.

140,881.—*Manufacture of Hollow Rivets.*—MELLEN BRAY, Newton, Mass. Application filed March 17, 1873.

The die is such as is now commonly used for forming a head upon the closed end of a tube, but to increase the size of the head a short section of tube (closed or not at one end) is in this instance placed either upon or within the main tube, and both are then flattened together.

Claim.—1. In the process of forming a hollow rivet, by upsetting the end portion of a closed tube, the combination, with the closed end of the tube, of a secondary or supplementary piece of tube, to be upset to furnish additional material to form the head of the rivet, substantially as described.

2. The hollow rivet, formed by the process herein described, as a new manufacture.

140,882.—*Crane.*—ROBERT BRIGGS, Philadelphia, Pa. Application filed June 26, 1873.

The endless driving-rope passes around the pulley on a driving-shaft adapted to fixed bearings clear of the crane. The rope takes the course around the horizontally-arranged pulley revolving freely on a pintle of the frame; a second endless driving-rope passes around the same pulley over guiding-pulleys on the shaft and around pulleys on the other shaft, through which motion is communicated to the hoisting-gear and chain-barrel.

Claim.—1. The combination, with a crane, of a double-grooved pulley, D, deriving its motion from a driving-pulley clear of the crane, through the medium of an endless rope, A, and having its motion transmitted through another endless rope, A', to the driving-gear of the hoisting mechanism, all substantially as set forth.

2. The combination of the shaft H, its pulleys serving as guides for the rope A', and the clutch mechanism described, or its equivalent, with the driving-shaft *d* of the gearing for operating the carriage.

3. The combination of the pulley D on the pivot of the crane, and the endless rope A', with the pulleys J J' on the driving-shaft I of the hoisting-gearing, and the clutch mechanism described, or its equivalent.

4. The rope A' formed into a loop for carrying a weighted pulley, *q*, by causing it to pass from the pulleys J J' over the pulleys *p p*, in the manner set forth.

5. The combination of the driving-shaft *d* and its gear-wheels d^1 and d^2, with the driving bevel-wheel d^3, through which the said shaft can slide without turning, independently of the same, all substantially as and for the purpose specified.

140,883.—*Automatic Toy.*—HENRY L. BROWER, New York, N. Y. Application filed May 24, 1873.

The motive power is attached to the toy figure by mechanism arranged to give said toy a series of leaps and swinging motions alternately in opposite directions but at irregular intervals of recurrence, imitating a self-propelled gymnastic performer.

Claim.—1. The toy, composed of a flexible figure mounted on an oscillating bar operated by clock-work, in such manner as that said bar will make a complete revolution in one direction and a subsequent complete revolution in the opposite direction, substantially as specified.

2. The gears I J, with suitable operating means, and pinion *d* mounted on a support moved relatively to the said wheels so as gear alternately with each, and arranged to give motions in opposite directions to a toy figure from a constant motion of the wheels, as specified.

3. The stop *g* arranged as shown relatively to the flexible arms E of a toy acrobatic figure in combination with suitable operating means to induce a motion of the shaft or spring-bar C alternately in opposite directions, as specified.

4. The spring-bar C, slotted at the end, as described, and arranged in combination with shaft D, so that it may be keyed, either tightly or loosely upon it, at will, in order to vary the movements of the automaton, as described.

140,884.—*Apparatus for Loading Carts.*—JACOB BYERLY, Frederick, Md. Application filed June 26, 1873.

Weighted pawls are arranged on the frame of the machine so as to engage automatically with the racks beneath the cars to hold the latter on the dumping platform and to dump and release them.

Claim.—1. The weighted pawls F F, in combination with the racks G on the bottom of the cars, arranged and operating as described.

2. The continuous drawing-ropes *d*, arranged and operating in the manner and for the purpose described.

3. The arrangement of the several parts composing the cart-loading apparatus, herein described and shown, viz., the rails A A^1, forming the ways on which the wheels of the cars run, the pulley-shaft C having the continuous ropes, the cars B held and released automatically by the weighted pawls, the whole operating substantially as and for the purpose set forth.

140,885.—*Cultivator.*—JACOB CAYLOR, Fairview, assignor of one-half his right to CHARLES E. JONES, Redkey, Ind. Application filed October 12, 1872.

Interposing a transversely-recessed block having its outer faces plated with metal between the cultivator-shank and the beam to render easy adjustment of the shank, in connection with the adjustable brace provided with an eye, to which the brace is secured.

Claim.—In a cultivator, the combination of the transversely-recessed block D, having its outer face plated with smooth metal, the laterally-adjustable shovel-beam E, provided with the eye *e* and the adjustable perforated braces F, substantially as shown and described.

140,886.—*Potato-Screen.*—GEORGE CLAFLIN, Miller's Corners, N. Y. Application filed March 6, 1873.

A potato-screen made in two parts, the lower part provided with a smooth bottom, slightly inclined to the front. Above the stationary bottom, and moving on friction-rollers at the sides, is a frame provided with different sized screens, the smaller coming first. The potatoes are put in at the rear, and the frame is raised up and pushed from or pulled toward the operator, thus imparting to the potatoes a rolling motion. The front and rear are provided with spouts, through which the potatoes pass out.

Claim.—The screen-frame B, provided with the screens C C' and cleat *m*, when combined with the main frame A, provided with the spouts *d f*, the whole so arranged that said cleat acts as a division between the screened potatoes, as herein shown and described.

140,887.—*Sash-Cord Guide.*—CHARLES B. CLARK, Buffalo, N. Y. Application filed June 23, 1873.

A sash-pulley, consisting of face-plate and case, divided into longitudinal parts held together by friction, is cast with two pairs of frictional arms projecting from the face-plate within the shell or case. A bar or friction-guide is cast on the interior of the sides of the case, and engages with the friction-arms, thus forming a reliable connection between the face-plate and the case, of symmetrical form, easily molded, and giving larger extent of surface in the bearings of the axle-journals.

Claim.—In a divided case sash-pulley the arms C C C C on the face-plate A and ribs D D of the shell B, arranged and operating substantially as and for the purposes set forth.

140,888.—*Constructing Bridges.*—THOMAS C. CLARKE, Philadelphia, Pa., assignor to himself, DAVID REEVES, ADOLPHUS BONZANO, and JOHN GRIFFEN, Phœnixville, Pa. Application filed July 2, 1873.

Claim.—The mode described of erecting bridges—that is to say, building on each shore of the river to be spanned one-half of the bridge, swinging the two halves round on turn-tables and permanently securing them where they meet, then introducing beneath the turn-tables rollers which will permit longitudinal expansion and contraction of the bridge and anchoring the shore ends of the bridge, all as described.

140,889.—*Carpet-Rag Looper.*—WILLIAM CLAYTON, Jr., Bristol, Conn. Application filed February 25, 1873.

Claim.—The tool herein shown, consisting of a carpet-rag looper, button-hole cutter, and quilt-frame holder, either with or without the sewing-clamp, substantially as and for the purpose described.

140,890.—*Mowing-Machine.*—CHARLES COLAHAN, Cleveland, Ohio. Application filed April 26, 1873.

To the rear side of the inner end of the finger-bar is attached a journal or pivot, which journal or pivot has its bearing in a modified form of the ball of a ball-and-socket joint, and from which ball lateral spurs or pivots extend, having their bearings in supports at right angles to the pivot first named, thus forming a two-way joint.

Claim.—The pivoted drag-bar C and cutter-bar A, having the two-way joint connecting the same, consisting of the pin A, head B having the hole *d*, and rocking bearing *e*, all constructed and arranged for operation, as and for the purpose specified.

140,891.—*Egg and Cake Beater.*—JOHN W. CONDON, Logansport, Ind. Application filed January 3, 1873.

An egg and cake beater constructed with beaters revolving in opposite directions, with wings attached to the driving-shaft, and with an outer frame with scrapers on its sides and bottom, with double-acting gears attached to the main shaft to give motion, and all the moving parts connected with and attached by a bracket, and the bracket to an upright post by a clamp and thumb-screw.

Claim.—The means described for operating the beaters and scrapers I in opposite directions, consisting of the frame H, rods *g g*, pinion G G', shaft F, and crank-wheel E, arranged as set forth.

140,892.—*Compound Steam-Engine.*—JOHN H. COOPER and ABRAM D. EMERY, Philadelphia, Pa. Application filed February 27, 1873.

The casing which unites the two cylinders is made open, so that the heads and pistons can be removed. The peculiar arrangement of the ports permits the condensed water in the small cylinder to flow through the exhaust-ports into the large cylinder, from which it is carried by the inclined exhaust of the latter. The stuffing-boxes are constructed so that if the two cylinders get out of line they will adapt themselves to the untrue line of the bore of the cylinders.

Claim.—1. A compound engine having large and small cylinders A and B, united by an open casing, D, or frame, in the side of which communicating passages are formed between one of the cylinders and a steam-chest common to both cylinders, all substantially as set forth.

2. The base H', combined with and forming a part of the large and small cylinders and connecting casing D, as specified.

3. The combination of the steam-chest, common to both cylinders, the slide-valve E, constructed as described, the ports *a a' f f'* A, arranged in respect to each other, to the valve, and to the bores of the two cylinders, all as set forth.

4. The combination of the two cylinders and piston-rod and the compensating stuffing-boxes, constructed and applied to the cylinder-heads substantially as and for the purpose specified.

140,893.—*Device for Securing Man-Hole Covers.*—JOHN J. CRAVEN, (Bergen District,) Jersey City, N. J. Application filed January 13, 1873.

The man-hole is secured and readily removed by a removable cam-lever provided with projecting pins on each side, passing under ears on the tank-cover.

Claim.—The removable holding-pin E, and its eccentric F and handle-bar G, in combination with bearings *a* for said pin, and the cover B, substantially as described, whereby the holding device can be entirely removed from the vessel and quickly inserted in place.

140,894.—*Loom.*—GEORGE CROMPTON, Worcester, Mass. Application filed November 9, 1872.

The horizontal hooked jacks are pivoted to the vertical harness-levers and operated by reciprocating bars. The jacks rest upon the pattern-cylinder, which is driven by means of a crown-wheel, pin-wheel, shaft, and bevel-gearing, the shaft being constructed in two parts with a rotating and sliding connection for the purpose of disconnecting the cylinder, when desired, from the driving-gear. The fly-wheel is rigidly connected to the loose pulley, and the belt so arranged as to operate the driving and loose pulley at the same time, or the loose pulley alone. The brake mechanism is so arranged that when the belt is shifted to the loose pulley the brake is applied, and when shifted back it is released. The picker rock-shaft carries a sliding arm so constructed and arranged that in reversing the loom the picking mechanism is inactive.

Claim.—1. The combination and arrangement, substantially as shown and described, of the gears *l m*, shaft *k*, pin-wheel *i*, crown-wheel *g*, and pattern-chain or cylinder, with respect to the upright harness-levers, the jack resting upon the pattern-chain or cylinder, and the lifter, depresser, and evener-bars operated by the rocker-arms, levers *u y* and link *q* connecting the arm *r* with the wheel.

2. In combination with the loom mechanism, the pulley g^2 fast upon the shaft e^2, and the loose pulley h^2 fast upon an auxiliary shaft which bears the fly-wheel p^2, and a shipper mechanism holding the belt with relation to both pulleys, substantially as and for the purpose described.

3. In combination with the fast pulley g^2, loose pulley h^2, and reversing-pulley i^2, a brake mechanism and a shipper mechanism, that in shifting the belt to the loose pulley applies the brake z^2, and in shipping the belt to the reverse or fast pulley releases the brake, substantially as described.

4. The combination of the lever f^2, operated by the dagger to release the shipper-lever, with the lever a^2 that applies the brake z^2 by means of the intermediate devices, substantially as described.

5. In combination with the shaft s^2 that operates the picker-staff, the sliding cam or incline x^2 that is turned by the arms y^2 on the shaft d^2 in the forward movement of said shaft, but is slid upon said shaft by said arms without rotating it when the motion of the shaft is reversed.

6. In combination with the harness and driving mechanism, a pattern-chain or cylinder, arranged to be thrown out of operative connection with the harness and driving mechanism at the will of the operator by means of the adjustable sleeve *x* and cam-sleeve y^2 on the rotating shaft, substantially as shown and described.

140,895.—*Revolving Seat.*—GEORGE F. DAWSON, Washington, D. C. Application filed June 14, 1873.

The internally-threaded tube, in which works the revolving bolt, is provided with a flanged top plate, the flanges of which embrace the heads of the legs. The lower part of the tube is threaded externally, on which works a nut that holds the lower plate against the inside surface of the legs.

Claim.—1. The legs C having legs C' C' C' C' combined with

the plates *b b'* and *d*, the end-threaded tube B, and the nut D, as and for the purpose described.

2. The combination, with the tube B, threaded externally at the lower end, of the plate *d*, with or without a flange, d^1 or d^2, and held by a nut, D, as and for the purpose set forth.

140,896.—*Cigar-Machine.*—CHARLES J. DELBRIDGE, Rochester, N. Y. Application filed November 2, 1872.

The surfaces of the rollers are composed of washers or rings which intermatch so that the rollers close around the cigar more perfectly.

Claim.—1. In a cigar-machine, the series of rollers D D D, when they are formed with a series of washers or rings, *c c*, which intermatch, as herein shown and described, and for the purpose specified.

2. In combination with the washers *c c*, the interposed division-plates *f f*, arranged and operating as herein described.

140,897.—*Iron Fence.*—BENJAMIN G. DEVOE, Fredericktown, Ohio. Application filed April 3, 1873.

A wrought-iron facing is laid in the mold in which the post is cast and thus joined to it. For the corner-posts wrought-iron hooks are inserted and angular facings employed, together with a metallic base; all placed in the mold before casting.

Claim.—1. The fence-post herein described, formed of a wrought-iron facing, A, and cast-iron main portion B, constructed and united together in the manner and for the purposes set forth.

2. The corner or gate post herein described, consisting of the wrought-iron disks C D, cast metal portion E, posts G H, and top I, all constructed and united together as set forth.

3. In combination with the corner-post, as described in the foregoing second claim, the hooked bolts *d* and the cross-bar J, constructed and arranged substantially as and for the purposes herein set forth.

140,898.—*Sash-Holder.*—JONATHAN L. DEVOL and JAMES M. OKEY, Parkersburg, W. Va. Application filed July 1, 1873.

A spring-hook is combined with a bolt and operating-lever, all arranged inside a shell or case and attached to the window-sash in such manner that, as the bolt enters the keeper in the jamb or window-frame, the hook at the same time enters another aperture in the keeper, and, hooking over the edge thereof, locks the device firmly in place, preventing any horizontal movement of the bolt, whereby it might be released, (as by the jarring of cars, &c.,) until the hook is first lifted by the lever, the terminal movement of which will then withdraw the bolt and allow the sash to be raised or lowered.

Claim.—The bolt B, lever D, and hook E, when combined and arranged in such relation to one another and to the recess or recesses in which the bolt and hook are received, that the bolt cannot be retracted until the hook has been first disengaged, substantially in the manner set forth.

140,899.—*Numbering-Head.*—CHARLES W. DICKINSON, Belleville, assignor to himself and GEORGE ROWDEN, Newark, N. J. Application filed March 12, 1873.

A hub, fast to the shaft, is oscillated by a lever, and carries a series of dogs, each consisting of one detaining and one actuating dog for each number disk, which disks are mounted loosely upon a cylinder, and are each provided with ten slots, one cut entirely and nine partially through their bodies. As the actuating-dog E moves back it enters one of the partial slots of the unit-disk just as its pin H releases the detent-dog F, which the spring-pin G forces out of the slot it engages. As the hub moves forward it rotates the disk locked to it by the dog E until the dog F coincides with a slot into which it is forced by the spring-pin G, which has been thus moved to the rear of its pivot, thus setting and locking the disk for printing. When the whole slot of the unit-disk coincides with the dog E, the corresponding dog of the tens-disk, which has ridden upon the inner periphery of the unit-disk, enters a semi-slot of its disk, and the two are thus locked and move together. At the next rearward movement the tens-dog is raised and rides upon the periphery of the unit-disk until the whole slot is again engaged. These motions follow throughout the disks.

Claim.—1. The locking-pawls or detents F, when constructed as shown, and combined with the cylinder B and the disks A, substantially as and for the purpose specified.

2. The means employed for throwing the pivoted detents F into or out of engagement with the disks A, consisting of the spring-studs G, contained within and oscillated by the rock-shaft D, substantially as and for the purpose shown.

3. The operating-pawls E when constructed as shown, and combined with the rock-shaft D and disks A, substantially as and for the purpose set forth.

4. The operating-pawls E and detents F, when arranged to operate as cams, and combined with each other by means of the pins H, substantially as and for the purpose shown and described.

5. The operating-pawls E constructed as shown, and combined by means of projections *e''* and lips *e'''*, substantially as and for the purpose specified.

6. In combination with the disks A provided each with a full notch, *f'*, and nine half-notches *a*, the operating-pawls E provided with the projections *e'*, substantially as and for the purpose shown.

7. In combination with the rock-shaft D and operating-pawls E, the cylinder B provided with the openings *b''*, substantially as and for the purpose set forth.

8. The operating-pawls E, the detents F provided with the notches *f'*, the pins H, and the rocker-shaft D, in combination with each other and with the edge *b'''* of the cylinder B or its equivalent, substantially as and for the purpose shown and described.

9. In combination with the operating-lever K, the pivoted button I provided with the spring-stud *i*, and the stop L secured within and extending outward from the head C, substantially as and for the purpose specified.

140,900.—*Children's Chair.*—JEROME F. DOWNING, Erie, Pa. Application filed June 24, 1873.

The seat has an opening in it covered by a sliding cushion, and both are connected, by elbow-shaped arms, to the chair-frame, so that they can be swung to the rear of said frame. The shelf or table in front of the chair is connected, by a swivel-joint, with a sliding block that slides in a groove in one of the arms of the chair. The rear of the table has an adjustable rest projecting from the under side thereof.

Claim.—1. The seat G having an opening, G, sliding cushion-frame H, and the pivoted elbow-shaped arms G' G', the same being combined and arranged in connection with the frame of a child's chair, in such manner as to operate substantially as described.

2. The arm D of a child's chair, having a slot, D', table L, and swivel-joint *l*, when the latter is secured to a sliding block so as to operate within said slot D', substantially as described.

3. The table L having cleats or strips M M, sliding rest M, and spring-latch M', the whole being constructed, combined, and arranged to operate substantially as described.

140,901.—*Curtain-Fixture.*—LLOYD J. EARLL, Union City, Pa. Application filed March 18, 1873.

The curtain and roller are suspended by a wire frame having bearings and eyes and double-journaled detachable disks.

Claim.—The combination of curtain B, suspended by adjustable cords from the cornice, the wire frame having bearings *d d* and eyes *d' d'*, and the double-journaled detachable disks C C, all constructed and relatively arranged in connection with the same curtain-fixture, as and for the purpose described.

140,902.—*Steam-Nozzle.*—WILLIAM ERNST, New York, N. Y. Application filed April 30, 1873.

The mouth-piece is made removable so that access may be had to the conical spout to regulate the current of steam by increasing or diminishing the annular space between the spout and mouth-piece without disturbing the connecting-pipes.

Claim.—The body of the nozzle G, formed with a flange, *g'*, in combination with the mouth-piece K and adjustable spout J, all constructed and arranged to operate as shown and described.

140,903.—*Hat-Stretching Machine.*—RUDOLF EICKEMEYER, Yonkers, N. Y. Application filed June 11, 1873.

Angularly-shaped stretching-fingers, hinged at their inner ends upon studs radiating from a screw-threaded spindle suspended from an arm, are connected to an adjusting-plate above by jointed links, by which the fingers are operated by the rotation of a hand-wheel, in whose recessed hub the adjusting-plate is loosely fitted.

Claim.—1. In a hat-stretching machine which operates on the corrugation principle, a set of tip-stretching fingers, each of which has a longitudinal stretching-surface, and is hinged at its inner end to a support which is common to all of the fingers, substantially as and for the purposes specified.

2. The stretching-fingers B, hinged to a suitable support upon axes which radiate in the same plane from a common center, substantially as described.

3. In a corrugation hat-stretching machine, the several angularly-radiating fingers, hinged at their inner ends, and provided with longitudinal radiating tip-stretching surfaces, in combination with a suitable former for sustaining the hat, substantially as and for the purposes specified.

4. The combination of the several angular and radial stretching-fingers with the mechanism for adjusting, substantially as described, whereby the tips and squares of hats of various kinds and sizes may be stretched to any desired degree, as set forth.

140,904.—*Siding Hook.*—JAMES F. ELLIOTT, Forest, Ill. Application filed April 7, 1873.

The hook is sustained against the jambs of windows, &c., or corner-boards by the extension-bar and jam-nut. The boards are supported in the hook.

Claim.—1. The combination of the hook A, bar B pivoted thereto, and adjustable stud C, substantially as and for the purpose specified.

2. The combination of the hook A A' having spurs *a*, reversible bar B, and adjustable stud C *c*, substantially as and for the purpose specified.

140,905.—*Cutter-Head.*—JOHN F. W. ERDMANN, Philadelphia, Pa. Application filed October 5, 1872.

The cutting-blades are bedded upon a sheet of India rubber.

Claim.—The combination, with the bit B constructed from a thin plate of steel furnished with a feather-cutting edge, of the rotary cutter-head A and elastic cushion *c*, arranged substantially as and for the purpose described.

140,906.—*Cigar-Machine.*—THEODORE ERNST, Fort Madison, Iowa. Application filed September 10, 1872.

A roller has a groove for the cigar-bunch and an apron adjusted by rod and ratchet-wheel, the said roller being partially revolved by a treadle and strap, and retracted by a coiled spring located within it. The table has an opening covered with wire cloth, a hinged lid for exposing the rolling mechanism to view, an inclined way, and a hinged box for receiving the cigar.

Claim.—1. The combination of the plates C C, roller D, shaft *b*, lugs *c c'*, coiled spring *f*, sleeve A, toothed wheel *i*, shaft *s*, and lever *y*, all constructed and operating substantially as and for the purposes herein set forth.

2. The arrangement, with the mechanism herein described for making cigars, of the table A with wire-cloth-covered opening *w*, hinged lid B with opening *z*, incline J, and hinged box K, all substantially as and for the purposes herein set forth.

140,907.—*Filter.*—JAMES M. EVARTS, New Haven, Conn. Application filed April 16, 1873.

A ring for receiving the filtering material and retaining it in position is formed with an angular rib to receive an elastic packing, by means of which the ring is fitted in a recess in the filter-shell and a water-tight joint obtained

Claim.—The ring C for receiving the filtering substance, constructed with an angular rib, in combination with an elastic packing, so that said ring may be fitted in the recessed shell, as described.

140,908.—*Apparatus for Extracting Nitrate of Soda.*—ROBERT F. FAIRLIE, London, England. Application filed April 25, 1873.

The wagon-bodies, cylindrical in form and provided with internal arms for working up the contents, are supported upon trunnions upon the wagon-frame and rotated by means of suitable shafts and clutches, whereby the quantity of water and steam used in extracting the nitrate is diminished and the working of the crude nitrate facilitated.

Claim.—1. The wagon-bodies B B mounted on the axis C C, adapted to have a free rotation inside the cachucho A, substantially as and for the purpose specified.

2. The driving-shaft K having a clutch or driver, G, in combination with the wagon-bodies B B and their respective shafts and clutches, substantially as described, for the purpose specified.

3. The clutches or drivers G G, or equivalents, in combination with the mounted cylinders B B, substantially as and for the purpose herein set forth.

4. In combination with the rotating wagon-body, the bars or arms E R, substantially as and for the purpose herein set forth.

140,909.—*Railway Switch.*—MEDARD FELS and JOHN W. FELS, Cincinnati, Ohio. Application filed June 26, 1873.

A disk is attached to the axles of certain cars which are intended to traverse the main line only. Said disk operates a tappet which shifts the switch-point so as to clear the line, the point being reset by another tappet after the passage of the car. All cars not provided with a disk are switched off by the point as it lies in its ordinary position.

Claim.—The combination of the switch E *f*, rod G, pivoted center-plate H *h h'*, connecting rods *j j'*, rock-shafts K *k* K' *k'*, and tappets M M', when employed in connection with the rails C C' D D', and adapted to be operated by a rotary disk, N, substantially as herein described and illustrated.

140,910.—*Mold for Forming Clay Articles.*—CHARLES A. FISCHER, Baltimore, Md. Application filed May 9, 1873.

A mold for shaping articles of clay, having recess to receive excess of clay.

Claim.—The two-part mold N having die P with its circumjacent channel *p* and clay-space Q in cover, applicable as and for the purpose described.

140,911.—*Apparatus for Making Gas from Oils.*—SAMUEL H. GOLDTHORP, Pittsburg, Pa., assignor to R. H. SMITH, same place. Application filed June 4, 1873.

The retort surrounds a part of the stove, the shell of the stove forming the inner surface of the retort.

Claim.—A heating-stove provided with an exterior shell, H, arranged, as described, so that it, with that part of the stove which it surrounds, will form a gas-retort, substantially as herein set forth.

2. The flanges A A, within the retort, formed by the stove and the exterior shell, substantially as and for the purposes herein set forth.

140,912.—*Eye-Glass.*—STANLEY GERACEN, Rye, N. Y. Application filed February 7, 1872.

In jointed or pivoted eye-glasses the spring is applied to projections extending beyond the pivot, instead of being applied within or beneath the pivot.

Claim.—1. The combination, with a pair of eye-glasses of an elastic cushion arranged as a compression-spring to keep the glasses in position when in use, substantially as herein described.

2. The combination, with eye-glass frames, of arms or shoulders extending beyond the connecting-pivot, substantially as shown and described, to receive the spring which holds the glasses in position when in use.

140,913.—*Powder-Keg.*—CHARLES GREEN and WILLIAM WILSON, Jr., Wilmington, Del. Application filed July 2, 1873.

Claim.—A powder-keg, constructed of a cylinder of paper, pasteboard, or any equivalent fabric, connected and inclosed by heads and staves, in the manner and for the purposes substantially as hereinbefore set forth.

140,914.—*Rotary Steam-Engine.*—CHARLES GROTZ, Ottumwa, Iowa, assignor to himself, D. B. DENNISON, J. T. HACKWORTH, J. G HUTCHISON, W. T. MAJOR, and ALLEN JOHNSTON, same place. Application filed May 22, 1873

The piston-blade is completely surrounded on its edges with flexibly-seated packing, and the ends of the drum are also provided with the same, so that steam tight joints at all points between the cylinder and drum and piston are obtained.

Claim.—In combination with the steam-cylinder, eccentric drum, and reciprocating piston-plate, the side-spring packing-strips and end rocking-packing pieces for the piston-plate, and the end-spring packing-strips for the drum said parts being constructed and arranged together for operation substantially as shown and described.

140,915.—*Railway Switch.*—BENJAMIN HALL, St. Louis, Mo. Application filed May 28 1873.

The switch-rails are seated in triangular recessed "head-chairs," embracing both portions of the rail, which rises upon a toggle when shifted and falls securely into place during the last half of the movement. The "head-chairs" are provided with lips M M' for holding the base of the rail, and with lateral openings for the escape of dirt, &c.

Claim.—1. The switch-rails A A', provided with the recesses *a a'*, the head-chairs F F', constructed as described, the toggles J J', the main tracks D D', and side tracks E E', combined, arranged, and operating substantially as described and shown.

2. The head-chairs F F, provided with the lips M M', &c., and toggles J J, combined arranged, and operating substantially as and for the purpose set forth.

3. The head-chairs F F', provided with the openings K K', constructed and arranged as and for the purpose shown.

140,916.—*Fruit-Jar.*—ELLA G. HALLER, Carlisle, Pa. Application filed June 25, 1873.

Claim.—A fruit-jar body and cover, A B, respectively, blown in a single piece, with the downwardly-beveled outside groove C, and the inside beveled flange *b*, as and for the purpose described.

140,917.—*Railway Switch.*—FRED. P. HANCHETT, Nepeuskun, Wis. Application filed May 3, 1873.

The movable rail of the switch is made with a so-called "blind head," W, at the joint, covered by a projecting lip, and a similar lip covers a projection at the moving extremity, with the object of excluding grit, and also of preventing the easy removal of the shifting-rail, either by design or accident.

Claim.—The switch-rail D, formed with blind-head W, in combination with lips K and O, when constructed and arranged substantially as described, and for the purpose specified.

140,918.—*Water-Supply Valve.*—PATRICK HARVEY, Chicago, Ill., assignor to NELSON C. GRIDLEY, same place. Application filed March 31, 1873.

At the end of a valve-stem, which is operated through a perforated piston, is attached a flexible valve, so arranged that upon removing the piston and rod the valve shall be drawn through its seat and removed therewith.

Claim.—1. In a water-supply valve, the perforated piston H, in combination with the washer J, constructed of the material specified, and arranged and operating substantially as and for the purposes set forth.

2. In a water-supply valve, the grooved stem I, provided with the washer N, attached to its end by means of the nut K, in combination with the fixed valve-seat L, the said stem and seat being constructed and arranged substantially as shown and described, to allow the said washer to be drawn and pushed through the valve-opening, for the purposes set forth.

140,919.—*Milk-Cooler.*—JAMESON F. HAWKINS, Hannibal, Mo. Application filed April 22, 1873.

The cover is made with a conical surface, a central vertical tube, and a water-guard, so that it can be adapted to any can and present a large cooling surface to the milk.

Claim.—A milk-cooling-vessel cover, having an inclined varying cooling-surface, A, within the vessel, a vertical central tube attachment, B, and a circumferential water shed or guard, C, and adaptable to vessels of varying lesser diameters, as described.

140,920.—*Manufacture of Umbrella-Notches.*—ABRAM HERZBERG and ISAAC HERZBERG, Philadelphia, Pa. Application filed May 27, 1873.

Blanks having radial projections are cut from a sheet of metal by the cutter A entering the die B from which the blank falls into the recess *a* of the die D, when plunger E descends and bends the projecting pieces up, and at the same time slightly draws down the center The blank is transferred to another die, where a punch cuts out the center, and an upper die on the punch bends in the ends and completes the notch.

Claim.—1. The punch A and its plunger E having a projection, *f*, in combination with a die, D, having the recess *e*, opening *h m*, and shoulder *i*.

2. The combination of the die H, its opening *n*, and recess *q*, with the plunger G, and its movable collar *t*.

3. The mode or process described of manufacturing umbrella-notches—that is to say, punching from a sheet of metal, blanks, Fig. 3 and forming these blanks into notches by bending and punching in the manner described.

140,921.—*Machine for Mitting Stereotype-Molds.*—ROBERT A. HILL, Chicago, Ill. Application filed March 6, 1873.

A ductile plate is attached to a bar having ratchet-teeth on one edge and a rack upon the other, and mounted in the feed-bed. As each die is depressed upon its surface and struck by the hammer the bed is fed forward the width of a letter by a pawl-ratchet-pinion, and rack. At the completion of a line the bed strikes an elbow lever, H, which has engaged the rack and moves the plate longitudinally such a distance that when it is withdrawn to its normal position by its spring—when the pawl J, moved by the arm *j*, lifts the detent I—one of its ratchet-teeth will engage the fixed wedge E and move and adjust the plate to properly space the lines preparatory to stamping the next line.

Claim.—1. The combination of the hinged lever B with holder K and set-screw *n*, the die or stamp *b*, spring *y*, and key V, constructed and arranged to operate substantially as and for the purposes herein set forth.

2. The combination, with the hammer-lever W and connecting-bar T, of the crow-lever D, ratchet-wheel *d*, cog wheel P, and cogs *s* on the bar E for the purposes herein set forth.

3. The spring-pawl L, engaging with the ratchet-wheel *d*, and provided with the pin L in combination with the pawl lifter J, for the purposes herein set forth.

4. The hook *f* attached to the bar E and operating on the pawl-lifter J, for the purposes herein set forth.

5. The push-bar K attached to the bar E and operating on the pawl-lifter J, for the purposes herein set forth.

6. The combination of the cogged and toothed bar N, plate G with guides *e e*, and bar E, as and for the purposes herein set forth.

7. The elbow-lever H with points P and R, and the spring O, operating in combination with the plate G, as and for the purposes herein set forth.

8. The beveled tooth O operating in combination with the bar N, as and for the purposes herein set forth.

140,922.—*Toy Catapult.*—WOODBURY S. HOW, Cincinnati, Ohio. Application filed May 14, 1873.

Made principally of wire and in one piece, and adapted for carrying in the pocket.

Claim.—1. The toy catapult formed of the elastic members or loops A D A′ and A″ D′ A‴ *e*, in the described combination with cap B or guide B′, or both, substantially as set forth.

2. In combination with the elements A D A′, A″ D′ A‴ *e*, and B or B′, the coiled or helical spring-elbow D″.

3. In the described combination with the elements A D A′, A″ D′ A‴ *e*, and B′, the hook *h* for locking the parts into compact form for the pocket, as explained.

4. In combination with the elements A D A′, A″ D′ A‴ *e*, and B′, the separable joint *h e′* and the brace-coupling F.

5. In combination with the elements A D A′ and A″ D′ A‴, the braces F′ and I, guide J, and trigger K *k k′*, or devices substantially equivalent.

140,923.—*Pneumatic Telegraph.*—ALBERT JAYNOR, Regent's Park, England. Application filed March 26, 1873.

The transmitting air-chamber is provided with a valve controlled by a peculiarly-formed cam on the operating crank or index-shaft, so as to equalize the pressure at each pause or rest in the signaling. A notched plate, against which a light spring from the diaphragm-lever is pressed, serves to give precision to the movements of the receiving-index.

Claim.—1. The valve B, lever *c*, and cam A, in combination with the air-chamber *a* having flexible top, and with one or more air-pipes *b b*, substantially as described.

2. The air-chamber *a* having flexible diaphragm 1, in combination with one or more air-pipes, *b b*, and the sancer *c*, substantially as described.

3. The corrugated quadrant piece, D, arranged and operating in respect to the index-hand 2, as and for the purpose specified.

140,924.—*Electro-Deposition of Aluminum.*—JOHN A. JEANÇON, Newport, Ky. Application filed November 1, 1872.

Dissolve the desired salt of aluminum or a double salt of aluminum and potassium, sodium, &c., in distilled water, and concentrate to 20° Baumé, (at 50° Fahrenheit.) The battery used is either four pairs of Smee's zinco-platinum or three Bunsen's zinco-carbon, the elements connected for intensity. The solution is heated to 140° Fahrenheit, slightly acidulated, and a plate of aluminum is attached to the negative wire in working.

Claim.—The herein-described process for aluminum plating, by means of electricity from aqueous solutions of the salts of aluminum, substantially as herein specified.

140,925.—*Metal-Drilling Machine.*—JACOB C. KELLER, Philadelphia, Pa. Application filed May 24, 1873.

The upper part of the frame carrying the drill-spindle is hinged to the lower or fixed frame, and is adjustable at any desired angle with the table, up to ninety degrees. A sleeve journaled in a vertical slide in front of the table, supports the boring-tool when used for enlarging holes.

Claim.—1. A drilling-machine in which a frame carrying the drill-spindle is hinged to the permanent frame or standard, having a vertically-adjustable table, all substantially as described, so that the drill-spindle can be adjusted to a position at right angles, or at any other angle, to or parallel with the table, as set forth.

2. The adjustable frame B′ carrying the drill-spindle, the fixed frame B, and the connecting sleeve H, in combination with a shaft, I, passing through and turning in the said sleeve, and the gearing described, or its equivalent, by which the said shaft derives its motion from the driving-shaft and transmits it to the drill-spindle.

3. Tops or shoulders *x* and *f* arranged on the fixed frame or standard B, in the manner substantially as described, in respect to the adjustable frame B′ and to the table F, so as to insure a proper adjustment of the drill-spindle at right angles to or parallel with the table, as set forth.

4. The combination of the adjustable frame carrying a drill-spindle with the slide G and its vibrating bearing *m*.

140,926.—*Hasp-Lock.*—JACOB KINZER, Pittsburg, Pa. Application filed February 20, 1873.

Claim.—A hasp containing the lock-case *a*¹ and lock, the slot *b* for the staple, a pair of guides formed by the boxing of the hasp immediately above such slot, in combination with the pin *d* having the bread part *d′*, the recess *h*, and flange *f*, all constructed and combined substantially as set forth.

140,927.—*Apparatus for Cooling and Removing Blast-Furnace Slag.*—ANDREW KLOMAN, Pittsburg, Pa. Application filed June 16, 1873.

A series of pans or boxes smaller at the bottom than at the top, and provided with removable central tapering pins are supported in a spider and rotate in an annular water-chamber. Slag is run into the pans, and, after cooling, is removed by tackle inserted into the eye of the pin. The pin, being wedge-shaped, is readily removed from the block and replaced in the pans.

Claim.—1. As a step in the removing of blast-furnace slag or cinder, running the same off into boxes which are partially or wholly immersed in water, substantially as described.

2. In combination with an annular water-pan, A, a series of boxes, D, suitably arranged to be rotated successively under the spout leading from the tap-hole of the blast-furnace, substantially as set forth.

3. In combination with a slag-receiving box, a lifting-pin, *b*, largest at its lower end and having an eye or equivalent connecting device at its upper end, substantially as set forth.

4. A centering pin or projection and a recess corresponding thereto, one arranged in the bottom of each box D and the other on the bottom of each lifting-pin *b*, substantially as set forth.

5. The combination of the trough A, spider B B¹, the boxes D, and caps *n*, arranged substantially as described.

6. The combination of the annular rings B, boxes D, and T-heads *d′*, or other suitable stop device in lieu thereof, substantially as described.

140,928.—*Metallic Roofing.*—CHARLES LEWANDO, Cambridge, Mass. Application filed December 21, 1872.

The metallic plate is folded at the edges and attached by a single nail. The part N is folded under on the line *p p*, (this constituting the novelty,) thereby covering the nail and locking the lower angle. The successive plates interlock by means of the folds.

Claim.—The metallic roof, when the same is formed by uniting the plates A A and B B, &c., cut and folded and arranged substantially as described, and for the purpose set forth.

140,929.—*Sewing-Machine Stand.*—HENRY LOTH, Philadelphia, Pa. Application filed May 6, 1873.

The sewing-machine is secured to a bed that is hinged to the table-top, and the latter is rendered vertically adjustable in its frame by combining a spindle having a central and two end pinions with a segmental rack attached to the under side of the bed, and two vertical plain racks attached to the under side of the table-top, one near each end. The spindle has a milled head at one end, by which it is operated. When the machine-bed is inclined the table-top is lowered by means of the racks and pinions.

Claim.—1. The combination of the top B, hinged bed A, and the pinions and racks, or equivalent devices, whereby the opposite movements of the top and bed are so equalized as to preserve the distance between the band-wheel A and the driving-shaft revolving in fixed bearings.

2. The combination, with the hinged bed or trap A and adjustable table B, and with their racks *f* and *e*, of the spindle F and its pinions for simultaneously operating the said hinged bed and table, substantially as herein described.

140,930.—*Compound Hinge.*—HENRY LOTH, Philadelphia, Pa. Application filed May 6, 1873.

The several leaves are hinged by rule-joints at their corners, and all the surfaces are upon the same horizontal plane. An ordinary leaf is pivoted in the usual way to the side of one of the number of leaves used. These are secured to the three or four legs of a table, and to its lid allowing the entire table to fold compactly together.

Claim.—1. The within-described compound hinge, consisting of three or more connected sections, *b*, *c*, &c., the intermediate section or sections being constructed with two circular projections, and the outermost sections with one, and the surfaces of all the sections being on the same plane, substantially as and for the purpose specified.

2. The combination, with the outermost section *d* of the hinge, of a hinged leaf, *k*, for the purpose specified.

140,931.—*Windmill.*—WILLIAM W. MARSH and OREN E. MILES, Sycamore, Ill. Application filed April 21, 1873.

The shaft of this wheel, where it unites with the pitman, is bent to form a crank which passes through a ball located in the head which forms the bearing for the ball, and makes a universal joint for the shaft to play back and forth in as the wind is light or heavy. When light the stroke of the piston will be short, pumping a small quantity of water. As the wind increases in force its pressure upon the sails and the end of the mill will force the crank-shaft through the ball, lengthening, thereby, the stroke of the piston and increasing the quantity of water.

Claim.—1. In a windmill, a movable shaft, D, substantially as and for the purposes specified.

2. The spring *e*, in combination with a movable shaft, D, substantially as and for the purposes specified.

3. The sails F, slotted curved arms *r*, plate *n*, and pins *u*, in combination with a movable shaft, D, and spring *e*, substantially as specified.

4. The movable shaft D, when provided with a graduated crank, *v*, substantially as and for the purpose specified.

5. The movable shaft D, spring *e*, and chain *m*, substantially as described.

6. The movable shaft D having a graduated crank, *v*, in combination with the ball-and-socket joint *d e*, substantially as described.

7. The jointed stay A, in combination with the pitman-rod and head P *e*, substantially as specified.

140,932.—*Apparatus for Cleaning Knives, Forks, &c.*—EMMA MARWEDEL, Washington, D. C. Application filed June 10, 1873.

Within a suitable case are arranged the two pads *a* and *b*, which are so constructed as to conform to the inside and outside of the spoon or fork. A device for scouring knives is arranged within the cover.

Claim.—The receptacle A provided with the scouring-pads *a*, *b*, and E, the said parts being constructed and arranged, relatively to each other, as shown and described.

140,933.—*Machine for Cutting Rubber Sheets into Strips.*—THOMAS J. MAYALL, Boston, Mass. Application filed June 28, 1873.

The rubber sheet passes under binding-rods or rolls, which press it against the carrier-drum, and is cut by knives arranged obliquely in a rack over the carrier-drum. The strips pass to and are wound upon a series of spools upon loose shafts. These spools receive their motion from a series of friction-rolls beneath, and suspended above them are a second series of spools which supply the cambric or other lining to be wound with the strips.

Claim.—1. In a machine for cutting uncured rubber sheets into strips, the combination of a rotary carrier-drum, constituting the table or support for the rubber sheet during the cutting operation, with adjustable presser or binding bars or rollers, arranged to hold the rubber sheet down on the drum, substantially as and for the purposes shown and set forth.

2. The combination, with the carrier-drum and adjustable presser or binding bars or rollers, of cutters for dividing the sheet of rubber passing beneath said presser and over said drum enter strips, substantially as shown and set forth.

3. In a machine for cutting up sheets of uncured rubber into strips, the combination, substantially as set forth, with the cutters, of devices substantially such as described, for discharging water on the cutters or on the sheet of rubber immediately in advance of and in line with the cutters during the operation of the machine, for the purposes stated.

4. The rolls or shafts upon which the rubber strips are wound, each of said shafts resting on and between two rollers revolving in the same direction and deriving its rotary movement from its frictional contact with said rollers, as herein shown and described.

5. The combination of the shafts for receiving the rubber strips and the rollers, which support and impart movement to said shafts with the rotating carrier-drum and cutting mechanism and adjustable presser or binding-rolls, substantially as herein shown and described.

6. The combination of the shafts for receiving the rubber strips and the rollers which support and impart movement to said shafts, of shafts or rolls carrying the cambric or other lining to be wound up with the rubber strips, under the arrangement and for operation as shown and set forth.

7. In combination with the rotating carrier-drum, the horizontal knife-carrying bar arranged above said drum, and the yielding knives held in slanting slots formed in said bar, so as to cut the sheets of rubber passing below into strips with beveled edges, substantially as and for the purposes set forth.

140,934.—*Machine for the Manufacture of Hose.*—THOMAS J. MAYALL, Boston, Mass. Application filed June 30, 1873.

A lining of uncured rubber is applied to the revolving mandrel and enveloped by canvas or cords longitudinally arranged to prevent the wrapping-threads from cutting into the rubber. The threads from the spools are then passed through the bowed guide under and over the movable tension-bars, through the reed, and wrapped around the end of the covered mandrel. Motion is given to the traveling-carriage, the mandrel revolving at the same time so as to lay the threads in a uniform manner. At the end of its travel suitable mechanism reverses the movement of the carriage.

Claim.—1. The means herein described for supporting the hose-mandrel, the same consisting of a revolving chuck or cup-like socket, adapted to receive and hold firmly one end of the mandrel, and to impart rotary movement to the mandrel, in combination with uprights or standards placed at suitable distances apart and carrying friction-rollers, upon and between which said mandrel is supported and rests, said standards being formed and arranged as set forth, so as not to interfere with the winding of the cords from end to end of the mandrel.

2. The combination, with the sliding carriage and its spool-rack, of a reed and reed-frame carried by the said carriage, the frame being adjustable up and down, and toward and away from the mandrel, substantially as shown and described.

3. The combination, with the sliding carriage and adjustable reed-frame, of the tension device carried by said frame, and arranged and operating substantially as shown and set forth.

4. The adjustable reed-frame carrying the tension device and bowed guide, said parts being arranged together, substantially as set forth.

5. The combination, with the sliding carriage traveling back and forth in a line parallel with the hose-forming mandrel, of the reed and adjustable reed-frame, the tension, the bowed guide, and the spool-rack, under the arrangement and for operation substantially as shown and set forth.

6. In combination with the sliding carriage and the means, substantially such as described, for driving the same in either direction, the shipper-bar, operated, to reverse the movement of said carriage, partly by a finger on the carriage engaging stop-pins on said bar, and partly by a vibratory weighted lever connected with the bar, and operating to complete the movement of said bar commenced by the carriage-finger, substantially in the manner shown and set forth.

140,935.—*Scraper.*—WILLIAM D. MAYFIELD and JOSEPH M. PAYNE, Fort Worth, Tex. Application filed May 24, 1873.

The scraper is pivoted in a swinging frame and is elevated or depressed from the driver's seat, being connected by means of a ball and chain passing over a pulley to the rear end of the draw-bar, so that when the draw-bar is released by a spring-bolt, which the driver operates, it slides upon the tongue and the force of the draft is exerted in lifting the scraper with its load. The backing of the team lowers the scraper for action and locks the draw-bar. The swinging frame is adjustable at its rear end for varying the inclination of the scraper.

Claim.—1. In a road-scraper, the combination of the movable draw-bar D secured to the tongue C by clasps *c*¹ *d*¹, and the spring-bolt E with the chain *d*², the pulley D′, the bail I, the scoop K, and the pivots *i*, substantially as specified.

2. In a road-scraper, the chains *g g′*, the brace G′, the bars H, the bail I, the chain *d*², and the adjustable bar N, in combination with the frame M, the spring-bolt L, and the scoop K, substantially as specified.

3. The combination of the bar D, the scoop K, and the frame M with the seat R and the brake O, substantially as described.

140,936.—*Wash-Boiler.*—EDWARD H. MCDONALD, Wytheville, Va., assignor of one-half his right to SAMUEL Y. TOWSON, St. Louis, Mo. Application filed March 1, 1873.

Is constructed in two parts, separated in its center, with an upper chamber connected with the lower by a pipe extending from its bottom with a joint at the center, through which the steam is conducted, which is covered by a perforated division or plate connected to and with the lower chamber or section, and has outlet-pipes for passing off the steam and water.

Claim.—1. The condenser D, provided with the tubes 2 3 and perforated plate E, substantially as set forth, in combination with the boiler F.

2. The false bottom A B, boiler F, condenser D, tubes *c* 2 3, and discharge *n*, substantially as shown and described.

140,937.—*Stone and Glass Polishing Machine.*—JOSEPH MEHAS, New Albany, Ind. Application filed April 3, 1873.

The polishing-blocks are composed of wood faced with felt and incased in a metallic frame, which has a recess in the top for the reception of a weight. A number of blocks are linked together and form a chain, which is connected to a swinging frame that moves them longitudinally. A sidewise movement is given to the chains by means of an attachment to right-and-left-hand threaded rods, operated by the swinging frame and having a reversing mechanism.

Claim.—1. The block-chains herein described, consisting of the blocks G G and H H and frames I, constructed as described, and connected by means of a frame, J, with the screw-shafts *d*, substantially as and for the purposes set forth.

2. The combination, with the screw-shafts *d d*, of the double cog-wheel K, frame L with pawls *m m*, and roller M, and the double incline N, substantially as and for the purposes herein set forth.

3. The combination of the swinging frame C, screw-shafts *d d*, block-chains G H I, frames J with pins *i i*, and the bars *f*, all constructed and operating substantially as and for the purposes set forth.

140,938.—*Rotary Cutter.*—CHARLES H. MELLOR and MORRIS L. ORUM, Philadelphia, Pa. Application filed January 11, 1873.

A removable central cutter is inserted within the arms for surface-cutting.

Claim.—The cutter having side cutting-arms A A and an end cutting-bit, D, as set forth.

140,939.—*Stove-Pipe Shelf, &c.*—DAVID R. MOORE, Owego, N. Y. Application filed May 7, 1873.

A pan, formed to fit around a stove-pipe, has a flat cover and a damper, and arms on which clothes may be dried.

Claim.—1. The combination of the perforated pan A with collar *a* and sliding damper *n*, plate D with collar *a′*, and plate C with opening *b* and damper *h*, all substantially as and for the purposes set forth.

2. The combination of the pan A, the arms *p p*, and catches *i i*, all substantially as set forth.

140,940.—*Smoking-Pipe.*—WILLIAM H. MORRIS, Brooklyn, assignor to himself and ARTHUR B. ROSS, New York, N. Y. Application filed March 5, 1873.

The bowl of the pipe is reversible, having movable covers at both ends and tubular openings leading to the stem, which acts as a faucet to close the connection leading to the upper end of the bowl and open that leading to the lower end, so that the smoking can be continued without relighting the pipe, by simply inserting fresh tobacco in the upper end of the bowl upon the remaining embers, applying the cover, and reversing the bowl.

Claim.—The reversible bowl and removable covers applied to and combined with the stem that closes one of the tubular passages, 2 or 3, and opens the other, substantially as set forth.

140,941.—*Construction of Houses.*—THOMAS W. H. MOSELEY, Hyde Park, Mass. Application filed February 25, 1873.

The boards are laid up so as to leave notches or recesses at the corners of the house for the reception of corner-strips or fenders.

Claim.—1. The combination of the lapped ends of the boards B, forming notched or recessed corners, with corner-fenders applied, as set forth.

2. The composite wall, consisting of the boards B with lapped ends *b* and inter-spaces, the corner-strips F, and the cement H filling said inter-spaces and enveloping the edges of the boards, all as herein described.

140,942.—*Construction of Houses.*—THOMAS W. H. MOSELEY, Hyde Park, Mass. Application filed June 17, 1873.

The roofs and floors are constructed of parallel beams or framing enveloped by a body of cement, which fills the spaces between the beams and completely covers the upper and under surfaces of the floor or roof, strips being laid across the joists at intervals to receive the flooring-boards or sheathing for the roof. A covering of felt and gravel is laid over the sheathing-boards, and is secured at the edges of the flanged metallic plates.

Claim.—1. The composite flooring and roofing, constructed of parallel beams, filling and coating of cement, and stripe T, substantially as specified.

2. The combination of the felt U, or its equivalent, gutter G, flanged stripe V V', and outer coating W, arranged and connected as set forth.

140,943.—*Gage for Erecting Plank Walls.*—THOMAS W. H. MOSELEY, Hyde Park, Mass. Application filed June 17, 1873.

A gage for temporary use in erecting walls of wood and plaster. It is composed of two boards placed either parallel or at right angles to each other, furnished with a hinged brace or shore adjustable to different heights, and having a hinged stake at foot. The gage for the corner is right-angled in section, with a rectangular strip inserted in the angle to form a groove for the reception of permanent corner-pieces.

Claim.—The gages N N', constructed and arranged to operate in manner substantially as and for the purposes set forth.

140,944.—*Escapement for Watches.*—DON J. MOZART, Ann Arbor, Mich.—Case A. Application filed May 14, 1873.

The balance-staff carries a disk cut out or made concave on the edge at one side, each of the angles carrying a ruby-pin, which receives alternate impulse from two horns carried on an arm from the escapement-shaft, upon which a four-leaved pinion is fixed to engage with the adjoining wheel.

Claim.—The detent *a* and plate *d* with fangs *e e* upon the shaft *b*, and the disk A with the ruby-pins *i i* upon the balance-staff *f*, all constructed as described, and arranged to operate in combination with the escapement-wheel A, balance-wheel B, and hair-spring C substantially as and for the purposes herein set forth.

140,945.—*Roofing Composition.*—CHARLES MUELLER, Warren, Mass. Application filed February 17, 1873.

Claim.—A fire and water proof roofing made as described—that is, a layer of clay or other aluminous earth, cut straw or hair, and sand, a layer of slaked lime, and a layer of cement, all applied in the manner herein set forth.

140,946.—*Machine for Finishing Pencils.*—THEILE H. MÜLLER, Yonkers, N. Y. Application filed May 28, 1873.

The pencils are forced from the bottom of the feed-hopper under a spring-lever with a beveled end to turn the pencil into a proper pre-determined position for finishing the sides.

Claim.—1. In pencil-feeding machinery, a yielding or adjustable pencil-guide, arranged in front of the pencil-hopper, so that the pencils, as they are fed therefrom, shall successively pass under it, and formed on its under side with one or more inclined surfaces adapted to operate upon the pencils passing beneath, substantially as and for the purposes set forth.

2. The combination of the yielding and adjustable pencil guide-lever with the pencil-hopper and the feed groove or channel beneath said hopper and lever, the whole arranged, for joint operation, substantially as shown and set forth.

140,947.—*Table-Hinge.*—JAMES W. PALMER, Pana, Ill. Application filed June 2, 1873.

An ordinary butt-hinge leaf is provided with an elongated leaf and guide and a spring latch, which engages with a detent or keeper. The outer ends of these latches or plates are connected together by a rod, and a spring is provided which presses against the rod in a direction toward the head or knob, projecting beyond the leaf of the table. By means of this construction the table-leaf is held up by the combined force of the elongated hinge-leaf and the latch or plate, which extend across the joint, the lock being effected by the catch or detent engaging automatically over the double leaf and plate, while pressure on the knob overcomes the force of the spring and releases the parts, so that the table-leaf can be lowered.

Claim.—1. The table-hinge C, provided with the ordinary butt-hinge leaf *c*, the elongated leaf *c'*, and a guide, *d e*, substantially as and for the purposes set forth.

2. The combination of the arms *m m*, rod *r*, spring *s*, and bevel-ed hook *n* with the hinge C and table A B, substantially as and for the purposes set forth.

3. A table-hinge combined with a spring-latch and a detent or keeper adapted to engage with the spring-latch automatically and hold the table-leaf in a horizontal position, substantially as described.

140,948.—*Coverlet.*—CHARLES K. PEVEY, Worcester, Mass. Application filed June 19, 1873.

Between the sheets of cotton cloth or wadding is placed a sheet or sheets of thin paper, preferably crimped or corrugated.

Claim.—A bed comforter or coverlet having the interposed paper applied, substantially as shown and described.

140,949.—*Match-Box.*—CHARLES PRAHL, Stapleton, N. Y. Application filed March 20, 1873.

The box is divided into cells for each match. A plate, hinged at bottom and held against the cells by a spring, has a roughened surface, against which the tips must bear on being withdrawn.

Claim.—A match box constructed as herein shown, and provided on its interior surface with the series of separate match-cells *a a*, in combination with the hinged flaps *b b*, having the friction-surfaces *d d*, and with the springs *c c*, all constructed and arranged as and for the purpose specified.

140,950.—*Meat-Chopper.*—HUGH P. RANKIN, Allegheny, Pa. Application filed May 24, 1873.

A revolving hopper and chopping-block and vertical cutters. The cutters are operated from a crank-shaft through yokes and sliding blocks, the crank-shaft being loosely journaled to yield when a hard substance is struck by the knives.

Claim.—The yokes G *g g* that carry the cutters, combined with a crank-shaft K, loosely journaled in open slots *a a* of uprights A A to rise whenever a bone or other hard substance is struck by the knives, in the manner described.

140,951.—*Apparatus for Producing Intermittent Rotative Movements.*—RUSCOE C. REYNOLDS, Lawrence, Mass. Application filed June 6, 1873.

Claim.—1. For intermittently rotating the gear *l* and a roll or shaft connected therewith, the combination of the eccentric *d*, arm *f*, ratchet *h*, pinion *k*, and pawls *i*, arranged and operating substantially as described.

2. In combination with the two eccentrics *d g*, the head *r* with its slot *s* and clamp-screw *t*, substantially as shown and described.

3. In combination with the ratchet *h*, pinion *k*, and gear *l*, the pinion *u*, ratchet *v*, and pawls *w* for retaining the gear, substantially as described.

140,952.—*Railway Tie.*—GEORGE R. RICHARDSON, Earlville, Ill. Application filed May 26, 1873.

The tie is made in two parts, secured together by screw-bolts. A key prevents lateral play. Wedges are driven in between the two parts at the ends, and afford a means of raising and tightening up the track when any depression occurs, without the labor of tamping.

Claim.—The permanent and adjustable parts of said railroad tie, in combination with each other and with the wedges by which the adjustment is to be made, substantially as described.

140,953.—*Circuit-Closer for Railroad Signals.*—DAVID ROUSSEAU, New York, N. Y., assignor to himself and WM. C. SMITH, same place. Application filed April 9, 1873.

Placed underneath rail between ties; the flexure of rail pressing B down upon E and closing circuit; rubber cushion C holding them apart normally.

Claim.—1. The combination of the top and bottom plates B D, cushion C, and metallic conductor F with each other to constitute an electric circuit-closer beneath a railroad rail, as described.

2. The combination of the adjustable spring E with the metallic conductor F and with the cushion C and plates B D for operation, as set forth.

140,954.—*Ant-Trap.*—LEANDER RUBARTH, Davilla, assignor of one-half his right to JOHN J. PIKE, Milam county, Tex. Application filed March 25, 1873.

The trap is a hollow cone with a center tube which extends below it, each having a detachable overhanging flange. The outside of it is covered with sand for the easy approach of the ant to the inlet.

Claim.—In combination with the hollow cone C, the tube B extended below the bottom thereof at *a*, as and for the purpose shown and described.

140,955.—*Bed-Bottom.*—THOMAS J. SHEARS, Ypsilanti, Mich., assignor of one-half his right to BENJAMIN F. POTTER, same place. Application filed June 11, 1873.

Belts, transverse and longitudinal, interlaced; the longitudinal belts rigidly attached at one end and adjustably at the other, form the bed-bottom, which is held to a proper tension by a roller and ratchet.

Claim.—1. A bed-bottom formed of belts C C and C' C', substantially in the manner described, it being rigidly attached at one end and adjustably at the other, as herein set forth.

2. The combination of the bed-bottom C C C' C', clamp B, roller D, ratchet-wheels *b*, pawls *d*, and lever G, all constructed and arranged, as described, within a frame, as set forth.

140,956.—*Laying Cement Pavements.*—ALEXANDER F. SHIRMA, New York, N. Y., assignor of one-half his right to BERNARD F. MCCAHILL, same place. Application filed May 15, 1873.

The long dividing-plates are notched upon their upper flanges to admit of the insertion of the short cutting-plates, which fit the spaces exactly. The plates are graduated for depth.

Claim.—1. The combination of the cutting-plates B with the dividing-plates A provided with notched flanges, for the purpose of forming a cement pavement, in the manner described.

2. The cement-dividing plate A, graduated substantially as and for the purpose herein shown and described.

140,957.—*Car-Coupling.*—WILLIAM P. SUDDENS, State Line City, assignor to himself and ROBERT CRAIG, Warren county, Ind. Application filed February 21, 1873.

The end of the coupling-pin being placed in the longitudinal groove, coupling will be effected by one draw-head being driven back so that its hole comes beneath the pin. When it is desired that cars should remain together without being coupled the end of the pin is placed in the transverse grooves.

Claim.—1. A buffer-head having in its upper surface longitudinal and transverse or angular grooves for the lower end of the coupling-pin to rest in, arranged substantially as and for the purpose set forth.

2. In combination with a buffer-head having in its upper surface longitudinal and transverse or angular grooves, the bracket or yoke E, arranged to operate substantially as and for the purpose set forth.

140,958.—*Steam-Cylinder Lubricator.*—LEVI F. SMITH, Philadelphia, Pa. Application filed June 6, 1873.

The soft metallic plate that forms the packing between the oil-reservoir and its cover is secured in a hollow cup which is arranged in the stem of such cover in such a manner that it may revolve therein, and thereby relieve the friction and wear occasioned by the screwing on and off of said cover.

Claim.—1. The combination of the stem B with interior chamber *a* of larger diameter than the screw-passage leading thereto, the stem *b* with raised screw-threads on its upper end, the cup E, detachable disk H of soft metal, and the confining-screw *b*, all substantially as and for the purposes herein set forth.

2. The combination of the reservoir D, tube J with hollow screw *d*, globe I with tube K and chambers *f f'*, valves L L', and indicating-finger *h*, all constructed and arranged substantially as and for the purposes herein set forth.

140,959.—*Fare-Box.*—ROBERT D. O. SMITH, Washington, D. C., assignor to JOHN B. SLAWSON, same place. Application filed September 28, 1872.

The guiding-chute delivers the fare at the side of the inspection-chamber, over which is a circular opening in the frame. The fare is swept into the treasury by a vibrating wiper. The box or treasury slides freely in the bottom of the box, to which it is locked by dropping-bolts. A cover, having an irregular end, is inserted through a slot over the box, and, while locking itself to the treasury, and thus closing it, raises the bolts and detaches the locking-bolts and releases the treasury, which is removed and its cover unlocked by a suitable key.

Claim.—1. A fare-box constructed with a semicircular inspection-chamber, A, provided with a transparent cover, *a*, and a vibrating partition or wiper, C, to remove the fares after inspection and deposit them in the passage X leading to the locked safe below, substantially as set forth.

2. In combination with the vibrating partition or wiper C, the swinging doors D and the automatic locking-bolts operated by the wiper-shaft, substantially as set forth.

3. In combination with a safe or drawer, O, provided with locking-bolts P to secure it in its case, a removable sliding combined key and cover, S, and an independent automatic lock, T, to secure said cover S when the same has been inserted, substantially as and for the purpose herein set forth.

4. In combination with the locking-bolts P, the swinging levers R and the sliding cover S, fitted to act as a key to move said levers and locking-bolts, substantially as described.

140,960.—*Farm-Gate.*—THOMAS STEERS, Milton, Wis., assignor of one-half his right to W. G. HAMILTON, same place. Application filed April 17, 1873.

A bar pivoted on the latch end of the gate passes through a guide on the hinge end and hinges to the upper part of the post. The lower hinge slides up and down on a fixed rod. When the gate is lifted for the passage of sheep a cam on the hinge end serves to retain it.

Claim.—The combination of the gate C with strap *a*, the post A with vertical rod *b*, staples *d d*, and hook *f*, the pivoted lever D with eye *h*, the guide E with teeth *i i*, and the pawl G, all constructed and arranged to operate substantially as and for the purposes set forth.

140,961.—*Seeding-Machine.*—HERMAN F. STINDE, St. Louis, Mo. Application filed May 6, 1873.

The furrow-openers consist of V-shaped wheels as to their peripheries, the two outside ones being fixed to the axle and the others independent in their vertical motion. The seed-box has a positive feed, by means of cups upon a shaft in the bottom of the seed-box, and the seed is conveyed to the ground by means of semicircular tubes, one within the other, to allow vertical movement.

Claim.—1. The combination of the frame or harness 1 and 2 with the wheels D^1 D^2 D^3 D^4 D^5 and loops or staples *x* fastened to the cross-piece connecting the posts A^1, in the manner and for the purpose herein set forth.

2. The combination of the supporting-wheels of the machine D and D^5 with the frame A, at the front and side of the same, and the vertical arm 2^{ax} and cross-piece connecting the posts A^1, in the manner and for the purpose herein set forth.

3. The combination of the metallic circular feed-pipe *g'* with the arm a^1, colter or tooth *a* with its wings a^x, and tube *b*, in the manner and for the purpose herein described.

4. The circular metallic feed-pipe *g*, combining with and fitting into the feed-pipe *g'*, both formed upon the same arc of a circle, and allowing a free and easy vertical movement of the pipe *g'* upon the pipe *g*, when constructed and arranged in the manner and for the purpose herein described.

5. The combination of the hooks a^2 with the frame or harness 2, colter-arm a^1, rod or chain a^2, and bar E, in the manner and for the purpose herein described.

6. The combination and arrangement of the levers C c^2 c^4 with the foot-piece c^5, the connecting-rods d^2 d^3 with the curved bars d^4, and bar E, in the manner and for the purpose herein described.

7. The combination and arrangement of the levers C c^3 with rod d^3, crank-lever f^1, and feed-slide *f*, in the manner and for the purpose herein described.

8. The feeding-rod A having formed upon it a series of cylinders or hubs, A^5, in each of which open spaces A^3 are formed of varying size, to regulate and control the supply of seed received within such spaces to be delivered to the seed-pipes *g g*, in the manner herein set forth.

9. The combination, with the feed-rod A, constructed as above set forth, of the bottom f^3 and the feed slide or valve *f* and feed-box B, in the manner and for the purpose herein set forth.

10. The within-described method and arrangement by which the foot-piece c^5 is sustained and released by means of the curved bars c^3, treadle *c*, lever c^4, and its connecting-rods a^1, c^3, and c^5.

140,962.—*Feeding Paper to Printing-Presses.*—CLARENCE H. STODDARD and EDWARD D. NORTON, Ithaca, N. Y. Application filed February 24, 1873.

The paper having been seized by nippers on the impression-cylinder, weighted fingers on a rod above drop upon the feed-table, and, by pressing upon the paper, insure the same remaining smooth.

Claim.—In combination with an impression-cylinder, *a*, having gripers *c*, the guiding-fingers A on a pivoted bar, *d*, having a pendulous lever, *e*, which is intermittingly vibrated by a stop, *f*, on the cylinder.

140,963.—*Driven Well.*—GEORGE W. STORER, Philadelphia, Pa. Application filed June 30, 1873.

An inner wire or strainer is secured upon the periphery of the tube. There is also another wire wound spirally around the same and connected therewith by means of corrugated strips of metal to prevent derangement and obstruction of the strainer while it is being forced into the ground.

Claim.—1. In combination with the perforated tube A and coiled wire C, the corrugated strips D placed upon and secured to said parts, substantially as and for the purpose specified.

2. In combination with the wire C wound spirally upon the tube A, and secured in place by means of the corrugated metal strips D, the wire E, coiled around and secured to said strips, substantially as and for the purpose shown.

140,964.—*Mode of Uniting Boot and Shoe Soles to the Uppers.*—WENDELL STRASSER, Taylorsville, assignor to himself and SAMUEL S. RAUCHMAN, Muskingum county, Ohio. Application filed June 7, 1873.

The upper of a shoe is secured to the sole by staples driven so as to interlock and form a continuous metallic thread.

Claim.—A series of nails, B, applied together to the sole and upper of a shoe, and made to interlock in the manner and for the purpose specified.

140,965.—*Potato-Planter.*—CHRISTIAN SVENDSEN, Blair, Neb. Application filed September 24, 1872.

The potatoes are received from a hopper upon two spiral cylinders winding in opposite directions. The potatoes are cut by a revolving knife, and pass to the hill by a conductor.

Claim.—1. The construction and arrangement, with relation to the hopper D, of the shaft L, pinions P Q Q', worms O O', and spout R, all operated by the traction-wheel axle for planting or dropping the potatoes in the furrow, substantially as described and shown.

2. The wheel N, adapted to revolve by means substantially as described, when arranged, relatively to the worms O O' and dropper-spout R, as described, for the purpose set forth.

140,966.—*Bustle.*—AMOS W. THOMAS, Philadelphia, Pa. Application filed June 5, 1873.

Claim.—1. The construction and arrangement of the bow D, substantially as herein described, its extremities being curved so as to cross or intersect the bows A, to which they are secured by a suitable device, as an eyelet.

2. The tape C, or equivalent strap, lapping over the ends of the bows A A, and made fast by suitable means, as eyelets, substantially as herein described.

3. In combination with the bows, or any number of them, and cord E, the eyelet *c*, or other device for holding, applied after the cord has been passed through an opening to fasten said bows and cord, substantially as described.

140,967.—*Window-Screen.*—JOHN A. THOMPSON, Readington, N. J. Application filed May 24, 1873.

The frame, by reason of the metallic boxes, is extensible so as to fit any desired opening, where it is clamped by means of the thumb-screws. The screen is made to conform to the width of frame required by means of the winding-roller D.

Claim.—The combination of the three-sided frame A, sheet-metal boxes B B having longitudinal slots *a a*, the set-screws *b b*, bar C, roller D with square journal *d*, and screen G, all constructed and arranged substantially as and for the purposes herein set forth.

140,968.—*Harness-Saddle.*—SAMUEL E. TOMPKINS, Sing Sing, N. Y.—Case A. Application filed March 15, 1873.

Claim.—1. The combination of recesses *a* in the frame, one on each side of the channel B, with the flanges C exterior to said recesses, substantially as described.

2. The combination of recesses *a* in the frame, one on each side of the channel B, with the flanges C exterior to said recesses, when said flanges are provided with holes *c*, &c., substantially as described.

3. The combination of recesses *a* in the frame, one on each side of the channel B, with the flanges C exterior to said recesses, either with or without holes *c*, &c., when said recesses contain leather D, substantially as described.

4. The combination of recesses *a* in the frame, and of flanges either with or without holes exterior thereto, substantially as described, when said recesses open out on either side of the frame at the top, the extensions F of the leather pieces D therein contained constituting the middle leather for the saddle.

140,969.—*Harness-Saddle.*—SAMUEL E. TOMPKINS, Sing Sing, N. Y.—Case B. Application filed March 15, 1873.

Claim.—1. The body-frame A, consisting of a thin plate with thickened strengthening portions on the under side along the edge, or thereabout, when such plate is constructed substantially as described.

2. The said frame made flat on the upper side with a sunken bridge, N, at the top, and openings P below it for the back-band to pass over the bridge, and under the middle portion of the frame down the sides, substantially as described.

3. The notches S in the ends of the body-frame A, and projections T to give shape to the back-band, substantially as and for the purpose described.

4. The saddle-frame A, having a plane upper surface, strengthening-ribs on the under side, and a notch and projections at the lower ends, substantially as described.

5. The under plates B, having a wide deep groove on the upper surface to allow the back-band and flap to spring down under the frame between flanges, in the manner described.

6. The said plates having holes Y in the flanges to nail on the leather portions, substantially as described.

7. The plates having holes Z for the nuts of the pad-screws, substantially as specified.

8. The plates having a notch, *b*, and projections *d* at the lower end to allow space for the stiffener, as described.

9. The plates having the notch *s* at the upper end, to allow the back-band to extend up in small saddles, as described.

10. The combination of under plates B with plates A, when said under plates are provided with holes for pad screw-nuts.

11. The middle portion X of the flap to be depressed to make room for the back-band, separated from the sides of the flap by slits *b'*, but not cut off at the ends, substantially as specified.

140,970.—*Harness-Saddle.*—SAMUEL E. TOMPKINS, Sing Sing, N. Y.—Case C. Application filed March 15, 1873.

Claim.—1. A frame cast with a sunken bridge at the top and raised bridges at the middle portions below, so arranged that the back-band passes over the sunken bridge and under the raised bridges, substantially as described.

2. The combination, with a frame cast with the bridge at the top for the back-band to pass over and raised bridges at the middle portions below for it to pass under, of the lower middle portions V for the back-band to pass over, substantially as described.

3. The terret-screws screwed to the middle bridge, which forms a portion of the frame, to allow the back-band to pass under them, substantially as described.

4. The middle portions I, having a raised portion, W, to allow of fitting the terret-nuts flush with the under side, as described.

5. The combination of the strengthening-ribs Y with the frame, when these above are continuous, substantially as described.

6. A frame, with the side portions N, top bridge M, raised bridge I, and lower middle portions V, constructed and arranged substantially as described.

7. The holes Q and R in the seat, to connect it either at the center or rear, substantially as specified.

140,971.—*Corn-Harvester.*—GEORGE M. TOPE, Lecsville, Mo. Application filed June 17, 1873.

Disk-cutters, one of which has a circumferential groove for the other to work in, sever the standing stalks, which are conveyed and delivered in the rear of the machine in quantities sufficient for a shock.

Claim.—1. The combination of the circular knife J with the circumferentially-grooved and serrated wheel K, the two being arranged and operating together, substantially as set forth.

2. The combination of the inner frame C', provided with the rigid guards A A, which are each formed of a single rod and extend around three sides of the frame, with the main frame C, with its upright shafts and endless belts G G, all constructed substantially as and for the purposes set forth.

3. The disks or flanges L L, provided with guards *k k*, in combination with the carrier-belts, substantially as and for the purposes herein set forth.

4. The combination of the ropes f^3, shaft b^3, pulleys d^3, spring *n*, and hooks *m*, substantially as and for the purposes herein set forth.

5. The combination, in a corn-harvester, of the pivoted or hinged derrick M N and hinged part H' of the platform, substantially as and for the purposes herein set forth.

140,972.—*Street-Car Awning.*—CLAUDIA B. TURNBULL, Washington, D. C. Application filed June 13, 1873.

The awning is drawn out by pulling the cords B', and is drawn in by pulling the cords B''. The awning is long enough to protect the horses.

Claim.—In combination with the sliding street-car awning, the cords B' and B'', one attached to lugs C at the extremity of the frame B and the other attached to the front of the awning-frame, the intermediate pulleys *b b' b''*, and cleat E, by means of which the driver, from his position on the front platform, may throw the awning forward, draw it back, or secure it in any desired position, substantially as set forth and shown.

140,973.—*Piston-Rod Packing.*—WILLIAM W. VANDERBILT, New York, N. Y. Application filed May 10, 1873.

The stuffing-box has reverse conical sections, each section having its edges chamfered, so that when two are put together they form a recess with indentations to allow the water of condensation to pass around the various sections, thus making the packing steam-tight.

Claim.—A packing for rods or shafts, composed of a series of sectional conical rings, each section being provided with a groove or recess, *a*, substantially as and for the purpose described.

140,974.—*Pruning-Shears.*—GEORGE VANFOSSEN, Bethesda, Ohio. Application filed June 7, 1873.

An oscillating knife-blade has two cutting-edges for operation upon a double hook-shaped blade, and is connected to the lever-handle by a short link.

Claim.—1. In a pruning-tool with stationary counter-bearings, the combination of the lever D, the link E, and the double-edged knife-blade C.

2. In a pruning-tool, the combination of the shank M, the pivot-holes a^1 a^2, the lever D, the link E, and the knife-blade C with the holes a^3 a^4 a^5, for the purpose of reversing the lever D and its connection with the blade C, and for the purpose of making a chisel of the cutting-edge on the off-side of the blade C.

140,975.—*Bed-Bottom Spring.*—JOHN A. VAN WERT and ARTHUR CROOLEY, Elmira, N. Y. Application filed May 22, 1873.

The spring, made of one piece of wire, has a double stem passing through the center. The base rests upon a slat, through a slot in which the looped end of the stem passes, and through the loop of which a key is inserted.

Claim.—In combination with the slat A, the spring B having the doubled stem C and key *d*, either with or without the cap piece D, as herein shown and specified.

140,976.—*Curtain-Fixtures.*—FELIX WALKER, New Orleans, La. Application filed April 11, 1873.

A round bar bent and sharpened at both ends, and combined with a clutch bearing a cord, wheel, and disks.

Claim.—The combination of the reversible round bar A with bent and sharpened ends *a a*, the clutch B, wheel C, and disks D D, all used with an endless cord, *b*, as and for the purposes set forth.

140,977.—*Step and Step-Box.*—JAMES WATSON, Philadelphia, Pa. Application filed May 5, 1873.

The segmental bearings are held in place by one set of screws and tightened by another set. The disks under the spindle are concave and convex and capable of lateral play, so that the point of wear is constantly being shifted.

Claim.—1. The combination, with a spindle, of a series of disks, H H, arranged below the end of the spindle, and capable of a limited lateral motion, substantially as and for the purpose set forth.

2. The combination, with the segmental bearing-pieces A, of the retaining-screws *a a* and set-screws *b*, as specified.

3. The step-box B, closed at the bottom, and adapted to receive the adjustable segmental blocks A A and disks H H, substantially as described.

140,978.—*Oscillating Cabin for Vessels.*—BERNHARD WEISKER, New York, N. Y. Application filed May 15, 1873.

A platform is hung or pivoted at the middle thereof in a swinging frame. The ends and sides of said platform and frame are connected by rods with vibrating cross-beams of rock-shafts, which have pendent weights rigidly attached thereto to operate as a counterbalance to inequalities of weight on the platform or floor.

Claim.—The combination of pendulums C H with the oscillating frame B and the oscillating floor E of a cabin in a vessel, substantially as shown and described.

140,979.—*School-Desk.*—FRANCIS A. WILBER, Wabash, Ind Application filed May 5, 1873.

Two sliding hinged boards or sections are arranged under the desk-top so that they can be drawn out and form an extended table, or the outer section can be turned back and form a book-support. Pivoted levers are arranged on the sides of the desk to support the outer section when it is turned back.

Claim.—1. In a school desk, the sliding hinged sections *a b*, so arranged within the desk that they may be drawn out and the section *a* turned up to form a book-support, substantially as described.

2. In combination with the sliding sections *a b*, one or more pivoted levers, *c*, arranged at the side of the desk to support the section *a* when turned up, substantially as described.

140,980.—*Die for Making Car-Coupling Pins.*—CHARLES H. WILLIAMS, Cleveland, Ohio. Application filed May 21, 1873.

The dies are adapted to the making of pins of rectangular bars. Dies A gripe the blank and round the corners of it; header B upsets and tapers the head and shapes the collar, and other dies point the other end of the pin.

Claim.—1. The combination of the dies E F G H, constructed as shown, and relatively arranged to operate in such a manner as to impart or give a tapering point to a coupling-pin made from a flat bar of iron having rounded edges, substantially as described.

2. The combination of the clamping or griping dies A A' and the heading-die B for developing the collar and the dies E F and G H for pointing the pin, the whole being constructed and arranged to operate substantially as described.

140,981.—*Die for Manufacturing Car-Coupling Pins.*—CHARLES H. WILLIAMS, Cleveland, Ohio. Application filed May 22, 1873.

A round rod is clamped by two griping-dies, while a header descends and slightly tapers the end and swages a shoulder around the rod near the same end. In another pair of dies this tapered end is flattened, and then placed in another set, where the head is finished and the chain-hole formed in it. The opposite end of the blank is then pointed, which finishes the pin.

Claim.—1. The griping-dies A A' and header or die B for developing the collar, in combination with the pointing-dies K K', the whole being constructed and arranged to produce, by their joint operation, a car-coupling pin, as shown in Fig. 5, substantially as described.

2. The combination of the compound die D and the die E for flattening and drawing out the end of the bar, said dies being of the configuration shown, and constructed and arranged, as stated, so as to permit of their being refaced and refitted without enlarging the cavity they form, substantially as and for the purpose specified.

3. The combination and construction of the dies F F' swaging-dies, G G', and punch H, the whole being arranged and operating as shown, for necking and punching the pin, substantially as described, as and for the purpose specified.

4. The combination of the dies A A' and B for forming a collar, dies K K' for pointing the pin, the compound dies D and the die E for flattening and drawing out the end of the bar, and the dies F F' and G G' and punch H for necking and holding the pin for the action of the punch, substantially as described.

140,982.—*Balance-Wheel for Sewing Machines.*—DAVID G. WILLIAMS, York, Pa. Application filed June 7, 1873.

A loose fly-wheel is arranged upon a sewing-machine shaft with a pawl and ratchet connection, so that the said fly-wheel may be coupled to the shaft only for a forward motion, but will at all times turn loosely when the motion is reversed; also with a stopping-lever which throws the ratchet out of connection, so that the fly-wheel may be revolved either way without affecting the shaft.

Claim.—The combination, with the shaft of a sewing-machine and a loose fly-wheel thereon, of a ratchet-connection, operating in one direction only, and a key-tumbler for disengaging said ratchet-connection when desired, as specified.

140,983.—*Needle-Threader for Sewing-Machines.*—MARY A. WILLIAMS and JOHN T. WILLIAMS, Chicago, Ill. Application filed December 12, 1872.

The thread pushed through the eye of the needle by the point is pressed into and held by the spring-jaw, so that the thread cannot be drawn back by the point.

Claim.—The sewing-machine needle-threader, consisting of the point P for thrusting or carrying thread through the eye of the needle, combined with the plate C, spring B B', and spring-jaws J, all constructed substantially as and for the purpose hereinafter set forth.

140,984.—*Manufacture of Dental Gold.*—RICHARD S. WILLIAMS, New York, N. Y. Application filed June 27, 1873.

A plate having its front and rear edges and one of its sides turned down at right angles to the face of a bed-plate, on which rests the foil with one end bearing against a bridge, is placed over, and one end on, the foil and drawn backward until it reaches a stop, crimping the foil in the operation. The plaited foil is then passed over a spirit-lamp, annealing and making ductile the gold, and is again placed on the bed-plate, when its sides are squeezed between the bridge and turned-down edge of the plate, forming the foil into a bar.

Claim.—1. The apparatus hereinbefore described for preparing dental gold.

2. The process hereinbefore described for preparing dental gold.

140,985.—*Fare-Box.*—JAMES F. WINCHELL, Springfield, Ohio, assignor, by mesne assignments, to JOHN B. SLAWSON, New York, N. Y. Application filed September 6, 1872.

The money and fare drawer has, at its inner end and side, locking-bolts which secure it to the fare-box. A cover, locked open, is unlocked from the drawer by a key which, as a lever, slides it to close the drawer, in which position a spring-bolt secures it, and releases the same from the fare-box, when it is removed and the locked cover again released by another key to gain access to its contents.

Claim.—1. A drawer for fare-boxes, having an automatic lock, *x*, at its inner end for securing the same in its case, and a sliding lid, *w*, for closing the opening in the top of the drawer, and constituting the means or medium for operating the drawer-retaining lock *x* to release the drawer, and a lid-lock, *v*, for securing the lid prior to the release of the drawer, so that the drawer is necessarily closed and locked in the act of releasing it, substantially as herein shown and described.

2. The combination of the stud-catch *y* with one or more circumferential grooves or notches and the lever-bolt 1 with its spring 2, constructed and arranged substantially as shown, for the purpose specified.

3. The catches 4, (two or more,) in combination with the drawer-lid *w* and lock *v* and the drawer-retaining lock *x* for the purpose set forth.

4. The spring-bolts 6 (one or more) and catch 7, arranged and operating substantially as described, in combination with the drawer-lid *w*, for securing the lid in open position and preventing its operation, except by the proper key *t*, as set forth.

5. The spring bolt or catch 14 and ratchet-rack 15, or one or more notches, arranged substantially as described, in combination with a fare-drawer, with sliding lid closed and locked, in the act of operating such bolt or catch, for the purpose set forth.

6. A fare-box provided with a drawer, when said drawer fastens itself in the box in such a manner as to be released only by the movement of a sliding lid, substantially as herein described.

7. A fare-box provided with a drawer which locks itself in the case by means of sliding it in place, and a sliding lid, substantially as herein described, when said lid is moved back over the opening of the drawer and locked, and the drawer unlocked from the case by the movements of said sliding top effected by the action of one key.

8. In combination with a fare-box drawer having a sliding lid for closing and subsequently detaching the same, a key, *t*, constructed substantially as herein described, for releasing and sliding the drawer-lid and withdrawing the closed receptacle.

140,986.—*Change-Gate.*—ALBERT W. WOOD, St. Louis, Mo., assignor to JOHN B. SLAWSON. Application filed February 25, 1873.

The gate is hung upon central pivots embraced by a frame made in two sections and provided with flanges on opposite sides, which limit the play of the gate to one direction only. It is opened by pressure of the hand, and closed by a spring centering one of its pivots.

Claim.—1. In combination with a centrally-pivoted gate, A, a spring A, as arranged to close the gate, in the manner described.

2. In combination with the gate A and spring A, or its equivalent, as described, a gate-frame consisting of two halves, B and C, provided with flanges *e* and *f*, when so arranged, with relation to each other, that the gate can only be opened from either side at one end only, substantially as described.

140,987.—*Flat-Iron Heater.*—JOSEPH C. WRIGHT and JAMES W. SUSSA, Moline, Ill. Application filed April 11, 1873.

Claim.—The combination, with the base A and casing B inclosing lamps C, of the sad-iron-shaped plate G, with alternate up- and down ears *m n*, and the perforated plate D resting on the lugs *b b*, and wire rod *d*, all constructed substantially as and for the purposes set forth.

REISSUE PATENTS.

5,484.—*Bustle.*—MOSES K. BORTREE, Jackson, Mich.—Patent No. 136,127, dated February 25, 1873. Application filed May 17, 1873.

Claim.—1. In a bustle constructed substantially as herein described, the adjusting-cords C, in combination with the band A and springs B, arranged to operate substantially as set forth.

2. The combination of the band A, springs B, adjusting-cords C, and springs E, when the parts are arranged substantially as and for the purposes set forth.

3. The combination of the band A and springs B and E, arranged as shown, with the spiral or coil spring H, substantially as described, and for the purposes specified.

4. The arrangement of the band A, springs B, adjusting-cords C, expander D, and springs E, substantially as and for the purposes described.

5. The arrangement of the band A, springs B, adjusting-cords C, expander D, springs E, with the brace F and spring H, substantially as and for the purposes set forth.

6. The combination and arrangement of the band A, springs B, adjusting-cords C, expander D, springs E, brace F, and adjusting strap G, substantially as described, and for the purposes set forth.

7. The combination of the adjusting-strap G with the band A, springs B and E, and coil-spring H, substantially as and for the purposes described.

5,485.—*Reed-Organ.*—RILEY BURDETT, Erie, Pa.—Patent No. 135,687, dated February 11, 1873. Application filed June 27, 1873.

Besides the qualifying-vent attachment to the stop-valve, three sets of reeds are located in front of the tracker-pins.

Claim.—1. The vent B, in combination with the reed-mute, to allow of a partial or full opening thereof, substantially as described.

2. The reed-board I having three, either full or partial, sets of reeds in front of the tracker-pins, two of which sets enter the reed-board obliquely, substantially as shown.

5,486.—*Process of Making Coke from Lignites, &c.*—HENRY ENGELMANN, Salt Lake City, Utah Ter.—Patent No. 136,592, dated March 11, 1873. Application filed July 7, 1873.

Claim.—1. The process of coking brown coal, lignite, imperfectly coking stone-coal, and analogous coal-like material incapable of effective coking by the usual practice with ordinary coking-ovens, by subjecting these substances to a high initial and sustained heat above the cherry-red, so termed, applied laterally throughout the mass, and derived from a source of heat which is partly or wholly distinct from the combustible gases evolved by the coking process itself, and of a degree above the one created in the ordinary coking-furnaces by the combustion of the coking-gases, substantially as herein set forth.

2. The facilitating of the process of coking of the materials named in claim 1 by mingling the same, if necessary, with coal-tar, asphaltum, or analogous substances, or with bituminous coking-coal, or with coking-coal and coal-tar or asphaltum, &c., together, before subjecting the whole to the high and sustained heat of the coking-oven, substantially as set forth.

3. The process herein described of compacting by mechanical pressure the material to be coked after its introduction into the coking-oven, for the purpose specified.

5,487.—*Machine for Turning Logs.*—ESAU TARRANT, Muskegon, Mich., assignor to ALEXANDER RODGERS, same place.—Patent No. 81,432, dated August 25, 1868. Application filed June 25, 1873.

A toothed or serrated bar is provided with means for imparting to it a vertically-reciprocating movement, when the teeth of the bar catching in one side of the log partially rotate it.

Claim.—1. The toothed bar herein described, operating substantially in the manner and for the purpose specified.

2. The toothed bar C, pivoted at its lower end between the blocks E, which are adapted to slide in vertical grooves formed in the posts D, whereby the said bar C is rendered vertically movable and capable of adjustment to suit logs of different sizes, substantially as herein set forth.

3. The combination of the pivoted brake R, connection S, and pivoted bridge-tree O, substantially as herein shown and described.

4. The combination, with the bar C, of the cord or chain F, pulley G, shaft J, drum I, friction-pulleys K L, and adjustable shaft M, substantially as set forth.

5. The combination of the cam P and shaft Q and weighted arm T with the connected brake and bridge-tree, to operate as and for the purpose described.

5,488.—*Machinery for Goring Gaiters.*—JOSEPH WALDEN, Newark, N. J., assignor of one-half interest to GEORGE PLATTE.—Patent No. 136,508, dated May 7, 1872. Application filed August 12, 1872.

The plate A has converging grooves cut upon its face, which indicate the proper position for the lining, which is held in position by spring-clamps. Attached to the swing-plate are other clamps which press the upper elastic gore-piece and lining when prepared for adhesion.

Claim.—1. The grooved plate A, when made to mark the position in which the lining is to be placed thereon to be folded, and with grooves to aid in folding the edges around the gore-opening, as described.

2. The plate A, made substantially as described, in combination with the spring-clamps *c c*, arranged to receive the shoe-lining and hold it in its adjusted position on said plate while the edges are being creased and folded, as described.

3. The tapering guide-clamp C, made and combined with the plate A to hold the elastic gore, and furnish a guide to set the front and back of the different-sized upper against, as set forth.

4. The press-plates *d d*, combined with the plate A to press the gore, the lining, and the upper, or either two of them, together, as described, for the purpose specified.

5,489.—*Automatic Gate.*—WILLIAM I. WORCESTER, Harvard, Ill.—Patent No. 136,892, dated March 18, 1873. Application filed June 20, 1873.

The latch which holds the gate to and that which holds it open are both operated from the same lever, which is controlled by means of a pendant within reach of the driver approaching the gate, the main latch sliding horizontally against a reacting spring.

Claim.—1. The latch I, in combination with the wire A, lever F, and post E, for the purposes set forth.

2. The combination of the handles G, levers F, posts B E, rod H, link *a*, latch I, and wire A with a gate, substantially as and for the purposes described.

3. The combination of the gate, post C, latch D and connecting-wire, link *b*, rod H, link *a*, levers F, posts B E, and handles G, when the parts are arranged to operate substantially as and for the purposes specified.

4. The arrangement of the gate A, posts B C E, latch D, levers F, handles G, rod H, latch I, links *a b*, and springs *d*, when the parts are constructed and combined to operate substantially as and for the purposes set forth.

5,490.—*Clip-Plate for Carriage-Springs.*—NORMAN C. DEAN, Union Springs, N. Y., assignor of one-half interest to SILAS S. BLISS, same place.—Patent No. 134,859, dated January 14, 1873. Application filed May 17, 1873.

The plate receives the spring-clips and prevents them from being displaced.

Claim.—The metallic plate A, constructed as herein described, having the central vertical hole *a*, parallel transverse flanges *c*, and re-enforced channels *b*, adapted to receive the spring-clips, substantially as and for the purpose set forth.

5,491.—*Inhaler.*—NILES I. DONALDSON, Worcester, Mass.—Patent No. 134,861, dated January 14, 1873. Application filed May 31, 1873.

The vessel to contain the acid is furnished by a bulb blown upon the tubes. The alkali is placed in the wash-bottle, when a single one may serve.

Claim.—1. The combination, with the receptacle in an inhaling apparatus, of the peculiarly-constructed inlet-tube C provided with a bulb, D, upon the lower side of the bent or horizontal portion *a* of the tube, substantially as set forth.

2. The combination, with the inlet-tubes C C', of the funnels or valves F, substantially as and for the purpose set forth.

3. An inhaling apparatus, consisting of a main receptacle, A, having a single opening provided with a stopper, B, inlet-tube or tubes C, liquid bulb or bulbs D upon the lower side of the bent or horizontal portion of the tube which is within the main receptacle and drait-tube E, substantially as set forth.

4. The peculiarly-constructed inlet-tube C bent at *a*, as shown, and having the communicating bulb D blown on the lower side of the bent or horizontal portion of the tube, as and for the purposes specified.

5,492.—*Dress-Facing.*—WILLIAM H. GALLUP, Troy, N. Y.—Patent No. 136,396, dated April 29, 1873. Application filed June 24, 1873.

Claim indicates the invention.

Claim.—As a new article of manufacture, a skirt-protecting facing composed of a plain band of stiffened fabric and a fluted strip attached thereto, substantially as and for the purpose described.

5,493.—*Cylinder for Burring-Machines.*—JOSIAH K. PROCTOR, Philadelphia, Pa., assignor of one-half interest to CHARLES R. LINDSAY.—Patent No. 132,690, dated October 29, 1872. Application filed April 12, 1873.

Claim.—In combination with a grooved cylinder, the toothed wire, constructed as shown, wedge-shaped in cross-section, and applied by having its base inserted in the spiral groove of said cylinder, and secured therein by the compression of the metal of the cylinder around it, as specified.

5,494.—*Dovies for Lining Cement Pipes.*—MELVIN STEPHENS, Brooklyn, N. Y.—Patent No. 126,100, dated April 23, 1872. Application filed June 5, 1873.

Cone left in until cement sets, and then withdrawn.

Claim.—1. The manufacture of cement-lined metal pipe, by means of a contractible cylindrical core that retains the cement lining firmly in contact with the pipe until the cement has consolidated, after which the core is removed, substantially as set forth.

2. The cylinder *a*, with the toggles connected to the inside thereof, for expanding and sustaining the cylinder, and for contracting the same previous to removal, substantially as set forth.

3. The contractible cylinder *a*, connected removably to the conical spreader, substantially as and for the purposes set forth.

5,495.—*Saddle-Tree.*—SAMUEL E. TOMPKINS, Sing Sing, N. Y.—Patent No. 30,168 dated September 25, 1860; reissue No. 4,709, dated January 9, 1872. Application filed May 29, 1873.

Claim.—1. A saddle tree, when constructed with depressions in its sides retaining the stiffener or stiffeners and tongues of flap wholly within such depressions and flush with the top of the flanges, substantially as described.

2. A saddle-tree, when constructed with depressions in its sides for retaining the stiffener or stiffeners and tongue of flap, substantially as described, in combination with the level flanges.

3. A saddle-tree, constructed with depressions in its sides for retaining the stiffener or stiffeners and tongue of flap, such depressions containing a series of holes, substantially as described.

4. A saddle-tree containing such depressions and level flanges, such flanges containing a series of holes, substantially as described.

5. An interposed or separate piece of leather applied to a removable seat-tree, substantially as and for the purposes described.

6. The arrangement of the underneath surface, substantially as described, of a cast-metal harness saddle-tree containing depressions F F in its sides, which depressions form bearings on the under side.

7. The combination of a projection on the tree for retaining the seat in position, with recesses in the under side of the said seat, in which said projection rests, and serves as a support and rest for the front side of the seat.

8. A hook constructed with a shoulder at its rear, when combined and arranged with a jog on the under side of the tree, substantially as described.

INDEX OF INVENTIONS PATENTED JULY 15, 1873.

	Class No.	Whole No.
Abdominal supporter, E. J. Harding	156	140,778
Auger, earth, Baisley and Wilson	51	140,756
Aluminium, electro-deposition of, J. A. Jeançon	113	140,924
Bale tie, cotton, F. Cook	7	140,766
Bales, hoop tie for cotton, E. J. Beard	7	140,873
Barrel hoop, H. Willard	40	140,862
Barrel making machinery, H. P. Hall	40	140,776
Bed bottom, T. J. Shearrs	62	140,935
Bed bottom, J. V. Taylor	62	140,856
Bed bottom spring, Van Wert and Crooley	62	140,975
Boiler, wash, E. H. McDonald	136	140,936
Boot and shoe soles to the uppers, uniting, W. Strasser	16	140,964
Boots and shoes, machine for cutting off pegs in, A. Whittemore	16	140,803
Box, match, C. Prahl	90	140,949
Box scraper, A. Tester	29	140,857
Bridges, constructing, T. C. Clarke	21	140,888
Bustle, M. K. Bortree, (reissue)	60	5,484
Bustle, A. W. Thomas	60	140,966
Candles, drip cup for, D. M. Ayer	90	140,753
Cans, preparation of solder for sealing oyster and fruit, E. Morris	136	140,840
Car awning, street, C. B. Turnbull	121	140,972
Car coupling, E. W. Barker	122	140,805
Car coupling, W. P. Siddens	122	140,957
Car coupling pins, die for making, C. H. Williams	122	140,980
Car coupling pins, die for making, C. H. Williams	122	140,981
Car, dumping, J. Hughes	121	140,779
Car starter, T. W. Johnston	122	140,781
Car stove, railroad, W. S. Jones	154	140,831
Carding machines, waste removing device for, G. W. Craner	28	140,814
Carpet rag looper, W. Clayton, Jr	95	140,889
Carriage springs, clip plate for, N. C. Dean, (reissue)	31	5,490
Carts, apparatus for loading, J. Byerly	79	140,884
Chair, child's, J. F. Dowdings	62	140,900
Chair, invalid, T. Armstrong	62	140,968
Churn, reciprocating, Barrett and Fenimore	45	140,871
Churn, reciprocating, L. I. Bodenhamer	45	140,880
Churn, reciprocating, M. W. Staples	45	140,796
Cigar bunches, machine for making, S. Scholfield	160	140,848
Cigar bunches, machine for making, D. A. Wightman	160	140,860
Cigar bunches, machine for making, D. A. Wightman	160	140,861
Cigar filler, apparatus for arranging, S. Scholfield	160	140,850
Cigar machine, C. J. Delbridge	160	140,806
Cigar machine, T. Ernst	160	140,906
Cigar machine, S. Scholfield	160	140,845
Cigar machine, S. Scholfield	160	140,846
Cigar machines, roll for, D. A. Wightman	160	140,859
Cigar trimmer, S. Scholfield	160	140,847
Cigar wrapping machine, S. Scholfield	160	140,849

	Class No.	Whole No.
Clamp, J. E. Sinclair	29	140,852
Clay articles, mold for forming, C. A. Fischer	115	140,910
Coke from lignites, &c., process of making, H. Engelmann, (reissue)	61	5,486
Cooler, milk, J. F. Hawkins	45	140,919
Cooler and show case, combined water, P. J. Hanonr	58	140,777
Cooling storage rooms, apparatus for, J. Ring	58	140,792
Cotton gin, M. E. Pratt	41	140,791
Coverlet, C. K. Pevey	62	140,948
Crane, R. Briggs	79	140,882
Cultivator, J. Caylor	43	140,885
Cup for candles, drip, D. M. Ayer	90	140,753
Curtain fixture, L. J. Earll	62	140,901
Curtain fixture, F. Walker	62	140,976
Cutter head, J. F. W. Erdmann	174	140,905
Cutter, rotary, Mellor and Orum	173	140,938
Cylinder for burring machines, J. K. Proctor, (reissue)	28	5,493
Dental gold, manufacture of, R. S. Williams	46	140,984
Desk, school, F. A. Wilber	62	140,979
Dish heater, S. S. Fitch	154	140,769
Ditching machine, H. Gonellas	114	140,920
Doors, construction of, W. W. J. Toussaint	50	140,799
Dredging machine, H. Gonellas	52	140,821
Dress facing, W. H. Gallup, (reissue)	38	5,492
Drilling machine, metal, J. C. Keller	100	140,925
Drills, feeding mechanism for rock, J. Doty	124	140,767
Egg and cake beater, J. W. Condon	88	140,891
Egg carrier, J. A. Bean	116	140,807
Engine, compound steam, Cooper and Emery	150	140,892
Engine, rotary steam, C. Grotz	150	140,914
Eye glass, S. Greacen	157	140,912
Eye wash, R. C. Fisher	98	140,768
Fare box, R. D. O. Smith	42	140,959
Fare box, J. F. Winchell	42	140,985
Fence, iron, B. G. Devoe	52	140,897
File, paper, J. F. Winter	146	140,863
Filter, J. M. Evarts	167	140,907
Fire-proof shutter, I. S. Mettler	30	140,839
Flat iron heater, Wright and Sarsa	154	140,987
Floor, L. S. Wood	30	140,864
Fruit jar, E. G. Haller	58	140,916
Furnace for roasting ores, shaft, T. McGlew	99	140,837
Furnace slag, apparatus for cooling and removing blast, A. Kloman	85	140,927
Gage, dial for pressure, J. Annin	148	140,867
Gaiters, machinery for goring, J. Walden, (reissue)	16	5,488
Gas and water mains, coupling for, W. Kilburn	167	140,834
Gas from oils, apparatus for making, S. H. Goldthorp	66	140,911
Gate, automatic, W. I. Worcster, (reissue)	52	5,489
Gate, change, A. W. Wood	42	140,986
Gate, farm, T. Steers	52	140,960
Generator, steam, I. Barton	148	140,872
Grain binder, J. F. Gordon	74	140,822
Grindstone, J. F. and S. H. Green	70	140,823
Harness saddle, S. E. Tompkins	72	140,968
Harness saddle, S. E. Tompkins	72	140,969
Harness saddle, S. E. Tompkins	72	140,970
Harvester, E. M. Awry	74	140,804
Harvester, corn, G. M. Tope	75	140,971
Harvester knives, machine for grinding, J. M. Connel	74	140,810
Harvester knives, machine for grinding, J. M. Connel	74	140,811
Hat stretching machine, R. Eickemeyer	76	140,903
Hinge, compound, H. Loth	24	140,930
Hinge, table, J. W. Palmer	24	140,947
Hoisting machine, P. W. Mellen	79	140,786
Hook, siding, J. F. Elliott	29	140,904
Hoop tie for cotton bales, E. J. Beard	7	140,873
Hose coupling, S. Ingersoll	167	140,830
Hose reel, T. J. Mayall	81	140,784
Hose, machine for the manufacture of, T. J. Mayall	84	140,934
Houses, construction of, T. W. H. Moseley	30	140,941
Houses, construction of, T. W. H. Moseley	30	140,942
Inhaler, N. I. Donaldson, (reissue)	156	5,491
Inhaler, Hunter and Woods	156	140,828
Ink for stamping purposes, J. B. F. Jud	146	140,782
Insect destroyer, J. A. Finney	63	140,818
Iron and steel, manufacture of, Bolton, Jr., and Pedder	85	140,761
Ironing board, E. Bassett	91	140,758
Journal box lining, S. Gwynn	87	140,774
Journal box lining, S. Gwynn	87	140,775
Knitting machine, C. Callahan	89	140,909
Knitting machine, O. F. Tripp	89	140,800
Knives, forks, &c., apparatus for cleaning, E. Marwedel	88	104,932
Lamp, J. M. Clark	90	140,764
Lamps, supplying oil to street, R. V. De Guinon	90	140,815
Last block fastener, D. Huard	16	140,827
Lemon squeezer, J. H. Mead	88	140,785
Lock, hasp, J. Kinzer	93	140,926
Logs, machine for turning, E. Tarrant, (reissue)	130	5,487
Loom, G. Crompton	95	140,894
Lubricator, steam cylinder, L. F. Smith	87	140,958
Man hole covers, device for securing, J. J. Craven	110	140,893
Meat chopper, H. P. Rankin	25	140,950
Meat and vegetable cutter, Hall and Ellis	25	140,824
Medical compound, T. T. Wright	98	140,986
Mirror holder, W. Simpson	68	140,851

	Class No.	Whole No.
Miter box, G. M. Stevens	99	140,853
Miter machine, D. Bull	29	140,763
Motion, device for transferring, W. H. Benson	67	140,878
Movement, apparatus for producing intermittent rotative, E. C. Reynolds	67	140,951
Mowing machine, C. Colahan	74	140,890
Nozzle, steam, W. Ebbitt	118	140,902
Numbering heads, C. W. Dickinson	15	140,899
Organ, reed, R. Burdett, (reissue)	106	5,485
Packing, piston rod, W. W. Vanderbilt	151	140,973
Paint for oil barrels, &c., W. L. Elkins	107	140,817
Pavement, W. Kilburn	110	140,835
Pavement, laying cement, A. F. Shyrma	110	140,956
Pen, fountain, J. Goodyear	146	140,771
Pencil case, S. S. Rembert	146	140,862
Pencils, machine for finishing, T. H. Muller	174	140,946
Petroleum, refining, S. Van Syckel	47	140,801
Pipes, device for lining cement, M. Stephens, (reissue)	20	5,494
Pipe, smoking, W. H. Morris	100	140,940
Pitcher, molasses, D. C. Ripley	88	140,793
Planter, potato, C. Sveadsen	133	140,965
Potato screen, G. Claflin	63	140,893
Powder keg, Green and Wilson, Jr	71	140,913
Press, cotton, J. P. Pridgeon	7	140,841
Printing press, C. B. Cottrell	117	140,813
Printing press, feeding paper to, Stoddard and Norton	117	140,960
Pruning shears, G. Vanfossen	63	140,974
Pump, cylinder for lining wooden, R. W. Wheeler	118	140,982
Pump, double-acting force, J. P. Flanders	118	140,819
Pump plunger and pump, N. P. Sheldon	118	140,795
Railway rail joint, J. Bishop	120	140,760
Railway signal apparatus, electric, F. L. Pope	50	140,790
Railway signals, circuit closer for, D. Rousseau	50	140,953
Railway switch, A. C. Garratt	120	140,770
Railway switch, M. and J. W. Fels	120	140,909
Railway switch, B. Hall	120	140,915
Railway switch, F. P. Hanchett	120	140,917
Railway tie, G. R. Richardson	120	140,952
Rivets, manufacture of hollow, M. Bray	14	140,881
Roof truss, iron, A. Gottlieb	126	140,772
Roofing composition, C. Mueller	126	140,945
Roofing, metallic, C. Lewando	126	140,928
Rubber sheets into strips, machine for cutting, T. J. Mayall	84	140,933
Saddle tree, S. E. Tompkins, (reissue)	72	5,495
Sash cord guide, C. B. Clark	24	140,887
Sash holder, Devol and Okey	24	140,898
Saw, wheel or pulley for band, Roche and Orton	150	140,794
Scaffold, adjustable, J. S. Tilley	30	140,858
Scraper, Mayfield and Payne	51	140,935
Scraping hogs, apparatus for, McNeil and Dalton	25	140,838
Screw cutting machine, Jaycox and Webster	14	140,789
Sealing oyster and fruit cans, preparation of solder for, E. Morris	136	140,840
Seat, revolving, G. F. Dawson	62	140,895
Seeding machine, H. F. Stinde	133	140,961
Sewing machine, T. L. Melone	134	140,787
Sewing machine stand, H. Loth	134	140,919
Sewing machine table, J. Bennor	134	140,874
Sewing machine table, J. Bennor	134	140,875
Sewing machine table, J. Bennor	134	140,876
Sewing machine treadle, W. D. Wood	134	140,985
Sewing machine, balance wheel for, D. G. Williams	134	140,839
Sewing machine, extension table for, J. Bennor	134	140,877
Sewing machines, needle threader for, M. A. and J. T. Williams	134	140,983
Sharpening machine, Kesley and Rigney	131	140,832
Shoe, ladies' gaiter, H. C. Letsinger	16	140,836
Shoe, rubber, Hyatt and Canfield	16	140,829
Sifter, A. Bardell	170	140,869
Soap, manufacture of, F. M. Pleins	98	140,789
Soda, apparatus for extracting nitrate of, R. F. Fairlie	1	140,906
Spade and fork, H. Stone	141	140,855
Spike, G. N. and G. N. Sanders, Jr	103	140,844
Spinning ring, J. B. Bancroft	142	140,757
Steel and other metals to anneal them for punching, &c., treating Bessemer, G. W. Billings	85	140,759
Steel plates, manufacture of, O. Bolton, Jr	100	140,762
Step and step box, J. Watson	67	140,977
Stereotype molds, machine for making, R. A. Hill	164	140,921
Stone and glass polishing machine, J. Meisse	68	140,937
Stove, heating, J. L. Ring	154	140,843
Stove pipe shelf, D. R. Moore	98	140,939
Stove pipe shelf, W. Patterson	98	140,788
Stove, summer, W. A. Barlow	154	140,870
Tassel for umbrellas and canes, W. Harnsch	165	140,925
Telegraph, pneumatic, A. Jaynor	158	140,923
Thill coupling, C. F. Kidder	31	140,833
Tobacco transplanter, C. E. Bates	63	140,806
Toy, automatic, H. L. Brower	143	140,883
Toy automaton, R. J. Clay	143	140,765
Toy catapult, W. S. How	143	140,922
Toy money box, T. A. Taylor	143	140,796
Trap, ant, L. Rubarth	63	140,954
Trap and seed safe combined, animal, S. V. Greer	143	140,773
Trap, hog, A. B. De Vore	144	140,816
Umbrella notches, manufacture of, A. and I. Hersberg	165	140,929
Vessels, oscillating cabin for, B. Weisker	137	140,978
Wagon weighing attachment, J. W. Hill	132	140,826

	Class No.	Whole No.
Walls, gage for erecting plank, T. W. H. Moseley	29	140,943
Washing machine, J. W. Conroy	91	140,812
Watch escapement, D. J. Mozart	36	140,944
Water closet, J. H. Stevens	8	140,797
Water elevator, S. Bennett	118	140,806
Water, pneumatic apparatus for elevating, Blanchard and Prall	118	140,879
Water supply valve, P. Harvy	152	140,918
Well, driven, G. W. Storer	51	140,963
Windmill, W. W. Marsh and O. E. Miles	118	140,931
Windmill, J. F. Stewart	118	140,854
Window sash and frame, D. Mackay	30	140,783
Window screen, J. A. Thompson	30	140,967

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED JULY 15, 1873.

American Metaline Company, The, assignee 140,774, 140,775
Annin, J., Dial for pressure gage 140,867
Armstrong, T., Invalid chair 140,868
Awry, E. M., Harvester 140,804
Ayer, D. M., Drip cup for candles 140,755
Baisley, G. H., and G. Wilson, Earth auger 140,736
Bancroft, J. B., Spinning ring 140,737
Bardell, A., Sifter 140,869
Barker, E. W., Car-coupling 140,805
Barlow, W. A., Summer stove 140,870
Barrett, E., and G. W. Fenimore, Reciprocating churn 140,871
Barton, I., Steam generator 140,872
Bassett, E., Ironing board 140,758
Bates, C. E., Tobacco transplanter 140,808
Baughman, S. S., assignee 140,964
Beam, J. A., Egg carrier 140,807
Beard, E. J., Hoop tie for cotton bale 140,873
Bennett, S., Water elevator 140,808
Bennor, J., Sewing machine table 140,874
Bennor, J., Sewing machine table 140,875
Bennor, J., Sewing machine table 140,876
Bennor, J., Extension table for sewing machines 140,877
Benson, W. H., Device for transferring motion 140,878
Billings, G. W., Treating Bessemer steel and other metals to anneal them for punching 140,759
Bishop, J., Railway rail joint 140,760
Blanchard, J. M., and W. E. Prall, Pneumatic apparatus for elevating water 140,879
Bliss, S. S., assignee, (reissue) 5,490
Bodenhamer, L. L., Reciprocating churn 140,880
Bolton, C., Jr., and J. Pedder, Manufacture of iron and steel 140,761
Bolton, C., Jr., Manufacture of steel plates 140,762
Bonsano, A., assignee 140,888
Bortree, M. K., Bustle, (reissue) 5,484
Bray, M., Manufacture of hollow rivets 140,881
Briggs, R., Crane 140,882
Brower, H. L., Automatic toys 140,883
Bull, D., Miter machine 140,763
Burdett, R., Reed organ, (reissue) 5,485
Burt, F. C., assignee 140,836
Byerly, J., Apparatus for loading carts 140,884
Callahan, C., Knitting machine 140,809
Canfield and Hyatt 140,829
Cayler, J., Cultivator 140,885
Cladin, G., Potato screen 140,886
Clark, C. B., Sash cord guide 140,887
Clark, C. S., assignee 140,805
Clark, J. M., Lamp 140,764
Clarke, T. C., Bridge 140,888
Clarridge, J., assignee 140,805
Clay, R. J., Toy automaton 140,765
Clayton, W. Jr., Carpet rag looper 140,889
Colahan, C., Mowing machine 140,890
Condon, J. W., Egg and cake beater 140,891
Connel, J. M., Machine for grinding harvester knives 140,810
Connel, J. M., Machine for grinding harvester knives 140,811
Conrey, J. W., Washing machine 140,812
Cook, F., Cotton bale tie 140,766
Cooper, J. E., and A. D. Emery, Compound steam engine 140,892
Cottrell, C. B., Printing press 140,813
Craig, R., assignee 140,957
Craner, G. W., Waste removing device for carding machine 140,814
Craven, J. J. Securing man hole covers 140,893
Crompton, G., Loom 140,894
Crosley and Van Wert 140,975
Cunningham, J., assignee 140,857
Dalton and McNeil 140,838
Dawson, G. F., Revolving seat 140,895
Dean, N. C., Clip plate for carriage springs, (reissue) 5,490
De Guimon, R. V., Supplying oil to street lamps 140,815
Delbridge, C. J., Cigar machine 140,896
Dennison, D. B., assignee 140,914
Devoe, B. G., Iron fence 140,897
Devol, J. L., and J. M. Okey, Sash holder 140,898
De Vore, Hog trap 140,816
Dickinson, C. W. Numbering heads 140,899
Donaldson, N. L., Inhaler, (reissue) 5,491
Doty, J., Feeding mechanism for rock drills 140,767
Downing, J. F., Child's chair 140,900
Earll, L. J., Curtain fixture 140,901
Ebbitt, W., Steam nozzle 140,902
Eickemeyer, R., Hat stretching machine 140,903
Elkins, W. L., Paint for oil barrels, &c. 140,817
Elliott, J. F., Siding hook 140,904
Ellis and Hall 140,824
Emery and Cooper 140,892
Engelmann, H., Making coke from lignites, (reissue) 5,486
Erdmann, J. F. W., Cutter head 140,905
Ernst, T., Cigar machine 140,906
Evarts, J. F., Filter 140,907
Fairlie, R. F., Apparatus for extracting nitrate of soda 140,908
Fels, M. and J. W., Railway switch 140,909
Fenimore and Barrett 140,871
Finney, J. A., Insect destroyer 140,818
Fischer, C. A., Mold for forming clay articles 140,910
Fisher, R. C., Eye wash 140,768
Fitch, S. S., Dish heater 140,769

Wright, J. C., and J. W. Sursa, Flat iron heater 140,987
Wright, T. T., Medical compound 140,866

BOUND VOLUMES OF PATENTS.

The Office is now prepared to furnish to subscribers the monthly volumes of patents at $125.00 per annum, bound in half-sheep.

In these volumes the specifications are in full, the type of the same size as the printed patents and records; the drawings are in full, but are one-half the size (linear) of those attached to the patents and bound up for record; the illustrations are four on a page, but *fac-similes* of the originals, with the headings and signatures.

The volumes are the same size as the patents and the OFFICIAL GAZETTE, and have an average of 800 pages of specifications, 200 of drawings; total of each volume about 1,000 pages. They commenced with the issue of July 2, 1872, being the successors in this form of the weekly volumes of patents published under the joint resolution of Congress, passed January 11, 1871, which discontinued the publication of the illustrated annual report of the Commissioner of Patents, and provided for the publication *in lieu* thereof of complete copies of the specifications and drawings of patents issued subsequently to June 30, 1869. Under this resolution the volumes were to be placed for free public inspection in the capital of each State and Territory of the United States, and in the clerk's office of certain of the federal courts. The Commissioner is also authorized by the resolution to "furnish a complete set of such specifications and drawings to any public library which will pay for binding the same into volumes to correspond with those in the Patent Office, and for the transportation of the same, and which shall also provide proper custody for the same, with convenient access for the public thereto, under such regulations as the Commissioner shall deem reasonable."

After filling the requisition as provided above, a surplus remains which the Commissioner now offers at the rate of $125.00 per annum—say, 1,000 pages per month: 9,600 pages of specifications, 3,120 pages of drawings—12,720 pages.

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

REMITTANCES.

All money sent by mail, either to or from the Patent Office, will be at the risk of the owner. In no case should money be sent inclosed with models. All payments to or by the Office must be paid in specie, Treasury notes, national bank-notes, certificates of deposit, or post-office money-orders.

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 31, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1868,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the police of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks)	6,500
SEWING-MACHINES and attachments	2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes	4,000
PRINTING; including presses, type, and printers' furniture	2,500
CARRIAGE-WHEELS; including hubs, spokes, tires, and axles	1,200
FELTING and HATS; including caps, bonnets, flock, &c.	1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments)	1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs	1,400
CARRIAGES and WAGONS; (excepting wheels, hubs, and axles) (in progress.)	

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished, gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited and the invention therein described will become public property, as against the applicant therefor, unless he shall make a new application within two years from the date of notice of the original allowance.

The following abbreviated forms of the Patent Office classification by subject-matter may be of assistance to persons ordering copies of specifications and drawings by class. Of course the classes vary somewhat in number of patents, and in following a branch of industry it may be necessary to group several classes to secure absolute completeness. These groupings will readily suggest themselves to the inventor or mechanic.

Aërated liquor apparatus	1	Leather	92
Air and gas engines	2	Locks and latches	93
Amalgamators, ore-mills	3	Locomotives	94
Architecture	4	Looms	95
Artificial limbs, &c	5	Manures	96

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 4.—NO. 4. TUESDAY, JULY 22, 1873. PRICE { $5,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1873 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

COMMISSIONER'S DECISIONS.

BROOKFIELD AND HEMINGRAY *vs.* BROOKE.—*Interference.*

[*Appeal from the decision of the Board of Examiners-in-Chief in the matter of the interference between the applications of James M. Brookfield and Robert Hemingray and the patent of Homer Brooke, for* IMPROVEMENT IN THE MANUFACTURE OF INSULATORS. *Decided July* 3, 1873.]

Where two conflicting applications are pending in the Office at the same time, and a patent is issued upon one of them by mistake without declaring an interference between them, the rights of the parties will be determined on the same ground as if both were applicants; the one who has obtained a patent will derive no advantage from it in the controversy, neither will the other be prejudiced by it.

The party who first conceived an invention, and made drawings of it, and endeavored to induce manufacturers to adopt it and introduce it, without whose aid it could not be done, held to be the prior inventor, although his competitor, being a manufacturer himself, was enabled thereby to anticipate him in introducing it into use.

LEGGETT, *Commissioner:*

This cause was decided by the Examiner of Interferences in favor of Brooke, and by a majority of the Board in favor of Hemingray, one member dissenting. Brookfield has filed an admission that both the other parties precede him in date of invention, which leaves the question of priority to be decided between them only. The invention in controversy is a process of making glass insulators for telegraph-wires. Molten plastic glass placed in a mold of suitable form to make an insulator receives a plunger, which is quickly withdrawn, leaving a hole into which a screw-threaded mandrel is inserted. As soon as the glass becomes slightly cooled and set the mandrel is unscrewed, leaving the cavity screw-threaded. The respective steps in the process are the same, except that Brooke proposes to rotate his mandrel while it is descending into the cavity in the glass. Hemingray thrusts his in, and relies alone on unscrewing it to perfect the glass screw-thread.

Brooke's application was filed December 11, 1869, and his patent granted January 25, 1870. Hemingray's application was filed January 3, 1870. Both were pending in the Office at the same time, but by some mistake they were assigned to different classes, and Brooke's patent was granted without an interference. This was in violation of the statute, and Hemingray is not to be prejudiced under such circumstances by the fact that Brooke has a patent. See *Hamilton* vs. *Foster*, Decisions, 1869, p. 30. This interference was declared before preliminary statements were required by the rules of the Office. Hemingray does not fix the date of his invention definitely in his testimony, but says he made it before the 4th of February, 1869, in warm weather, and he thinks in July or August, 1868. At that time a number of insulators were made by the process in question. This is amply proven, and is conceded by Brooke. At least one of the insulators then made was put into use. In May, 1869, he manufactured and sold a large number. It is not necessary to consider the testimony of Hemingray further. The substance of it all is, he completed and successfully practiced his invention in the summer of 1868, employed it largely to supply the trade in the spring of 1869, and applied for a patent early in January, 1870.

Brooke proves that he conceived the invention in the winter of 1867 and 1868, and made a drawing of a machine necessary to the actuation of the process, and illustrating it so far as it is possible to exhibit a process by a drawing. This drawing, which is put in evidence, was exhibited to others, as they testify in support of Brooke, and the machine and process were intelligibly explained to them during the spring and summer of 1868. Brooke at the same time expressed his intention

to take out a patent. In February, 1869, he showed his drawing to a model-maker, explained the invention, and inquired, "What would be the cost of getting up models for the Patent Office?" (Shedlock, 2, 3.) He swears he made efforts at different times to induce different parties engaged in glass manufacture to use his invention. In June, 1869, he practically tested his process in Brookfield's shop, as is fully proven, successfully making a number of insulators. Brookfield was present and gave him an order for a machine, which was completed and delivered July 6, following. Afterward, the same year, he made Brookfield other machines. These are the facts in proof in behalf of the parties, respectively, and they are nowhere disputed. The question is whether Brooke, being first to conceive the invention, used reasonable diligence to adapt and perfect it for practical use. It is to be noted that he is not a glass manufacturer, and Hemingray is. Although he could (as he swears he did in 1869) make the machine, he could not himself readily use it to practically test his process. The best he could do, or all that he could reasonably be required to do, was to explain the process, in connection with the drawing of the machine, to those engaged in glass manufacture who would be likely to be interested by him to take it up and test it. This he did, and in about a year and a half from the date of his first conception of it he succeeded in introducing it into use in Brookfield's shop.

It is not shown by what means he could have had it used or tested any sooner than he did. There is nothing standing against him except the mere lapse of a comparatively short period of time during which another, better situated, perfected and used the invention. He accounts for his delay, and for no greater delay than that his own oath uncontradicted is sufficient. The reason alleged for not applying for a patent sooner, and thus conferring his invention upon the public, is that "he did not feel in circumstances to make application," and it is nowhere alleged or shown that he was. The screw-threaded insulator itself was patented. He could not use his process without making terms with the patentee, and he swears he saw him and tried to interest him in his invention. Hemingray employed the process as soon as he thought of it, because it was for his interest to do so, and he had nothing to prevent him.

But the question is not who *used* it first. That is not the only matter of importance in a controversy of this character. Precedence in its inception, the date of its origination, the time when sufficient proof shows it to have been so far developed by the aid of a drawing or model as to be actually communicated to the knowledge of others, who attest both their knowledge and the means of their knowledge, *is* quite as important. Brooke was unquestionably first as to that much of the act or work of invention, and the test of reasonable diligence afterward must not be applied with unreasonable rigor to cut him off. Although he did not at first perfect and prove his invention by use, or by embodying it in due form in an application for patent in this Office, I think he is shown by the proof to have been reasonably diligent in doing both. If I am correct in this opinion, his right to a patent should not be denied.

The decision of the Board is reversed and priority awarded to Brooke.

GEORGE CROMPTON.—*Appeal.*

[Appeal from the decision of the Board of Examiners-in-Chief in the matter of the application of George Crompton for patent for LOOMS.—*Decided July 16, 1873.]*

LEGGETT, *Commissioner:*

It appears that this application has been in interference with an application of John C. Duckworth, and that priority of invention has been decided in favor of Duckworth, who has since been granted his patent. Now applicant submits an amended claim covering, as he alleges, subject-matter which is patentable, which was not involved in the interference, and which is not to be found in Duckworth's patent. In connection with his claim he enters a disclaimer referring to the matter claimed by Duckworth, as follows:

"I do not claim the employment of two series of heddle-levers, one series pendent on one fulcrum, and another series upright on another fulcrum, in combination with horizontal jacks which are in direct contact with the pattern-chain between their pivotal points and notches. But what I do claim as of my own invention is—

"A series of long upright levers, one lever for each leaf of heddles, and each connected to a leaf of heddles, in combination with horizontal jacks which are in direct contact with the pattern-chain between their pivotal points and notches, substantially as and for the purpose described."

From this it is apparent that the only difference between the subject matter of applicant's claim and that of Duckworth's is that Duckworth claims heddle-levers arranged in two series, one above the other; in other words, each lever is divided into two parts, the upper part resting upon and being raised by the lower part. The divided levers or double series, as the Examiner remarks, work, in combination with the other elements of the claim, as one lever. The long single levers are old. Duckworth substituted the double series for them, as he sets out in his patent, because, on account of their length, they were slender and frail, and difficult to cast in a sufficiently perfect manner. Besides, when one was broken the whole lever had to be replaced. By employing two shorter levers, pivoted so as to operate as a single lever, for the purpose of working the heddles, something was saved in case of breakage. He also sets forth in his patent that the arrangement and operation of the pattern mechaniam, jacks, &c., "does not depend upon having the heddle-levers arranged in two series, but is equally applicable to a single series of long upright heddle-levers."

This is obvious, I think, and therefore applicant does not present a combination at all different as such from Duckworth's. The same subject-matter is in Duckworth's patent mentioned as an alternate or equivalent construction, so far as the combination claimed is affected. The decision of the interference in his favor was necessarily an adjudication upon the subject-matter now claimed, as the Examiner and Board have held.

The decision of the Board is affirmed.

THOMAS SLAIGHT.—*Appeal.*

[Appeal from the Board of Examiners-in-Chief in the matter of the application of Thomas Slaight for patent for LOCKS.—*Decided July 3, 1873.]*

A seal-lock in which the bow and seal must be locked by separate movements has merit as an improvement, although a lock has been patented in which both were locked by one movement, but the seal might be released in locking the bow.

LEGGETT, *Commissioner:*

The combination of parts claimed by the applicant is not to be found in the reference cited. The question is whether an equivalent construction is shown. The same general result is accomplished by applicant's lock and that of Kitson & Bennor. In other words, a single bolt fastens the bow and seal in each. Nevertheless, there is a considerable difference in the working of the two locks, as there is also in their construction.

In the patented lock either bow or seal may be locked alone, and in applicant's both must be locked at the same time.

The Board regard this as an advantage in favor of the former, and think there should be little hesitation in granting a patent for the improvement over applicant's lock which the patented lock exhibits. This goes one step too far for the purpose of their argument. It is an admission that there is a substantial difference between the two locks; that they are not equivalents in construction, and is conclusive against their finding. Which is practically superior, and actually entitled to be regarded as an improvement upon the other, is a question for the public. If they are substantially different in construction and operation, that is as far as inquiry in the Office need go. That they are I agree with the Board, and if it were material it might be shown that applicant's lock, whether as a whole a better lock or not, has one or two points of superiority. For instance, the act of locking the bow will unlock the seal of the patented lock (if that has been first secured) unless special care is taken. This is not the case with applicant's.

The decision of the Board is reversed.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—SOUTHERN DISTRICT OF NEW YORK.

ELM CITY COMPANY *vs.* GEO. H. WOOSTER.

[In Equity.—Before Woodruf, J.]

A mere agreement to transfer an invention for the joint use of the inventor and of those who advance means for working it, which was entered into more than two years before the patent was applied for, but was not consummated till within that time, will not affect the validity of the patent.

A corporation may maintain a suit in the district where its rights are infringed, although it was created under the law of a State without the district.

Testimony as to the prior knowledge and use of the invention by persons not named in the answer will be considered on the hearing, if no motion is then made to strike it out, although it was objected to when it was taken.

WOODRUFF, *J.:*

The testimony in this case is very greatly conflicting or very much of it is not entitled to credit, either because, in my opinion, the witnesses exaggerate their asserted achievements, erroneously state the time, or describe inventions which did not in fact embrace the patented invention, or refer to crude or imperfect endeavors to imitate the Magic Ruffle, which appears to have been popular at the time when, according to the evidence, many were seeking to compete with those engaged in its manufacture.

After a laborious examination of the evidence my conclusions are—

First. The patentees were the first inventors of the plaiting attachment mentioned in the patent described in the bill of complaint, and on which the suit is founded.

Second. The defendant has infringed the rights of the complainant, as assignees of the said patent, as alleged in the bill of complaint, by the use of a plaiting attachment embracing the said patent invention.

Third. The said patent is not void on the ground that there was any fraudulent misrepresentation in the specification annexed to the patent. No such fraudulent misrepresentation is proved. Nor is the patent void upon the ground that the invention was not the joint invention of the patentees. The testimony proves such joint invention most clearly and distinctly.

There was no such sale of the patented machine or apparatus two years before the application for a patent as renders the patent void. An agreement for the transfer of the invention for the joint benefit of the inventors and those who will advance money for the manufacture or use of the machines invented, not carried into execution, and unaccompanied by any public use of the machine, but being prospective in its character, not consummated until within the said two years, does not in my opinion affect the validity of the patent.

Fourth. I find no ground upon which to hold that a corporation created by the law of a State without the limits of this federal judicial district, may not maintain a suit here for an infringement of their rights committed here.

These conclusions necessarily require a decree in favor of the complainant, according to the prayer of the bill.

It is obvious that the defendant has introduced testimony which was not admissible as a defense, relating to the knowledge and use of the invention by persons not named in the answer, to some or all of which objection was made by the complainant on the taking of testimony. I have not, however, regarded the objection in my consideration, because the briefs submitted do not involve a motion to strike out such testimony, and my conclusions are therefore founded on all the proofs.

Let a decree be entered for the complainant awarding the relief prayed for.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

25,183.—*Nail-Machines*—Granted to DANIEL DODGE, August 23, 1859. Application filed May 23, 1873. Hearing August 6, 1873.

25,191.—*Machines for Making Paper-Bags.*—Granted to WILLIAM GOODALE, August 23, 1859. Hearing August 6, 1873.

25,199.—*Feeding Paper to Printing-Presses.*—Granted to RICHARD M. HOE, August 23, 1859; reissued June 20, 1871. Hearing August 6, 1873.

25,235.—*Manufacture of Iron.*—Granted to BERNARD LAUTH, August 23, 1859. Application filed May 22, 1873. Hearing August 6, 1873.

25,237.—*Horizontal Wheels.*—Granted to ABRAHAM ANDREWS and HARRISON KALBACH, August 30, 1859. Application filed May 26, 1873. Hearing August 13, 1873.

25,239.—*Elastic Hose Tubing*, granted to JOHN C. BOYD, August 30, 1859. Application filed May 29, 1873. Hearing August 13, 1873.

25,269.—*Nail Machines*, granted to DANIEL DODGE, August 30, 1859. Application filed May 31, 1873. Hearing, August 13, 1873.

25,342.—*Stoves.*—Granted to EDWARD M. MANIGLE, September 6, 1859. Application filed June 5, 1873. Hearing August 20, 1873.

25,344.—*Machines for Wiring the Joints of Clothes Pins*, granted to ALVIN C. MASON, September 6, 1859. Application filed May 31, 1873. Hearing, August 20, 1873.

25,364.—*Watches.*—Granted to CHARLES E. JACOT, September 6, 1859. Hearing August 20, 1873.

25,373.—*Machines for Making Paper Boxes.*—Granted to SILAS B. TERRY, September 6, 1859; reissued May 17, 1870. Application filed June 5, 1873. Hearing August 20, 1873.

25,385.—*Heels for Boots and Shoes.*—Granted to SIMEON DODGE, Jr., and BENJAMIN POTTER, Jr., September 13, 1859. Application filed June 13, 1873. Hearing August 27, 1873.

25,434.—*Cotton-Scrapers.*—Granted to JONATHAN H. MITCHELL, September 13, 1859. Application filed June 16, 1873. Hearing August 27, 1873.

25,442.—*Boilers and Steamers.*—Granted to DANIEL R. PRINDLE, September 13, 1859. Application filed June 13, 1873. Hearing August 27, 1873.

25,443.—*Seeding-Machines.*—Granted to SILAS G. RANDALL, September 13, 1859; reissued May 23, 1860. Application filed June 11, 1873. Hearing August 27, 1873.

25,473.—*Scales.*—Granted to ANDREW TURNBULL, September 13, 1859. Application filed May 31, 1873. Hearing, August 27, 1873.

25,484.—*Grain-Separators.*—Granted to JONATHAN L. BOOTH, September 20, 1859; reissued September 25, 1860, and November 29, 1864. Application filed June 14, 1873. Hearing September 3, 1873.

25,488.—*Hydraulic Presses.*—Granted to M. H. CLARK, September 20, 1859. Application filed June 20, 1873. Hearing September 3, 1873.

25,499.—*Railroad-Car Seat.*—Granted to ELI WHEELER, September 20, 1859. Application filed June 17, 1873. Hearing September, 3, 1873.

25,506.—*Lamps.*—Granted to HALVOR HALVORSON, September 20, 1859; reissued June 6 and December 5, 1871. Application filed June 6, 1873. Hearing September 3, 1873.

25,508.—*Tailors Shears.*—Granted to ROCHUS HEINISCH, September 20, 1859. Application filed June 20, 1873. Hearing September 3, 1873.

25,512.—*Bung-Hole Borer and Reamer.*—Granted to JOSIAH KIRBY, September 20, 1859. Application filed June 19, 1873. Hearing September 3, 1873.

25,544.—*Try-Cocks for Steam-Boilers.*—Granted to JOHN F. COOK, September 20, 1859. Application filed June 16, 1873. Hearing September 3, 1873.

25,565.—*Rolling-Mills.*—Granted to JOHN and GEORGE FRITZ, September 27, 1859. Application filed June 27, 1873. Hearing September 10, 1873.

25,569.—*Reducing-Slats.*—Granted to TYLER HOWE, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,570.—*Mode of Arranging Couches in Railroad Cars.*—Granted to EDWARD C. KNIGHT, September 27, 1859. Application filed May 31, 1873. Hearing, September 10, 1873.

25,573.—*Molding Water-Traps.*—Granted to JAMES ALLEN LOWE, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,586.—*Burglar Alarms.*—Granted to ABBOTT Q. ROSS, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,588.—*Steam Punching-Machines.*—Granted to JOHN SPARROW, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,646.—*Steam-Boilers.*—Granted to JOSEPH HARRISON, Jr., October 4, 1859. Application filed June 30, 1873. Hearing September 17, 1873.

25,668.—*Construction of Prisons.*—Granted to EDWIN MAY, October 4, 1859. Application filed June 23, 1873. Hearing September 17, 1873.

25,673.—*Machines for Lasting Boots and Shoes.*—Granted to JAMES PUSHTON, October 4, 1859; reissued January 6, 1863. Application filed July 5, 1873. Hearing September 17, 1873.

25,683.—*Hydrants.*—Granted to CHARLES L. STACY, October 4, 1859; reissued June 6, 1865. Application filed June 28, 1873. Hearing September 17, 1873.

25,692.—*Sewing-Machines.*—Granted to KASIMIR VOGEL, October 4, 1859; reissued November 1, 1864. Application filed July 5, 1873. Hearing September 17, 1873.

25,701.—*Skeleton Skirt.*—Granted to JAMES DRAPER, October 4, 1859; reissued August 1, 1865. Application filed July 2, 1873. Hearing September 17, 1873.

25,726.—*Hand-Machine for Wiring Blind-Rods.*—Granted to BIRAM C. DAVIS, October 11, 1859. Application filed July 12, 1873. Hearing September 24, 1873.

25,733.—*Double-Friction Couplings.*—Granted to JOSHUA HENDY, October 11, 1859; reissued March 25, 1873. Application filed July 7, 1873. Hearing September 24, 1873.

25,747.—*Method of Combining Emery with Caoutchouc.*—Granted to THOMAS J. MAYALL, October 11, 1859. Application filed June 16, 1873. Hearing September 24, 1873.

25,767.—*Cutting and Panning Cakes.*—Granted to JOHN H. SHROTE, October 11, 1859. Application filed July 11, 1873. Hearing September 24, 1873.

25,784.—*Mode of Manufacturing Barrels, &c.*—Granted to GEORGE W. BANKER, October 11, 1859. Application filed July 8, 1873. Hearing September 24, 1873.

25,796.—*Jacquard Machines.*—Granted to AVERY BABBETT, October 18, 1859. Application filed June 30, 1873. Hearing October 1, 1873.

25,797.—*Harvesters.*—Granted to EPHRAIM BALL, October 18, 1859. Application filed July 18, 1873. Hearing October 1, 1873.

25,807.—*Hem-Folders.*—Granted to LEVERETT CLARK, October 18, 1859. Application filed July 19, 1873. Hearing October 1, 1873.

25,814.—*Sleeping-Cars.*—Granted to JOHN DANNER, October 18, 1859. Application filed July 12, 1873. Hearing October 1, 1873.

25,843.—*Cultivators.*—Granted to THOMAS MCQUISTON, October 18, 1859; reissued May 16, 1871. Application filed July 11, 1873. Hearing October 1, 1873.

25,862.—*Weeding-Hoes.*—Granted to JAMES M. ADAMS, October 18, 1859. Application filed July 18, 1873. Hearing October 1, 1873.

25,867.—*Machines for Covering Saddle-Trees.*—Granted to JOHN MACLURE, October 18, 1859. Application filed July 14, 1873. Hearing October 1, 1873.

25,874.—*Bronzing-Machines.*—Granted to GEORGE H. BABCOCK, October 25, 1859. Application filed July 25, 1873. Hearing October 8, 1873.

25,883.—*Construction of Glass Coffins.*—Granted to JOHN R. CANNON, October 25, 1859. Application filed July 23, 1873. Hearing October 8, 1873.

25,978.—*Tackle-Blocks.*—Granted to ISAAC E. PALMER, November 1, 1859; reissued September 8, 1863, April 11, 1865, and December 8, 1868. Application filed July 26, 1873. Hearing October 15, 1873.

25,984.—*Bit-Stocks.*—Granted to NELSON SPOFFORD, November 1, 1859; reissued April 23, 1867. Application filed July 28, 1873. Hearing October 15, 1873.

26,243.—*Water-Closet Basins.*—Granted to WILLIAM BOCH, Sr., November 29, 1859. Application filed June 10, 1873. Hearing November 12, 1873.

27,530.—*Manufacture of Gun-Barrels.*—Granted to JAMES H. BURTON, March 20, 1860, and antedated to September 29, 1859; reissued December 26, 1871. Application filed July 1, 1873. Hearing September 16, 1873.

30,201.—*Apparatus for Freezing Liquids.*—Granted to FERDINAND PHILIPPE EDOUARD CARRÉ, October 2, 1860; reissued in two divisions February 18, 1873. Patented in France August 24, 1859. Application filed May 17, 1873. Hearing August 13, 1873.

EXTENSIONS GRANTED.

24,963.—*Improvement in Flour-Packers*, granted to SAMUEL TAGGART, August 2, 1859; reissued November 7, 1871, numbered 4,626.

Claim.—1. A portable auger packing-machine having a short packing-shaft and a pressure-controlling brake, and the several parts constructed and arranged to occupy a single floor of a mill instead of two or three stories, as heretofore, as described.

2. In a machine for packing flour and other substances, having a packing shaft and auger, the combination therewith of a variable brake for increasing or diminishing the packing pressure upon the flour when required, essentially as described.

3. The combination, substantially as described, of a packing-shaft and auger with means for connecting it with a controllable brake, consisting of the lever C, connecting-rod K, and pinion M, as described.

4. In combination with a friction-weighted brake and a packing-shaft, the hand-wheel L for controlling the descent of the packing-shaft into the barrel, as described.

5. The upper bearing for the packing-shaft and the bearing for the clutch-wheel formed in one and the same fixed plate, as described.

6. The oil-chamber for the clutch-wheel, constructed and arranged to serve also as an annular centering guide thereto, as described.

7. The barrel-lifter, constructed and arranged to have an automatic lateral swinging movement to deliver the filled barrel out of the way of the filling-tube, as described.

8. A barrel-lifter, having a vertical swiveling-post connected to the frame by guides to admit of its descent, and an oblique guide arranged to operate by a fixed projection, by the weight of the filled barrel, to impart thereto a lateral swinging movement from beneath the flour-tube, as described.

9. The combination of the swinging barrel-lifter with the operating cam-lever U V, guide Y, and fixed projection Z, as described.

10. The guide Y and fixed projection Z, constructed and operating to both swing the filled barrel laterally out of the way and arrest the unfilled one centrally with the filling-tube, as described.

Disclaimer filed July 19, 1873.

Disclaims seventh, eighth, ninth, and tenth clauses of claim, as above set forth.

24,915.—*Improvement in Casting Copper Cylinders*, granted to FREEBORN ADAMS, August 2, 1859.

Claim.—A tube or cylinder cast out of copper and free from blow-holes and other similar defects, when produced as herein stated.

24,923.—*Improvement in Elevators for Warehouses, Factories, Mines, &c.*, granted to ALBERT BETTELEY, August 2, 1859.

Claim.—1. The combination of an automatic safety-shipper and brake apparatus with an elevator, substantially as described, arranged to operate only to prevent an elevation of the car beyond a fixed limit.

2. The combination of the weight *q*, flexible rope or chain *c*, with the shipping and brake-controlling mechanism, substantially in the manner and for the purpose set forth.

24,953.—*Improved Meat-Cutter*, granted to JOHN G. PERRY, August 2, 1859.

Claim.—Combining the revolving knives with a cylinder or block, having studs upon its surface, substantially as herein set forth.

DISCLAIMERS FILED.

24,963.—SAMUEL TAGGART, Indianapolis, Ind.—*Improvement in Flour-Packers*, dated August 2, 1859; reissued November 7, 1871, No. 4,626. Disclaimer filed July 19, 1873. Disclaims:

"Everything claimed in the seventh, eighth, ninth, and tenth clauses of the said claim."

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date July 22, 1873.]

6,776.—*Nubia.*—HENRY BOOT, Philadelphia, Pa., assignor to THOMAS DOLAN & Co., same place.—A. Application filed June 28, 1873.

6,777.—*Nubia.*—HENRY BOOT, Philadelphia, Pa., assignor to THOMAS DOLAN & Co., same place.—B. Application filed June 28, 1873.

6,778.—*Nubia.*—HENRY BOOT, Philadelphia, Pa., assignor to THOMAS DOLAN & Co., same place.—C. Application filed June 28, 1873.

6,779.—*Casket-Handle Tip.*—GEORGE W. BUNNELL, West Meriden, Conn., assignor to C. ROGERS & BROTHERS, same place. Application filed July 9, 1873.

6,780.—*Hand-Bell.*—EZRA G. CONE, East Hampton, Conn. Application filed October 29, 1872.

6,781.—*Ornamental Chain-Link.*—VIRGIL DRAPER, North Attleborough, assignor to OSCAR M. DRAPER, Bristol, Mass.—A. Application filed May 24, 1873.

6,782.—*Ornamental Chain-Link.*—VIRGIL DRAPER, North Attleborough, assignor to OSCAR M. DRAPER, Bristol, Mass.—B. Application filed May 24, 1873.

6,783.—*Ornamental Chain-Link.*—VIRGIL DRAPER, North Attleborough, assignor to OSCAR M. DRAPER, Bristol, Mass.—C. Application filed May 24, 1873.

6,784.—*Carpet.*—JOHN POWELL, Kidderminster, England assignor to HENRY JECKS DIXON & SONS, same place. Application filed June 13, 1873.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date July 22, 1873.]

1,371.—*Cross-Cut Wood-Saws.*—E. C. ATKINS & Co., Indianapolis, Ind. Application filed June 18, 1873.

1,372.—*Scarfs, Ties, and Bows.*—BROWNSON BROS. & Co., Chicago, Ill. Application filed June 23, 1873.

1,373.—*Medicine.*—DUNBAR DICK, New York, N. Y. Application filed July 14, 1873.

1,374.—*Mineral Water.*—C. & E. E. DUNBAR, Waukesha, Wis Application filed July 2, 1873.

1,375.—*Stove-Polish.*—FLETCHER & DWYER, Lynn, Mass. Application filed July 7, 1873.

1,376.—*Bottles of Brandy.*—HENRICH IMHORST, New York, N. Y. Application filed June 28, 1873.

1,377.—*Steel and Iron.*—LENG & OGDEN, New York, N. Y. Application filed July 15, 1873.

1,378.—*Smoking-Tobacco.*—LOEWENTHAL, KAUFMAN & Co., Chicago, Ill. Application filed June 16, 1873.

1,379.—*Millers' Soap-Stone Packing.*—SELLERS BROTHERS, Philadelphia, Pa. Application filed June 7, 1873.

1,380.—*Steel and Iron Wares.*—SWEET, BARNES & Co., Syracuse, N. Y. Application filed May 24, 1873.

1,381.—*Heaters.*—THE GOLD HEATING COMPANY, New York, N. Y. Application filed July 12, 1873.

1,382.—*Steam-Gages and Engine-Room Fixtures Generally.*—THE UTICA STEAM-GAUGE COMPANY, Utica, N. Y. Application filed July 12, 1873.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date July 22, 1873.]

ORIGINAL PATENTS.

140,988.—*Lamp.*—THOMAS B. ATTERBURY, Pittsburg, Pa., assignor to himself and JAMES S. ATTERBURY, same place. Application filed May 14, 1873.

An air-tube is applied to a glass lamp and the air conducted through the glass bowl of the lamp and through the tube to the center of the flame.

Claim.—A bent or curved air-tube, C, passed through and secured to one side of a glass bowl near its top, and extended up through the center of the burner, substantially as described.

140,989.—*Combined Ruler and Blotter.*—ROBERT M. AUSTIN, Philadelphia, Pa. Application filed May 29, 1873.

A triangular strip of metal is clamped upon a sheet of blotting-paper.

Claim.—The ruler A, formed with the spring-clips a^2 a^3, combined with a sheet of blotting-paper, B, substantially in the manner and for the purpose herein set forth.

140,990.—*Carpet-Cleaner.*—HIRAM W. BATES, Allston, Mass. Application filed April 11, 1873.

With a suitable frame is arranged a series of supporting vibratory lines, and two reciprocating beaters having mechanism to operate them.

Claim.—The two series D D' of whips *c c c* and the separate shafts *d d*, constructed and arranged together and with the series of lines *b b b*, as described, and provided with mechanism by which said two series of whips or beaters, when in operation, are actuated successively on opposite sides of the medial line of a carpet one series being made to approach while the other is caused to depart from the carpet, all substantially as explained.

140,991.—*Paint for Roofing, Wood, Metals, &c.*—JOHN C. BILLS, Ottumwa, and CARROLL M. BILLS, Albia, Iowa. Application filed July 8, 1873.

Coal-tar, Japan varnish, asphaltum, spirits of turpentine, sulphate of zinc.

Claim.—The combination of the several ingredients used, with the proper proportion of each ingredient, and the manner of compounding and using the same, as set forth in the foregoing specification.

140,992.—*Griddle-Greaser.*—WASHINGTON H. BIXLER, Easton Pa. Application filed June 16, 1873.

A cast-metal bar has formed on one end a handle, on the other end a scraper, and near one end a cup to contain the greasing substance. The cup is provided with a perforated cap, over which is placed a cloth, which is held in place by a metallic ring having slots which fit the pins on the cup.

Claim.—1. The combined griddle greaser and scraper, consisting of the bar A having the handle A' and scraper C, and holding the lard-cup B, provided with a cloth or other covering to limit the escape of the contents, substantially as specified.

2. A griddle-greaser, in combination with cup B, perforated cap D, cloth E, and securing-ring F, substantially as described.

140,993.—*Hat-Pressing Machinery.*—DANIEL BROWN, Wrentham, Mass., assignor to himself and WILLIAM E. GRONER, same place. Application filed May 21, 1873.

The sleeved die is raised in contact with the socket-die and held in such position by the rotation of the shaft, after which the plunger descends through a hollow dome partially filled with water, and, by displacement of the latter, distends the rubber diaphragm to press the hat within the die. The continued rotation of the shaft unlocks the dies and returns the sleeved die to its lowermost position.

Claim.—1. In the Bat-press, as described, the mold-carrier A, the hollow dome *e* and its diaphragm *f* and piston *g*, arranged together and combined with the connecting-rods C C, cranked gears D D, partially-toothed gears *p p*, pitman *h*, and eccentric *i*, and with the locking apparatuses or mechanisms *q r t u v*, all substantially as specified.

2. The combination of the system of clawed shafts *c'*, their slotted arms *b'*, the ring *z*, and studs *a*² applied to the support-plate *y* provided with the screw *x*.

3. The arrangement and combination of the system of clawed shafts *c'*, slotted arms *b'*, ring *z*, studs *a*² applied to the support-plate *y* provided with the screw *x*, with the mold-carrier A arranged with the hydraulic press F, as explained.

140,994.—*Sash-Fastener.*—THOMAS P. COIN, Beconsborough, Iowa. Application filed November 21, 1872.

A case or shell, carrying a roller having diagonally-cogged teeth, is so arranged on the sash that the diagonal teeth mesh in a diagonally-cogged strip attached to the window-frame. The case also contains a sliding spring-bolt, the head of which corresponds to the configuration of, and, ordinarily, locks the roller, so that it cannot turn upon its axis until released by the action of a lever having its thumb-piece projecting through a slot in the side of the case, thus holding the sash firmly to prevent rattling, increasing the strength of the device, and producing a noiseless and exact motion.

Claim.—1. The combination, with the diagonally-curved roller B, of the bolt D with cogged or toothed head *f*, spring *e*, and lever E, all substantially as and for the purposes herein set forth.

2. The combination of the casing A, diagonally-cogged roller B, diagonally-cogged strip C, spring-bolt D with cogged or toothed head *f*, and the lever E, all constructed and arranged substantially as and for the purposes herein set forth.

140,995.—*Method of Etching Plates for Electrotyping.*—ALFRED DAWSON and HENRY T. DAWSON, Cedars Chiswick, assignors to GEORGE WILLIAM PETTER and THOMAS DIXON GALPIN, London, England. Application filed January 24, 1873.

Claim.—1. The improvement in the art of producing a coated metallic design-plate for electrotyping, consisting of the following operations, viz: The application of a fusible grounding composition to a metallic plate; the melting of the composition on the plate by heat, and the spreading of it while hot, so as to form a ground, which is permitted to harden; the removal of portions of the ground by tools, so as to form the design or drawing; the building up of the interspaces by the application of melted material; the remelting of the grounding composition by flame, to produce the rounding of the edges, all substantially as before set forth.

2. The improvement in the art of producing a coated metallic design-plate for electrotyping, consisting of the following operations, viz: The application of a fusible grounding composition to the metallic plate; the melting of the composition upon the plate by heat, and the spreading of it by heat, so as to form a ground, which is permitted to harden; the removal of portions of the ground by tools, so as to produce the design or drawing; and the subsequent remelting of the ground by flame, all substantially as before set forth.

140,996.—*Cooking-Stove.*—CHARLES H. DOUGLAS, Hartford, Conn. Application filed May 14, 1873.

Claim.—1. The hinged and movable bonnet or hood H and the valve F operated by and in conjunction with it, as and for the purpose specified.

2. The casting C, as a combination of seat for a ventilator-valve and support for a pipe-shelf.

140,997.—*Knife.*—LAREN EDDY, Taunton, Mass. Application filed June 25, 1873.

The bolster, which is cast upon the blade and handle, is provided with an extension which embraces the blade in the back and both sides, and serves as a finger-rest, and also to more securely hold the blade. The blade is pierced near the tang and the end of the handle is grooved, so that the bolster, when cast upon them, secures the two together very firmly.

Claim.—1. The bolster, provided with the thumb or finger rest or projection *d*, and made to embrace the blade on opposite sides of it, as specified.

2. The blade, provided with the recess *c*, in combination with the bolster furnished with the projection *d*, extended into such recess and on opposite sides of the blade, substantially as specified.

3. The handle A, provided with the recessed or grooved tenon *a*, in combination with the blade B, recessed or holed, as described, and with a bolster, D, cast on and into said blade and tenon, all substantially as specified.

140,998.—*Carburetor.*—FISHER AMES FISHER, Elizabeth, N. J. Application filed January 16, 1873.

Claim.—The combination of the cup K for receiving the feed-liquid and discharging it through the wicking or carbureting-chamber with the inverted cup O for forming, with said cup K, a water-joint that shuts off the liquid from the float-chamber, substantially as and for the purpose specified.

140,999.—*Stove-Pipe Drum.*—ALBERT W. FOOTE, Buffalo, N. Y. Application filed January 20, 1873.

Claim.—1. The combination of the central damper D and circular or ring damper E, as shown or described.

2. The combination of the flat inner head J and its suspended cylinder M with the opposite flat inner head J' and its suspended cylinder N, substantially as shown or described.

3. The combination of the elements of the first claim with the perforations L in the head J, for the purpose set forth.

141,000.—*Rotary Pump.*—JAMES E. GILLESPIE, Norwich, Conn. Application filed May 15, 1873.

Upon the inside of the heads of the cylinder are fixed eccentric rings upon which move loose eccentric rings. These latter guide and support the radially-sliding pistons, by reason of pins upon extensions of the pistons engaging with recesses in the loose rings.

Claim.—1. The stationary eccentric D and loose ring E, in combination with the radial pistons of a rotary pump, substantially as and for the purposes described.

2. The radially-sliding pistons C, having extensions *c c* toward the shaft, as shown, in combination with the correspondingly recessed or grooved revolving drum and loose eccentric ring E, substantially as and for the purpose set forth.

3. The combination of the pins upon the piston C with the recesses *s* in the loose ring E, substantially as and for the purpose specified.

141,001.—*Fastening for Bureau-Drawers.*—AMARIAH J. GRANT, Williamstown, N. Y. Application filed April 10, 1873.

To the back of drawers is attached a staple. From one angle of a bell-lever, which is pivoted to the under side of the top of the outer case, is suspended a bar having hooks at right distances to connect with the staples. From the angle or bell lever is connected a lever or shaft which extends to the outside of the case, by which the drawers may be locked or unlocked.

Claim.—In the above-described fastening for sliding drawers, the bars *d*, hooks *c*, and catches *b*, or their equivalents, combined, arranged, and operated substantially as and for the purposes herein described.

141,002.—*Metallurgic Gas-Furnace.*—JOHN M. HARTMAN, Philadelphia, Pa., assignor to TAWS & HARTMAN, same place. Application filed April 15, 1873.

The air and gas are projected against a brick breast placed in the fire-chamber of the furnace in front of the air-pipes, and become ignited by contact with the breast, which has been previously heated. The ends of the air-pipes are protected by fire-proof tips. The amount of gas passing is regulated by adjusting the valve by means of a lever and pin or ratchet. Any explosion of the gas will force the valve against its seat, cutting off connection with the gas-supply.

Claim.—1. The gas-chamber A, in combination with the air-pipes C, and the breast or brick work M, substantially for the purpose shown and described.

2. The gas-chamber A of a gas-burner, in combination with the balance or blow-shut valve H, for the purpose shown and described.

3. The valve H, constructed with a conical or tapering back, and a valve-seat bearing or ring, as and for the purpose shown and described.

4. The chambers A and G, constructed separately, and bolted or otherwise secured together by their flanges *b c*, substantially as and for the purpose shown and described.

5. The valve H, arm I, shaft J, lever K, the openings *e*, and the pin *f*, as and for the purpose shown and described.

6. The depending fender L, in combination with the chamber A, for the purpose shown and described.

7. The chamber A, in combination with the pipes C, as shown and described.

8. The chamber A, pipes C, and the valves E, as and for the purpose shown and described.

9. The pipes C, in combination with the fire-proof tips D, for the purpose shown and described.

141,003.—*Machine for Jointing Staves.*—EDWARD HOLMES and BRITAIN HOLMES, Buffalo, N. Y. Application filed March 9, 1872.

A stave-holding device is so arranged, in front of a revolving disk provided with planing cutters, as to present the edges of a stave alternately to the disk at the proper angle for jointing.

Claim.—1. The combination, with the cutter-wheel C and knife D, having dovetailed ends, of the fastening-bolt *f* and bearing-block A, provided with dovetail notch *f'*, substantially as shown and described.

2. The combination, with the cutter-wheel, stave-holder I, radial arms M M', and adjustable bars L L', of the hinged arms J J, substantially as hereinbefore set forth.

3. The combination with the stave-holder I, provided with arms I', of the radial arms M M' and arms J, for the purpose of controlling and shifting the centers of the stave-holder I to any desired point to produce the radius required, substantially as hereinbefore set forth.

4. The combination, with the cutter-wheel, stave-holder I, and hinged bearings J, of the reacting spring *j*, substantially as hereinbefore set forth.

5. The combination, with the stave-holder I and cutter-wheel C, of the lever N and rod *n'*, for the purpose of swinging the stave-holder from one side of the center of the cutter-wheel to the other, and to hold the stave firmly against the cutter-wheel while being jointed, as hereinbefore set forth.

6. The combination, with the stave-holder I, pivoted clamp *p*, and foot-lever *q*, of the toggle-joint link *r* and adjusting bearing-block *s*, substantially as and for the purposes set forth.

141,004.—*Belt-Tension Apparatus.*—SEWELL E. JEWETT, Haverhill, Mass. Application filed June 2, 1873.

Tighteners maintained in the driving-belt, and limit or vary the tension or friction of the belt on its pulley.

Claim.—The combination of the vibratory hanger I, pulleys F G, draft mechanism R, auxiliary belt E, main belt D, and the driving and driven pulleys A C, all being arranged and applied together substantially in the manner and to operate as specified,

the said draft mechanism R consisting of the chains *c c f*, levers *e e*, guide-pulleys *d d h i*, links *g g*, and weight h, all arranged as set forth.

141,005.—*Breast-Cup.*—ALBERT M. KNAPP, Lowell, Mass. Application filed December 26, 1872.

The base of the vacuum-cup of the ordinary breast-pump is made of elastic perforated rubber. When the operation of withdrawing the air ceases, the elasticity of the rubber exerts a pressure upon the breast. This is repeated at every stroke of the air-pump, and imitates somewhat the operation of a child in drawing the breast.

Claim.—As a new article of manufacture, in combination with the vacuum-cup of the ordinary breast-pump, the elastic perforated rubber base, as shown.

141,006.—*Metal-Planing Machine.*—GEORGE C. LARNED, Worcester, Mass. Application filed January 30, 1873.

The two tool-posts are secured to hinged aprons or lift-plates in the usual manner, and find their support in a single stem that connects them to the planer-head.

Claim.—The tool-holder for iron-planers, composed of a shank having a head with two tools and lifts, operating in opposite directions, when constructed and operating substantially in the manner and for the purposes described.

141,007.—*Vest-Supporter.*—BASHARD F. MARTIN and ELIAS MAPES, Rochester, N. Y. Application filed January 29, 1873.

The flexible frame, sufficiently described in the claim, is placed under the vest-front to keep it in proper shape.

Claim.—A flexible vest-front supporter or stiffener, consisting essentially of the neck-plate A, cross-plate B, and curved side plates *a* and *a'*, constructed and arranged substantially as shown and described, for the purpose set forth.

141,008.—*Lantern.*—WILLIAM MCKAY, Newburyport, Mass., assignor to himself and CHARLES E. BAILEY, same place. Application filed April 23, 1873.

Air passes through openings in bottom frame of lantern up between glass plates, and thence into flame-chamber. The glass plates slide in grooves upon the uprights, and also fit at bottom in grooves in the detachable perforated threshold. The slates are removed by withdrawing threshold and sliding them through slots in the lower frame.

Claim.—1. A lantern provided with one or more air-inductor passages, *g*, arranged between glass plates *f f'*, and opening into the upper part of the lamp or flame-chamber of such lantern, and provided at their lower parts with one or more air-inducta, *i*, all being substantially as specified.

2. The combination of the grooved separate threshold B with the lantern-case A, provided with the opening *e* and the grooves *b* in the posts at the ends of such opening, all being substantially as described.

3. The threshold B, provided with the grooves A and the air-passage *i*, arranged in it as described.

141,009.—*Toy.*—ROBERT G. MESSINGER, Norwich, Conn. Application filed May 31, 1873.

Instead of the usual momentum ball of whirligigs, a disk is used provided with pivoted rods terminating in knobs, which rods have to-and-fro motion in the plane of the disk's revolution, and are variously colored.

Claim.—1. The combination of the balls D D, having pivoted arms, with the center piece C, to give momentum to a whirling toy, substantially as specified.

2. The toy herein described, consisting of the handle A, stem B, string E, center piece C, and balls D, substantially as and for the purposes set forth.

141,010.—*Flash Light-Signal.*—WILLIAM MITCHELL, London, and JOHN JOSEPH MAYO, Benhilton, Sutton, England. Application filed May 24, 1873.

A cylindrical lantern with a lens at one side, and having arranged within it two rotating screens, one sectional and opaque, the other composed of different colored translucent divisions. By means of connections extending through the hollow supporting-post of the lantern, either division of the colored screen may be brought coincident with the lens, and the light alternately shut off and allowed to pass by rotating the sectional opaque screen.

Claim.—The lantern A, hollow supporting-post B, disks F and G, screens D and E, tubes *d* and *e*, and levers Dx and Ex, when constructed as shown, and combined to operate substantially as and for the purpose specified.

141,011.—*Railway-Car Wheel.*—WILLIAM H. PAIGE, Springfield, Mass., assignor of one-half his right to S. T. HAMMOND, same place. Application filed March 20, 1873.

Claim.—1. An improved two-plate wrought-iron car-wheel, wherein the hub F, side plates, and rim or tire D are forged separately and welded together, substantially as described.

2. A two-plate wrought-iron car-wheel, having the hub, plates, and tire forged out separately and welded together, the tire D having a steel facing welded thereto, substantially as described.

3. A double-plate wrought-iron car-wheel, having the hub made in two separate parts, welded to the side plates of the wheel, and designed to be secured upon the axle, all substantially as set forth.

141,012.—*Milling-Machine.*—GEORGE T. PELLINGS, Philadelphia, Pa. Application filed April 10, 1873.

Two short shafts, located one on each side of the live-spindle of the lathe, and which, with the latter, are driven by gearing, are connected by means of jointed connecting-rods to two rotatable burr-cutters located on a table that is adjustable vertically. The breadth of the burrs is equal to the length of section to be milled, and their bearings are adjustable on the table, in virtue of which their axes may be set parallel or inclined to one another.

Claim.—1. The combination, with the lathe-centers, of the two revolving cutters, arranged on opposite sides of said centers, and the vertically-moving carriage, on which said cutters are supported.

2. The combination of shafts S S', knuckle-joints E^1, and vertically-movable revolving cutters O^1 O^2.

3. The combination, with a vertically-movable slide and carriage, on which revolving cutters are mounted, of screw-shaft X, gear Y, worm Z, and shaft A^1, revolved by power applied to pulley D^2.

4. The combination, with a vertically-movable slide and carriage, on which revolving cutters are mounted, of screw-shaft X, gear Y, worm Z, and shaft A^1, revolved by wheel I^2 and gears E^1 and F^2.

5. The combination of the lathe-bed, stays U U', gibs V V', and slide T, supporting the carriage and cutters.

141,013.—*Music-Notation.*—JOSEPH P. POWELL, Cincinnati, Ohio. Application filed August 12, 1873.

Claim.—In a system of musical notation, the characters shown at *a b c* of the drawing, formed as shown, to designate the first, third, and fifth of the scale, substantially as described.

141,014.—*Carpenter's Gage.*—MATHURIN C. ROBICHAU, Marblehead, Mass. Application filed May 19, 1873.

Two heads are used upon one stem, one of which, D, has one side flush with the side of the stem A.

Claim.—As an article of manufacture, the above-described gage, composed of the adjustable head B, T-shaped bar A, adjustable head D, slide L, and spur S, operating in slot P, in conjunction with metal cap H, set-screw E, and spur F, when constructed in the manner and for the purposes set forth.

141,015.—*Reel for Clothes-Lines.*—CAROLINE ROSENTHAL, Philadelphia, Pa. Application filed February 21, 1873.

A reel is connected by gearing to a cylinder which contains a coiled spring that will wind up the line. An adjustable catch holds the gearing when desired.

Claim.—The combination of coiled spring A, box B with its spur-wheel C, pinion-wheel D, catch E provided with a spiral spring, F, and slotted pivoted catch G, when arranged and combined with the reel, as herein described, and for the purposes set forth.

141,016.—*Mode of Treating Fibrous Substances in the Manufacture of Paper-Stock.*—THOMAS ROUTLEDGE, Ford Works near Sunderland, England. Application filed August 31, 1872.

In commencing the boiling process, the first vessel of the series being filled with fibrous substance, boiling ley is supplied through pipe B', filling the vessel above level of pipe B leading to next vessel. After this vessel has been charged with fibrous material, cock K is opened and another charge of ley is run into vessel No. 1, which displaces an equal amount into No. 2, and so on. This saves fuel, as the ley goes hot into each boiler before firing up. When ley has passed through the series of boilers and the material has been sufficiently boiled, No. 1 is disconnected from No. 2 and a charge of fresh water is run into it. Then Nos. 1 and 2 are connected again, and No. 3 is disconnected, and so on.

Claim.—The continuous system of boiling in an alkaline ley and subsequent washing with water, in a series of vessels connected together, substantially as and for the purpose hereinbefore described.

141,017.—*Machine for Spreading Silk.*—JOHN SAULT, South Manchester, Conn. Application filed March 12, 1873.

The silk, as it comes from the dressing-rooms, is laid cross-wise on a supplementary feed-apron located above and at right angles to the main one, and having a reciprocating endway motion to distribute the fibers longitudinally on the main apron. Beating-rods loosen the fibers on the supplementary apron and facilitate their even distribution.

Claim.—1. In combination with the drawing mechanism A and feeding-apron C, a reciprocating cross-feeding device, substantially as described, adapted to receive the fiber lying transversely and to deliver it in its proper position upon the ordinary feeding-apron, substantially in the manner and for the purpose herein set forth.

2. In combination with the drawing mechanism, the feed-apron C and a reciprocating cross-feeding mechanism, an automatic beating or loosening device acting on the fiber near the point where it is delivered from the reciprocating cross-feed to the true feeding-apron, substantially in the manner and for the purpose herein set forth.

141,018.—*Axle and Sleeve for Vehicles.*—WILLIAM H. SPARKS, Absecom, assignor of one-half his right to JAMES D. SOUDER, Williamstown, N. J. Application filed October 17, 1872.

The screw-thread for engaging the nut extends inward and engages with an internal thread in the outer end of the sleeve to guard against accident should the nut work off.

Claim.—1. The axle A, having at each end a collar, *c*, and conical enlargement *d'*, in combination with the sleeve B, having a corresponding conical cavity and an enlargement, *e*, to increase strength, substantially as and for the purpose set forth.

2. The combination of the nut C with the sleeve B, having a screw-thread, *f'*, and the axle, having a screw-thread, *f*, for securing the sleeve against the collar *c* and enlargement *d'*, substantially as set forth.

141,019.—*Fastening for Sliding Doors.*—ELIAS W. STAPLES, Jr. Norwich, Conn. Application filed May 13, 1873.

Claim.—1. The combination and arrangement of the catch-piece C and the guide-piece A with the sliding bar B having stops D I, the catch-notch *b*, and the locking-hole O extending through both the bar B and the catch-piece C, when so constructed that the bar B slides through the guide-piece A and catches, substantially as herein set forth.

2. The combination, with the sliding bar B and catch-piece C, of the cam L, pin N, and spring M, substantially as and for the purpose described.

3. The combination, with the guide-piece A and sliding bar B, of the pin E and notch and slot K, substantially as and for the purposes specified.

141,020.—*Kettle-Lifter.*—EARL AMRI THURRELL, Lowell, Mass., assignor of one-half his right to JOSEPH CHURCHILL, same place. Application filed September 23, 1872.

Two levers, with handles, pivoted upon a support which can be firmly pressed against a vessel so as to firmly grasp it.

Claim.—The combination of the pivoted levers B B and the support A, substantially as described.

141,021.—*Harrow.*—JOHN A. WALKER, Nashville, Tenn., assignor of two-thirds his right to J. M. SHARPE and WM. H. MORROW, same place. Application filed December 28, 1872.

A central piece of cast metal perforated vertically in the center, into which perforation is driven a piece of wood, and through this the harrow-tooth is also driven. The central piece has four arms of equal length at right angles to each other that receive connecting-links from other centers. By multiplying these centers, and placing them in a rectangular or square frame, a flexible harrow is produced.

Claim.—The combination of cross A, ferrule J, tooth K, pins L L′″″, links F F and H H′″, and frame G, all as described and arranged, for the purposes set forth in the above specification.

141,022.—*Washing-Machine.*—WILLIAM R. WALTON, Freeport, Ill. Application filed May 29, 1873.

An independent circular base, to be placed in an ordinary wash-tub, has radial rollers and ribs, above which a ribbed follower is rotated.

Claim.—1. In the base A, the combination of the rolling rubbing-surfaces C D and the stationary rubbing-surfaces E, as described.

2. The combination of the follower, constructed substantially as described, and the base A having the rolling and stationary rubbing-surfaces, as and for the purpose set forth.

3. The described machine, consisting of the base A, standard B, rollers C D, rubbing-blocks E, ribbed follower F, standards *g g′*, cross-bar A, and pin *i*, combined and arranged as described, for the purpose set forth.

141,023.—*Basket.*—SHEPHERD H. WHEELER, Niles, Mich. Application filed January 24, 1873.

The bottom of the basket is made separately from the body, and of short pieces crossing each other radially, and the outer ends are secured between the outside and inside series of staves by the bottom hoops.

Claim.—A basket-bottom, consisting of the short pieces B crossing each other radially at the center, with their outer ends secured between the outside and inside series of staves A A by the bottom hoops C C, substantially as and for the purposes hereinbefore set forth.

141,024.—*Shawl-Strap.*—FANNIE H. WILLIS, Boston, Mass. Application filed June 19, 1873.

Rubber bands are secured to each end of the handle, and hold the package, instead of the straps which are ordinarily used.

Claim.—The combination of the elastic band *d* with a holder, *a*, substantially as specified.

141,025.—*Sole-Channeling Machine.*—CYRUS C. BALLOU, Albany, N. Y., assignor to "THE EAST NEW YORK BOOT, SHOE, AND LEATHER MANUFACTURING COMPANY," New York city. Application filed February 15, 1873.

Provision is made for pressing back the flap upon the sole, and for clearing the channel of chips of leather left by the groover.

Claim.—The combination of the guide B, knife D, and groover F, with the plow E and roller H, when arranged to operate as and for the purpose specified.

2. The plow E having a detachable groover, F, constructed substantially in the manner and for the purpose specified.

3. The plow J having a projecting point, K, as and for the purpose herein set forth.

141,026.—*Truss-Bridge.*—ALFRED BANNISTER, Alameda, Cal. Application filed May 28, 1873.

The bridge chord or truss consists of two or more longitudinal timbers alternately joined and separated in curved lines to form alternate bays, and strengthened by struts, ties, and braces.

Claim.—A truss for supporting the spans of bridges and other structures, composed of two or more continuous beams or timbers, alternately separated and brought together, so as to form oval or elliptical bays, which alternate and are united together in the manner substantially as above described.

141,027.—*Tilting Gate.*—JOHN BARTHOLF, Hillsborough, Wis. Application filed March 22, 1873.

The gate is formed in two symmetrical halves. Each half consists of horizontal rails held at each end by a batten on each side, and pivoted therewith. The half gate, being drawn upward by a cord attached to the inner end of its bottom rail, moves between two fixed outer posts, to the outer side of which it is hinged near the base. The outer battens now rest at an angle in a slotted inclined brace, and the rest of the gate continues to ascend until its parts come close together in a vertical position. The operation is by cords, pulleys, and weights.

Claim.—The combination, with double main posts A A, of two folding half-gates, C C, each consisting of pivoted side posts *d*, rails *e*, pivoted at both ends, middle posts *d′ d′*, and supports B B, as and for the purpose described.

141,028.—*Saw-Mill.*—BERNHARD BERNDT, Williamsport, Pa., assignor to RILEY & MAITLAND, same place. Application filed May 29, 1873.

The journal-box, which carries the inner end of the feed-shaft, is so arranged as to have a vertical as well as horizontal movement.

Claim.—The combination of the finger-headed lever F, the adjustable plate e^3, the sliding block *e*, and guide-block E, substantially as described.

141,029.—*Parallel Ruler.*—GUSTAV BLUMCK, New York, N. Y. Application filed May 10, 1873.

A sliding frame carrying an adjustable ruler is moved a regulated distance upon a guide-piece by the depression of a curved band-spring, an inclined lug upon which impinges against another upon the sliding frame. Spiral springs draw the parts in position for another movement.

Claim.—1. The frame A, provided with bearing C, pin D, slide E, ruler G, spring H with tapering key I, and rest *e*, as and for the purpose described.

2. The main frame A, composed of center part B and side parts B′, connected by rods *b*, and arranged to slide upon each other, substantially as set forth.

3. The central part B, having inclined bearings C with lugs *g′*, projections *n′*, springs *g*, slot *a*, lever *d*, scale *f*, set-screw F, and ruler G, substantially as described.

4. The side pieces B′, having rests *i* and guide-screws *l*, as set forth.

5. The sliding piece E, having central pin D, standards *m* with pins *h* and set-screws *n*, and top plates E′, for the purpose described.

6. The top plate E′, having the slots l^1 for guiding slide piece E in the direction of the longitudinal axis, and slots l^2 for spring H, as set forth.

7. The sliding piece E, being recessed, in combination with rectangular pieces *o* below slots l^2, and leather bottom stripe *p*, as set forth.

141,030.—*Medical Compound for Neutralizing the Taste of Cod-Liver Oil.*—CHARLES D. BRADLEY, Taunton, Mass. Application filed May 1, 1873.

Claim.—The composition, substantially as and for the purpose described, consisting of one or more carminative essential oils, sulphuric ether, and the essence of lemon, or the equivalent of the latter, all as set forth.

141,031.—*Roller-Clearer for Spinning-Machines.*—CHARLES B. BROWN, Lewiston, Me., assignor to himself and ALVIN WOODMAN, same place. Application filed April 5, 1873.

The enlarged part only of the clearer bears against the lower drawing-roller so as to be turned by it, the reduced parts not bearing closely against the draw-roller, and thereby operating more effectually, it is claimed, to catch the flyings, and also enable them to be removed with greater facility. The clearer is preferably covered with flock.

Claim.—The covered clearer-roll, provided with an enlargement, *b*, as and for the purpose specified.

141,032.—*Spring-Cradle.*—FRANKLIN CHICHESTER, Milwaukee, Wis.—Case A. Application filed June 7, 1873.

The ends are divided into two parts, and spiral springs are introduced between them, with sufficient space for rocking.

Claim.—The separate pieces A, B, and C, with spaces E E between them, combined with the intermediate spring D, arranged to support and allow the cradle to rock, in the manner described.

141,033.—*Cradle.*—FRANKLIN CHICHESTER, Milwaukee, Wis.—Case B. Application filed June 7, 1873.

To the end frames are attached flat springs, which are attached to round bases that have an edged pivot which supports the end frames.

Claim.—The combination, with cross-rails A A and bases B B, of pivot C and plate-spring D, arranged between the said cross-rails and base-pieces, to support and allow the cradle to swing, in the manner described.

141,034.—*System of Supplying Steam, &c., to Buildings for Extinguishing Fires.*—JOHN A. COLEMAN, Providence, R. I. Application filed March 25, 1873.

A series of pipes connected with a group of steam-boilers extend through the streets, and are connected with pipes in the buildings. The last-mentioned pipes are provided with means for attaching hose or with sprinklers, and are also connected with the water-main. By means of suitable valves, arranged to be operated from the outside, the pipes can be supplied with steam or water for extinguishing fires.

Claim.—The steam system described, consisting of a series of pipes or mains extending through a city or district and connected with centrally-located boilers and with pipes applied to buildings, the said pipes being connected with the water-main and provided with valves, as specified, whereby the pipes may be furnished with a supply of steam or water for extinguishing fires, substantially as set forth.

141,035.—*Baling-Press.*—WILLIAM M. CONNER, Burlington, assignor to ALBERT G. WINSTON, same place, and ALEXANDER V. WINSTON, Covington, Ky. Application filed April 16, 1873.

A baling-press having a vertically-acting follower which is elevated and depressed by a pair of toggles, the latter being set in motion by cords or chains which are wound in opposite directions upon a shaft.

Claim.—1. The baling-press herein described, having the follower K elevated and depressed by the operating devices C *e* D *d*, and toggle arrangement H H′, I I′, and *g g′*, the pinion *d* being provided with the pawl F and cord *f* to enable the tramper to control the movements of the follower K, as and for the purpose specified.

2. The door L *l l′*, constructed as described, with the stirrups *m*, loops *m′*, and hook-shaped lugs P P′, as and for the purpose specified.

141,036.—*Saw.*—SYLVESTER COOK, Alpena, Mich. Application filed May 10, 1873.

The teeth are arranged in sets of four cutting-teeth, with a clearing-tooth at each end, one-half the teeth in each set facing the others.

Claim.—The teeth, arranged in groups of four, separated by the wide notches D, said groups, arranged in pairs B B′ and C C′, fronting in opposite directions, the teeth being constructed as described, and having a clearer, G, arranged with each pair, all substantially as specified.

141,037.—*Deck-Sash or Ventilator-Opener for Railroad Cars.*—JAMES E. CROSS, Adrian, Mich., assignor to ILLINOIS MANUFACTURING COMPANY, same place. Application filed May 21, 1873.

A crank-arm on a vertical actuating-rod is connected to a swinging sash by means of a rod and ball-and-socket joints. The sash retains any desired position by reason of the pressure of a spring on a plate attached to the actuating-rod.

Claim.—1. The connecting-rod C and its ball-and-socket joints, combined with the pivoted sash B, crank-arm *e*, and actuating-rod D, substantially as and for the purpose described.

2. The spring *s* in the box C′, combined with the plate G, an actuating-rod, D, crank-arm *e*, connecting-rod C, and a swinging sash, B, substantially as described.

141,038.—*Cleaning Wool of Burrs, &c.*—THOMAS CROSSLEY, Bridgeport, Conn. Application filed July 2, 1873.

The fumes made by burning sulphur and saltpeter are passed through the wool placed upon racks or grating. The wool is then dried and passed through a burr-picker.

Claim.—The process of disintegrating the beard of burrs, seeds, and other vegetable matters entangled in wool by passing a sulphuric or sulphurous acid smoke through the wool, substantially as specified.

141,039.—*Propelling Vessels.*—GEORGE W. DOW, Brooklyn, N. Y. Application filed March 22, 1873.

Wheels, inclosed in the sides of vessels and near the stern, receive the water at their centers, and it is forced out through short channels leading out at the stern, or is deflected to branch passages leading forward and out at the sides. The direction of the water is controlled by valves situated at the intersection of the forward and rear channel. By this construction the usual long channel entirely through the vessel, from bow to stern, is dispensed with, and consequently economy of storage-room is obtained.

Claim.—The combination, with suction-wheel and channel H, of the return-channel I, arranged as and for the purpose described.

141,040.—*Faucet Attachment.*—ERASTUS L. DUNBAR, Bay City, Mich. Application filed May 17, 1873.

Two sharp-edged studs project from the tube, which is placed in a hole slotted to admit the lugs in the wood. A quarter-turn causes the lugs to cut into the wood. A jam-nut on the tube is screwed down to tighten it.

Claim.—1. The stop-cock A having its tube A′ provided with the studs *a a*, substantially as and for the purpose set forth.

2. The combination, with the tube A′ of the stop-cock, provided with the studs *a a*, of the jam-nut, substantially in the manner and for the purpose set forth.

141,041.—*Stop-Valve.*—GEORGE W. EDDY, Waterford, N. Y. Application filed April 26, 1873.

The gates are forced to their seats by means of the levers, (pivoted to plates secured to cross-head in which stem works,) which are operated by the head of valve-stem being depressed, and are released, and they, with the plates and cross-head, raised, upon the saw-head being elevated.

Claim.—The combination of gates D and levers H, each having the lugs described, the device E F having edge and adjusting notches, and the valve-stem provided with enlargement I, substantially as and for the purpose specified.

141,042.—*Sharpening-Machine.*—SIMEON F. EMERSON, Akron, Ohio. Application filed May 9, 1873.

The device is capable of horizontal and inclined adjustment. Ears are formed upon the base which limit the movement and support the wheel-standard in position.

Claim.—1. The ears 1 formed on the base for limiting the movement of the wheel-standard and supporting it in position, substantially as described.

2. The base *c*, standard 2, head 3, and arms 5 7, in combination with a driver and suitable driving mechanism, substantially as shown.

3. The movable adjustable base *s* provided with ears 1 1 and arms *b b*, substantially as set forth.

141,043.—*Blast-Furnace Breast-Plate.*—ROBERT A. FISHER, San Francisco, Cal. Application filed June 6, 1873.

The breast-plate is made with an angular indentation, so as to carry the portion in which the slag-spouts are placed almost up to the fire-arch, shortening the distance which the slag has to flow between the tuyere and slag-spout. To prevent the destruction of the breast-plate a shield is attached and the intervening space filled with fire-clay.

Claim.—1. The arrangement of the slag-spouts in the front of the furnace, as described, so that they shall be heated from the fire-arch, preventing the slag from being chilled while passing out, as set forth.

2. The shield or supplementary back D, in combination with the front or breast plate of a smelting-furnace, substantially as and for the purpose described.

141,044.—*Washing-Machine.*—JOSIAH GLINES, Postville, Iowa. Application filed May 31, 1873.

Is constructed with rolls and frame, in ordinary form, having a U-shaped spring under the lower roll resting upon a cross-bar, by which tension is given the rolls, and a bar or rod extending from the frame, with a yoke and thumb-screw to attach it to the tub.

Claim.—1. The arrangement of the uprights A, cross-bars B, division-board C, corrugated or fluted rollers D F, crank E, and U-springs H with respect to each other, substantially as herein shown and described.

2. The combination of the pivoted bar J and clamp K L with the uprights A, cross-bars B, and rollers D F, substantially as herein shown and described.

141,045.—*Spring-Joint for Watch-Cases.*—JOHN GORDON, San Francisco, Cal. Application filed November 16, 1872.

The spring for throwing open the watch-case is applied to an arm from the case-hinge entirely beneath the pillar-plate, thus permitting the latter to be fitted closely against the butt or barrel of the hinge, and avoiding any opening for the protrusion of the spring.

Claim.—1. The case, joint, or hinge having the attached lug *m*, in combination with the operating-spring, as herein shown, whereby I am enabled to construct a joint and case spring without having any opening for the admission of dust, and avoiding the piercing of the plate A, as set forth.

2. The lug *m* attached to the case B, when constructed to act as a stop or guard, substantially as set forth.

141,046.—*Kerosene Heater.*—ZIBA B. GRANDY and CYRUS E. GRANDY, Stafford Springs, Conn., assignors to themselves and WILLIAM D. HEALD, same place. Application filed April 26, 1873.

The heating-vessel, adapted to be used in connection with a lamp and its chimney, consists of two concentric compartments. Cocks are applied, one to the exterior and one to the interior compartment.

Claim.—The lamp-chimney A, combined with two concentric chambers, D F, arranged on a common base, B, and having cocks G H, respectively, as and for the purpose described.

141,047.—*Shoemakers' Pinchers.*—WILLIAM H. HANNA, Chico, Cal. Application filed May 10, 1873.

Claim.—A pair of shoemaker's pinchers having the jaws in the same longitudinal plane and the teeth abutting against the turning-face of the jaws, so as to bring the bite near to the pivot A, and thereby not only to secure more leverage in the gripe, but thus to enable the upper to be drawn close to the last, in the manner described.

141,048.—*Scroll-Sawing Machine.*—MARQUARD HANSEN, San Francisco, Cal. Application filed February 3, 1873.

The saw-table is arranged upon a spherical bearing in such a manner as to admit of inclination in any direction.

Claim.—1. The arrangement of the rocking lever *f*, with its end block *d* moving in the slides *e e*, in combination with the connecting-rod *j*, walking-beam I, adjustable link K, spring-bar *l*, and upper slide *n*, substantially as and for the purpose above described.

2. The table-top B, with its ball-and-socket bearing *t*, in combination with the adjusting-rods *x y*, bolt V, and nut W, substantially as and for the purpose above described.

141,049.—*Metal-Planing Machine.*—ROBERT HARPER, Glenn Mills, Pa. Application filed May 24, 1873.

The cross-head, sliding on ways, is operated by means of two parallel screws swiveled to the frame, and connected by gearing to a transverse driving-shaft. The tool-post is adjustable both horizontally and vertically on the cross-head by means of screws and sliding blocks.

Claim.—1. The combination of the bed A, swiveled screws B, gear-wheels C D, or equivalent, shaft E, crank-wheel F, cross-head G, ways H, adjusting-blocks I J M, adjusting-screws K N, and adjustable tool-holder P R, with each other, substantially as herein shown and described.

2. The combination of the set-screws T with the bed A, and with the operating parts of the machine, substantially as herein shown and described.

141,050.—*Sash-Cord Fastener.*—HORACE HARRIS, Newark, and FREDERIC HEWITT, Bloomfield, N. J. Application filed February 28, 1873.

Instead of the usual knob to retain the cord in the metal which is inserted in the frame, a barbed wedge is used.

Claim.—As a new article of manufacture, the metal piece *a* with the tapering hole *c*, and the wedge *e* with the serrated edge *f*, and the knob *n*, substantially as and for the purpose specified.

141,051.—*Hoisting-Machine.*—CHARLES H. HERSEY, Boston, Mass. Application filed June 19, 1873.

The brake and driving pulley are both operated by a single movement of the arm.

Claim.—In combination with the drum-shaft friction-pulley *c*, the driving-pulley *g*, fixed upon a shaft extending through an eccentric, which eccentric is actuated by a lever-arm carrying a brake, the brake *e* and pulley A being simultaneously actuated by manipulation of the arm, substantially as described.

141,052.—*Packing for Piston-Rods and Valve-Stems.*—WILLIAM HESTON, Akron, Ohio. Application filed April 11, 1873.

It is provided with an outer textile covering, and is made of a conical form on its inner surface to crowd the fibrous packing against the piston-rod.

Claim.—The packing above described, as a new article of manufacture, constructed substantially as described.

141,053.—*Game-Board.*—FRANCIS P. HOLMES, North Bridgewater, Mass. Application filed May 5, 1873.

The quoit-board is a horizontal table resting upon short legs and having a movable bull's-eye, which, upon being depressed by the stroke of the quoit, sounds a bell. The board has an upholstered or other cover, and, when not in use as a game-board, serves for a seat.

Claim.—1. As an improved article of manufacture, the above-described game-board, the same consisting of the quoit-board C, the disk D provided with the adjustable rod *d*, the hammer F, and lever E, and bell G, constructed, arranged, and combined together, and applied to the case A, in manner and for the purpose set forth.

2. In combination with the subject-matter of the foregoing claim, the upholstered cover B, as and for the purpose set forth.

141,054.—*Sad-Iron.*—WILLIAM L. HUBBELL, Brooklyn, N. Y. Application filed April 15, 1873.

Claim.—1. The sad-iron made with the shells *a b*, with an opening at one end to set over the burner, and with channels *i* for the gas-jets, in combination with the wire helix introduced into recesses near the inner edges of the shells *a b*, substantially as set forth.

2. The malleable-iron bracket-piece *f*, cast with projecting pins *i* that are riveted to the shell *b*, in combination with the handle *d* that is recessed for receiving the upper ends of such bracket-pieces, and secured to them by rivets or screws 5, as set forth.

141,055.—*Die for Punching Washers.*—RUSSELL HUMPHREY, Unionville, Conn. Application filed December 2, 1872.

The cutting-end of the punch is composed of two parts—an internal and an external punch. The die-block has depressions corresponding to these parts, and a circular projection that enters the space between the inner and outer punches. By this arrangement two washers are cut at the same time.

Claim.—1. The combination and arrangement of the punches *a* and *b*, the expelling-thimble *c*, and the pins *e*, constructed and designed to operate substantially as described.

2. In combination with the punches *a* and *b*, the die *d*, having corresponding openings for such punches to enter, and a projection, *f*, corresponding to the opening between the punches, constructed and designed to operate substantially as described.

3. The combination of the die *d*, having the groove *c* and opening *e*, with the expelling devices described, constructed and designed to operate substantially as described.

141,056.—*Truss-Bridge.*—HENRY J. HUNTER and JESSE RICE, Scioto, Ohio. Application filed June 14, 1873.

The three chords are composed of three timbers each, and the posts of two each. The posts pass between the members of the middle chord, and are "boxed" or "halved" into the members of the upper and lower chords. The truss is braced at each panel by diagonal braces E F, the latter of which extend below the lower chord to give greater tensile strength. The ends of the middle and upper chords extend beyond the end posts, and are joined to the lower chord by converging braces.

Claim.—1. The combination of the middle, top, and bottom chords A B C, comprising three timbers each, posts D, and braces E and F, the braces and posts being arranged with and secured to the posts and chords, substantially as specified.

2. The top and middle chords extended beyond the posts at the ends and provided with braces G, substantially as specified.

141,057.—*Cane-Stripper.*—ROBERT C. JAMES, Denison, Tex. Application filed April 19, 1873.

Claim.—The combination, with the stripping-blades D, of the grooves or troughs I, as described.

141,058.—*Machinery for Shaping Boot and Shoe Soles.*—JOSEPH B. JOHNSON, Lynn, Mass., assignor to SWAIN, FULLER, & CO., same place. Application filed June 25, 1873.

Improvement on patent No. 75,428, granted March 10, 1868. A sliding mold-carrier is provided with molds for right-and-left soles, in combination with a rotating bar or last-carrier provided with one right and one left last, with its supporting-foot.

Claim.—1. The combination of the movable mold-carriage I (or such and the two molds G H) and the mechanism for moving such carriage (or carriage and molds) laterally, as described, with the rotary bar C', or the latter and its two lasts D E, all being substantially as specified.

2. The slide A, furcated arm *i*, the studs *i' k*, in combination with the mold-carriage and its operative mechanism, consisting of the notched bar *l*, crank *m*, gear *n n'*, sleeve *o*, arm *p*, and grooved post *r*, applied to the bar C', as set forth.

3. The mechanism or combination for moving the mold-carriage laterally, such consisting in the notched bar *l*, crank *m*, gears *n n'*, sleeve *o'*, arm *p*, and the grooved post *r*, all being arranged and applied to the bar C' and to the mold-carriage either by a stud therefrom or by a slider and furcated arm and stud, as specified.

4. The combination of the treadle-lever L' and its system of toggles with mechanism, substantially as described, for operating such lever by a belt applied to a driving-pulley, U, such mechanism consisting of the driving-pulley U, the clutch T, the shaft Q, the belt P, the fork V, the retractive spring *x*, the bar W, and the cam-plate Z, all arranged and combined substantially as set forth.

5. The combination of the lever-operative mechanism and the pawl S and ratchet-wheel R, applied to the shaft and the clutch, the said pawl and ratchet being for the purpose specified.

6. The combination of the lever-latch A' and its operative spring a^2 with the treadle L, provided with mechanism for operating it, as described.

141,059.—*Bolt-Heading Machine.*—JAMES O. JONES, Brooklyn, assignor to himself and ADOLPH STARKE, New York, N. Y. Application filed March 27, 1873.

The jaws that receive the end of the rod to be headed move longitudinally, one of which is fixed to the slide, while the other is hinged to it. Inclines on the head operate the hinged jaw to open and close it, and the heading-punch works in the center of the slide.

Claim.—The jaw A, hinged to the sliding stock *c*, and carrying one of the dies, *i*, for the bolt-head, in combination with the heading-punch sliding in the stock *c* and the mechanism for opening and closing the jaw *k*, substantially as set forth.

141,060.—*Ice-Cream Freezer.*—ANTONIO LUCATTI, New York, N. Y. Application filed June 21, 1873.

An ice-receptacle is provided with a gate to admit ice in any desired quantity into a chamber around the cream-receiver, and air passes up a hollow shaft, so that the cream on both its inner and outer surfaces is cooled at the same time.

Claim.—1. The open-bottomed tube E, passing up through the center of the cream-receiver D, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the ice-receptacle B provided with a gate, C, with the tub A of an ice-cream freezer, substantially as herein shown and described.

3. An ice-cream freezer formed of the tub A, the ice-receptacle B provided with a gate, C, the cream-receiver D, the open-bottomed tube E, the shafts G and K, the gear-wheels I and J, the frame H, the covers L and M, and the spatula N, constructed and operating, in connection with each other, substantially as herein shown and described.

141,061.—*Paint Vessel and Package.*—JOHN W. MASURY, Brooklyn, N. Y. Application filed May 15, 1873.

Consists in the construction of a metallic tube with apertures opposite each other in the ends thereof, and containing inside a movable diaphragm for expelling the contents. The thimble in the diaphragm is so constructed as, when the diaphragm is operated by the rod, it prevents it from tilting.

Claim.—1. The arrangement of an aperture, O, in one end of a tube opposite to the aperture G in the other end, in combination with an independent movable diaphragm, B, substantially as and for the purposes specified.

2. The movable diaphragm B, provided with the socket S, or its equivalent, for the purpose of preventing the canting of the diaphragm in a receptacle for plastic substances when pressure is applied.

3. A movable diaphragm of a concavo-convex form in a can or tube, substantially as and for the purposes specified.

4. A tube or can for plastic material, with its ends or heads, the one of a convex and the other of a concave shape, in combination with a concavo-convex diaphragm, substantially as and for the purposes specified.

5. As a new article of manufacture, pocket paint-cans, made substantially as and for the purposes specified.

6. The propelling-rod C, with a socket or finger, F, used in combination with a projection or socket in a movable diaphragm, in a can for plastic material, substantially as and for the purposes specified.

7. A traveler or screw-cap, T, in combination with a propelling-rod which works through it to force down a diaphragm, substantially as and for the purposes specified.

141,062.—*Fire-Extinguisher.*—HIRAM S. MAXIM, Brooklyn, N. Y. Application filed March 14, 1873.

Two generators connect with a series of pipes extending to different parts of the building. The main one is charged with gas-generating material. The supplementary one is an automatic generator. The foraminous shell containing the alkali is attached to the movable gas-holder, and is of such a length that while the generator is full of gas the alkali will be above the acid, but on account of any leakage the shell will dip into the acid-generating gas and maintain the pressure in the holder and pipes. When a fire breaks out, and the plugs are melted, burned, or blown from the pipes, the gas-holder falls, a collar on its rod strikes a lever, releasing a hammer which strikes the discharging-end of the main generator, or sounds an alarm.

Claim.—1. The combination, with a system of pipes, of a generator of gas to keep the pipes constantly filled, and automatic mechanism to produce an alarm or set in operation the extinguishing apparatus when one of the nozzles is opened, substantially as set set forth.

2. The combination of tank D and gas-holder E, in which gas is generated and retained, with the main generator A and pipes K, substantially as described.

3. The combination of acid-vessel C, hammer F, and hook *j*, tripping-lever G, operating in connection with holder E E and flange N, substantially as and for the purpose hereinbefore set forth.

4. The combination of foraminous shell H, or its equivalent, tank D, check-valve M, chamber J, gas-holder, and distributing-pipes, substantially as and for the purpose described.

141,063.—*Steam-Trap.*—HIRAM S. MAXIM and LORING P. HAWES, Brooklyn, N. Y. Application filed March 14, 1873.

A thin metallic vessel having a wooden block in its center to prevent collapse, and filled with gummy substance and alcohol. Said vessel is placed within another containing steam, the heat of which causes the alcohol to expand, closing the inlet and contracting at low temperature, thus acting as a trap.

Claim.—1. The combination of the expansive vessel B, adjusting-spindle *c*, and stuffing-nut I, operating in connection with the steam-inlet G, substantially as and for the purpose hereinbefore set forth.

2. The wooden support C introduced within the expansion-vessel B and held in position by the pins *a*, in combination with the inclosing-case and valve-seat, substantially as and for the purposes set forth.

3. The expansion-vessel B of a steam-trap, containing alcohol above a layer of resinous material, for preventing the escape of alcohol, or the vapors thereof at the joint in the metal, substantially as set forth.

141,064.—*Clothes-Reel.*—JAMES MCMAHON, Ann Arbor, Mich. Application filed May 17, 1873.

The clothes-reel is constructed with arms from the center shaft, having on their ends pivoted rollers which are allowed easy revolution. On each roll is attached, by elastic rings, a binding-slat, to secure the clothes to the roller.

Claim.—1. In combination with a revolving clothes-bar, D, the binding-slats E, when constructed and arranged to operate substantially as and for the purposes set forth.

2. The posts A, radial arms C, shaft B, and revolving clothes-bars D, when the parts are constructed and combined to operate substantially as and for the purposes described.

141,065.—*Carriage-Seat.*—JACOB N. MILLER, Bellefontaine, Ohio, assignor to MILLER BROTHERS, same place. Application filed February 21, 1873.

The main seat slides on ways concealed beneath the tops of the sides of the carriage-body, and the ways are arranged as to permit the top of the back portion of the body to be inclosed.

Claim.—1. The seat B supported on ways *d*, concealed beneath the upper plates or rails of the sides of the bed, substantially as set forth.

2. The slides D extending around the outer and upper edges of the sides of the body, so as to avoid any interference with in closing and paneling the top of the rear part of the bed, substantially as set forth.

3. The screw-cylinder E, lever F, rods G G, bell-crank levers H H, and clamps I I, combined and arranged to operate in connection with the seats B and rails D, substantially as set forth.

4. The bolts or pins T and stops *t* employed to limit the movement of the seat B in the manner substantially as set forth.

5. The movable front seat C attached by hinged legs J, and having short rear legs F on which it rests when in either position, in combination with the sockets p^1, which support it in position for a driving seat, substantially as set forth.

6. The construction and combination of the bearing or bushing K *k*, stud *j*, bolt L, and hinged leg J, substantially as set forth.

7. The seat-backs Q constructed with pivot-hooks *q* and supported by sockets R, arranged centrally between the front and rear edges to admit of reversing the said backs, substantially as set forth.

141,066.—*Candle-Guard.*—BENJAMIN MORGAN, San Francisco, Cal. Application filed February 17, 1873.

A circular disk divided equally is surrounded by a raised flange. The halves are hinged, and have handles and springs for opening and closing the device. A central opening admits the candle, and the melted tallow is prevented from passing through the junction of the two parts by a narrow strip of metal extending thereunder.

Claim.—1. A candle-guard consisting of the parts A A' and hinge C, operated by the spring D and handle E, substantially as described.

2. In combination with the parts A A', hinge C, spring D, and handle E, the thin plate or flange G G, as and for the purpose specified.

141,067.—*Manufacture of Sugar.*—JAMES A. MORRELL, New York, N. Y. Application filed June 4, 1873.

Claim.—The mode of inducing a separation of the glucose or grape-sugar and crystallizable sugar contained in saccharine solutions, preparatory to the evaporation and granulation of the same, by passing through such solutions induced currents of electricity, whether accompanied by atmospheric currents or not, such solutions being afterward evaporated and granulated according to any known process.

141,068.—*Process for Delaying the Fermentation of Saccharine Solutions.*—JAMES A. MORRELL, New York, N. Y. Application filed May 14, 1873.

Currents of air, heated to a temperature of two hundred and twelve degrees or upward of Fahrenheit's scale, are passed through the juice as it flows from the mill.

Claim.—The mode of delaying the fermentation of saccharine solutions, in order that they may be preserved for future use, by passing currents of hot air through them, so as to coagulate the albumen and kill the fungous spores contained therein.

141,069.—*Pessary.*—OTHO M. MUNCASTER, Washington, D. C. Application filed February 14, 1873.

The stem of the pessary is left to freely move in a plate which rests upon the lower part of the abdomen, and thus adjusts itself vertically to suit the movement of the wearer. A small flexible loop extends back toward the arms from about the middle portion of stem, just below the part within the vagina. The vertical adjustments and fastenings of the stem are all within a cylinder, and present no rough points.

Claim.—1. The plate A to rest over the symphysis pubis, combined with the pessary-stem which passes through it, and is left free to move within it, as directed.

2. The adjustable fastening, composed of the two clamps upon the upper end of the stem G, combined with the slotted part of the lower end M, all being inclosed within the cylinder E, and all arranged as described.

3. In combination with the above, the loop running backward to the anus, all as directed.

141,070.—*Apple-Parer.*—WILLIAM A. C. OAKS, Reading, Pa. Application filed June 6, 1873.

Is constructed with a gear and flanged pinion, having intermitting teeth, by which an intermitting action is produced at a point which allows a revolution of the apple, and pares it at the stem, and by its action is again connected and the apple pared.

Claim.—In apple-parers, the combination of the flanged pinion D, with recessed teeth *e*, with the gear-wheel C, having also recessed and extended teeth, arranged in such a manner as that the pinion rotates and produces a full revolution of the fork-shaft while the gear-wheel remains at rest, substantially as and for the purpose described.

141,071.—*Leg for Furniture.*—JAMES C. OAS and JAMES M. BAIRD, Wheeling, W. Va. Application filed May 17, 1873.

The two parts of each leg are notched at the top and fit in grooves in the side rails, and held in place by a button attached to the under side of the table-top. The lower ends of the leg are connected together by two inclined blocks.

Claim.—The leg composed of two parts, A B, notched at top and fitting in grooves of rails D, connected at the bottom by blocks E and at the top by button G, as and for the purpose specified.

141,072.—*Manufacture of Beer and Yeast.*—LOUIS PASTEUR, Paris, France. Application filed May 9, 1873.

Impure yeast is caused to act on a solution of sugar, and when fermentation has ceased the liquid is decanted. Into a shallow dish, previously dipped in boiling water, a little beer-wort, preserved by the "Appert process," is put, and a small portion of yeast deposit made by the above process is added, the whole being then covered by a glass plate. The yeast which has been exhausted by the sugar solution is thus revivified and purified. The apparatus of the third claim is for testing the purified yeast.

Claim.—1. The method of obtaining pure yeast by eliminating the organic germs of disease from brewers' yeast, in the manner described.

2. Yeast, free from organic germs of disease, as an article of manufacture.

3. The vessel, having neck A B, rubber tube *b' c'*, and glass plug C D, as and for the purpose described.

4. The apparatus, consisting essentially of a covered vessel having water-trough around the top, rubber tube *e d*, metal pipe *e*, tube *d f g*, top and bottom gutters, and pipes D E, together with suitable cocks, thermometer, outlets, and inlets, substantially as set forth.

141,073.—*Wheel-Plow.*—JOHN C. PEARL, Meadota, Ill. Application filed February 21, 1873.

Claim.—1. The combination of the suspension-rod H^3, which swivels in a sliding coupling attached to the frame of the carriage, and the plow-beam E, which is loosely sustained in the fork of the suspension-rod by a bolt passing underneath it, substantially as and for the purpose specified.

2. The herein-described coupling for suspending a plow-beam, composed of the parts H, H^1, H^2, and H^3, constructed and connected substantially as set forth.

3. The combination of the platform D, elongated socket G fixed thereto, angular draft and suspension rod F F^1, and laterally-adjustable plow-beam E, all constructed and connected substantially as specified.

141,074.—*Water-Wheel.*—EDWARD R. PERCY, Lawrence, Kans. Application filed July 26, 1872.

A water-wheel with a horizontal axis, in combination with fixed upright posts, pillars, or columns, constructed so that the wheel can slide in them and be sustained by the water alone, and caused to revolve in all the varying depths of the running water on which it floats. There is also a floating dam, in combination with the floating wheel and upright posts.

Claim.—1. A water-wheel having a horizontal axis, in combination with fixed upright posts, pillars, or columns, constructed, as described, so that the wheel will be sustained by the water alone, and caused to revolve in all the varying depths of the running water on which it floats.

2. In combination with the floating wheel and upright posts, the floating dam, as and for the purposes described.

141,075.—*Seat for Harvesters, &c.*—JOHN G. PERRY, Kingston, R. I. Application filed May 6, 1872.

A seat is formed from a sheet of metal swaged to the neces-

sary form, and is attached to a block to keep it in position, and secured by a bolt which connects the whole to a spring.

Claim.—A seat for harvesters, &c., consisting of a sheet-metal plate, A, swaged into shape, in combination with the block C and bolt *a*, as and for the purposes specified.

141,076.—*Printing-Telegraph.*—GEORGE M. PHELPS, Brooklyn, N. Y. Application filed December 17, 1872.

Pulsator-wheel *c*, driven by friction, makes and breaks circuit through lever *c'* and point 6, and is stopped by arm taking against key while motor-train continues revolving. Brake applied when necessary to stop train and break circuit. Escapement controlled by two magnets. Current sent through each alternately by circuit-closing device on type-wheel shaft. Other features as per claims.

Claim.—1. The pulsator-wheel *c*, lever *c'*, and springs 4 and 5, combined with the circuit-screw 6, for opening and closing the circuit by the wheel *c*, substantially as set forth.

2. The lever *k*, spring-brake 10, and arm and pin 12, in combination with the pulsator-lever *c'*, for stopping the motor and closing the circuit simultaneously, substantially as set forth.

3. The two magnets *p* and *q*, acting in opposite directions upon the armature 17 and escapement 16 for the type-wheel *m*, in combination with the circuit-changer, acted upon by the type-wheel shaft, to direct the pulsations alternately through the magnets *p* and *q*, substantially as set forth.

4. The sliding shaft 38, and stop 39, and weighted pawl, taking the screw upon the type-wheel shaft, in combination with the weighted lever w^1, substantially as and for the purposes set forth.

5. The weighted armature *x* and electro-magnet *y*, in combination with the circuit-closing spring *x'*, point 30, and main and local circuits, substantially as specified, and operating as set forth.

141,077.—*Inking Apparatus for Oscillating Printing-Presses.*—GEORGE W. PROUTY, Charlestown, Mass. Application filed April 8, 1873.

The ink is more thoroughly broken up and distributed by giving to the ink-table a succession of rectilinear motions, first in one direction and then in the opposite, by means of a cam.

Claim.—The ink-distributing table T, in combination with the cam U *d*, so arranged and operated as to impart to said ink-table a succession of rectilinear motions in one direction, and then a succession of similar motions in the opposite direction, substantially as described.

141,078.—*Sash-Holder.*—GEORGE W. RICHARDSON, Columbus, Ky. Application filed June 21, 1873.

A cogged sector or pinion and rack-toothed wedge are arranged within a shell or case for attachment to the window-sash. The sector is thrown automatically forward by a spring. A spindle passes through the sector, and an operating-lever is fastened to the end of the spindle outside the shell. The toothed wedge is moved up and down by the sector parallel with the casing, its frictional face in contact therewith.

Claim.—1. The arrangement of the spring J, in combination with the sector or pinion D and the wedge G, as and for the purposes described.

2. An automatic sash-lock, consisting of the shell A, spindle E, lever F, sector or pinion D, wedge-rack G, and coil-spring J, arranged substantially as shown and described.

141,079.—*Curling-Iron.*—LEO ROSENSTEIN and SIGMOND FEDER, Memphis, Tenn. Application filed June 4, 1873.

The inner tube or tubes are to contain heated water.

Claim.—1. A curling-iron composed of two or more concentric tubes, arranged substantially as and for the purposes specified.

2. In a curling-iron, the combination, with the tube A, of the tube B, braces *c*, rim *b*, stopper D, and plug E, when arranged substantially as and for the purposes described.

141,080.—*Scroll-Saw.*—JOHN W. ROWLINGSON, Binghamton, N. Y. Application filed May 26, 1873.

The saw is secured to the reciprocating cross-head by jaws, which are caused to gripe the saw by springs which force them together.

Claim.—The combination of the jaws D D and springs *c c* with the guide-plate E and adjustable guide-plate G, cam and lever J, removable block H, and their connections on the suspended standard B, all being constructed as herein shown and described, for the purpose set forth.

141,081.—*Carpenter's Bevel.*—SAMUEL D. SARGENT, Hartford, assignor to THE STANLEY RULE AND LEVEL COMPANY, New Britain, Conn. Application filed May 2, 1873.

Lengthwise through one of the sides of the bevel-stock is arranged a rod having a conical point, which enters and impinges against one side of an opening in the pivot around which the blade plays. The rod has a screw-thread upon it, and one of its bearings has a corresponding thread, so that by turning a thumb-piece upon the projecting end of the rod it is forced as a wedge into the opening in the pivot and draws the two sides of the stock together upon the blade, thus fastening it in any desired angle.

Claim.—The cone-shaped thumb-screw *c* arranged laterally in the stock, in combination with the bolt *c*, substantially as and for the purpose set forth.

141,082.—*Clothes-Pounder.*—EDWARD S. SAXTON, Greenfield, Ill. Application filed May 10, 1873.

A wood block turned to form with a center opening for the handle, and having two rows of concentric holes or openings of unequal depth, the outer row having openings for air, communicating with the inner by a groove on its bottom.

Claim.—The improved pounder, formed of a wooden block provided with the central hole F leading out through the top of the block, the two circular concentric rows of holes B and D, the shallow circular communicating groove E formed between them, and the openings C in the side of the block, all as shown and described, for the purposes specified.

141,083.—*Camel for Raising Sunken Vessels.*—HENRY H. SIEBE, WILLIAM A. GORMAN, and THOMAS CHRISTY, Jr., London, England. Application filed July 1, 1873.

A vessel or float consisting of two hulls united at one end, forming a single bow, and connected at the opposite end by an arch or bridge, has hoisting apparatus connected therewith, and is thus adapted to raise sunken bodies.

Claim.—The within-described single vessel for raising sunken ships or other bodies, in which two lateral parts, *a a*, uniting in the form of an ordinary bow or prow, *b*, are rigidly connected above the water-line by a structure or bridge, *c*, with or without intermediate structures of bridges *c'*, and provided with lifting apparatus and tackle, the whole being arranged and operating as herein set forth, for the purpose specified.

141,084.—*Reel.*—ROBERT SIMON, Paterson, N. J. Application filed March 8, 1873.

The strand, being unwound from this reel, is always on top at the crossings, and can therefore be picked up with facility after breakage, &c.

Claim.—A reel whose arms A are provided with dividing-disks, as described, for separating the parts of the skein, so that the silk or thread wound on such reel may be crossed in opposite directions in the spaces between alternate pairs of arms, in order that at such crossing each separate strand will be above its predecessor, as and for the purpose set forth.

141,085.—*Cotton-Seed Planter.*—JOHN L. SLOCUMB, Raymond, Miss. Application filed November 16, 1872.

A rectangular frame supported in front by the opener and in rear by the covering-wheel, the latter actuating, by two belts, a stirrer in the hopper in front of it, and a feeder in a spout beneath the hopper.

Claim.—The combination, with hopper and slides, of spout F, provided with rotary arms U and stationary arms V, arranged to operate as and for the purpose described.

141,086.—*Pile-Driver.*—CHARLES H. SMITH, Bloomer, Wis. Application filed May 10, 1873.

The drop of the pile-driver is worked by an endless chain and driving-wheel, so arranged that the chain engages the drop immediately after striking, and elevates it without loss of time. The drop carries a centering-wheel, I, to cause the line of gravity to coincide with the guiding-grooves, and the disengagement is effected by means of the mechanism shown in Fig. 4 and claimed in the third clause.

Claim.—1. The combination, with a rag-wheel, over which passes the chain by which the hammer is raised, of a ratchet, K I, on the rag-wheel shaft, and a subjacent sliding pawl, to enable the hammer to be locked to and unlocked from the chain, in the manner described.

2. The combination, with chain F, wheel G, and drum J, of rag-wheel H and centering-wheel I journaled in the drop, to give a non-frictional perpendicular rise and fall.

3. The combination, with movable detent pawl or slide N that locks the rag-wheel shaft, of a shaft having eccentric P and trip-arm R thereon, and with a stop, T or S, to enable the hammer to be tripped at the times and in the manner set forth.

141,087.—*Clasp for Suspenders.*—JOSEPH W. SMITH, Boston, Mass. Application filed January 15, 1873.

A buckle and slide are combined so that two straps may be attached at a right angle and made adjustable in relation to each other.

Claim.—The slide and buckle combined, constructed and operating substantially as described.

141,088.—*Sewing-Machine.*—DAVID M. SMYTH, Lynn, Mass., assignor to STICKNEY, ELLIOTT & WILSON, New York, N. Y. Application filed May 14, 1873.

The cams moved by the ratchet and pawl operate the first one mentioned in the claims, to move through a rock-shaft and links, a pin to stop the lower feed when desired, and the second cam acts against a block in which the needle-bar reciprocates and moves it with the needle laterally, thus enabling the machine to stitch in irregular lines.

Claim.—1. The cams *c* and 5 revolved progressively by a ratchet and pawl, in combination with the swinging needle-bar and block 6 and the locking-bolt *k*, to lock out of action the ordinary feed motion, substantially as set forth.

2. The arrangement of the oscillating plate *r*, pawl *s*, ratchet *s'*, and link *t*, connected with the needle-bar and the arms *u* and *v'* of shaft *v* that actuates the locking-bolt *k*, in combination with the lever *f* and feed-bar *e*, substantially as set forth.

141,089.—*Spinning-Top.*—JOHN SPENCER, Chicago, Ill. Application filed April 16, 1873.

A series of tops arranged to be spun by a single throw.

Claim.—The spinning-top A, provided with a conical receptacle, W, and the nest of cones *a*, *b*, *c*, *d*, *e*, and *f*, which cones are expelled from the top, separated, and made to turn independently of each other by the centrifugal motion imparted to the top, all said parts being constructed and arranged to operate substantially as specified.

141,090.—*Apparatus for the Manufacture of Gas.*—WILLIAM H. SPENCER, New York, N. Y. Application filed May 20, 1873.

Apparatus for carrying out the process covered by Letters Patent No. 131,035. Two arches, side by side, contain the retorts for decomposing hydrocarbon and steam. From a gas-holder, which receives the gas from the first bench of retorts, the gas is pumped through a second gasometer or governor to the second bench of retorts, where it meets and is diluted by steam. After the diluted gas leaves the second bench of retorts its candle-power may be increased by admitting rich gas to the main by means of a pipe connecting with the pipe for rich gas at a point between the pump and second bench.

Claim.—1. A counter-weighted gas-holder receiving the rich gas from the retorts, in combination with a forcing apparatus that passes a regulated quantity of such gas through retorts and in contact with steam at a high temperature, substantially as and for the purposes set forth.

2. The combination of a regulator with a forcing apparatus, a gas-holder, and a retort for superheated steam, substantially as specified, when said regulator is placed between the pump or forcing apparatus and said retorts, for the purposes set forth.

3. In a gas apparatus in which the rich gas is passed through a retort with superheated steam, a connecting-cock between the pipe from the holder containing such rich gas and the conveying-main, to regulate the illuminating power of the gas, substantially as set forth.

141,091.—*Broaching-Machine.*—AXSON P. STEPHENS, Brooklyn, assignor to THE STEPHEN'S PATENT VISE COMPANY, New York, N. Y. Application filed January 24, 1873.

The bearing for supporting the article to be broached is a perforated hemispherical block backed by a concave abutment, and the broach is actuated by a screw propelled by a nut that is revolved by power transmitted to it by belt and gearing.

Claim.—1. The self-adjusting bearing *s* within the abutment *r*, in combination with the broaching-tool *a* and its actuating mechanism, substantially as set forth.

2. The nut *h* and its flange *i*, bearing against the pillar-block *k*, and actuated by the wheel *g*, in combination with the screw *e*, broaching-tool *a*, and supporting-bars, substantially as set forth.

141,092.—*Grafting.*—CHARLES E. SIMONDS, Salem, Mass. Application filed March 15, 1873.

A thin sheet of elastic India rubber is wound around the scion and stock so as to exclude water and keep the parts in contact. Dissolved rubber is used to cause the adhesion of the band.

Claim.—The described improvement in the process of grafting, it consisting in the use or application of India rubber with the stock and scion or bud, substantially in manner as specified, the rubber being in the form of an adhesive sheet or band wound about the stock and scion, and against or upon itself, so as to cause the folds to adhere together and constitute an elastic and water-proof cover to the joint, all as explained.

141,093.—*Fire-Escape.*—JOSEPH A. TALPEY, Somerville, assignor to JOHN HITCHCOCK, trustee, Boston, Mass. Application filed June 21, 1873.

An improvement on Patent No. 139,484, June 3, 1873. The grooved chain-wheel is made in two parts, with lugs and corresponding depressions, so that when taken apart, turned half-way round, and reunited, the chain-wheel is converted into a rope-wheel, the number of sprockets being uneven. The centrifugal levers are arranged with hooks, which serve as means of connection with the revolving arms. The chamber in which the weights revolve is arranged eccentrically to compensate for the increased friction in the lower section of the cylinder, due to gravity.

Claim.—1. In a machine for lowering goods, to be used as a fire-escape and for other purposes, a grooved pulley divided into two parts in a plane at right angles to its axis, provided with the ribs *d d* on either side of said groove, and the lugs *e e* upon one part, and corresponding recesses in the other part arranged to be secured together in two opposite positions at will, to form a sprocket or chain wheel, or a pulley adapted to be operated by a rope, substantially as described.

2. The weighted levers I I, provided with the lips or hooks *i*, arranged with relation to each other, and connected to the arms H H, as shown, and serving as brakes to retard the speed of revolution by being thrown outward by centrifugal action against the inclosing casing, substantially as described.

3. The arrangement of the chamber B eccentrically to the axis of the revolving parts, substantially as described, for the purpose specified.

141,094.—*Windmill.*—CHARLES A. TAYLOR, Hartford, Conn. Application filed March 8, 1873.

Each sail or wing consists of a rigid central post springing from the front end of the shaft, having a flap upon either side of the post, hinged thereto so that they may swing backward. There is a weight attached to keep the sails fully expanded, and by altering the weight the pressure can be adjusted to the opposing pressure of the wind in such a way as to keep the mill in proper limits. Through the center of the length of the shaft is a rod having some longitudinal play. On the front end of this rod are the arms, from the ends of which run connecting-rods.

Claim.—1. A windmill-sail, consisting of a fixed central post, *c*, with flaps c^1 c^2 hinged thereto upon either side, substantially as described, and for the purpose set forth.

2. The combination of the sails, composed of the central post *c* and the flaps c^1 c^2 hinged thereto upon either side, the connecting-rods c^3 c^4, the arms d^1 d^2 d^3 d^4, the rod *d* running through the length of the shaft *a*, the swivel-arm *f*, cords *f'*, and weight *g*, all constructed, arranged, and designed for operation, substantially as and for the purpose set forth.

141,095.—*Tuck-Marker.*—FRED. L. TILESTON, San Francisco, Cal. Application filed May 31, 1873.

The standard of the base-plate supports the spring and the creasing-arm, the latter being acted and pressed against the fabric by one end of the spring, which is moved by the needle-bar. The adjustable gage and spring guide the edge of the material and smooth it.

Claim.—The base-plate and its connected supporting-head, in combination with the adjustable bent creasing-arm, the spring N O, and the sliding gage-plate and spring, all constructed and operated as described.

141,096.—*Dovetail-Machine.*—ALFRED C. VAN ALSTINE, New York, N. Y. Application filed April 5, 1873.

The different parts of sash are dovetailed in this machine and tenons formed by the arrangement of the carriage in connection with the various cutters, the carriage being automatically tilted by ratchet-wheels, pawls, and escapements.

Claim.—1. The combination of the tongue T', escapement *c' d*, ratchet-wheels *a'*, cog-wheels R, pawl 4, and pawl-bar 3, with the branched guide-slot and the carriage M, substantially as specified.

2. The combination of the finger-bar N of the tilting bar V, branched guide-slots Q F I, tongue T', and automatic devices for shifting the tongue.

141,097.—*Earth-Boring Machine.*—GEORGE WILSON and GEORGE H. BAISLEY, Hamilton, Mo. Application filed April 8, 1873.

Claim.—1. The hinged boxes or journals *n* for throwing the boring-shaft out of gear with the driving mechanism, substantially as shown and described.

2. The elevating mechanism, consisting of the shaft *c'*, drum *m*, and wheel *c'*, when arranged, substantially as described, so that it can be operated either independently of, or in connection with, the driving mechanism for raising and lowering the boring-shaft, substantially as specified.

3. The shaft *b*, pinions *e g*, and wheel *d*, in combination with the shaft *h* and spur-wheel *i*, substantially as set forth.

141,098.—*Dumping-Truck.*—FREDERICK H. ABEEL, New York, N. Y. Application filed May 24, 1873.

The end-gate is locked by means of a sliding rod having a hooked end, with which a lever pivoted to the front of the wagon engages. The load is supported upon rollers and the end-gate, and as the latter is unlocked the load slides off from the wagon.

Claim.—1. In a dumping-truck, the hinged tail-board A, arranged to partly support the load, in combination with the locking mechanism B E G H, or its equivalent, for holding or releasing the tail-board, substantially as set forth.

2. The arms B B, rods E E, slotted plate G, and lever H, in combination with the tail-board A, substantially as and for the purpose herein set forth.

3. The roller *d* and elevated roller *e*, in combination with the tail-board A, substantially as shown and described.

141,099.—*Wheel for Vehicle.*—CHRISTIAN ANDEREGG, Lawrenceburg, Ind. Application filed May 14, 1873.

Improvement on patent No. 129,499, July 16, 1872.

Claim.—The combination of stepped wooden hub and spokes A C B D and webbed metallic band E E' F, the metallic band with the socket-webs below the periphery, so as to receive the upper shoulders of the spokes, all substantially as set forth.

141,100.—*Disinfecting and Deodorizing Apparatus for Water-Closets.*—JOHN M. B. BAKER, Lennox Road, Southsea, England. Application filed June 12, 1873.

Within the cylinder containing the disinfecting liquid, and near the bottom, is fixed a small pump-barrel fitted with a flexible plunger operated from the lever which works the flushing-plug. On the descent of the plunger a graduated quantity of the liquid is forced into the pipe leading to the pan. The upper part of said pipe is provided with a conical valve of vulcanized India rubber, slit at its apex, and with a flanged base of woven or textile fabric, the base being secured between the connecting-pipes when screwed together.

Claim.—1. In combination with the reservoir A, the barrel C, plunger D, rod E, rod U, lever R, and pipes H L communicating with the closet-pan M, all arranged and operating substantially as described, for the purpose specified.

2. In combination with the pipes H and L and barrel C, the intermediate valve B, constructed, arranged, and operating substantially as herein described.

141,101.—*Hot-Air Flue for Heating-Furnaces.*—GEORGE R. BARKER, Germantown, Philadelphia, Pa. Application filed March 31, 1873.

An adjustable valve upon the hot-air pipe operates to govern the admission of hot-air to the ventilating-flue.

Claim.—The adjustable valve C, or its equivalent, constructed and arranged to operate in combination with the hot-air flue or pipe A, and the ventilating flue or pipe B, substantially as and for the purposes hereinbefore described.

141,102.—*Compound Faucet.*—WILLIAM S. BATE, Philadelphia, Pa. Application filed June 18, 1873.

By means of two supply-pipes hot and cold water are brought to the faucet, the handle of which, being turned to certain positions, allows water to pass through one of two discharge-pipes—from either the hot or cold supply-pipes, or partly from one and partly from the other. Upon turning the handle to certain other positions the water is permitted to pass through a second discharge-pipe, the temperature being changeable as before.

Claim.—1. A compound faucet in which a casing having two supply-pipes, *a* and *b*, and two discharge pipes or nozzles, is combined with a valve, B, having ports so arranged as to establish communication between either of the supply-pipes independently, or both simultaneously, and either of the discharge-pipes, all substantially as specified.

2. A compound faucet in which a casing, A, having two supply-pipes, *a* and *b*, and a discharge pipe or nozzles, *c* and *d*, is combined with a valve, B, having a surface-port, *h*, for establishing communication between either or both of the supply-pipes and the said discharge-pipe, all substantially as specified.

3. The combination, with the discharge-pipe *c*, of the channel and passage *p* in the valve, for the purpose specified.

141,103.—*Car-Coupling.*—THOMAS BEDDOW and ALEXANDER T. JACKSON, New Albany, Ind. Application filed April 26, 1873.

A pivoted tumbler, which is adapted to fit into a recess formed in the upper part of the draw-head, engages with a projection on the end of the coupling-link. The notch of the link is so beveled and the tumbler is so pivoted that, in the event of any car upsetting, the link will be automatically detached.

Claim.—The combination of the draw-head A, constructed with the recess C, as described, and having the tumbler D with its oblique rear end pivoted therein, with the link E having its coupling-shoulders beveled outward, substantially as shown and described.

141,104.—*Gage-Cock.*—JOHN F. BELLEMRE and FRANK R. FLEKE, Reading, Pa. Application filed April 22, 1873.

If the valve should leak, the escape-passage in the cock having been closed by the central plug, the seat may be unscrewed, and if the defect is in the seat it may be reversed. The peculiar form of the valve and hollow plug permits the removal of the former and the ready exit of the steam.

Claim.—1. The combination, with a gage-cock, of the seat E, constructed substantially as described, so that it may be reversed, for the purpose set forth.

2. In a gage cock, the valve D, having the collar *d*, neck d^1, and flat sides d^2, in combination with the hollow plug F having a transverse channel in its inner end, substantially as and for the purpose specified.

141,105.—*Hardening Steel Wire and Thin Sheets of Steel.*—ALFRED BENJAMIN, Newark, N. J. Application filed July 17, 1873.

Claim.—1. The process of hardening steel wire or thin steel by treating it, when properly heated, to a strong blast of air or gas, substantially as herein set forth.

2. The continuous process of treating and hardening steel wire or thin steel, wherein the material, as it emerges from the heating process, passes at once into a strong blast of air or gas, substantially as described.

3. The continuous processes of heating, hardening, and tempering steel wire or thin steel, wherein the material, as it emerges from the heating process, passes through a strong blast of air or gas, and thence into the tempering process, substantially as set forth.

141,106.—*Stove-Platform.*—GILBERT E. BINGHAM and JOHN F. EWING, Chicago, Ill. Application filed March 1, 1873.

The board B, the upper surface of which is covered with sheet metal, is fitted within the flanges a^1 a^2 of the ring A, which is composed of two or more pieces, which are connected together by means of the lugs *c* and rivets or screw-bolts.

Claim.—1. The stove-platform, consisting of the cast-metal ring A, made in two or more pieces, the board B, and the sheet-metal cover *z*, substantially as shown and described.

2. The flanges a^1 a^2 on the inner edge of the ring, substantially as shown and described.

3. The board B, covered with sheet metal, and held between the flanges a^1 a^2, substantially as shown and described.

141,107.—*Chimney-Cap.*—THOMAS BOYD, Cambridgeport, Mass. Application filed May 21, 1873.

A cylindrical cap surmounts the cone and is attached thereto by a ball screwed upon the stem. An elastic cushion surrounds the stem for prevention of noise in turning. The cone is weighted at its upper extremity, and the shaft about which it turns reaches nearly to the top.

Claim.—1. A cap for ventilator and chimney flues, suspended and provided with an upper outside enlargement, G, substantially as and for the purpose described.

2. The elastic cushion *f*, against which the cap I is confined on its suspension-stem *a*, substantially as described, for the purpose specified.

3. The concave top I to the inner part of the cap, substantially as described, for the purpose set forth.

141,108.—*Trace-Buckle.*—EDWARD K. BRAYTON and JOHN BAUGH, Eau Claire, Wis. Application filed May 24, 1873.

The buckle-frame and clamping-plate are both corrugated on their inner sides. A movable yoke or brace holds the clamp together, and secures the trace by means of a wedge, which is attached to the tug.

Claim.—1. The trace-clamp, consisting of the wedge C to be fastened to a hame or trace, the brace D, and the pressure-plates E F with corrugated friction-surfaces, substantially as specified.

2. In a trace-coupling, the friction-plate F with the buckle-blanks or guides f^1, and the strap-slots f^2 f^3, substantially as specified.

141,109.—*Restoring Tinned Sheet-Iron.*—WILLIAM E. BROCKWAY, New York, N. Y., assignor to WILLIAM L. BROCKWAY, same place. Application filed July 5, 1873.

After collecting a sufficient quantity of cans, subjects them to a temperature of 1,000° in a suitably-constructed oven, and, thereby, not only divesting the iron of all the tin, but annealing the iron. The iron is then taken from the oven and passed between rollers, which press upon it sufficient to straighten and prepare it for market.

Claim.—The above-described process for restoring and utilizing waste material, substantially as set forth.

141,110.—*Seal for Locks.*—FRANKLIN W. BROOKS, New York, N. Y., assignor to EDWARD J. BROOKS, same place. Application filed June 18, 1873.

A thin fibrous material, with numbers, names, initials, or any private or other marks upon it, is applied behind or beneath the glass, the latter serving to protect the paper seal, and having to be broken before the seal can be removed or access had to the lock.

Claim.—The combination of a transparent or semi-transparent protector with a paper seal for locks, substantially as herein described, for the purposes stated.

141,111.—*Wheel for Vehicles.*—JOSEPH Q. BRYER, Wilmington, Del. Application filed February 8, 1873.

A rubber lining placed between the bore of the hub and the axle-box, is forced by any lateral shock into a recess formed in the bore, thereby lessening the shock.

Claim.—1. The plug F, having the flanges *f* and groove *g*, communicating with the recesses *b c*, in combination with the axle-spindle and axle-box, substantially as specified.

2. The hub A, having enlargement I in the middle, and having in the enlargement the groove or recess *a* and the spoke-mortises partly through the enlargement, in combination with the rubber lining B placed between the axle-box and bore of the hub, and extending under said recess *a*, substantially as shown and described.

141,112.—*Tape for Hoop-Skirts.*—CHARLES C. CARPENTER, New York, N. Y. Application filed May 14, 1873.

Claim.—1. As a new article of manufacture, a tape for hoop-skirts having an open body or mesh-work, A, and solid or closed bars B, substantially as described and shown.

2. As a new article of manufacture, tapes for hoop-skirts, constructed substantially as above described, when formed in sheets or widths for separation and use as tapes, as set forth.

141,113.—*Port-Stopper Fastening.*—JOHN CARVER, Lincolnville, assignor of one-half his right to JONATHAN P. CILLEY, Rockland, Me. Application filed May 10, 1873.

Port-stopper made in sections, each of which is separately secured by means of a link and key, and a single cross-bar, which bar is provided with a plurality of slots for receiving the links.

Claim.—A port-stopper, consisting of a plurality of horizontal pieces, B B, each provided with a staple, C, for the reception of a link, D, in combination with a single vertical cross-bar, E, having diagonal slots to receive the inner ends of the links, through which wedge-shaped keys are inserted, as and for the purpose set forth.

141,114.—*Culinary Apparatus.*—REUBEN H. CAZIER, Philadelphia, Pa. Application filed March 5, 1873.

The boiler is placed inside the cylinder on suitable supports, so as to leave a draft-passage all around. The top of this space and a portion of the boiler are covered by a hinged metallic annulus. The steam, &c., easily flow off through this passage.

Claim.—The case A, pan B, lugs *a*, and the open lid or ring C, substantially as and for the purpose shown and described.

141,115.—*Seat-Hinge.*—MARCELLUS W. CHASE, Buffalo, N. Y. Application filed June 30, 1873.

An axial bolt clamps the two parts of the joint together and constitutes the pintle. The seat-arm is provided with a segmental projection, and the standard-arm with a lug and a concentric flange, said flange having a recess or opening to allow the passage of the projection on the seat-arm portion of the joint when the bolt is removed.

Claim.—A seat-hinge comprising a central bolt, C, for clamping the parts together, and a flange, *w*, having a recess, *u*, a stop-lug, *x*, and a projection, *v*, concentric therewith, and formed and arranged on the standard and seat-arm, substantially as herein described.

141,116.—*Process for the Manufacture of Artificial Leather.*—HENRY A. CLARK, Boston, Mass.—Case C. Application filed July 12, 1873.

Lithographic ink or some adhesive substance is transferred to the surfaces of the material to be treated by the ordinary lithographic-press process.

Claim.—The mode or process herein described of preparing paper or other sheet material, for the purpose specified.

141,117.—*Artificial Leather.*—HENRY A. CLARK, Boston, Mass. Case B. Application filed July 12, 1873.

Ink is transferred to the sheet material by the ordinary lithographic-press process, and after it has dried a coating of some water-proof material is applied to both surfaces, after which the remaining unprepared surface is coated (preferably by the process before mentioned) with an adhesive substance and sprinkled with some suitable flock.

Claim.—Paper, or cloth, or other suitable sheet material, prepared on one side with flock, on the other with lithographic ink, and on both sides water proofed, all substantially as herein described, for the purpose specified.

141,118.—*Preparing Cloth, and Paper, and Like Fabrics to Imitate Leather.*—HENRY A. CLARK, Boston, Mass.—Case A. Application filed July 12, 1873.

Lithographic ink is applied to the surface of the stone and the material then laid on the prepared surface. The sheet material, after subjection to the ordinary transfer operation of a lithographic press, is removed from the stone, and after it has dried a water-proof coating is applied to both surfaces.

Claim.—Paper, or cloth, or other suitable sheet material, prepared on one or both sides with lithographic ink, and on both sides water-proofed, all substantially as herein described, for the purpose specified.

141,119.—*Manufacture of Vapor Gas.*—COBERT L. COHEN, Philadelphia, Pa. Application filed May 13, 1873.

Claim.—1. The employment, in the manufacture of vapor gas, of chloride of lime, substantially as set forth.

2. The employment, in the manufacture of vapor gas, of chloride of lime and sulphuric ether, substantially as set forth.

141,120.—*Sash-Fastener.*—ALEXANDER COLE and EZRA DAVIS, Saratoga Springs, N. Y. Application filed May 21, 1873.

The bed-piece is constructed with rounded recess, lip, shoulder, and guards, to confine a bent coiled spring, and has likewise a socket for hinging the thumb-piece, the rivet connecting or hinging this latter to the bed-piece passing through both coils of the spring. The bed-piece, thumb-piece, and spring are inserted in a cavity of the window-frame and fastened by a single screw.

Claim.—1. The spring *e*, bent and coiled as shown and described, in combination with the rivet or bolt *f*, which connects the thumb-piece with the bed-piece, the rivet passing through both coils *i i*, all as shown and described.

2. The bed-piece *c*, constructed as described, with a rounded recess back of the hinge adapted to receive the coils of the spring and the socket of the thumb-piece, and having the lip *n* and the side rims or guards *l l*, aiding to maintain in position the free ends of the spring, all substantially as shown and described.

3. The combination of the bed-piece *c*, thumb-piece *d*, and the spring *e*, adapted to be applied to the window by a single screw, when these parts are constructed, relatively arranged, and operate as set forth.

141,121.—*Reclining Chair.*—EDWARD COLLINS, New York, N. Y. Application filed June 6, 1873.

The seat rests on a pedestal connected by a globe-joint and pivoted legs in the rear, and the back is adjustable by levers and racks.

Claim.—1. The combination of the seat F, arms A, back B, and rods C, provided with the notched bars D for engagement with projections *d* on the back, substantially as and for the purpose shown and described.

2. The legs G pivoted to the seat, and connected to the seat and arms by rods *e* and levers K engaging with notches in the arms for holding the seat in different positions, substantially as shown and described.

3. A globe-joint for connecting the seat with the pedestal, consisting of the bowls L M, formed with projections and depressions *l m*, and secured by a bolt, P, whereby the chair may oscillate backward and forward, and may be held in position when facing in different directions, substantially as shown and described.

141,122.—*Saw.*—JOSEPH CROOKES, St. Louis, Mo., assignor of one-half his right to JOSEPH W. BRANCH, same place. Application filed June 17, 1873.

The cutting-tools are placed between spring jaws which are held securely in the saw-plate by an eccentrically-grooved disk.

Claim.—The combination of spring-clamp E, eccentrically-grooved cam G, and diamond or other set or cutter K, substantially as set forth.

141,123.—*Last-Block Holder.*—DAVID DANIELS, Park's Corners, Ill. Application filed April 10, 1873.

The plate has projections at each end upon its lower side, which run in a groove in the wooden last and prevent the holder from turning.

Claim.—As a new article of manufacture, the slotted plate *a*, having the projections on its lower side so as to hold it in the proper position, substantially as shown and described.

141,124.—*Can for Oysters.*—CHARLES H. DEXTER, Baltimore, Md. Application filed July 8, 1873.

By making the hole in one side and the seam in the middle of the other side the hole can be made larger and with a seat for the cap, because it interferes with no soldered seam, and the seam can be more easily soldered. The pieces that form the ends of the cans are creased and have unbroken-lipped corners to protect the corners of the can, and are crimped to the can before soldering.

Claim.—1. An oyster-can having a filling-hole through one of the sides of its body and opposite a seam, *g*, in the side opposite said hole, substantially as described.

2. Creased ends or heads B, having channels *e* and depressed edges *a*, which latter terminate at the corners of the heads in unbroken lips *b*, substantially as described.

3. The ends or heads B, constructed as described, and crimped or pressed upon the body of the can previously to soldering, substantially as described.

4. The seam in one of the sides of the can, as set forth.

141,125.—*Manufacture of Push-Top for Watches.*—JOHN C. DUBBER, Cincinnati, Ohio. Application filed March 1, 1873.

A cylindrical bar, homogeneous or of bars of different metals soldered together, is first knurled on its surface, then turned to the form of a connected series of push-top blanks, and these blanks are then successively drilled out and out off.

Claim.—The method or process of manufacturing watch case push-tops by knurling the entire periphery of a metallic bar or rod and subsequently turning, drilling, and cutting the same, all substantially as herein described.

141,126.—*Ladder.*—JOHN EAGON, Batesville, Ohio. Application filed March 27, 1873.

The ladder is extensible, and is supported on a base-frame of timber, so as to be adjusted at different angles of elevation, being sustained in an inclined position by hinged braces which are stepped in mortises in the base-frame.

Claim.—The ladder B having the hinged tenoned braces B', in combination with the frame or base A, mortised at different points, substantially as and for the purposes specified.

141,127.—*Harvester-Rake.*—WILLIAM T. EASTES, Summitville, Ind. Application filed June 23, 1873.

A sliding rake, connected to a series of folding levers, discharges the gavel at the inner end of a rectangular platform by means of a foot-lever with intermediate links, and is returned by the action of a spring.

Claim.—The slat-frame *a a* with the sliding clips a'' a'', the slides *s s*, the levers *t t'*, the links *s' s'*, and the slats H H, in combination with the bar *v*, rake-bar *e*, rod or bar E, lever *c'*, rod c'', lever *d'*, rod *m*, spring *f*, and lever or treadle F, all constructed and arranged substantially as and for the purpose set forth.

141,128.—*Rotary Engine.*—WINSLOW P. EAYRS, Boston, Mass., assignor of one-half his right to TIMOTHY E. STUART, same place. Application filed May 14, 1873.

The cleats are so arranged that one valve admits a full head of steam while the other has been moved by them, and cuts off so that the steam admitted may expand. The rollers in the abutments, which are forced radially against the segments of cylinder by steam acting through suitable passages, act as packings.

Claim.—1. The cleats *f f*, arranged in front of the abutments *d d* in the steam-channel of the wheel A, and operating on the valves G G', substantially as and for the purposes herein set forth.

2. The combination of the wheel A having steam-channel *b*, abutments *d*, rollers *e*, and cleats *f*, the casings D, valve-boxes E E', valves G G', inlets H H', and outlets I I', all constructed and arranged substantially as and for the purposes herein set forth.

141,129.—*Frictionless Journal and Shaft-Bearing.*—JAMES ECCLES, Philadelphia, Pa., assignor to himself and SAMUEL ECCLES, Jr., Baltimore, Md. Application filed April 22, 1873.

The sizes of the friction-roller and box are so proportioned with reference to the size of the axle that their respective surfaces, when in contact, shall correspond with the pitch-line or circle of the gearing that unites them.

Claim.—1. Making the surfaces of the interior periphery of the box, the rollers, and the axle, where in contact, correspond with the pitch-line of their respective gearing, in place of making the teeth so that their faces shall project out only to the inner periphery of the box and of the axle, respectively, as required by the specification of the patent granted to Joseph Harris, Jr., February 22, 1848.

2. In the case of end-thrust or pressure, so to construct the plates, whose friction otherwise is to be obviated by the use of conical geared rollers, that their surfaces, where in contact with the surfaces of said rollers, shall correspond with the pitch-lines, respectively, of the gearing, by which said plates and gearing are united.

141,130.—*Grain-Separator.*—OSCAR J. EVERSON, Lake City, Minn. Application filed October 22, 1872.

Hopper feed-gate sliding horizontally so as to be retained in position without locking; hopper-mouth arranged to discharge grain, &c., through the blast onto chess-screens, from which tailings pass into spout, the grain falling through onto grain-screens.

Claim.—1. The combination and relative arrangement of the gate Z, guides *z*, pivoted lever A', and hopper Y, constructed as and for the purpose specified.

2. The combination of the hopper Y with its discharge-opening, arranged relatively as shown, the blast-chute K, and the screens O and P, substantially as and for the purpose shown.

3. In combination with each other and with the screen-shoe L, the screens O and P and tailings-spout B', substantially as and for the purpose set forth.

4. The means employed for securing the tailings-trough to or upon the screen shoe, consisting of the metal loops or stirrups C and D', provided with the openings *c* and *d'*, respectively, and fitted to or over the screws E', substantially as shown and described.

141,131.—*Fire-Plug.*—JOSEPH P. GALLAGHER, St. Louis, Mo. Application filed May 19, 1873.

The valve-chamber is formed with one or more outflow-pipes for the attachment of hose, and with an extension-barrel in which moves a compound valve. The outlet-pipes are connected to the barrel by a brace-pipe, through which the water escapes when the valve is closed into an annular chamber surrounding the stem, and in communication with the water-escape orifice on the opposite side of the barrel. Beneath the valve-chamber is a water-chamber having a slide-valve to close communication when repairs are necessary.

Claim.—1. The combination of valve-chamber A, barrel B, compound valve C *c* C', having annular recess or chamber *c''*, outlet-pipe B', and escape-passages *f b*, substantially as set forth.

2. The slide-valve H, working in the chamber G and operated by the valve-stem I, lever K, and fulcrum-bracket L, in combination with the chamber A and pipe B', substantially as and for the purpose shown and described.

3. The combination of the valve-chamber A, barrel B, outlet or outlets B', valves C *c* C', hand-screw D *d* having collar D', and the water-escape passages *f b*, substantially as set forth.

141,132.—*Coating Metal with Copper.*—OCTAVE GAUDUIN, JEAN B. J. MIGNON, and STANISLAS H. ROUART, Paris, France. Application filed February 11, 1873.

Dry chloride or fluoride of copper and cryolite, to which is

added chloride of barium, is melted in a crucible. The iron or steel goods to be coppered are scoured and then dipped into the mixture.

Claim.—The process of coating articles with copper by immersing said articles in a bath of fused copper salts, with or without other materials, as set forth.

141,133.—*Cooler for Soda-Water, &c.*—WILLIAM GEE, New York, N. Y. Application filed March 27, 1873.

A series of chambers composed of convex disks and pipes connecting them in such manner that the liquid to be cooled is conveyed from the upper part of each chamber to the lower part of the next.

Claim.—The reversed pipes D E, in combination with the centrally-connected, vertically-arranged chambers A A, essentially as and for the purpose herein set forth.

141,134.—*Corset.*—THOMAS S. GILBERT, Birmingham, Conn. Application filed June 3, 1873.

The corset-springs are re-enforced, without increasing their thickness, by means of metallic stripe held in pockets in the corset near the back edges of the main steels, and parallel thereto.

Claim.—1. The supplemental springs x^2, consisting of narrow metallic strips or wires, the same being held in pockets near the back edge of each main steel, and parallel thereto, as herein shown and described, for the purposes set forth.

2. A straight strip, 2, introduced between the first and third sections of each half of a corset, as herein specified, for the objects stated.

3. The compound back pieces, consisting of sections 5 6, formed and united as herein described, the inner section 6 being tapered downward to the width of the eyelet edges, and the lower ends of the adjoining sections 5 so shaped as to give the requisite hip-fullnesses, which are thus made to begin near the middle of the back, as set forth.

141,135.—*Feathering Paddle-Wheels.*—GEORGE K. GLENN, Ashton, Ill., assignor of one-half his right to JOHN L. ROBINSON and MICHAEL ROBINSON, same place. Application filed May 17, 1873.

The paddle-floats are hinged to the ends of the arms, and levers, sliding in and out from the center of the wheel by the action of cams and rollers, cause the floats to present their broad surface to the water as long as they exert any propelling force, and then to feather on their hinges when leaving the water, and thus raise no weight of fluid with them.

Claim.—In a paddle-wheel, the combination and arrangement of the hinged paddles E E provided with the bent rods or loops E' E', the sliding arms F F provided with the rollers G G, or their equivalents, and with the pins e' e', extending into the loops E' E', the cam H, and the pivoted cam I, all substantially as and for the purposes specified.

141,136.—*Washing-Machine.*—HIRAM C. GROVER, Nunda, N. Y. Application filed April 23, 1873.

A washing-machine constructed with octagonal heads, with its outer edge covered with rounds, forming a cage open for the passage of water, and the heads or ends corrugated upon the inner sides, and having wood balls with their surfaces corrugated, by which a rolling motion is given in their contact with inner surface of the heads and outer bars when in use. The cage or cylinder is journaled at its center, and is fitted to journal-boxes on the edge of the tub on which it revolves.

Claim.—The fluted heads C, rounds D, and fluted balls G, all constructed and arranged for operation as and for the purpose herein set forth.

141,137.—*Abdominal Supporter.*—JOHN W. GURLEY, Petersburg, Va. Application filed May 22, 1873.

The corset for the abdomen is made from a single piece, and is laced at the rear and at each side. It is furnished with shoulder-braces and with stocking-supporters, which latter are bifurcated at their tops and fastened directly to the supporter at each side of the side lacing.

Claim.—The combination of the single-piece supporter with back and side lacings, the shoulder-braces and straps for attachment to the stockings, the same being bifurcated at the top and attached directly to the corsets each side of the side lacings, all arranged as described.

141,138.—*Corn-Harvester.*—LEONIDAS HAMILTON, Panora, Iowa. Application filed May 10, 1873.

A large roller, with a gathering wing or screw on the front end of it, is placed parallel with a small one, the two acting together to sever the ears from the standing stalks and deliver them to the husking-rollers, which are placed to one side and at right angles to the gathering-rollers.

Claim.—1. The roller I, with the screw-shaped propelling-plate i, diminishing and contracting into a shallow spiral groove, s, and with the fluted cylindrical surface, in combination with the cylinder K with partly-fluted cylindrical surface, the cylinder K being of comparatively small diameter to facilitate the nipping of the corn-ears, and also to prevent their being caught and mashed between said cylinders.

2. The combination, with the screw-shaped roller I, of the rollers M and N, arranged in pairs and provided with cutters or knives o, and with spiral ribs w and spiral grooves m, for the purpose set forth.

3. The combination of the post c^1 fastened to the end of the axle-tree C, the sliding axle-plate c^2, the rope or chain x', the pulley c^3, and the elevating shaft or windlass X, substantially as set forth.

141,139.—*Furnace for Melting Metals.*—JAMES HARRISON, East Hampton, Conn. Application filed February 20, 1873.

The form of the tap-hole enables any molten metal remaining in the conduit to be forced back into the furnace by the clay-plug used to close the tap-hole, preventing the metal from chilling in the conduit, and facilitating successive tappings. The furnace is provided with a swinging crane to facilitate the removal of the detachable breast. The breast is held in place by a screw-bolt and a stay-bar, which engages with catches on the frame.

Claim.—1. The funnel-shaped metallic tapping-hole M with the breast C, substantially as and for the purpose described.

2. The combination of the screw-bolt P, collars R, and breast-plate C, substantially as described.

3. The combination of the breast-plate C with the stay-bar n and the screw-bolt P, substantially as described.

4. The combination of the swing-crane L with the breast-plate C, substantially as described.

5. The taper fire-place G, with the funnel-shaped arch I, in combination with a furnace, as and for the purpose specified.

141,140.—*Stump-Extractor.*—TOBIAS HERRIG, Jasper, Ind. Application filed May 14, 1873.

Claim.—1. The frame-pieces A A, hinged together, and having the trigger H and guide J connected to them, as and for the purpose set forth.

2. The bars D D', with their levers and collars, in combination with the frame and the trigger H, as and for the purpose set forth.

141,141.—*Combined Refrigerator and Water-Cooler.*—HENRY W. B. HERVEY, Philadelphia, Pa. Application filed July 12, 1873.

Water is admitted into a vertical tank through a tube having an air-vent and provided with a stopper, and passes into a cooler, which supports the ice and which runs at right angles to the tank, from whence it is drawn by a faucet. The cooler is provided with flanges, which conduct the ice-drippings into troughs, from whence they pass into a waste-pipe.

Claim.—The water-tank, water-cooler, and ice-rack, combined in one, made of any suitable materials, in combination with the air-tube, flanges, and drip-troughs, as arranged and described, for the purpose herein set forth.

141,142.—*Cover for Fruit-Baskets.*—JOHN C. INGHAM and CHARLES COLBY, Benton Harbor, Mich. Application filed June 6, 1873.

Constructed from tapering strips crossed at the top, weakened at suitable distances to give it the form of an inverted pan, secured to hoops which conform to the top of the basket, and is held to it by projecting ears fitted to the hoops or supports of the basket by nails or tacks.

Claim.—The within-described cover for fruit-baskets, composed entirely of strips D D and hoops *b b*, said strips being weakened a suitable distance above the hoops, and bent one upon the other, thus forming an open and elevated cover with flattened top, as and for the purpose set forth.

141,143.—*Seeding-Machine.*—GEORGE F. STROUD, Oshkosh, Wis., assignor to WM. D. STROUD, same place. Application filed December 7, 1872.

The seed-box carries in its bottom a series of slides, which are adjustable so that the quantity can be regulated. The seed-slides are worked by a cam-wheel upon the hub of the driving-wheel. An agitator sweeps the seed into the seed-cups.

Claim.—1. The slides Q R, made adjustable longitudinally by means of the arms Y pivoted on X, and set-screw *b*, and provided with projections S and recesses T, in combination with the plates L and N, provided respectively with rectangular slots M and O O', substantially as and for the purposes hereinbefore set forth.

2. An agitator, composed of the lever *e* loosely mortised in the bottom of the seed-box A, and the longitudinal sweep *g* provided with the pendent arms *h* and mortised upon the upper end of the lever *e* when operated by the plates L and N, substantially as and for the purpose hereinbefore set forth.

3. In combination, the serpentine cam-wheel *m*, plates L N, slides Q R provided with the slots M, O O', U, and V, all arranged relatively one to the other, substantially as and for the purposes hereinbefore set forth.

141,144.—*Combined Roller and Planter.*—OLEY KNUDSON, Effingham, Ill. Application filed March 18, 1873.

Two rectangular frames are hinged together, and each carries a roller. Forward of each roller is a seed-box with an adjustable slide working beneath both from a cam on one of the wheels. The furrow-openers are raised and lowered by a weighted lever, and can be thrown out of use when the machine is used simply as a roller.

Claim.—1. In a combined corn-planter and land-roller, the hinged frames A A', adapted to conform to inequalities in the ground, and provided with the stationary seed-box F and sliding box F', the latter being adapted to accommodate itself to the independent movement of the frame A by means of the hinged arm U and ways T, substantially as described.

2. The shafts W W' of the drills V V', connected by the bent single arm Y and bifurcated arm Y', substantially as described.

141,145.—*Cultivator.*—OLIVER KUGLER, Raritan, assignor to himself, JAMES D. MCCAULEY, and JACOB VAN FLEET, Clinton, and JOHN A. THOMPSON, Reddington, N. J. Application filed September 14, 1872.

Concave scrapers are attached to runners, which converge in the rear. These are followed by shorter scrapers or shares, which throw the clean soil toward the row of plants.

Claim.—1. The combination, with gatherers L L, of arms M M, arranged as and for the purpose specified.

2. The hook-chain K on projecting end of bar I, ring *k*, rods J J, and chains *k' k'*, combined and arranged with a cultivator-frame, as described, to form a flexible draft.

141,146.—*Cultivator.*—OLIVER KUGLER, Three Bridges, assignor to himself, JAMES D. MCCAULEY, and JACOB VAN FLEET, Clinton, and JOHN A. THOMPSON, Reddington, N. J. Application filed June 24, 1873.

A rectangular frame supported on runners, having inwardly-projecting scraping wings and a rear cultivating attachment.

Claim.—1. The combination of the runners A A, front and rear standards B B, cross-bars C C, center draft-beam D, and handles E E to constitute the cultivator-frame, substantially as herein set forth.

2. The combination of the up-and-down adjustable bar H, with keys and screw-rods, with laterally-adjustable bar I, plow-shanks J J, pivoted plows K K, slotted as described, and held by pins or screws *i i*, as and for the purposes herein set forth.

141,147.—*Treating Ores.*—MATTHEW LAFLIN, Chicago, Ill. Application filed June 14, 1873.

Claim.—The process herein described for treating ores, the same consisting in heating them in a close retort so as to prevent access of air, and then subjecting them to the action of a caustic alkaline solution, substantially as set forth.

141,148.—*Coal-Car Elevator.*—PHILIP H. LAMEY, Wiconisco, Pa. Application filed July 7, 1873.

The coal-car is drawn up and over the knuckle of slope, and the pusher-truck drawn toward the discharge end of landing; the small truck will start at bottom of main weight-truck, and as the bumpers of small truck come in contact with the bumpers of main weight-truck the latter is drawn along to upper end of pit. This main weight-truck is heavy, and is used only in starting the coal-cars and drawing them up grade and a little over the knuckle of the slope; the main weight-truck will then stop, while the hook-truck and small weight-truck will continue on. The hooks will drop down over a plane and on a level with weight-truck track and stop, while the small weight-truck stops at bottom of main weight-track.

Claim.—1. The combination, with pusher-truck catch, of two springs that yield to a sudden jar, in the manner and for the purpose described.

2. The combination, with pusher, of a front hook-truck, connected thereto by coupling-ropes that admit of slack at the times and for the purpose set forth.

3. The combination, with coal-car, of the drop-hooks, traveling in advance thereof until the spread-chains are hooked and then falling, in the manner specified.

4. A track for weight-truck below and of the same pitch with the inclined car-track, arranged in a pit and covered to protect it against dirt from the coal-cars, in the manner described.

141,149.—*Device for Increasing the Friction of Helical Gearing.*—GEORGE LINDSAY, Belfast, Ireland. Application filed February 25, 1873.

Claim.—The loop *m*, adapted to embrace the collar D', in combination with said collar and with wheels having helical threads fixed on the shafts C D, as specified.

141,150.—*Molding-Pipe.*—ANDREW W. A. LOGEN, Rochdale, England. Application filed April 19, 1873.

The pattern rests on bearings and projects through a table, on which the sand is molded. The journals have depressions on the upper side, so that when the pattern is revolved it is at the same time withdrawn from the sand.

Claim.—The rotary pattern, provided with flanges B B and depressions *d d* in the journals, in combination with the box or table D, the removable slotted or notched slides *c*, and the anti-friction bearing-rollers *a a*, substantially as specified.

141,151.—*Umbrella.*—COMEGYS C. LUBY, Philadelphia, Pa. Application filed June 12, 1873.

Claim.—1. A drip-cup provided with a stick independent of the umbrella-stick, so that it may be applied either to finished or unfinished umbrellas, substantially as described.

2. A telescopic ferrule, forming the cover for an umbrella drip-cup, substantially as described.

3. In combination with an umbrella drip-cup stick, the screw-ferrule G, substantially as described.

4. The plug E, in combination with the cup and ferrule, for the purpose of forming a water-tight joint, as set forth.

5. In combination with the umbrella-stick B, the cup-stick D having the screw *d*, substantially as described.

6. The combination of a stick, D, screw-ferrule G, drip-cup F, and ferrule H, substantially as described.

141,152.—*Piano.*—GEORGE C. MANERE, New York, N. Y. Application filed April 17, 1873.

The sounding-board is attached directly to the iron frame, so as to form, with the wrest-plank and strings, a compact and solid structure independent of the casing. The braces of the iron frame, just above the wrest-plank box, are made separate and removable.

Claim.—1. The metal frame A, sounding-board E, and wrest-plank C, when said parts are combined and arranged substantially as described.

2. The movable pieces or clips *a*, arranged in combination with the wrest-plank C and box B of the metal plate frame A, substantially as described.

3. The wooden frame D, containing the slots *d* and combined with a metal frame, A, and sounding-board E, the latter being arranged between the frames A and D, substantially as specified.

4. The transverse bar F, applied to the front edge of the frame D, in combination with the frame A and sounding-board E, as set forth.

141,153.—*Thrashing-Machine.*—RALPH H. MARTINDALE, Hobbleville, Ind. Application filed May 10, 1873.

A swinging board hung at the end of the thrashing-cylinder and extending down to a rake in the vibrating shoe, and a revolving beater, which beats the straw on its passage to the rake in order to more thoroughly separate any grain that may remain in the straw.

Claim.—The arrangement of the revolving beater M, swinging grain-board K, and rake L, substantially as and for the purposes herein set forth.

141,154.—*Apparatus for Dispensing Soda-Water and other Beverages.*—JOHN MATTHEWS, New York, N. Y. Application filed May 27, 1873.

A recording apparatus and registering device are connected with the fountain, by which the quantity drawn off is measured and recorded. A locking-roller is connected with the sirup-tanks, so that the sirup can be withdrawn only through the dispensing apparatus.

Claim.—1. The improved apparatus herein described for dispensing soda-water and other beverages, composed of an external case, a draft apparatus, a meter-chamber, and a cooling-chamber, as described.

2. The combination of a draft apparatus, a measuring apparatus, and recording devices, so as to dispense, measure, and register the number of portions of either soda-water or sirup, or of both, substantially as herein set forth and described.

3. The draft and measuring devices, consisting of the meter *m m*, with piston and piston-rod, in combination with the branched draft-arm and reversing-valve, substantially as described.

4. The sirup-tanks arranged with a soda-water apparatus and provided with locking-roller or equivalent means to lock the sirup-pumps, as set forth, either with or without the angular passages, so that the sirup can be withdrawn only through the dispensing apparatus, as described.

5. The combination of the sirup-pumps having projecting outlets, the sirup-tanks, arranged as set forth, with a dispensing apparatus, as described.

6. The combination of the three-branched draft-arm with the reversing-valve, as and for the purpose set forth.

7. The combination of a meter, connecting-passages, and draft-arm, arranged and operating substantially as described.

8. The locking-roller with a dial-plate and containing recesses or holes, arranged, as described, so as to permit the working of any particular sirup-pump, as set forth.

141,155.—*Rotary Pump or Engine.*—WILLIAM P. MARSON, Elmira, N. Y. Application filed May 7, 1873.

The case, made in two portions, is constructed with cam-grooves in its inner faces, into which plungers, pivoted at the periphery of the wheel, fit. Steam or water enters a port in one face, and, impinging upon the pistons, rotates the wheel, escaping through a port in the other face.

Claim.—1. The combination of the casing A B provided with recesses *h h'*, inlet-passages *a a*, and outlet-passages *b b*, with the revolving wheel C, constructed and arranged substantially as and for the purposes herein set forth.

2. The combination of the cams G G, constructed as described, and arranged in the wheel C, with the casing A B having ports *a b*, substantially as and for the purposes herein set forth.

141,156.—*Compound for Cleaning Polished Metals.*—MARK MCGLENN, Aurora, Ill. Application filed June 25, 1873.

Spirits of ammonia, lye, spirits of turpentine, sweet lard oil, hard soap, Tripoli or other earthy silicious substance, rain water.

Claim.—The hereinbefore-described compound, composed of the ingredients and in the manner substantially as and for the purpose specified.

141,157.—*Potter's Lathe.*—WILLIAM MEEK, Anderson, Ind. Application filed April 7, 1873.

Changeable case attached to lathe-head, so as to carry sectional molds of different sizes, the lower ends of mold-sections being secured in slotted disk F. Inner forming-tool adjustably secured to vertically-sliding cross-head.

Claim.—1. The combination of the case E E' attached to the lathe-head B, the slotted disk F, and mold-sections G, and raising-disk H.

2. The molding-tool N attached to the longitudinal sliding block O, and the vertical sliding bar P, all arranged and operating substantially as and for the purpose set forth.

141,158.—*Stopping Mechanism for Twisting-Machines.*—ANDREW J. MILLSTEAD, Woodberry, assignor of one-half his right to WILLIAM E. HOOPER & SONS, Baltimore, Md. Application filed May, 28, 1873.

When a strand breaks, or a spool runs out, a drop-wire will fall and be struck by a wing on a revolving shaft. The frame carrying the drop-wires will be swung back, and the lever L turned on its pivot so as to remove the driving-band from the groove in the whirl of the flier. The lever L will strike and swing a forked lever so as to move the strands out of the bite of the bosses of the rollers, stopping the delivery.

Claim.—1. The described mechanism, arranged to automatically throw the band from the whirl or pulley of any given flier upon the breaking of its thread, without thereby arresting the motion of any other flier.

2. As a means for throwing the yarn laterally out of the bite

or notion of the rollers, the swing-lever O hung on a center and arranged to vibrate, as set forth, in combination with the lever L, swing-frame K, and drop-wires m, arranged to operate, as described, upon the breaking of a thread back of the feed-rollers.

3. The combination, with the swing-frame K and the revolving winged shaft M, of the weight latch-lever P, automatically operating, when a thread breaks, to hold the frame and its drop-wires into the position in which they are swung by the revolving wings.

4. The combination of the described band-shifting devices or their equivalents with the described yarn-shifting devices or their equivalents, substantially as and for the purpose set forth.

141,159.—*Car-Starter.*—CLEMENT J. MOORE, Joliet, Ill. Application filed February 7, 1873.

A combination of levers, which may be attached to the draw-head of a car, to move the same.

Claim.—The bar *m* having the metal binding *o*, serrated point *s*, stop *n*, slot *q*, and stop *r*, in combination with the bar *a* and lever *c*, arranged and operating in the manner and for the purpose set forth.

141,160.—*Grain-Drier.*—WILLIAM F. MORGAN, Buffalo, N. Y., assignor to THE GREAT AMERICAN MALT AND GRAIN DRYING COMPANY, New York city. Application filed April 16, 1873.

The subdivision of the floor of the drier into a series of pockets is intended to secure a uniform distribution of the grain over the entire drying-surface. The scrapers are so adjusted as to adapt themselves to any inequalities in the surface of the floor.

Claim.—1. The combination, in a grain-drier having circular drying-floors and a central driving-shaft, of grain-carriers hung to radial arms *h*, and composed of radial scrapers *c* and concentric partitions *d*, substantially as and for the purpose hereinbefore set forth.

2. The combination, in a grain-drier having circular drying-floors and a central driving-shaft, of grain-carriers hung to radial arms *h*, and consisting of radial scrapers *c* and concentric partitions *d*, constructed of sections jointed together at *e'* and *d'*, substantially as and for the purpose hereinbefore set forth.

3. The combination, with the circular floor, shaft C, and radial beams *f f'* of a grain-drier, of the sleeve or ring K surrounding said shaft, and connecting the inner ends of said beams, substantially as hereinbefore set forth.

4. The combination, with the floors E and F, shaft C, and radial beams *f f'*, of the two connecting-sleeves K K, either cast in one piece or secured firmly together, substantially as and for purpose hereinbefore set forth.

5. The combination with the grain-hopper G of a grain-drier having horizontal drying-floors and radial revolving carriers, of the adjustable gage-board N, arranged at the rear of the discharge-opening of said hopper, substantially as and for the purpose hereinbefore set forth.

6. The combination, with a grain-drier having circular drying-floors and revolving carriers, of the grain-hopper G, provided with two or more independently-adjustable gates, M, arranged side by side on said hopper, substantially as and for the purpose hereinbefore set forth.

141,161.—*Calendar-Watch.*—DON J. MOZART, Ann Arbor, Mich. Application filed May 14, 1873.

The indexes of the calendar-dials on a watch-face are operated by a spring and peculiar works separate from, but tripped at the proper time by, the watch movement. There is also an a. m. and p. m. hand actuated by an extra tooth on the hour-hand wheel.

Claim.—1. The twelve-armed wheel E and spring G, operating in combination with the single cogs *o* on the pinions *m m'*, substantially as and for the purposes herein set forth.

2. The cogged segment I, operated by the pinions *m m'* in the manner herein described, in combination with the seven-cogged pinion A, shaft *c*, seven-armed wheel H, and ratchet device *f*, substantially as and for the purposes herein set forth.

3. In combination with the seven-armed wheel H, the shaft *n* with cogged eccentric *p*, and plate *t* with prongs *s s'*, operated by the tooth *u* on the hour-hand wheel *v*, substantially as and for the purposes herein set forth.

141,162.—*Lantern.*—SAMUEL NAYLOR, Independence, Iowa. Application filed June 10, 1873.

The chimney is secured in place by means of a round wire spring soldered to the lamp-fount, and a spring passing through the gallery, operating in conjunction with depending pieces attached to the lantern-top.

Claim.—1. The wire frame *f* on lamp D, in combination with wire springs *e* on the base A, substantially as and for the purpose set forth.

2. The springs A A, constructed and arranged as described, in combination with wire frame *f* and spring *e*, as and for the purpose set forth.

141,163.—*Sewing-Machine.*—ALBERT T. NICHOLS, Williamsport, Pa. Application filed May 21, 1873.

The saw-arbor is so constructed as to admit of a longitudinal movement, which allows the saws to be taken off without removing the arbor from its frame.

Claim.—The arrangement, with a saw-frame, of the longitudinally-grooved and endwise-movable saw-arbor A, having adjustable saws B B, and provided with a shoulder, *b*, at one end, and an adjustable collar, *d*, and set-screw *e* at the other end, all substantially as and for the purpose set forth.

141,164.—*Harvester-Rake.*—MANNING L. NIX, Chetopah, Kans. Application filed June 14, 1873.

A reciprocating frame placed beneath the slatted platform carries the rake, which is held in position for raking by a spring-pin on the slide in the frame, and automatically released as the slide strikes the side of the frame of the platform.

Claim.—1. The pivoted rakes B, recessed wheel G', slide E, stud G, reciprocating frame C, and slatted grain-platform A, combined substantially as and for the purpose specified.

2. The springs H', in combination with the pivoted rake B, slatted platform A, slide E, and reciprocating frame C', substantially as specified.

141,165.—*Adjustable Car-Window Stop.*—CHARLES PAGE, Meriden, Conn. Application filed May 20, 1872.

The sash and blind are separated by parting-strips, the latter forced apart by the adjustable stop.

Claim.—The elastic or movable cap C, in combination with the elastic or movable strips D, the whole forming a self-adjusting or automatic car-window stop device, substantially as described.

141,166.—*Brake for Preventing Retrograde Movement in Bearing and other Machinery.*—DAVID T. PEEK, New York, N. Y. Application filed July 9, 1873.

The rim of the wheel is corrugated or scalloped on its inner face, propelling a rubber ball forward up an inclined plane in a fixed chamber, and receiving the ball in one of the indentations in case of retrograde movement, thereby stopping the revolution of the wheel.

Claim.—The wheel A provided with a corrugated or scalloped edge, in combination with a fixed chamber, D, containing a roller, *b*, and provided with an inclined bottom, *a*, substantially as shown and described.

141,167.—*Making a Hydrate or Milk of Magnesia.*—CHARLES H. PHILLIPS and LAWRENCE REID, New York, N. Y., assignors to CHARLES H. PHILLIPS, same place. Application filed June 4, 1873.

Magnesia is dissolved in distilled water, and then filtered through paper, if desirable, after which is added a pure solution of caustic soda or potash. These two solutions are thoroughly mixed with each other, and, after standing about twenty-four hours, the clear liquor is drawn off and replaced by more distilled water. When water is added for the fourth washing, steam may be injected into the mass to agitate it.

Claim.—The process herein described of preparing a pure superhydrate of magnesia, to wit, by subjecting a soluble salt of magnesia to the action of a caustic alkali, in the manner substantially as set forth.

141,168.—*Lubricator.*—DAVID T. PRAY, Boston, Mass. Application filed April 12, 1873.

A tube leading from the oil-cup, nearly or quite to the periphery of the journal, and containing one or more balls, (in the latter case placed one above the other,) the lower one resting on the periphery of the journal and rotated by its action, the flow of oil being regulated by the number of balls in the tube, which balls are kept in place by a spring inclosed in the tube, which prevents their displacement, particularly when using a loose pulley.

Claim.—1. In a self-feeding oil-cup for supplying oil to a rotating or sliding bearing for purposes of lubrication, one or more spherical valves, *d d*, for checking or controlling the flow of oil, when arranged to be rotated by the movement of the bearing, substantially as described.

2. The combination of the ball-valves *d d* and the tube F with the oil-reservoir A, arranged substantially as described, for the purpose specified.

3. The combination, with the oil-reservoir A, of the ball-valves *d d* and the spring *e*, arranged and operating as described, for the purpose specified.

141,169.—*Folding Cover for Sewing-Machines.*—SAMUEL J. PUSEY, Philadelphia, Pa., assignor to WILLIAM H. GROVE, same place. Application filed April 17, 1873.

The top is hinged together in such a manner that it may be unfolded, inverted, and laid directly upon the top of the table at one side of the machine.

Claim.—A folding cover for sewing-machines in which the top, front, and back are hinged together, as described, so that they may be unfolded, inverted, and laid directly upon the top of the table at one side of the machine, as set forth.

141,170.—*Paper-File.*—RANSOM RATHBONE, New York, N. Y. Application filed June 16, 1873.

The string, fastened at the bottom, is wound around the two pins inserted in the end of the stick, and then drawn down between them.

Claim.—The combination, with the file, consisting of the guttered stick and cords, of the fastening for its cords, consisting of the two pins *b* and *c*, arranged in proximity to each other to bind the cord between them after it has been wound round them, essentially as and for the purpose specified.

141,171.—*Self-Closing Hatchway.*—ALEXANDER REID, New York, N. Y., assignor to himself and WILLIAM REID. Application filed January 24, 1873.

The rising car raises the hatch by its cam-shaped top and sides. The hatch is kept in a raised position till the car has passed by means of the curved levers connected by the rods *d* to the hatch, which levers press against the sides of the car and ease the fall of the door. In descending, the car raises the door and closes it by a reverse process.

Claim.—In combination with an elevator, *a*, formed with cam-shaped sides *a²*, and a hatch, *c*, the slides *c¹* working in grooves *b'*, levers *e* having curved arms or extensions *f*, connecting-rods *d*, and brackets *i*, all arranged, constructed, and operating substantially as described.

141,172.—*Steam-Boiler.*—SEBASTIAN EITTY, Dayton, Ohio. Application filed February 6, 1873.

Combines with an ordinary cylindrical boiler a central hollow partition, arranged below the boiler and connecting at each side with a series of tubes closed at their outer ends and in communication with the boiler through the hollow partition. The outer ends of the tubes are supported by plates, near the ends of the boiler. The object is to more effectually generate steam.

Claim.—The arrangement of the boiler A, hollow division K, and tubes B B, substantially as described.

141,173.—*Self-Adjusting Injector for Feeding Boilers.*—WILLIAM SELLERS, Philadelphia, Pa. Application filed June 12, 1873.

The regulation of the water is effected by the combining-tube alone. The jet passes through an orifice of suitable size in a diaphragm between the combining and delivery tubes. The waste thereby, at starting, takes place in the overflow-chamber through a weighted check-valve closing automatically when the jet has acquired sufficient velocity to enter the boiler.

Claim.—1. The combination, with a fixed receiving-tube and a fixed delivery-tube, of a self-adjusting combining-tube, substantially as described.

2. The combination of a fixed receiving-tube, a fixed delivery-tube, and a self-adjusting combining-tube with a regulating steam-plug.

3. The combination of a fixed delivery-tube, a self-adjusting combining-tube, an overflow-chamber, and a check-valve waste.

4. The combination, with the overflow-chamber, of a diaphragm, provided with an orifice, substantially as and for the purposes described.

5. The combination of the water-chamber, the overflow-chamber in which the delivery-tube is fixed, and the piston of the combining-tube defining these chambers in a continuous casing, substantially as described.

141,174.—*Injector for Feeding Boilers.*—WILLIAM SELLERS and COLEMAN SELLERS, Philadelphia, Pa. Application filed June 26, 1873.

The area of the jet of water is varied by combining and delivery ajutages having several tubes of different areas, and arranged to rotate simultaneously until the opening of the desired size is brought in line with the combining and delivery tubes, and are then held by a locking device.

Claim.—1. The construction of the combining-tube of the injector with a movable combining-ajutage containing two or more tubes of different transverse areas, substantially as before set forth.

2. The construction of the delivery-tube of the injector with a movable delivery-ajutage containing two or more tubes of different transverse areas, substantially as before set forth.

3. The construction of the movable combining-ajutage of a wedge form, so that the lengths of the tubes in it may be increased as their transverse area is decreased, substantially as before set forth.

4. The combination of the movable combining-ajutage of the combining-tube and the movable delivery-ajutage of the delivery-tube in such manner that both are caused to rotate simultaneously, substantially as before set forth.

5. The combination of the movable delivery-ajutage with the mechanism for moving the same, and for locking it in the position to which it is moved, substantially as before set forth.

6. The combination of the movable delivery-ajutage with the mechanism for moving the same, and with stops which prevent it from being moved in the wrong direction, substantially as before set forth.

7. The combination of the steam-plug and the mechanism for regulating the extent to which it can be operated, substantially as before set forth.

8. The combination of the movable combining-ajutage and the movable combining-tube in such manner that the two are held in contact when the combining-tube is moved to regulate the water-supply.

9. The combination of the steam-plug, the combining-tube, the movable combining-ajutage, the mechanism for moving and locking the combining-ajutage, and the mechanism for regulating the movement of the steam-plug, substantially as before set forth.

141,175.—*Inhaler.*—SAMUEL J. SHAW, Marlborough, Mass. Application filed June 26, 1873.

A long open-ended tube is passed through the cork and connects at its bottom with the ingress-tube and at its top is provided with a valve opening outward. Within this tube is placed the small vial containing the acid. Upon blowing into the mouth-tube the water cannot be forced over into the acid-receptacle.

Claim.—The combination, with the receptacle A, ingress-tube D, mouth-tube C, and stopper E, of an independent opening, G, and stop or valve F, substantially as and for the purpose set forth.

141,176.—*Weather-Strip.*—FERDINAND SIEKING, New York, N. Y. Application filed July 1, 1873.

Claim.—A weather-strip composed of two gaskets and two retaining-strips forming lips, each of which projects beyond its gasket and bears upon the opposite gasket, when the meeting surfaces close up, substantially as shown and described.

141,177.—*Car-Coupling.*—THOMAS SMITH, Waterford, N. Y. Application filed April 3, 1873.

When the pivoted head is struck by an approaching hook it recedes until the other hook has passed behind it, when it is forced back into place by a spiral spring. Uncoupling is effected by an upright lever and a chain attached to the actuating spring and passing through a hole in the arm of the pivoted head.

Claim.—The draw-bar or bumper A, having the pivoted head B with arm C, in combination with the spring D, lever E, and chain *b*, all constructed and arranged substantially as and for the purposes set forth.

141,178.—*Combined Sash-Fastener and Weather-Strip.*—EDWIN J. EFFINGER, Youngstown, Ohio. Application filed June 16, 1873.

A journaled spring-section of the upper part of an inside weather-strip serves, by catching under notches in the frame, to hold the sash up at various parts.

Claim.—The combination of the spring-knuckle section stop or locking device C, and its handle E with the spring weather-holding sash-strip B, as described.

141,179.—*Gas-Furnace.*—LEVI STEVENS, Washington, D. C. Application filed January 21, 1873.

Consists in forming carbonic oxide or protoxide of carbon from oxyhydrogen vapors or steam. Also in distilling bituminous coal, asphaltum, pine wood, &c., which will distill a carbon or hydrocarbon vapor or gas, which vapor or gas is used in the disintegration of oxyhydrogen vapor or steam. Also in the application of carbonic oxide or protoxide thus formed to steam-boilers, furnaces, &c., where heat is required.

Claim.—1. The arrangement consisting of the boilers A A with their furnaces, and the central boiler C with its furnace and retorts, or an equivalent device, constructed to operate substantially as herein described.

2. The retorts F, arranged as shown, together with the superheater G with its connecting-pipe, substantially as and for the purpose described.

3. In combination with the gas-generator, the main J, and the discharge-pipes L L, the heating-furnaces, the arrangement being substantially such as herein described.

4. The superheater G, consisting of the cast-iron box having the steam-space formed therein, with a series of short angular turns, as shown and described, whereby the current of steam is somewhat retarded in its flow, and is thoroughly broken up to effect a more thorough superheating of it, as set forth.

141,180.—*Gas-Furnace.*—LEVI STEVENS, Washington, D. C. Application filed March 24, 1873.

Superheated steam injected through the central tube draws the gas from the grate and coking-chamber through the perforations in the outer tube, where they mingle with the steam and are forced into the working-chamber.

Claim.—The coking-chamber D, with the pipes F and the pipes J or their equivalents, in the combination with the grate C.

141,181.—*Furnace for Roasting and Smelting Ores.*—LEVI STEVENS, Washington, D. C. Application filed January 17, 1873.

The ore is fed gradually down an inclined flue, wherein it is roasted by the escaping products of combustion. From this flue it falls into a second, where, the heat being more intense, the metal separates from the slag in its passage down the flue, the body of metal falling to the bottom of the reverberatory chamber, from whence it can be tapped.

Claim.—1. The combination, in a roasting and smelting furnace, of the inclined flues F and D with a single heating-furnace and regulating-dampers, when constructed and arranged to operate substantially as described.

2. The inclined flue F, provided with the revolving worm or screw I, arranged to feed the ore gradually to the inclined flue D, substantially as set forth.

3. The combustion-chamber A and the smelting-chamber B, in combination with the flues D and F, all arranged to operate substantially as and for the purpose set forth.

4. The arrangement of the gas-pipe M, air-pipe N with its regulating-cock S, and steam-pipe P with the nozzle O, the latter being arranged to deliver the combined gases against the deflecting-breast *b*, located between the combustion and smelting chambers, as shown and described.

141,182.—*Banjo.*—JOHN S. STILES, Springfield, Vt. Application filed March 14, 1873.

The rim and heads are in one piece and both of metal. The bridge, tail-piece button, handle, and strings may be also of metal.

Claim.—As a new article of manufacture, a banjo provided with a body composed of face, back, and rim of sheet metal, as herein specified.

141,183.—*Locomotive Head-Light.*—PETER F. STOUT, Philadelphia, Pa., assignor of one-half his right to WILLIAM C. ROBERTS, same place. Application filed February 5, 1873.

The lens is made horizontally adjustable within the reflector by a bar depending from a rocking shaft, which bar works in slots in the arms attached to the lens.

Claim.—The combination of the lens M, arms *d d*, slots *e e*, vibrating rod E, and arms B B, constructed and arranged substantially in the manner and for the purpose described.

141,184.—*Sash-Holder.*—GEORGE A. STURGIS, Delhi, N. Y., assignor to himself and DEXTER PETTENGILL, same place. Application filed June 5, 1873.

A vertical rod is arranged on inside of the sash, on which works a bracket attached to the upper sash, and consisting of an eccentric cam and spring operated by a knob. A double locking-segment is arranged for the lower sash, which has a spring-catch combined with a toe on its pivot, so arranged within a corresponding bracket that it is readily moved into or out of locked position by the hand applied to the knob. There is also a pull-cord, which

places the locking device of the upper sash in combination with the double locking-segment of the lower sash, this construction allowing the simultaneous raising or lowering of the two sashes, or the separate holding of either one or the other sash firmly in any desired position.

Claim.—1. An eccentric cam, *g*, and knob or handle G, applied to a sash-bracket, through which passes a rod, C, that is secured in a vertical position to a window-frame, A, substantially as described.

2. The V-shaped spring-catch *e'*, combined with a toe, *i*, on the pivot of the lower eccentric segment *g*, and with the lower sash-rail B' and rod C, substantially as described.

3. The combination of the lower double locking-segment *g* and its spring-catch *e'* with the single locking upper segment *g'* and the pull-cord *a*, substantially as described.

141,185.—*Devices for Loading Cartridges.*—THOMAS L. STURTEVANT, Framingham, Mass. Application filed June 6, 1873.

The shelf or chute I serves as a guide for the insertion of the wads and shot to the mouth of the cartridge.

Claim.—The combination, with the cylinder or chute and rammer of an implement for filling cartridges, of the shelf I, surmounting the wad-receiving orifice of such cylinder or chute, substantially as and for purposes stated.

141,186.—*Bag-Holder.*—CHARLES H. THOMAS, Williamsburg, Ohio. Application filed March 21, 1873.

The device claimed is attached to the exterior of a hopper or funnel for securing thereto the mouth of a bag or sack to be filled.

Claim.—1. The provision in a bag-holder of the pivoted clip G, having the bifurcated jaw H H' I, as and for the purpose described.

2. The combination of plate B, slotted lugs C C' *c c'*, shaft D, eccentric E F, retaining clip G *g g'* H H', shiftable pintle J, and spring K, or their equivalent devices, for the object stated.

3. The projection *f* on the handle E, in combination with the clip G in a bag-holder, adapted to operate substantially as herein described, for the purpose set forth.

141,187.—*Picking Mechanism for Looms.*—WILLIAM TOWNSEND, Auburn, N. Y., assignor of one-half his right to J. WESLEY PIERCE, same place. Application filed April 17, 1873.

The picking-stick is actuated by a tappet, roll, and rock-shaft, with a rigid connection between rock-shaft and stick, and the stick is withdrawn by a cam and strap connection, thereby dispensing with springs and weights. To enable the weaver more easily to throw the shuttle out of the box for inserting a fresh bobbin the strap of the withdrawing mechanism is attached to a blade-spring on the actuating-lever instead of the lever itself.

Claim.—1. The spring *m*, in combination with the lever D, belt *n*, pulley *p*, and staff A, as and for the purposes set forth.

2. The combination of the shaft C with arm *b*, roller *d*, cam *f*, lever D with its shoe *i*, spring *m*, guide-roller *p*, belt *n*, or its equivalent, picker-staff A, rod *a*, and lever B, all the parts being constructed and arranged to operate substantially as and for the purposes herein set forth.

141,188.—*Machine for Perforating Drive-Well Points.*—CHARLES L. TRAVIS, Minneapolis, Minnesota. Application filed May 6, 1873.

The article is supported and clamped upon a bed that can be moved longitudinally under three milling-tools, which are placed at equal distances apart. These tools are brought down by means of a hand-lever upon the article to mill holes in it in a row.

Claim.—In a machine for perforating drive-well points, the circular cutters *a a*, in combination with the arbors E E, the frame *d*, the lever F, the carriage B, and bed A, all constructed and arranged substantially as and for the purpose set forth.

141,189.—*Air and Gas Engine.*—OTTO TROMSIN, Berlin, Germany. Application filed August 26, 1872.

The reservoir for the exhaust air incloses the air-supply pump and its driving-shaft, and forms a support for the piston-cylinder and valve-chest. The exhaust air passes through a coil of pipe surrounded by water; thence into the reservoir, from which it is forced by the pump into the heater.

Claim.—1. In an air or gas engine, the reservoir-cylinder D for the exhaust air, made to receive and inclose the air-supply pump B and the driving-shaft U, and to support the piston-cylinder and valve-chest in relation to the parts inclosed, substantially as described, and to obtain the advantages stated.

2. The combination, with an air or gas reservoir cylinder, D, wherein the air-supply pump B and driving-shaft U are inclosed, and which carries at its end the working-piston cylinder A and the rotary cut-off valve D, of the valve-rod G, gearing H I, and driving-shaft U, when inclosed within the reservoir D, substantially as described, and to obtain the benefits stated.

3. In combination with the cylinder A, the air-supply pump B, and the reservoir D of a hot-air engine, a condenser, R, arranged and operating essentially as and for the purpose set forth.

4. The hot-air or gas engine, consisting of the cylinder D, to supply the air or gas, the pump B, piston-cylinder C, rotary valve E, working-shaft U, valve-rod G, gearing H I, heater J, and condenser R S, when these parts are constructed and arranged, for joint operation, substantially as described.

141,190.—*Carriage.*—FRANCIS M. WATSON, Columbia, Tenn. Application filed December 16, 1872.

Jointed couplings are placed between the front head block and the body of the buggy, and between the rear part of the buggy-body and the rear axle, thus dispensing with the ordinary perch-pole.

Claim.—The spring H, head-block E, cross-bar J, front axle, and fifth-wheel I, connected with the body of the carriage through the medium of the coupling G *a b* arranged on each side, all constructed and combined as and for the purpose specified.

141,191.—*Connecting-Rod.*—BENJAMIN F. WILSON, Salem, Ohio. Application filed June 4, 1873.

Claim.—1. A connecting-rod with screwed ends and screwed butts, when the several parts are arranged and operated conjointly, for the double purpose of connecting the parts and also tightening the boxes, as shown.

2. In combination with rod E E', butts G G', and boxes A A and set-nuts C C, the right and left-hand screwed sleeve D and set-nuts C' C', when arranged substantially as shown.

141,192.—*Tray for Cloth-Finishing Machines.*—AMASA WOOLSON, Springfield, Vt. Application filed May 14, 1873.

The edged tracks guide the cloth in a straight line from the delivering to the receiving end of a finishing-machine designed to act upon the cloth repeatedly. When the cloth is to be removed from the machine it can be folded down upon the lid.

Claim.—1. The guiding-tray for cloth-finishing machines, curved as described, and having its bottom formed of a series of parallel tracks or guides, C C, each having a sharp or angular edge along the upper surface, upon which the cloth rests, substantially as and for the purposes herein set forth.

2. The combination of the end piece A with hinged lid B and the ribs C, placed lengthwise of the tray, and arranged on a curve from the receiving to the delivering end of the same, all substantially as and for the purposes set forth.

REISSUE PATENTS.

5,496.—*Cradle.*—LEMUEL A. CHICHESTER, Poughkeepsie, N. Y.—Patent No. 95,768, dated October 12, 1869. Application filed July 2, 1873.

The end frames are constructed wholly or in part of one or more pieces of wood, bent to the proper shape, and are combined with rockers.

Claim.—As a new article of manufacture, a crib or cradle with the ends thereof constructed wholly or in part of one or more pieces of wood bent to the proper size and shape, in combination with rockers, substantially as hereinbefore described.

5,497.—*Combination Lock.*—HENRY CLARKE, Baltimore, Md., assignor, by mesne assignments, to THE CLARKE LOCK COMPANY, Louisville, Ky.—Patent No. 135,533, dated February 4, 1873. Application filed July 1, 1873.

The hook or bolt is held in the locked position by an eccentrically-formed toothed plate secured to a sleeve, within which sleeve sliding notched tumblers are placed, the said tumblers being supported by a stationary outer disk, through which they pass, and an inner annular plate. An outside hand is fitted to the said sleeve so as to draw out the tumblers, when they can be adjusted so that the eccentric plate may be rotated for the purpose of locking and unlocking the lock.

Claim.—1. A keyless lock in which slotted tumblers, arranged in an annular inclosure within the lock and capable of only a sliding movement, are elevated by the pulling outward of an exterior band, C, certain of the tumblers constituting a known combination being adapted to be pushed back to their original place, bringing them to such position with relation to the eccentrically-formed plate that certain teeth thereon can pass through slots in the depressed tumblers, and allow of the movement of the said plate, and the shooting out or in of the bolt, or the releasing of the spring-hook, as set forth.

2. The movable eccentrically-formed toothed plate *b b'*, sleeve B, tumblers *d d'*, and case A, relatively arranged, substantially as herein described, for the purpose specified.

3. The case A and bolt E, in combination with the sleeve B, band C, disk D, and tumblers *d d'* having pins *h*, substantially as and for the purpose herein set forth.

4. In combination with the tumblers *d d'*, the spring G, disk D, circular plate F, and washer H, substantially as herein shown, for the purpose specified.

5. The spring-hook I *m*, pivoted within the case at *k*, and catch K, in combination with the plate *b b'*, adapted to be made stationary or movable by means of the tumblers *d d'* operating with it, substantially as herein set forth.

5,498.—*Base-Burning Stove.*—JAMES EASTERLY, Albany, N. Y., assignor to JOHN S. PERRY, trustee and executor of MARY PERRY, deceased, and NATHAN B. PERRY.—Patent No. 12,362, dated February 13, 1855; reissue No. 3,009, dated June 30, 1868; extended seven years. Application filed February 13, 1873.

Light from the fire shines downwardly both through the central portion of the grate and through the space between the outer edge of the grate and the inner surface of the lower end of the fire-pot.

Claim.—1. The mica windows of the ash-pit, in combination with a space for illumination from the products of combustion between the wall of the fire-pot and the lateral edge of the grate.

2. The combination of the mica windows of the ash-pit with a grate which exposes the illumination from the products of combustion, both between the wall of the fire-pot and the lateral edge of the grate and beneath the grate.

3. In a base-burner having a downward draft into the ash-pit through the grate, and between the grate and the lateral edge of the fire-pot, illuminating windows or doors in the wall of said ash-pit, substantially as described.

4. A stove or heater which is provided with a magazine for reserve coal, and constructed with openings for the admission of air to the fuel at some point or points above the grate, substantially as described.

5. The circularly-movable register-ring, applied at the upper part of the fire-chamber E, and at a point between the magazine and said chamber, for allowing a downward draft through said fire-chamber below the superincumbent ignited coal, and through the grate into the ash-pit, substantially as described.

6. The combination of a magazine, a fire-pot, a grate, and an ash-pit which has windows of mica or other transparent material in it, the combination being such that the ash-pit becomes illuminated, and such illumination is exposed through the windows, as specified.

5,499.—*Coal-Drilling-Machine.*—JOHN GRIMM, Darlington township, Beaver county, Pa.—Patent No. 97,060, dated November 23, 1869. Application filed April 9, 1873.

The post has a longitudinal central opening with sliding or extension ends, by means of which it may be lengthened or shortened, and it also carries a pivoted nut which holds the drill-screw spindle.

Claim.—1. The threaded drill-spindle D, in combination with the screw-bearing C^2 and the standard A, substantially as and for the purposes described.

2. The jointed pivoted box-nut or screw-bearing C^2, jointed in a line parallel with line of its bearing, and pivoted by journals extending out at right angles thereto, substantially as and for the purposes described.

3. The post or standard A for sustaining the drilling-tools, either with or without an extension end, and having bearings upon its face, a center longitudinal opening, A^1, and clamp screws A^2 at its ends, substantially as and for the purposes set forth.

5,500.—*Puddling-Furnace.*—HUGH MCDONALD, Pittsburg, Pa.—Patent No. 129,153, dated July 16, 1872. Application filed February 24, 1873.

Reissue of Patent No. 129,153, July 16, 1872.

Claim.—In combination with the working-chamber of a puddling, boiling, heating, or smelting furnace, a partition-wall, D, extending transversely across the fire chamber or magazine, so as to divide the same into coking and combustion chambers, B B', and at the same time retain, substantially, its magazine capacity for the reception and combustion of fuel, as set forth.

5,501.—*Rotary Printing-Press.*—CHARLES MONTAGUE, Boston, Mass., assignor to CYRIL C. CHILD, same place. Patent No. 98,028, dated December 21, 1869. Application filed March 21, 1873.

A telescopic lever, vibrated on a rock-shaft by a crank, the pin of which is attached to the internal sliding piece of the lever, reciprocates the bed. A gear-wheel, so hung upon a stud outside the end of the crank-shaft that its axis is eccentric to axis of shaft, carries a crank-pin which projects inwardly and fits a slot cut in main gear, to cause cylinder and bed to move together during impression. The cylinder may be raised or lowered at will. The nipper-shaft is moved by an arm attached to its end striking a pin.

Claim.—1. The combination of suitable mechanism, substantially as described, for imparting motion to an impression-cylinder with the extensible vibrating-lever D D^2 and a reciprocating type-bed, B, substantially as set forth.

2. The combination of the cam-levers e^1 and e^2, dog *j*, bed B, and cylinder L, constructed and operating substantially as described, for the purpose specified.

3. The spring-wedge k^2 for arresting the action of the dog *j'*, constructed and operating substantially as described, for the purpose specified.

4. In combination with a reciprocating type-bed, the cam-wedge *n*, pins *m* and *k*, lever *l*, spring *o*, and arm or dog *h*, constructed and operating substantially as described, for the purpose specified.

INDEX OF INVENTIONS PATENTED JULY 22, 1873.

	Class No.	Whole No.
Abdominal supporter, J. W. Gurley	156	141,137
Axle and sleeve for vehicles, W. H. Sparks	31	141,018
Bag holder, C. H. Thomas	57	141,186
Banjo, J. S. Stiles	103	141,182
Basket, S. H. Wheeler	63	141,023
Baskets, cover for fruit, Ingham and Colby	63	141,142
Beer and yeast, manufacture of, L. Pasteur	19	141,072
Belt tension apparatus, S. E. Jewett	87	141,004
Bevel, carpenter's, S. D. Sargeant	29	141 061
Boiler, steam, S. Ritty	148	141,172
Boilers, injector for feeding, W. and C. Sellers	118	141,174
Boilers, self-adjusting injector for feeding, W. Sellers	118	141,173
Bolt heading machine, J. O. Jones	14	141,059
Boot and shoe soles, machinery for shaping, J. B. Johnson	16	141,058
Boring machine, earth, Wilson and Baisley	51	141,097
Breast cup, A. M. Knapp	156	141,005
Bridge, truss, A. Bannister	21	141,026
Bridge, truss, Hunter and Rice	21	141,056
Broaching machine, A. P. Stephens	100	141,091
Buckle, trace, Brayton and Baugh	72	141,108
Bureau drawers, fastening for, A. J. Grant	62	141,001
Can, oyster, C. H. Dexter	136	141,194
Candle guard, B. Morgan	90	141,066
Cane stripper, R. C. James	115	141,057
Car coupling, Beddow and Jackson	122	141,103
Car coupling, T. Smith	122	141,177
Car elevator, coal, P. H. Lamey	79	141,143
Car starter, C. J. Moore	122	141,150
Car wheel, railroad, W. H. Paige	122	141,011
Car window stop, adjustable, C. Page	121	141,165
Cars, deck sash or ventilator opener for railroad, J. E. Cross	106	141,037
Carburetor, F. A. Fisher	27	140,998
Carpet cleaner, H. W. Bates	62	140,990
Carriage, F. M. Watson	31	141,190
Carriage seat, J. N. Miller	31	141,065
Cartridge, device for loading, T. L. Sturtevant	32	141,185
Chair, reclining, E. Collins	69	141,121
Chimney cap, T. Boyd	106	141,107
Clasp for suspenders, J. W. Smith	38	141,087
Cloth finishing machines, tray for, A. Woolson	37	141,192
Clothes line reel, C. Rosenthal	91	141,015
Clothes pounder, E. S. Saxton	91	141,062
Clothes reel, J. McMahon	91	141,064
Coating metals with copper, Gauduin, Mignon, and Rouart	113	141,132
Compound for cleaning polished metals, M. McGlenn	35	141,156
Connecting rod, B. F. Wilson	67	141,191
Copper, coating metals with, Gauduin, Mignon, and Rouart	113	141,132
Corset, T. S. Gilbert	80	141,134
Cradle, L. A. Chichester, (reissue)	62	5,496
Cradle, F. Chichester	62	141,033
Cradle, spring, F. Chichester	62	141,038
Culinary apparatus, R. H. Cazier	154	141,114
Cultivator, O. Kugler	43	141,145
Cultivator, O. Kugler	43	141,146
Curling iron, Rosenstein and Feder	161	141,079
Doors, fastening for sliding, E. W. Staples, Jr	93	141,019
Dovetail machine, A. C. Van Alstine	173	141,096
Drilling machine, coal, J. Grimm, (reissue)	124	5,449
Electrotyping, etching plate for, A. and H. T. Dawson	54	140,995
Engine, air and gas, O. Trossin	2	141,189
Engine, rotary, W. P. Eayrs	150	141,128
Faucet attachment, E. L. Dunbar	167	141,040
Faucet, compound, W. S. Bate	167	141,102
Fire escape, J. A. Talpey	30	141,093
Fire extinguisher, H. S. Maxim	35	141,063
Fire plug, J. P. Gallagher	167	141,131
Fires, supplying steam, &c., to buildings for extinguishing, J. A. Coleman	118	141,034
Furnace breast plate, blast, R. A. Fisher	85	141,043
Furnace for melting metals, J. Harrison	99	141,130
Furnace for roasting and smelting ores, L. Stevens	99	141,181
Furnace, gas, L. Stevens	66	141,179
Furnace, gas, L. Stevens	66	141,180
Furnace, metallurgic gas, J. M. Hartman	99	141,082
Furnace, puddling, H. McDonald, (reissue)	85	5,500
Furnaces, hot air flue for heating, G. R. Barker	154	141,101
Furniture leg, Orr and Baird	68	141,071
Gage, carpenters', M. C. Robichau	99	141,014
Gage cock, Bellemare and Fleer	153	141,104
Game board, F. P. Holmes	143	141,053
Gas, apparatus for the manufacture of, W. H. Spencer	66	141,090
Gas, manufacture of vapor, R. L. Cohen	66	141,119
Gate, tilting, J. Bartholf	59	141,027
Gearing, increasing the friction of helical, G. Lindsay	67	141,149
Grafting, C. E. Symonds	63	141,092
Grain drier, W. F. Morgan	49	141,160
Griddle greaser, W. H. Bixler	89	140,988
Harrow, J. A. Walker	73	141,021
Harvester, corn, L. Hamilton	75	141,138
Harvester rake, W. T. Eastes	74	141,127
Harvester rake, M. L. Mix	74	141,164
Harvesters, &c., seat for, J. G. Perry	74	141,075
Hat pressing machinery, D. Brown	76	140,993
Hatchway, self-closing, A. Reid	79	141,171
Heater, kerosene, Z. B. and C. E. Grandy	65	141,046
Hinge, seat, M. W. Chase	24	141,115
Hoisting machine, C. H. Hersey	79	141,051
Hoop skirts, tape for, C. C. Carpenter	81	141,118
Ice cream freezer, A. Lucetti	58	141,060
Inhaler, S. J. Shaw	156	141,175
Iron, restoring tinned sheet, W. E. Brockway	99	141,109
Journal and shaft bearing, frictionless, J. Eccles	67	141,129
Kettle lifter, E. A. Thissell	154	141,089
Knife, L. Eddy	44	140,997
Ladder, J. Eagon	30	141,126
Lamp, T. B. Atterbury	90	140,986
Lantern, W. McKay	90	141,008
Lantern, S. Naylor	90	141,162
Last block holder, D. Daniels	16	141,123
Lathe, potters', W. Meek	80	141,157
Leather, artificial, H. A. Clark	56	141,117
Leather, preparing cloth, paper, &c., to imitate, H. A. Clark	56	141,118
Leather, process for the manufacture of artificial, H. A. Clark	56	141,116
Lock, combination, H. Clarke, (reissue)	93	5,497

	Class No.	Whole No.
Locks, seal for, F. W. Brooks	93	141,110
Locomotive head light, P. F. Stout	94	141,183
Loom picking mechanism, W. Townsend	95	141,187
Lubricator, D. T. Pray	87	141,168
Magnesia, making a hydrate or milk of, Phillips and Reid	35	141,167
Medical compound, C. D. Bradley	98	141,030
Milling machine, G. T. Pillings	100	141,012
Music notation, J. P. Powell	102	141,013
Oxes, treating, M. Ladin	3	141,147
Packing for piston rods and valve stems, W. Heston	152	141,058
Paddle wheels, feathering, G. K. Glenn	139	141,135
Paint for roofing, wood, &c., J. C. and C. M. Bills	107	140,991
Paint vessel and package, J. W. Maeury	107	141,061
Paper file, R. Rathbone	146	141,170
Paper stock, treating fibrous substances in the manufacture of, T. Routledge	108	141,016
Parer, apple, W. A. C. Oaks	88	141,070
Peanery, O. M. Muncaster	156	141,069
Piano, G. C. Maener	112	141,152
Pile driver, C. H. Smith	42	141,086
Pinchers, shoemaker's, W. H. Hanna	16	141,047
Pipe, molding, A. W. A. Logen	33	141,150
Planing machine, metal, R. Harper	100	141,049
Planing machine, metal, G. C. Larned	100	141,006
Planter, cotton seed, J. L. Slocumb	133	141,085
Plow, wheel, J. C. Pearl	114	141,073
Port stopper fastening, J. Carver	137	141,113
Press, baling, W. M. Conner	7	141,035
Printing press, rotary, C. Montague, (reissue)	117	5,501
Printing presses, inking apparatus for oscillating, G. W. Prouty	117	141,077
Propelling vessels, G. W. Dow	139	141,039
Pump, rotary, J. E. Gillespie	114	141,000
Pump or engine, rotary, W. P. Maxson	118	141,155
Punching washers, die for, R. Humphrey	14	141,055
Reel, R. Simon	17	141,084
Refrigerator and water cooler combined, H. W. B. Hervey	58	141,141
Roller and planter combined, O. Knudson	73	141,144
Ruler, parallel, G. Blunck	97	141,029
Ruler and blotter combined, R. M. Austin	143	140,989
Saccharine solutions, delaying the fermentation of, J. A. Merrell	155	141,068
Sad iron, W. L. Hubbell	154	141,054
Sash cord fastener, Harris and Hewitt	24	141,050
Sash fastener, T. P. Coin	24	140,994
Sash fastener, Cole and Davis	24	141,120
Sash fastener and weather strip combined, E. J. Sprague	24	141,178
Sash holder, G. W. Richardson	24	141,078
Sash holder, G. A. Sturges	24	141,184
Saw, S. Cook	131	141,036
Saw, J. Crookes	131	141,122
Saw mill, B. Berndt	130	141,028
Saw, scroll, J. W. Rowlingson	130	141,080
Sewing machine, A. T. Nichols	130	141,163
Sawing machine, scroll, M. Hansen	130	141,048
Seeding machine, G. F. Stroud	133	141,143
Separator, grain, O. J. Everson	159	141,130
Sewing machine, D. M. Smith	134	141,088
Sewing machine folding cover, S. J. Pusey	134	141,169
Sewing machines, &c., brake for preventing retrograde movement in, D. T. Peck	134	141,166
Sharpening machine, S. F. Emerson	131	141,042
Signal, flash light, Mitchell and Mayo	158	141,010
Silk, machine for spreading, J. Sault	140	141,017
Soda water, &c., cooler for, W. Geo	1	141,133
Soda water, &c., apparatus for dispensing, J. Matthews	1	141,154
Sole channeling machine, C. C. Ballou	16	141,025
Spinning machines, roller clearer for, C. B. Brown	142	141,031
Staves, machine for jointing, E. and B. Holmes	40	141,003
Steam trap, Maxim and Hawes	150	141,063
Steel wire and thin sheets of steel, hardening, A. Benjamin	85	141,105
Stove, base burning, J. Easterly, (reissue)	154	5,498
Stove, cooking, C. H. Douglas	154	140,996
Stove platform, Bingham and Ewing	154	141,108
Stove pipe drum, A. W. Foote	154	140,999
Strap, shawl, F. H. Willis	102	141,094
Stump extractor, T. Herbig	79	141,140
Sugar, manufacture of, J. A. Morrell	155	141,067
Telegraph, printing, G. M. Phelps	50	141,076
Thrashing machine, R. H. Martindale	159	141,153
Top, spinning, J. Spencer	143	141,089
Toy, R. G. Messinger	143	141,090
Trunk, F. H. Abeel	31	141,098
Tuck marker, F. L. Tileston	134	141,095
Twisting machines, stopping mechanism for, A. J. Milstead	142	141,158
Umbrella, C. C. Lusby	145	141,151
Valve, stop, G. W. Eddy	158	141,041
Vehicle wheel, C. Anderegg	31	141,099
Vehicle wheel, J. Q. Dryer	31	141,111
Ventilator opener for railroad cars, deck sash or, J. K. Cress	166	141,037
Vessels, camel for raising sunken, H. H. Siebe	82	141,083
Vest supporter, Martin and Mapes	38	141,007
Washing machine, J. Glines	91	141,044
Washing machine, H. C. Grover	91	141,136
Washing machine, W. R. Walton	91	141,092
Watch, calendar, D. J. Mesart	36	141,161
Watch cases, spring joint for, J. Gordon	36	141,045
Watches, manufacture of push tops for, J. C. Dueber	36	141,125
Water closets, disinfecting and deodorizing apparatus for, J. M. B. Baker	9	141,100
Water wheel, E. B. Percy	148	141,074
Weather strip, F. Stering	39	141,176
Well points, machine for perforating drive, C. L. Travis	100	141,186
Windmill, C. A. Taylor	118	141,004
Wool of burrs, &c., cleaning, T. Crossley	28	141,038

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED JULY 22, 1873.

Abeel, F. H., Dumping truck	141,098
Anderegg, C., Vehicle wheel	141,099
Atterbury, T. B., Lamp	140,988
Austin, R. M., Combined ruler and blotter	140,989
Baird and Orr	141,071
Baisley and Wilson	141,097
Baker, J. M. B., Disinfecting and deodorizing apparatus for water closets	141,100
Ballou, C. C., Sole channeling machine	141,025
Bannister, A., Truss bridge	141,026
Barker, G. R., Hot air flue for heating furnaces	141,101
Barthelf, J., Tilting gate	141,027
Bate, W. S., Compound faucet	141,102
Bates, H. W., Carpet cleaner	140,990
Baugh and Brayton	141,103
Bayley, C. E., assignee	141,008
Beddow, T., and A. T. Jackson, Car coupling	141,103
Bellemre, J. F., and F. R. Fleer, Gage cock	141,104
Benjamin, A., Hardening steel wire, &c	141,105
Berndt, B., Saw mill	141,028
Bills, J. C. and C. M., Paint for roofing, wood, &c	140,991
Bingham, G. E., and J. F. Ewing, Stove platform	141,106
Bixler, W. H., Griddle greaser	140,992
Blunck, G., Parallel ruler	141,029
Boyd, T., Chimney cap	141,107
Bradley, C. D., Medical compound	141,030
Branch, J. H., assignee	141,122
Brayton, E. K., and J. Baugh, Trace buckle	141,108
Brockway, W. E., Restoring tinned sheet iron	141,109
Brooks, F. W., Seal for locks	141,110
Brown, C. B., Roller clearer for spinning machines	141,031
Brown, D., Hat pressing machinery	140,993
Bryer, J. Q., Vehicle wheel	141,111
Carpenter, C. C., Tape for hoop skirts	141,112
Carver, J., Port stopper fastening	141,113
Cazier, R. H., Culinary apparatus	141,114
Chase, M. W., Seat hinge	141,115
Chichester, F., Spring cradle	141,032
Chichester, F., Cradle	141,033
Chichester, L. A., Cradle, (reissue)	5,496
Child, C. C., assignee, (reissue)	5,501
Christy, Siebe, and Gorman	141,083
Churchill, J., assignee	141,009
Cilley, J. P., assignee	141,113
Clark, H. A., Manufacture of artificial leather	141,116
Clark, H. A., Artificial leather	141,117
Clark, H. A., Preparing cloth, paper, &c., to imitate leather	141,118
Clarke, H., Combination lock, (reissue)	5,497
Clarke Lock Company, assignee, (reissue)	5,497
Cohen, E. L., Manufacture of vapor gas	141,119
Coin, T. P., Sash fastener	140,994
Colby and Ingham	141,142
Cole, A., and E. Davis, Sash fastener	141,120
Coleman, J. A., Supplying steam, &c., to buildings for extinguishing fires	141,034
Collins, E., Reclining chair	141,121
Conner, W. M., Baling press	141,035
Cook, S., Saw	141,036
Crookes, J., Saw	141,122
Cress, J. E., Deck sash or ventilator opener for railroad cars	141,037
Crossley, T., Cleaning wool of burrs, &c	141,038
Daniels, D., Last block holder	141,123
Davis and Cole	141,120
Dawson, A. and H. T., Etching plates for electrifying	140,995
Dexter, C. H., Can for oysters	141,124
Douglas, C. H., Cooking stove	140,996
Dow, G. W., Propelling vessels	141,039
Dueber, J. C., Manufacture of push tops for watches	141,125
Dunbar, E. L., Faucet attachment	141,040
Eagen, J., Ladder	141,126
East New York Boot, Shoe, and Leather Manufacturing Company, assignee	141,035
Easterly, J., Base burning stove, (reissue)	5,498
Eastes, W. T., Harvester rake	141,127
Eayrs, W. P., Rotary engine	141,128
Eccles, J., Frictionless journal and shaft bearing	141,129
Eddy, G. W., Stop valve	141,041
Eddy, L., Knife	140,997
Emerson, S. F., Sharpening machine	141,042
Everson, O. J., Grain separator	141,130
Ewing and Bingham	141,106
Feder and Rosenstein	141,079
Fisher, F. A., Carburetor	140,998
Fisher, R. A., Blast furnace breast plate	141,043
Fleer and Bellemre	141,104
Foote, A. W., Stove pipe drum	140,999
Gallagher, J. P., Fire plug	141,131
Galpin, T. D., assignee	140,985
Gauduin, O., J. B. J. Mignon, and S. H. Rouart, Coating metals with copper	141,132
Gee, W., Cooler for soda water, &c	141,133
George, W. E., assignee	140,982
Gilbert, T. S., Corset	141,134
Gillespie, J. E., Rotary pump	141,000
Glenn, G. K., Feathering paddle wheels	141,135
Glines, J., Washing machine	141,044
Gordon, J., Spring joint for watch cases	141,045
Gorman, Christy, and Siebe	141,083
Grandy, Z. B. and C. E., Kerosene heater	141,046
Grant, A. J., Fastening for bureau drawers	141,001
Great American Malt and Grain Drying Company of New York City, assignee	141,180
Grimm, J., Coal drilling machine, (reissue)	5,499
Grove, W. H., assignee	141,180
Grover, H. C., Washing machine	141,136
Gurley, J. W., Abdominal supporter	141,137
Hamilton, L., Corn harvester	141,138
Hammond, S. T., assignee	141,011
Hanna, W. H., Shoemaker's pinchers	141,047
Hansen, M., Scroll sawing machine	141,048
Harper, R., Metal planing machine	141,049
Harris, H., and F. Hewitt, Sash cord fastener	141,050
Harrison, J., Furnace for melting metals	141,139
Hartman, J. M., Metallurgic gas furnace	141,002
Hawes and Maxim	141,063
Heald, W. D., assignee	141,003
Herbig, T., Stump extractor	141,140
Hersey, C. H., Hoisting machine	141,051
Hervey, H. W. B., Combined refrigerator and water cooler	141,141
Heston, W., Packing for piston rods and valve stems	141,052
Hewitt and Harris	141,050
Hitchcock, J., trustee, assignee	141,053
Holmes, E. and B., Machine for jointing staves	141,003
Holmes, F. P., Game board	141,053
Hooper, W. E., & Sons, assignees	141,156
Hubbell, W. L., Sad iron	141,054
Humphrey, R., Die for punching washers	141,055
Hunter, H. J. and J. Rice, Truss bridge	141,056
Illinois Manufacturing Company, assignee	141,057
Ingham, J. C. and C. Colby, Cover for fruit baskets	141,142
Jackson and Beddow	141,103
James, R. C., Cane stripper	141,057
Jewett, S. E., Belt tension apparatus	141,004
Johnson, J. B., Machinery for shaping boot and shoe soles	141,058
Jones, J. O., Bolt heading machine	141,059
Knapp, A. M., Breast cup	141,005
Knudson, O., Combined roller and planter	141,144
Kugler, O., Cultivator	141,145
Kugler, O., Cultivator	141,146
Ladin, M. Treating oxes	141,147
Lamey, P. H., Coal car ventilator	141,148
Larned, G. C., Metal planing machine	141,006
Lindsay, G., Increasing the friction of helical gearing	141,149
Logen, A. W. A., Molding pipe	141,150
Lucotti, A., Ice cream freezer	141,060
Lusby, C. C., Umbrella	141,151
Manner, G. C., Piano	141,152
Mapes and Martin	141,007
Martin, B. F., and E. Mapes, Vest supporter	141,007
Martindale, R. H., Thrashing machine	141,153
Maeury, J. W., Paint vessel and package	141,061
Matthews, J., Apparatus for dispensing soda water, &c	141,154
Maxim, H. S., Fire extinguisher	141,062
Maxim, H. S., and L. P. Hawes, Steam trap	141,063
Maxson, W. P., Rotary pump or engine	141,155
Mayo and Mitchell	141,010
McCauley, J. D., assignee	141,145, 141,146
McDonald, H., Puddling furnace, (reissue)	5,500
McGlenn, M., Compound for cleaning polished metals	141,156
McKay, W., Lantern	141,009
McMahon, J., Clothes reel	141,064
Meek, W., Potters' Lathe	141,157
Messinger, R. G., Toy	141,090
Mignon, Rouart, and Gauduin	141,132
Miller Brothers, assignee	141,065
Miller, J. N., Carriage seat	141,065
Milstead, A. J., Stopping mechanism for twisting machines	141,158
Mitchell, W., and J. J. Mayo, Flash light signals	141,010
Montague, C., Rotary printing press, (reissue)	5,501
Moore, C. J., Car starter	141,159
Morgan, B., Candle guard	141,066
Morgan, W. P., Grain drier	141,160
Morrell, J. A., Manufacture of sugar	141,067
Morrell, J. A., Delaying the fermentation of saccharine solutions	141,068
Morrow, W. H., assignee	141,069
Mosart, D. J., Calendar watch	141,161
Muncaster, O. M., Peanery	141,069
Naylor, S., Lantern	141,162
Nichols, A. T., Sawing machine	141,163
Nix, M. L., Harvester rake	141,164
Oaks, W. A. C., Apple parer	141,070

Sargent, S. D., Carpenters' bevel	141,081
Sault, J., Machine for spreading silk	141,017
Saxton, E. S., Clother pounder	141,082
Sellers, W., Self-adjusting injector for feeding boilers	141,173
Sellers, W. and C., injector for feeding boilers	141,174
Sharpe, J. M., assignee	141,021
Shaw, S. J. Inhaler	141,175
Siebe, H. H., W. A. Gorman, and T. Christy, Jr., Camel for raising sunken vessels	141,083
Stering, F., Weather strip	141,176
Simon, R., Reel	141,084
Slocumb, J. L., Cotton seed planter	141,085
Smith, C. H., Pile driver	141,086
Smith, D. M., Sewing machine	141,088
Smith, J. W., Clasp for suspenders	141,087
Smith, T., Car coupling	141,177
Souder, J. D., assignee	141,018
Sparks, W. H., Axle and sleeve for vehicles	141,018
Spencer, J., Spinning top	141,089
Spencer, W. H., Apparatus for the manufacture of gas	141,090
Sprague, E. J., Combined sash fastener and weather strip	141,178
Stanley Rule and Level Company, assignee	141,081
Staples, E. W., Jr., Fastening for sliding doors	141,019
Starke, A., assignee	141,020
Stephens, A. P., Broaching machine	141,091
Stephens Patent Vise Company of New York, N. Y., assignee	141,091
Stevens, L., Gas furnace	141,179
Stevens, L., Gas furnace	141,180
Stevens, L., Furnace for roasting and smelting ore	141,181
Stickler, Elliott, and Wilson	141,092
Stiles, J. S., Banjo	141,182
Stout, P. F., Locomotive head light	141,183
Stroud, G. F., Seeding machine	141,143
Stuart, T. E., assignee	141,182
Sturges, G. A., Sash holder	141,184
Sturtevant, T. L., Device for loading cartridges	141,185
Swain, Fuller & Co., assignee	141,059
Symonds, C. E., Grafting	141,093
Talpey, J. A., Fire escape	141,083
Tawa & Hartman, assignees	141,002
Taylor, C. A., Windmill	141,094
Thissell, E. A., Kettle lifter	141,020
Thomas, C. H., Bag holder	141,186
Thompson, J. A., assignee	141,145, 141,146
Tileston, F. L., Tuck marker	141,095
Townsend, W., Loom picking mechanism	141,187
Travis C. L., Machine for perforating drive well points	141,188
Tressin, O., Air and gas engine	141,189
Van Alstine, A. C., Dovetail machine	141,096
Van Fleet, J., assignee	141,145, 141,146
Walker, J. A., Harrow	141,021
Walton, W. R., Washing machine	141,092
Watson, F. M., Carriage	141,190
Wheeler, S. H., Basket	141,023
Willis, F. H., Shawl strap	141,094
Wilson, R. F., Connecting rod	141,191
Wilson, G., and G. H. Baisley, Earth boring machine	141,097
Winston, A. G. and A. V., assignees	141,035
Woodman, A., assignee	141,021
Woolson, A., Tray for cloth finishing machines	141,192

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 31, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks)..... 6,500

SEWING-MACHINES and attachments..... 2,000

FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes..... 4,000

PRINTING; including presses, type, and printers' furniture. 2,500

CARRIAGE-WHEELS; including hubs, spokes, tires, and axles 1,900

FELTING and HATS; including caps, bonnets, flock, &c..... 1,200

WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments)..... 1,600

STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs..... 1,400

CARRIAGES and WAGONS; (excepting wheels, hubs, and axles) (in progress.)

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited and the invention therein described will become public property, as against the applicant therefor, unless he shall make a new application within two years from the date of notice of the original allowance.

The following abbreviated forms of the Patent Office classification by subject-matter may be of assistance to persons ordering copies of specifications and drawings by class. Of course the classes vary somewhat in number of patents, and in following a branch of industry it may be necessary to group several classes to secure absolute completeness. These groupings will readily suggest themselves to the inventor or mechanic.

Aërated liquor apparatus	1	Leather	92
Air and gas engines	2	Locks and latches	93
Amalgamators, ore-mills	3	Locomotives	94
Architecture	4	Looms	95
Artificial limbs, &c.	5	Manures	96
Baking	6	Mathematical instruments	97
Baling-presses	7	Medical compounds	98
Bathe, closets, &c.	8	Metallurgic processes	99
Bee-hives	9	Metal working	100
Bell and brass founding	10	Meteorological instruments	101
Bleaching, dyeing, &c.	11	Musical instruments	102
Blowers	12	Nails and spikes	103
Boats	13	Needles, pins, &c.	104
Bolts, nuts, rivets	14	Ordnance	105
Bookbinding	15	Organs	106
Boots and shoes	16	Paints and varnishes	107
Braid, thread, &c.	17	Paper-making	108
Breech-loaders	18	Paper manufactures	109
Brewing, cider, &c.	19	Paving	110
Bricks	20	Photography	111
Bridges	21	Pianos	112
Brushes and brooms	22	Plating	113
Buckles, buttons, &c.	23	Plows	114
Builders' hardware	24	Pottery	115
Butchering	25	Poultry, care of	116
Candles, soap, &c.	26	Printing	117
Carburetors	27	Pumps	118
Carding and roving	28	Punching and shearing	119
Carpenters' tools	29	Railroads, (the "Way")	120
Carpentry	30	Railroads, (rolling stock,) A	121
Carriages and wagons	31	Railroads, (rolling stock,) B	122
Cartridges and bullets	32	Revolvers	123
Casting	33	Rock-drilling and blasting	124
Casting soft metals	34	Rolling metals	125
Chemical processes	35	Roofing	126
Clocks and watches	36	Rope and cordage	127
Cloth-dressing, &c	37	Safes and vaults	128
Clothes-making	38	Salt	129
Coffins	39	Saw-mills	130
Coopering	40	Saws	131
Cotton	41	Scales and weights	132
Counting and registering	42	Seeders and planters	133
Cultivators	43	Sewing-machines	134
Cutlery	44	Sheep, care of	135
Dairy apparatus	45	Sheet metal working	136
Dental instruments	46	Ship-building, (the hull)	137
Distilling and rectifying	47	Ship-building, (masting, &c)	138
Driers	48	Ships, propulsion of	139
Edge tools	49	Silk	140
Electrical apparatus	50	Spades, shovels, &c.	141
Excavating and grading	51	Spinning	142

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 4.—NO. 5. TUESDAY, JULY 29, 1873. PRICE { $6,00 per year—single. / $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1873 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

COMMISSIONER'S DECISIONS.

BARAK T. NICHOLS.—*Appeal.*

[*Appeal from the decision of the Primary Examiner in the matter of the application of Barak T. Nichols for* IMPROVEMENT IN NAILS AND SPIKES.—*Decided July* 28, 1873.]

The exclusive privilege of fabricating out of sheet metal nails corrugated lengthwise may be secured to the inventor by a single patent.

He need not divide his application, and apply for a separate patent for each form of nail which he shows by way of illustration in his specification.

Other forms of such nails, if they possess the necessary requisites, may also be protected by subsequent patents, but they will be subordinate to the one first obtained.

LEGGETT, *Commissioner:*

Applicant proposes to make a nail of sheet metal longitudinally ridged or corrugated. He enumerates several advantages which he alleges appertain to a nail so made, independent of its form or size. These are comparative strength, lightness, cheapness of manufacture, slight displacement of material into which it may be driven, and increased surface of contact when driven, giving it greater holding power. He says nails of various shapes and sizes may be made of sheet metal and corrugated, and illustrates three forms of nails in his drawings, differing in taper, in being headed or not headed, and in being transversely bent into tubular or merely angular sectional outline. He makes no claim to any of these forms. The Examiner holds that these different forms "cannot be embraced in one application, being separate inventions," and he requires a division of this application. This, I think, proceeds from a misconception of applicant's real invention. His alleged invention is not in any particular form of nail, but in discovering that nails of various forms may be advantageously made of sheet metal and corrugated. The essence of the invention, if he has made one, is the adaptation of sheet metal to the making of nails, which have heretofore been made of other kinds of manufactured metals. This is by no means an obvious use of sheet metal. The claim is:

"A nail or spike formed of sheet metal, and grooved, ridged, or corrugated longitudinally, to stiffen it, substantially as described, as a new article of manufacture."

If this is a new product, in such a sense as to be patentable, there can be no reason why a claim such as this, as broad as the scope of the invention, should not be allowed. The invention is obviously applicable to various forms of nails, and applicant has merely illustrated this fact. There may be new forms of nails yet undiscovered to which it will apply. When they shall be produced they may be patented on account of their novelty, if it is of such a character as to render them patentable. The merit of such nails will be due to their form alone. But the forms of nails shown have nothing to do with this invention, except to illustrate it. A new article of manufacture may be a foundation invention, as well as any other subject of invention, and in such a case it is proper to grant a claim broad enough to protect it. Such a claim in a patent does not cut off other inventions; it merely renders improvements tributary, as all foundation patents do. This is not such a case as the authorities the Examiner relies on apply to, and his decision must be overruled.

ROBERT M. FRANKLIN.—*Appeal.*

[*Appeal from the decision of the Primary Examiner in the matter of the application of Robert M. Franklin for patent for* PROPELLING VESSELS.—*Decided July* 24, 1873.]

Every claim in an application must in one sense cover an independent invention, yet all the claims must pertain to one common subject.

Devices exclusively adapted to operate in a given machine may be claimed by themselves in a patent for the machine.

Mechanical movements which are applicable to general use cannot be claimed, though new, in the same patent with any particular apparatus in connection with which they may be shown in operation.

A combination which includes machinery and the subject upon which it operates is not patentable.

A mechanism through which any rectilinear motion may be made to give rotation to two shafts in opposite directions, cannot be claimed in the same application with other new devices in a propeller in which it is employed, though claimed in combination with the parts of the propeller with which it co-operates, and with the propeller itself.

The Commissioner has no power of requiring in all cases that applications should be divided in order that they may conform to the classification adopted by the Office.

LEGGETT, *Commissioner:*

Applicant entitles his invention "improvements for propelling vessels," and presents three claims exclusively referring to propellers. He also makes the following claim:

"The combination of the propellers and their shafts with the toggle-joint levers h i, cross-heads f f, guides g, piston-rod e, and balanced cranks j j, substantially in the manner and for the purpose herein described."

This claim, the Examiner holds, comprehends a subject of invention, distinct from that of the other claims, that should be presented in a separate application for patent and go to another class for examination. The original fourth claim, to which the Examiner objected, covered simply the toggle-jointed levers and their cross-heads for connecting the piston and the cranks of the propeller-shafts, whereby a single reciprocating piston is made to give rotary motion in opposite directions to two parallel shafts. These levers are merely means of converting reciprocating into rotary motion, as specified. They are as applicable for that purpose to any other shafts as to propeller-shafts, and they have no necessary connection with a piston-rod. Any link, arm, rod, frame, or bar having a reciprocating motion is equally well adapted to work them. They constitute of themselves a mechanical movement which must necessarily be applied and operated precisely as it is here, in every machine or device where the same object—viz., the rotation of two shafts in opposite directions—is desired to be accomplished. The amended claim now substituted does not cover a patentable combination, even if the mechanical movement embodied in the toggle-jointed levers be new, (which is doubtful,) because it includes the subject operated upon, as well as the machinery operating upon it. The axe with which a woodman chops might with as much propriety be claimed in combination with the log he is chopping as the toggled levers in combination with the propeller shafts and wheels. Adding the piston-rod to the other end of the series of parts claimed, it is as if the man, the axe, and the log were claimed in combination. Combination claims of this character, consisting of an enumeration of all the parts of a device, from the piston-rod of an engine to the vanes of a propeller, ought never to be allowed. They are, as they have frequently been termed, mere aggregation claims which do not conform to the requirements of the law, and if they did would be of no value to inventors. Applicant submitted this inventory of items, probably, to avoid the pertinent objection of the Examiner to the consideration of the claim for the toggled levers in this application. But it does not have that effect. It is clear that if there is anything patentable in the subject-matter of the claim it is in the toggled levers as originally claimed, comprising a mechanical movement, which is a distinct invention, being no part of and having no necessary connection with the subject of invention to which applicant's first three claims apply. It is not always possible or admissible to divide applications merely for the purpose of following the classification of inventions adopted in the Office. The Commissioner has no arbitrary power to require applications to be divided merely for such reason. The law requiring that but one *subject of invention* can be comprehended in the same patent must always form the basis of the division of an application. Every claim in an application, in order to be valid, must in one sense cover an independent invention, yet all the claims must pertain to one common device or subject of invention. Intermediate parts or combinations of parts constituting special devices exclusively adapted to a particular office in a given machine, although nominally distinct, may be claimed in an application covering the machine, because they are in such cases parts of the same subject of invention. The toggled levers under consideration are obviously not of this character.

The decision of the Examiner is sustained.

P. M. J. CHAMBLANT.—*Appeal.*

[*Appeal from the decision of the Board of Examiners-in-Chief in the matter of the application of P. M. J. Chamblant for* IMPROVEMENT IN BOBBINS FOR SEWING-MACHINES.—*Decided July* 31, 1873.]

When material advantages have resulted from the substitution of paper for metal in the fabrication of any article, there arises a presumption, in view of the different qualities of the two materials, that invention has been exercised.

But spools having been previously manufactured from paper, it is not patentable to make bobbins from that material in the same form in which bobbins have been made from metal.

It is incumbent on the Examiners-in-Chief and the Commissioner, as well as on the Examiner, to communicate to an applicant the grounds upon which he has been rejected.

LEGGETT, *Commissioner:*

Applicant proposes to make lenticular bobbins of paper or other like substance, for use in place of the metal bobbins commonly employed in sewing-machines of the construction of the Wheeler and Wilson machine.

The object is to have the bobbins filled with the required grades of thread and sold as articles of trade, and to make them so cheap that it will be more economical to take them out when empty and replace them by filled bobbins than to refill metal bobbins, as is now the practice in this class of machines. They are lighter than metal bobbins, and it is alleged that there is some advantage in that. The claim, which is preceded by a disclaimer referring to the existing state of the art, indicates the construction of the bobbin.

"A bobbin for sewing-machines, consisting of two disks of paper or similar light material, indented at their centers, and united by joining the inner surfaces of said indentations, substantially as described."

This construction, however, is not new, except as to the mode of fastening the disks together, for which glue or other adhesive mixture is used. The bobbins of Blodgett and Johnson, cited by the Examiner, exhibit metal disks indented at their centers and secured by rivets. It has not been held, however, and could not be justly held, that a metal bobbin is the equivalent of a paper bobbin, even though the construction of both were identical. The two materials are so essentially unlike, the situations in which paper articles can be successfully substituted for metal articles are so seldom to be met with, and the qualities of the articles themselves are so different—their difference furnishing the reason for the substitution—that in whatever new relation the discovery is made that a metal article can be advantageously replaced by a paper one, such discovery is likely to be of that ingenious character which the law was intended to encourage by affording the protection of patents.

But the forfeited application of J. S. McCurdy shows a spool made of paper. It consists of two paper disks united by a paper tube. It was intended as a substitute for ordinary wooden spools for thread, and also "for carrying the lower thread of lock-stitch sewing-machines." But when employed in this latter capacity it was suggested that a metallic case might be employed to receive it. Thus it appears that the form and construction of applicant's bobbin were old, and that a paper spool or bobbin for the same use in the same class of sewing-machines existed, of a construction differing only in having the disks united by a paper tube, instead of being indented at their centers and secured together at the edges of the indentations. He has not, therefore, originated the idea of using paper bobbins in sewing-machines or the form or plan of construction of his bobbin. All he has done is to make a bobbin of paper of the construction that had before been employed to make it of thin metal. There does not appear to have been any difficulty to overcome in doing this. The material for his bobbin, the pattern by which to make it, and the idea that it would be useful and practicable all being suggested, he merely did the work of a mechanic and not of an inventor. This case seems to have been dismissed by the Board rather summarily on a mere assertion, without any reasons being stated to support it. From an examination of the claim, which is all that is referred to, the correctness of the assertion respecting it is not apparent, and the applicant insists with some warmth that "the case has not been fairly considered on its merits" by the Board. Perhaps a clear statement of reasons for rejection, indicating a full and candid consideration of the case, would have satisfied the applicant of the correctness of the decision; at any rate it is due to applicants that such reasons be set forth in all cases. Section 41 of the statute imposes the same duty in this regard upon the Board and the Commissioner that it does upon Examiners.

The decision of the Board is affirmed.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

25,237.—*Horizontal Wheels.*—Granted to ABRAHAM ANDREWS and HARRISON KALBACH, August 20, 1859. Application filed May 28, 1873. Hearing August 13, 1873.

25,239.—*Elastic Hose Tubing*, granted to JOHN C. BOYD, August 30, 1859. Application filed May 29, 1873. Hearing August 13, 1873.

25,269.—*Nail Machines*, granted to DANIEL DODGE, August 30, 1859. Application filed May 31, 1873. Hearing, August 13, 1873.

25,243.—*Stoves.*—Granted to EDWARD M. MANDLE, September 6, 1859. Application filed June 5, 1873. Hearing August 20, 1873.

25,244.—*Machines for Wiring the Joints of Clothes Pins*, granted to ALVIN C. MASON, September 6, 1859. Application filed May 31, 1873. Hearing, August 20, 1873.

25,264.—*Watches.*—Granted to CHARLES E. JACOT, September 6, 1859. Hearing August 20, 1873.

25,273.—*Machines for Making Paper Boxes.*—Granted to SILAS B. TERRY, September 6, 1859; reissued May 17, 1870. Application filed June 5, 1873. Hearing August 20, 1873.

25,295.—*Heels for Boots and Shoes.*—Granted to SIMEON DODGE, Jr., and BENJAMIN POTTER, Jr., September 13, 1859. Application filed June 13, 1873. Hearing August 27, 1873.

25,434.—*Cotton-Scrapers.*—Granted to JONATHAN H. MITCHELL, September 13, 1859. Application filed June 10, 1873. Hearing August 27, 1873.

25,442.—*Boilers and Steamers.*—Granted to DANIEL R. PRINDLE, September 13, 1859. Application filed June 13, 1873. Hearing August 27, 1873.

25,443.—*Seeding-Machines.*—Granted to SILAS G. RANDALL, September 13, 1859; reissued May 25, 1869. Application filed June 11, 1873. Hearing August 27, 1873.

25,473.—*Scales.*—Granted to ANDREW TURNBULL, September 13, 1859. Application filed May 31, 1873. Hearing, August 27, 1873.

25,484.—*Grain-Separators.*—Granted to JONATHAN L. BOOTH, September 20, 1859; reissued September 25, 1860, and November 29, 1864. Application filed June 14, 1873. Hearing September 3, 1873.

25,488.—*Hydraulic Presses.*—Granted to M. H. CLARK, September 20, 1859. Application filed June 20, 1873. Hearing September 3, 1873.

25,499.—*Railroad-Car Seat.*—Granted to ELI WHEELER, September 20, 1859. Application filed June 17, 1873. Hearing September, 3, 1873.

25,506.—*Lamps.*—Granted to HALVOR HALVORSON, September 20, 1859; reissued June 6 and December 5, 1871. Application filed June 6, 1873. Hearing September 3, 1873.

25,508.—*Tailors Shears.*—Granted to ROCHUS HEINRICH, September 20, 1859. Application filed June 20, 1873. Hearing September 3, 1873.

25,512.—*Bung-Hole Borer and Reamer.*—Granted to JOSIAH KIRBY, September 20, 1859. Application filed June 19, 1873. Hearing September 3, 1873.

25,544.—*Try-Cocks for Steam-Boilers.*—Granted to JOHN F. COOK, September 20, 1859. Application filed June 10, 1873. Hearing September 3, 1873.

25,565.—*Rolling-Mills.*—Granted to JOHN and GEORGE FRITZ, September 27, 1859. Application filed June 27, 1873. Hearing September 10, 1873.

25,569.—*Bedstead-Slats.*—Granted to TYLER HOWE, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,570.—*Mode of Arranging Couches in Railroad Cars.*—Granted to EDWARD C. KNIGHT, September 27, 1859. Application filed May 31, 1873. Hearing, September 10, 1873.

25,573.—*Molding Water-Traps.*—Granted to JAMES ALLEN LOWE, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,586.—*Burglar-Alarms.*—Granted to ABBOTT Q. ROSS, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,588.—*Steam Punching-Machines.*—Granted to JOHN SPARROW, September 27, 1859. Application filed June 26, 1873. Hearing September 10, 1873.

25,640.—*Steam-Boilers.*—Granted to JOSEPH HARRISON, Jr., October 4, 1859. Application filed June 30, 1873. Hearing September 17, 1873.

25,662.—*Construction of Prisons.*—Granted to EDWIN MAY, October 4, 1859. Application filed June 23, 1873. Hearing September 17, 1873.

25,673.—*Machines for Lasting Boots and Shoes.*—Granted to JAMES PUDDINGTON, October 4, 1859; reissued January 6, 1863. Application filed July 5, 1873. Hearing September 17, 1873.

25,683.—*Hydrants.*—Granted to CHARLES L. STACY, October 4, 1859; reissued June 6, 1865. Application filed June 26, 1873. Hearing September 17, 1873.

25,692.—*Sewing-Machines.*—Granted to KASPER VOGEL, October 4, 1859; reissued November 1, 1864. Application filed July 5, 1873. Hearing September 17, 1873.

25,701.—*Skeleton Skirt.*—Granted to JAMES DRAPER, October 4, 1859; reissued August 1, 1865. Application filed July 9, 1873. Hearing September 17, 1873.

25,726.—*Hand-Machine for Wiring Blind-Rods.*—Granted to BIRAM C. DAVIS, October 11, 1859. Application filed July 12, 1873. Hearing September 24, 1873.

25,733.—*Double-Friction Couplings.*—Granted to JOSHUA HENDY, October 11, 1859; reissued March 23, 1873. Application filed July 7, 1873. Hearing September 24, 1873.

59,747.—*Method of Combining Emery with Caoutchouc.*—Granted to THOMAS J. MATALL, October 11, 1859. Application filed June 16, 1873. Hearing September 24, 1873.

25,767.—*Cutting and Pressing Cubes.*—Granted to JOHN H. SHEOTE, October 11, 1859. Application filed July 11, 1873. Hearing September 24, 1873.

25,784.—*Mode of Manufacturing Barrels, &c.*—Granted to GEORGE W. BANKER, October 11, 1859. Application filed July 8, 1873. Hearing September 24, 1873.

25,786.—*Jacquard Machines.*—Granted to AVERY BABBITT, October 18, 1859. Application filed June 30, 1873. Hearing October 1, 1873.

25,797.—*Harvesters.*—Granted to EPHRAIM BALL, October 18, 1859. Application filed July 18, 1873. Hearing October 1, 1873.

25,807.—*Hem-Folders.*—Granted to LEVERETT CLARK, October 18, 1859. Application filed July 19, 1873. Hearing October 1, 1873.

25,814.—*Sleeping-Cars.*—Granted to JOHN DANNER, October 18, 1859. Application filed July 12, 1873. Hearing October 1, 1873.

25,843.—*Cultivators.*—Granted to THOMAS MCQUISTON, October 18, 1859; reissued May 16, 1871. Application filed July 11, 1873. Hearing October 1, 1873.

25,862.—*Weeding-Hoes.*—Granted to JAMES M. ADAMS, October 18, 1859. Application filed July 18, 1873. Hearing October 1, 1873.

25,867.—*Machines for Covering Saddle-Trees.*—Granted to JOHN MACLURE, October 18, 1859. Application filed July 14, 1873. Hearing October 1, 1873.

25,874.—*Bronzing-Machines.*—Granted to GEORGE H. BABCOCK, October 25, 1859. Application filed July 25, 1873. Hearing October 8, 1873.

25,883.—*Construction of Glass Coffins.*—Granted to JOHN R. CANNON, October 25, 1859. Application filed July 23, 1873. Hearing October 8, 1873.

25,936.—*Cut-Off Valves of Steam-Engines.*—Granted to EDWARD R. ARNOLD, November 1, 1859. Application filed August 1, 1873. Hearing October 15, 1873.

25,978.—*Tackle-Blocks.*—Granted to ISAAC E. PALMER, November 1, 1859; reissued September 8, 1863, April 11, 1865, and December 8, 1868. Application filed July 26, 1873. Hearing October 15, 1873.

25,984.—*Bit-Stocks.*—Granted to NELSON STOFFORD, November 1, 1859; reissued April 23, 1867. Application filed July 28, 1873. Hearing October 15, 1873.

26,003.—*Telegraphic Machines.*—Granted to GEORGE M. PHELPS, November 1, 1859. Application filed July 30, 1873. Hearing October 15, 1873.

26,060.—*Machines for Making Box-Joints.*—Granted to JAMES STIMPSON, November 8 1859. Application filed August 2, 1873. Hearing October 22, 1873.

26,069.—*Sleeping-Cars.*—Granted to JOHN DANNER, November 8, 1859. Application filed August 4, 1873. Hearing October 22, 1873.

26,243.—*Water-Closet Basins.*—Granted to WILLIAM BOCH, Sr., November 22, 1859. Application filed June 10, 1873. Hearing November 12, 1873.

27,539.—*Manufacture of Gun-Barrels.*—Granted to JAMES H. BURTON, March 20, 1860, and antedated to September 29, 1859; reissued December 26, 1871. Application filed July 1, 1873. Hearing September 10, 1873.

30,291.—*Apparatus for Freezing Liquids.*—Granted to FERDINAND PHILIPPE EDOUARD CARRÉ, October 2, 1860; reissued in two divisions February 18, 1873. Patented in France August 24, 1859. Application filed May 17, 1873. Hearing August 13, 1873.

EXTENSIONS GRANTED.

24,947.—*Improvement in Journal-Boxes*, granted to JOHN A. MONTGOMERY, August 2, 1859.

Claim.—A journal-box formed of a sphere, or segment of a sphere, fitting into a cup or concave, and prevented from revolving with the shaft or journal by a pin and slot, as described, or their equivalent.

24,987.—*Improvement in Fishing-Reels*, granted to WILLIAM BELLINGHURST, August 9, 1859.

Claim.—The combination of the skeleton-ring R R R with the other parts of the reel, the whole being arranged in the manner and for the purpose substantially as set forth.

25,061.—*Improvement in Elevators or Hoisting Apparatus for Hotels, &c.*, granted to OTIS TUFTS, August 9, 1859, (LUCIUS A. BIGELOW and JOSIAH A. BRODHEAD, administrators.)

Claim.—1. The combination of the screw and the passenger car or platform.

2. The construction of a screw for elevating, having stays or bearings at intervals attached to the walls of a building or any fixed adjacent structure.

3. The construction of a nut with a slot or opening in the bank or side, to enable it to pass by the bearings or stays before referred to, and as hereinbefore described.

4. Constructing a nut or carriage with wheels or rollers, running upon the thread of the screw, substantially as described.

5. Controlling the descending motion of elevators or hoisting apparatus by means of fluid retarders, constructed substantially as described.

6. Regulating the action of fluid-retarders by means of a fly-ball governor, or its equivalent, substantially as described.

7. The construction, arrangement, and operation of passenger-cars of an elevator or hoisting apparatus, substantially as described—that is, providing the platform with side-walls and doors or gates, said doors or gates being combined with suitable mechanism, arranged in relation to stationary cams or projections on the gallery-floors, or any contiguous parts of the building, so as to open and close automatically, in the manner and for the purposes substantially set forth.

8. Opening and closing the doors of the galleries or landings automatically by means of cams or projections on the car, through a system of compound or multiplying levers, constructed and arranged substantially as herein described, and for the objects herein set forth.

9. Fastening and unfastening, automatically, the doors or gates of the car by spring-latches, or their equivalents, operated by cams or projections upon the gallery floors or adjacent walls of the building, substantially as described.

10. Fastening and unfastening, automatically, the doors or gates of the galleries or landings by spring-latches, or their equivalent, operated by cams or projections upon the car, substantially as described.

11. The arrester *w'*, in combination with the fluid-retarder, for the objects and purposes set forth.

12. Passing the shipping-rods and the cord or rod that operates the friction-brake through the car or platform, for the objects and purposes set forth.

Disclaimer filed August 7, 1873.

Disclaim as follows:

"1st. We disclaim the first (1st) claim, reserving the privilege of claiming, in a subsequent application for reissue, a combination of the elements of this claim with the nut specified in claim third (3d.)

"We disclaim the second (2d)claim.

"We disclaim all that is expressed by the words 'or carriage,' in the fourth (4th) claim."

25,015.—*Improved Wood-Saw Frame*, granted to JAMES HAYNES, August 9, 1859; reissued August 5, 1863, numbered 1,526.

Claim.—1. A wood-saw frame as made with a wooden-top cross-bar, E, tenoned or firmly fastened in the frame, and combined with the central or bottom wooden bar D, the wooden front and handle-bars F G, the saw-blade, and a straining mechanism separate from such top bar, or employed and to operate substantially as described.

2. The improved straining mechanism, substantially as described, the same consisting of the inclined plane, the rack, and strainer or lever, arranged and combined with the saw-blade and its frame, as specified.

DISCLAIMERS FILED.

25,061.—OTIS TUFTS, Boston, Mass.—*Improvement in Passenger-Elevator*, dated August 9, 1859. L. A. BIGELOW and J. A. BRODHEAD, administrators of the estate of said OTIS TUFTS, deceased. Disclaim:

"1st. We disclaim the first claim, reserving the privilege of claiming, in a subsequent application for reissue, a combination of the elements of this claim with the nut specified in claim third.

"2. We disclaim the second claim.

"3. We disclaim all that is expressed by the words 'or carriage' in the fourth claim."

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date July 29, 1873.]

6,785.—*Monumental Urn.*—NICHOLAS BRAYER, Rochester, N. Y. Application filed June 25, 1873.

6,786.—*Oil-Cloth.*—CHARLES T. MEYER and VICTOR E. MEYER, Lyon's Farms, N. J., assignors to EDWARD C. SAMPSON, New York, N. Y. Application filed June 23, 1873.

6,787.—*Oil-Cloth.*—CHARLES T. MEYER and VICTOR E. MEYER, Lyon's Farms, N. J., assignors to EDWARD C. SAMPSON, New York, N. Y. Application filed June 23, 1873.

6,788.—*Oil-Cloth.*—CHARLES T. MEYER and VICTOR E. MEYER, Lyon's Farms, N. J., assignors to EDWARD C. SAMPSON, New York, N. Y. Application filed June 23, 1873.

6,789.—*Oil-Cloth.*—CHARLES T. MEYER and VICTOR E. MEYER, Lyon's Farms, N. J., assignors to EDWARD C. SAMPSON, New York, N. Y. Application filed June 23, 1873.

6,790.—*Carpet.*—HORATIO SMITH, Kidderminster, England, assignor to JAMES HUMPHRIES & SONS, same place. Application filed July 5, 1873.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date July 29, 1873.]

1,383.—*Ginger-Ale, Seltzer Champagne Cider, Soda-Water, &c.*—BERLIN MINERAL-WATER COMPANY, Boston, Mass. Application filed July 17, 1873.

1,384.—*Blueing-Paper.*—DOLE BROTHERS, Boston, Mass. Application filed July 17, 1873.

1,385.—*Apple-Paring Machines.*—D. H. GOODELL, Antrim, N. H. Application filed July 10, 1873.

1,386.—*Composition for Softening, Polishing, and Preserving Leather.*—JOHN G. NORTH, Brookline, Mass. Application filed July 17, 1873.

1,387.—*Butter.*—S. STRAIGHT & SON, Hudson, Ohio. Application filed July 19, 1873.

1,388.—*Chewing-Tobacco.*—WALL, BELVIN & DAY, St. Louis, Mo. Application filed July 21, 1873.

1,389.—*Medicinal Composition.*—CHARLES D. BRADLEY, Taunton, Mass. Application filed July 23, 1873.

1,390.—*Soap.*—JAMES O. DRAPER, & CO., Pawtucket, R. I. Application filed June 14, 1873.

1,391.—*Small or Root Beer.*—SAMUEL F. STOWE, Providence, R. I. Application filed July 14, 1873.

1,392.—*Proprietary Medicinal Preparations.*—THE WILLSON CARBOLATED COD-LIVER-OIL COMPANY, New York, N. Y. Application filed July 10, 1873.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date July 29, 1873.]

ORIGINAL PATENTS.

141,193.—*Combined Latch and Lock.*—ANDY M. ADAMS, Sacramento, Cal. Application filed November 15, 1872.

The sliding plate is provided with a projection, which, when the plate is thrown forward by means of a key, engages in a notch in the tumbler and prevents the bolt from being operated by the knob.

Claim.—The tumbler *i* pivoted to the sliding bolt *a*, in combination with the sliding plate A carrying a projection, *n*, when the parts are arranged to operate substantially as set forth.

141,194.—*Rice-Cleaner.*—JOHN L. ARMS, New Orleans, La. Application filed February 13, 1873.

The hulls are removed from the rice by means of a huller, and are then separated from the same by a series of sieves, the rice passing through the sieves into a polisher, while the hulls are drawn off by a suction-fan, which completes the operation of hulling, cleaning, and polishing the rice.

Claim.—1. The huller and separator consisting of the cones C D provided with rubber, as stated, shaft B, the series of sieves or screens *e e*, and the fan *f*, the whole being constructed, combined, and arranged to operate substantially as described.

2. The huller and polisher F, consisting of the tube or jacket *i* having radial arms *h h*, and the shaft B having radial arms *d d*, the arms of each being covered with sheep-skin, rubber, or other soft material, substantially as described, as and for the purpose specified.

141,195.—*Spark-Arrester.*—ROBERT ASH, St. Louis, Mo. Application filed March 31, 1873.

Two parallel and inclined fans extend the whole breadth of the stack. They are kept in proper relative position by gear-wheels.

Claim.—1. The horizontal rotary screw-shaped fans *b b*, connected by the wheels 1 and 2, in combination with the smoke-stack of a locomotive-engine, substantially as and for the purposes hereinbefore set forth.

2. In combination, the rotary fans *b b*, chamber B, conducting-flues *c c*, and opening E, substantially as and for the purposes hereinbefore set forth.

141,196.—*Boot-Brushing Apparatus.*—MAX BECK and CHARLES SCHMIDT, Philadelphia, Pa. Application filed April 30, 1873.

Is constructed with an arch covered within it with bristles, and a brush on each extended side of it. Below the side brush are rows of bottom brushes across a receptacle for the dirt, &c., which is, or can be, drawn out to dispose of it. Over the front of the frame and drawer is a scraper.

Claim.—1. The combination of the brushes *a a*, the side brushes *b b*, and arched brush *d*, arranged above and at the rear of the brushes *a b*, as set forth.

2. The combination, in a boot-brushing machine, of a series of independent brushes, *a a*, arranged as and for the purpose set forth.

141,197.—*Steam Hoisting Apparatus.*—JAMES BROCK, Chicago, Ill. Application filed April 21, 1873.

Whenever the hoisting-cable breaks or slackens an apron fitting upon the hoisting-drum is freed, and, falling by its own weight, turns a short weighted shaft, which frees the spring of a second shaft, and the said spring, moving the second shaft, releases a weight which controls the reversing-lever of the engine, which is thus automatically operated.

Claim.—1. In combination with a drum, A, the apron A, shaft *e k*, spring *k*, bar *m*, and weight W, all constructed substantially as specified, for the purpose of operating the reversing-lever D in case of accident.

2. The shaft *e*, in combination with the apron *a* and shaft A, when the latter is connected with and arranged to operate the reversing-lever, substantially as described, all constructed and arranged to operate substantially as and for the purpose specified.

141,198.—*Breech-Loading Fire-Arm.*—PETER BOURDENEAUX, New York, N. Y. Application filed June 2, 1873.

The invention consists in the arrangement of two sliding catch-bars, one of which engages with a hook on the under side of a rib projecting backward from the upper side of the rear end of the barrel, and the other with a hook or hooks on the under side of the barrel for locking the barrels in position on the stock, said bars being connected by a rock-lever pivoted at its center, and operated by means of a lever and eccentric attached to the upper bar.

Claim.—The combination of the hooked rib or catch *a*, catch-bolt *c*, and vibratory connecting-lever K with the bolt J and catches A' A', substantially as and for the purpose herein specified.

141,199.—*Cultivator.*—EPHRAIM BRIGGS, Cleveland, Ohio. Application filed July 18, 1872.

Furrows are thrown up on both rows at same time.

Claim.—The combination, in a cultivator, of a center beam and two pivoted adjustable side beams with reversible shovels carried on tenoned wooden standards secured to the beams by double grooved metallic sockets, all arranged as described, and for the purpose set forth.

141,200.—*Washing-Machine.*—ISRAEL F. BROWN, New London, Conn. Application filed July 2, 1873.

A cylindrical cover, open and hinged at its center, has within it a receptacle with a center division, the journals of which extend from it to the outer sides of the cylinder, to which the crank is attached to give it motion. The receptacle is constructed in the form of nearly two ovals connected at the center, with ribs or rounds surrounding it, except the openings on each side, which are covered with a corrugated cover, which, by turning over, furnishes a washboard. Within the receptacle, from each side, is a division of ribs extending to the center division, by which the parts are separated by galleries at equal distances from the center circles, by which the clothes are dropped from one to the other and cleansed by the motion.

Claim.—The ribbed rotary receptacle A, constructed as shown and described, with the internal ribs a^2, partition, or equivalent, a^3, and doors *b*, substantially as specified.

141,201.—*Machine for Cutting Sugar into Blocks.*—PETER O. BRUNJES and ALBERT BENNACKENDORF, Hoboken, N. J. Application filed June 2, 1873.

Improvement on Patents Nos. 132,626 and 134,586. To the rear of the saws is a vertical sheet-metal case attached to the frame and terminating in a discharge-hopper, and in front aprons attached to the sides of the hood covering the sugar-loaf, the ends of the aprons being attached to rollers, which take up the slack as the traveling-frame moves in one or the other direction, the combined devices forming an inclosure surrounding the saws and preventing the escape of the fine dust. An additional retaining-pawl is used on the toothed feed-bar, and is thrown out of gear by a stationary stop just before the feed-pawl is acted upon by a second stationary stop.

Claim.—1. The curtains T and U, connected with the movable carriage I and wound upon rollers p^3 and r^4, for the purpose of constituting a shield for preventing the sugar-dust from reaching the operating-parts of the machine, substantially as described.

2. The belts or band s^4 and r^4, combined with the rollers p^3 and r^3 and with the curtains T and U, which are wound upon such rollers in the opposite direction to such belts or bands, substantially as and for the purpose herein shown and described.

3. The band or ring M, constructed with projecting hooks *c*, and made extensible and contractible, substantially as described, for application around the base of the sugar-loaf, as specified.

4. The combination of the plunger *m* on the rod L with the perforated head *j* of the tubular feed-bar J, for action against the base of the sugar-loaf, substantially as specified.

5. The combination of the head *j* of the tubular feed-bar J with the sliding shoe W, as specified.

6. The detaining-pawl *p*, arranged on the sleeve *s* and combined with the feeding-pawl *r* and cams *u* and *w*, for operation as described.

7. The jaws P and R, notched and applied to the carriage I, for operation substantially as described.

8. The combination of the crank g^2 of the sliding feed-bar with notched jaws P R and fixed stops *l'* and m^2, substantially as specified.

141,202.—*Portable Fence.*—SOLOMON G. BUSBEE, Chambers Court-House, Ala. Application filed June 20, 1873.

A fence of horizontal rails, formed into panels by end cleats, is upheld by laterally-inclined braces notched to receive the upper rail, secured to the outer ends of a transverse sill beneath the fence, a key being driven between the bottom rail and the sill.

Claim.—In combination with the panels A A, the panel-support, consisting of the notched sill B, the notched braces C C attached thereto, and the key-wedge D, arranged substantially as shown, and for the purpose described.

141,202.—*Glove.*—RUFUS D. BURR, Kingsborough, N. Y. Application filed April 9, 1873.

Claim.—1. A glove or gauntlet in which the bray back of the hand is formed or cut without fingers, and with which the back and portions of the front of the wrist are all in one continuous piece of material.

2. A gauntlet the front of the wrist of which is gore-shaped, and so arranged and combined with the remaining portion of the wrist that, when folded or made, the seams are brought on the inside of the wrist.

3. A glove or gauntlet having the parts that form the palm and the front, back, and side portions of the fingers made of a separate piece or pieces from the body of the back, substantially as described.

4. A glove or gauntlet finger-back composed of, or wholly reinforced with, leather, when combined with a back composed of cloth or other textile fabric, substantially as specified.

5. A glove or gauntlet in which these pieces, portions, or parts that form the sides of the palm and back portions of the fingers are connected, joined to, and closed on the body of the back with a continuous stitched seam, substantially as described.

6. A glove or a gauntlet composed of the parts H I J K L B C, folded and arranged as described, and having a piece of stiff leather or other material attached to the wrist as a stay or support for the same, as specified.

141,204.—*Metallic Window-Sash.*—FRANK M. CAMPBELL, St. Louis, Mo. Application filed June 25, 1873.

Claim.—A window-sash the frame and bars of which are hollow and constructed of sheet metal, having the upper edge of the bars and the upper edge of the lower part of the frame beveled, as described, to form the specified grooves *a b*, and having holes *c d*, substantially in the manner as and for the purpose set forth.

141,205.—*Baggage-Check.*—JOHN M. CURLESS, Cedar Rapids, Iowa. Application filed January 22, 1873.

The slotted face-plate is teed into the back plate, held between its flanges, and locked to it by a button.

Claim.—The baggage-check A composed of the back and front plates A A′, the former having the lateral flanges *a′ a″*, a button, and the slots *a a*, and the latter the interlocking flange or projection *a²*, substantially as specified.

141,206.—*Wood-Grinder.*—JOHN F. DANIELS, Boston, Mass., and JOHN H. HUBBARD, Stanstead, Canada. Application filed April 8, 1873.

A revolving cylinder is provided with tearing-teeth, against which the wooden logs are pressed by springs. The teeth are placed laterally in a zigzag position. The length of the fiber may be regulated by the width of the cutting-disks of which the cutting-cylinder is composed.

Claim.—1. A cutting-cylinder, *f*, composed of a number of cutting-disks, *g g g*, provided with cross-cut tearing-teeth on their circumferences, for the purpose of tearing off fibers, having pointed ends, as herein shown and described.

2. In combination with the cutting-cylinder *f*, as herein described, one or more revolving log-holders, made to rotate in movable frames *h h′*, as and for the purpose herein shown and described.

141,207.—*Puddler's Ball-Squeezer.*—FRANK DANKS, Cincinnati, Ohio. Application filed October 2, 1872.

The upper roll is driven by one of the lower rolls through the medium of a spur-gear connected to the journal of the upper roll by two links, and whose bearings rest loosely in curved slots in the frame of the machine. The upper roll may be forced downward constantly by the ordinary devices, and a bar lying between the lower rolls, connected to hooked levers, that may be operated at will by one of the lower rolls, ejects the bloom or billet when finished.

Claim.—1. The combination, with the gearing, of the links I I and the curved slots G G, by means of which the gearing of the pinion D with the wheel C upon the adjustable roll A is effected, and at the same time the pinion D is relieved from the weight of the intermediate spur-wheel E.

2. The self-adjusting crab V, in combination with the wheel C, the corrugated rolls B B′, and the upper compressing-roll A, substantially as and for the purpose described.

3. The combination of the levers E M, the shoe T, and the rolls B B′, when arranged and operating, substantially as described, to discharge the bloom from the machine.

141,208.—*Adjustable Stool.*—ARNOLD DOLL, Cleveland, Ohio. Application filed February 3, 1873.

A stool in ordinary form with a hollow upright, in two parts or sections, one sliding over the other. From a plate under the seat is suspended a wire connecting with a pawl fitted to a ratchet. Attached to one side of the inner cylinder from the rod and ratchet is connected a coiled spring, to control the pawl and keep it in contact with the ratchet and secure it in position when raised.

Claim.—The pawl G, rack H, link I, plate E, and spring J, as arranged in combination with the tube C, standard B, and seat D, in the manner substantially as and for the purpose set forth.

141,209.—*Ice-Cream Freezer.*—JAMES DOOLING, Boston, Mass. Application filed June 23, 1873.

The driving mechanism is connected to the cream-holder by a coupling, one-half of which is formed on the lower end of a sleeve-shaft, and the other made separate and hinged to it, and the two are fastened together by a swinging clasp passing over the ears of the coupling, and a pin passed through the three pieces.

Claim.—In combination with a cream-holder provided with a cover having a square or other flat-sided hub thereon, or of circular form with a spline groove or rib formed thereon, and any suitable mechanism for imparting rotary motion thereto, a coupling for connecting the cream-holder to the operating mechanism, made in two parts, one of which is made in the same piece with, or firmly secured to, the sleeve-shaft, through which motion is to be imparted to said cream-holder, and the other half is hinged thereto and arranged to swing in a horizontal plane at right angles to the axis of revolution of said shaft, and the two parts secured together by means of a clamp or pin, substantially as described.

141,210.—*Harvester-Cutter.*—JOHN W. H. DOUBLER, West Alden, N. Y. Application filed January 13, 1873.

A cutter-bar resting on the fingers in front of the finger-bar, and connected thereto by cam-links, is brought to rest by rubber cushions interposed between them.

Claim.—1. The combination of the cutter-bar B with the cushions *a a*, arranged in rear of the said bar and seated in the finger-bar A, as shown and described, substantially as and for the purpose set forth.

2. The combination and arrangement of the cams C C, plate A′, cutter-bar B, cushions *a a*, and finger-bar A, substantially as shown and described, and for the purpose set forth.

141,211.—*Eyelet-Setting Machinery.*—ARTEMAS B. EDMANDS, Saugus, Mass. Application filed June 21, 1873.

The upright portion of the frame, which supports the operative mechanism, is pivoted upon a vertical axis at or near its rear, so that its front end, in which are set the punching and setting tools, may vibrate from left to right and from right to left for the purpose of feeding the material. The eyelets are fed from the hopper into inclined chutes, and are lodged in recesses upon the periphery of a horizontal intermittingly-rotating wheel, and as the wheel presents an eyelet at a fixed point it is seized and carried to the setting-tool by a pair of rotating nippers.

Claim.—1. In an eyelet-setting machine, the frame B, hung upon a vertical axis at or near its rear end, and parallel, or nearly so, to the center line of the setting-plunger mounted in the front end of said frame, when said frame has mounted thereon all the mechanism for separating, delivering, and setting the eyelets, as well as punching the holes in the material, and arranged to vibrate upon said axis to feed the material, substantially as described.

2. The cam-path *f* in the cam-cylinder G, the lever H, acted upon by said cam-path, the rock-shaft H¹, the lever H², and the fulcrum-bolt A, or their mechanical equivalents, when the cam is mounted or has its bearings on, and levers are pivoted to, the frame B, all arranged and operating to vibrate said frame upon its axis, acting upon the pin A as its fulcrum, set in the base or other stationary portion of the machine, substantially as described.

3. The combination of the setting-plunger E, the crank-pin *a*, and cam-shaped slot *e*, formed in, or secured to, the plunger E, arranged and operating as described, for the purpose specified.

4. In an eyelet-setting machine, a hopper or receptacle for the eyelets, in the form of the frustum of a cone, placed upon its side, with the base of the cone in a vertical position and toward the setting-tools, substantially as described.

5. The combination, in an eyelet-setting machine, of a hopper for the reception of the eyelets in bulk, and provided with one or more openings from which the eyelets can escape when right side up, one or more inclined chutes, an intermittently-rotating wheel, provided with a series of recesses in its outer edge, and mounted upon a vertical axis, and a pair of intermittently-reciprocating nippers, arranged and operating as set forth, to feed the eyelets to the setting mechanism, substantially as described.

6. In combination with the wheel N, provided with a series of recesses in its outer edge, and arranged, as set forth, to convey the eyelets from the inclined chutes to the position to be received by the nippers, the groove *g*, to receive the flange of the eyelet, and guide or force it out of the wheel at the proper point, substantially as described.

7. The groove *g*, having its front end made the thickness of the flange of the eyelet lower than the other portion, substantially as described, for the purpose specified.

8. The pin *a*, arranged and operating substantially as described, for the purpose specified.

9. In combination with a series of inclined chutes for delivering the eyelets from a hopper, a conical or cylindrical hopper, placed upon its sides, and having its lower inside shaped to give that portion opposite the mouths of the several chutes an inclination upward from the outer chute on the side from which the brush approaches, substantially as described.

10. The intermittently-reciprocating step-bar W, provided with projecting tongues of rubber or other suitable flexible and elastic material, arranged and operating, as set forth, in combination with inclined chutes, substantially as described, for the purpose specified.

11. In combination with two or more inclined chutes for conveying the eyelets to the work, the pipe V, having one end closed, and the other communicating with an air-pump or other suitable air-forcing device, and provided with a perforation upon its under side to each of said chutes, all arranged and operating substantially as described, for the purpose specified.

12. In an eyelet-setting machine, a frame, upon which is mounted the eyelet separating, delivering, and setting mechanism, having its rear portion divided into two parts, and said two parts again united at the front, and having the eyelet separating and delivering mechanism placed between said parts, substantially as described, for the purpose specified.

141,212.—*Water-Elevator.*—JAMES B. ERWIN, Batavia, N. Y. Application filed June 23, 1873.

The lazy-tongs are operated by segmental gears connected thereto, and are prevented from oscillating by a guide-rod. A rod is connected to the handle and foot-lever, so that additional power is gained by operating both the foot-lever and handle when the downward stroke is given to raise the bucket.

Claim.—1. The combination of the segmental gears C C and series of levers F with the handle E, when said handle is pivoted to the levers and to one of the gears, in the manner described, and for the purpose specified.

2. The combination of the segmental gears C C, series of levers F, handle E, rod Q, and foot-lever Y, substantially as and for the purpose specified.

3. The rod U and staple V, operating in combination with the lever F, segmental gears C C, and handle E, substantially as and for the purpose specified.

4. The combination of the gears C C, levers F, handle E, rod Q, foot-lever Y, weight P, and rope or chain M, substantially as and for the purpose specified.

141,213.—*Marble-Molding Machine.*—JAMES FISH, Boston, Mass. Application filed June 25, 1873.

Two tables, arranged upon opposite sides of the grinder, are supported on parallel rails capable of moving rectilinearly either toward or away from the grinder, which molds two slabs simultaneously.

Claim.—1. In combination with the reciprocating rotary grinder A and the two movable tables B C, arranged as explained, mechanism, substantially as described, for simultaneously operating from one side of the frame D both beds, as set forth, and arresting them in any desirable positions within their ranges of movement, such consisting of the screw O, the spring R, the arm M, the lever K, and the two connecting-rods L L′, arranged together and applied to the tables and frame, substantially as described.

2. The combination of the screw O, the spring R, the arm M, the lever K, and the two connecting-rods L L′, in their arrangement with the frame D and the tables B C of the grinder A, as specified.

141,214.—*Machine for Cutting Balusters.*—PETTER J. FRANTZE, MANTINIUS TILLISEN, and JOHN A. GREGERSEN, Chicago, Ill. Application filed June 2, 1873.

The material is held in a suitable clamp, and each face of the baluster cut separately by presenting it to a rotating cutter of suitable form.

Claim.—The arrangement of the cutter-spindle B, constructed as described, the table D, standards D¹, holder D², and adjustable stops *b b*, with relation to the frame, substantially as and for the purpose set forth.

141,215.—*Fire-Proof Mansard Roof.*—WILLIAM J. FRYER, Jr., and GEORGE H. JOHNSON, New York, N. Y.; said JOHNSON assignor to said FRYER. Application filed May 14, 1873.

The roof is formed of hollow baked-clay tiles placed upon a bed-plate and between upright iron rafters, the ends of the tiles next to the uprights being recessed so as to inclose the uprights. Slates are fastened to the roof through the joints of the tiles.

Claim.—1. A fire-proof Mansard roof formed of a bed-plate, A, top beam B, uprights C, hollow baked-clay tiles D, and slate E, applied to a Mansard roof in the manner specified.

2. The metallic vertical rafters C, in combination with the hollow baked-clay tiles D, constructed in the form shown, and for the purpose specified.

3. The hollow baked-clay tiles D and covering of slate E, combined as and for the purposes shown and described.

141,216.—*Die for Molding Shoe-Soles.*—SYLVESTER B. FULLER, Lynn, Mass. Application filed May 7, 1873.

Claim.—The sole mold or dies, or upper one truncated at the heel, so that the sole, while being molded, may project at its heel out of and beyond the upper or both dies, substantially in manner and for the purpose set forth.

141,217.—*Rail for Street-Railways.*—MARIA L. GHIRARDINI, Providence, R. I. Application filed May 17, 1873.

Claim.—A concave thin metal rail, substantially such as described and shown, provided with downward-projecting sides spanning a wooden bed, to which it is secured by means of bolts or spikes passing through such sides.

141,218.—*Balanced Valve for Steam-Engines.*—WILLIAM GLEN, Toronto, Canada. Application filed March 14, 1873.

The central throttle-valve, in one position, regulates the passage of steam to the side double piston-valves, impinging against their ends, which govern the admission of steam to cylinders; and, in another position, controls its passage through and between the double pistons in such a manner that the engines can be readily reversed.

Claim.—The combination of the chambers M J H with the the valves A B C and ports G I L L′, when constructed and arranged for operation substantially as shown, and for the purpose set forth.

141,219.—*Flue for Buildings.*—EDGAR T. GOULD, Mont Clair, N. J. Application filed February 20, 1873.

Claim.—As articles of manufacture, composite sections of hot-air flues composed of an interior lining of sheet-tin and an exterior casing of plaster of Paris, combined in the manner substantially as described, said sections being adapted for, and so constructed as to form when joined each to the others, a continuous tube or flue, in the manner substantially as described, for the purposes set forth.

141,220.—*Truss.*—EDWIN W. HUNTER, Northampton, Mass. Application filed June 24, 1872.

Two waist-springs are used and connected adjustably together by metallic braces near the hips. The ends of the lower band are secured to the two ends of a convex spring, which bears against the pad.

Claim.—The combination, with the belt A′ and hinged pad B, of the upper belt or girdle A and the movable springs or braces D D, substantially as and for the purpose set forth.

141,221.—*Device for Centering Piston-Heads.*—OSCAR S. HOWARD, Bangor, Me., assignor to himself and HINCKLEY AND EGERY IRON COMPANY, same place. Application filed May 5, 1873.

Attachment to piston-heads, enabling them to be kept in the center of the cylinder, and remedying unequal wear.

Claim.—In combination with a piston-head, the slotted segments *c*, secured to the faces of said piston by bolts *d* passing through said slots, and adjustable by set-screws *f*, all arranged and operating substantially as and for the described purposes.

141,222.—*Reversible Plow.*—GEORGE W. HOWE, Vineland, N. J. Application filed April 17, 1873.

In reversible plows the colter needs to be adjusted to the land-side of the beam. The claim shows how this is accomplished.

Claim.—The pivoted double-edge colter, provided with drum, chain, and slide-bar, working by lever, substantially as and for the purpose described.

141,223.—*Shade-Holder for Lamps.*—MARK WIGGINS HOUSE, Cleveland, Ohio. Application filed May 29, 1873.

A divided ring, attached to retractile arms, enters the recess above the lower flange of the shade. The ends of the ring are extended to form thumb-pieces. Either the ring or the arms may be of spring metal.

Claim.—The combination of the stock, retractile arms, and divided ring, substantially as before set forth.

141,224.—*Can for Oils and other Liquids.*—MARK WIGGINS HOUSE, Cleveland, Ohio. Application filed May 29, 1873.

The upper part of the nozzle has an inwardly-projecting flange, so that the air-vent, which is made by a partition in the nozzle, and the liquid-passage may be closed by the same stopper. A flame-guard, composed of a thin strip of corrugated metal wound into a volute, is secured in an enlarged chamber, which is applied to the inner orifice of the liquid-passage.

Claim.—1. The combination, substantially as before set forth, of the nozzle with the partition having its inner end extended inward beyond the wall of the nozzle, so as to divide the nozzle into an external air-passage and an internal liquid-passage whose end extends beyond the inner mouth of the said air-passage.

2. The combination, substantially as before set forth, of the nozzle, the internal partition, and the internal flange at the exterior mouth of the nozzle.

3. The combination, substantially as before set forth, of the nozzle, the flame-guard, and the enlarged chamber in which the flame-guard is contained.

4. The combination, substantially as before set forth, of the nozzle, the flame-guard, the enlarged chamber for the flame-guard, and the partition which divides the nozzle into a liquid-passage and an air-passage.

141,225.—*Saw-Buckle.*—CHARLES W. HUBBARD, Pittsburg, Pa. Application filed December 2, 1872.

The strap by which the saw is attached to the gate has a bifurcated end, within which the buckle is secured.

Claim.—A saw buckle and hanger composed of a bifurcated hanger, *f*, and blanks D D, bent as at *d*, so that their upper ends may come face to face, while room is left between their opposite hook-ends for the insertion of the saw and straps, substantially as set forth.

141,226.—*Rotary Steam-Engine.*—EDWARD W. JENKINS, Camden, N. J., and SYLVESTER JENKINS, Landsdale, Pa. Application filed May 22, 1873.

The steam enters one end of the hollow stationary crank-shaft and passes into the hollow piston, and thence through fulcrum-neck through ports into cylinder, and is exhausted after the piston and cylinder have made a partial revolution, through the outer end of crank-shaft.

Claim.—The combination of a hollow piston, D, and hollow crank-shaft A with the cylinder C, the piston having slots A A in one side, which connect with the fulcrum-neck F of the cylinder, the neck being provided with ports *f f*, substantially as described.

141,227.—*Manufacture of Bolster-Plates.*—WILLIAM J. LEWIS, Pittsburg, Pa. Application filed May 19, 1873.

Claim.—1. The method hereinbefore described of making male bolster-plates—viz., first, rolling a raised part, *b′*, on the blank, and, second, stamping down the metal in the center of such raised part, so as to widen the blank and spread out the metal to form the ring, substantially as set forth.

2. The method herein described of making female bolster-plates—viz., first, rolling a raised part, *b′*; second, widening the bar by rolling it down; and, third, stamping therein the depressed ring, substantially as described.

141,228.—*Trestle.*—MAHLON M. LUCKY, Indianapolis, Ind. Application filed March 1, 1873.

Screw clamping-pieces to enable a trestle to be taken apart for easy transportation, and to facilitate the adjustment of differently-proportioned parts to different-sized rooms.

Claim.—The trestle-clamp composed of the parts C D E F G G′ H I J, constructed and arranged substantially as and for the purpose set forth.

141,229.—*Device for Dispensing Syrup in Soda-Water Apparatus.*—JOHN MATTHEWS, New York, N. Y. Application filed June 24, 1873.

An elongated valve-plug, by means of which the syrup is driven back from the delivery-tube, is operated by a cap provided

with internal screw-threads. A plate is arranged to act as a washer and to bear a label. The port of the faucet is made oblong, and placed transversely in order to secure the rapid discharge of the syrup.

Claim.—1. The valve-plug *c* provided with an extension, *y*, in combination with the faucet, so as to drive the syrup out of the forward portion, as and for the purpose set forth.

2. The cap *b* provided with an internal screw and external collar, *z*, in combination with the faucet, as set forth.

3. The cap *b* provided with screw-threads, in combination with the valve-plug *c* and faucet *a*, arranged and operated as set forth.

4. The plate *e* with opening, so as to slip over the stem and form a washer with an upward-projecting portion for a label, in combination with the faucet, provided with collar *i* and nut *d*, as set forth.

5. The faucet provided with the discharge-port *g* of an elongated form, transverse to the length of the faucet, so as to be entirely opened by a slight movement of the valve-plug, in combination with said plug.

141,230.—*Machine for Molding Clay Smoking-Pipes.*—HENRY E. MERRILL, Akron, Ohio. Application filed July 3, 1873.

Two or more sets of molds arranged upon a revolving table, said molds being opened and closed by a cam upon the standard around which the table revolves, the hollow in the bowl and the hole in the reed being made by punches operated by cams.

Claim.—1. The herein-described pipe-molds, consisting of the sections H H′, levers J, links L, and slide M, as arranged in relation to and in combination with the cam G, substantially in the manner as and for the purpose set forth.

2. In combination with the revolving table A, the pipe-molds arranged thereon in the relation to and operated by the cam G, in the manner as set forth, and for the purpose specified.

3. The punch O, spring R, and pulley P, as arranged in combination with the molds, consisting of the sections H H′, and with cam A′, in the manner substantially as and for the purpose set forth.

4. The punch S, spring C′, and cam B′, in combination with the molds above described, substantially as set forth, and for the purpose specified.

141,231.—*Compound for Mixing Paints.*—JOHN L. NEWELL, Port Huron, Mich. Application filed June 3, 1873.

Takes starch or farina, mix with cold soft water, and add bicarbonate of soda and thoroughly mix, and add boiling water until the mass thickens.

Claim.—1. The compound herein described, made of the ingredients substantially in the proportions and for the purposes herein described.

2. The described compound, consisting of one pound starch, four ounces bicarbonate of soda, ground and thoroughly mixed for shipment, as set forth.

141,232.—*Hydraulic Jack.*—ANTHONY V. OJEDA, San Francisco, Cal. Application filed June 5, 1873.

The main plunger is provided with a central bore for the operating-piston, and also with passages so arranged that water is taken from above the plunger and forced below it, by means of the piston, with the use of only one valve, which is opened by a projection on the piston when the latter is forced to its lowest point, permitting the water to escape to the upper side of the plunger.

Claim.—1. The plunger J, having an opening for the piston M, and provided with the inlet-passage *s*, and the valve O with the exit-passage *r*, when constructed to operate substantially as herein described.

2. The passage *u* through the plunger and opening against the valve, as shown, in combination with the valve O and the projection *t* on the bottom of the valve, whereby the passage is kept closed while the press is in operation, but can be opened to discharge the liquid when it is desired to depress the ram-head, as herein described.

3. In a hydraulic press or lifting-jack, the plunger J, working within the outer cylinder and provided with the passages *s*, *r*, and *u*, and the single valve O with its flat spring *p*, in combination with a solid piston, M, as herein described.

141,233.—*Apparatus for Lowering Pipes in Wells.*—SVEND P. ORESLUND, Omaha, Neb. Application filed October 3, 1872.

The ring G is drawn up by a suitable attachment, to close the arms and disengage them from the tube when it has reached its resting-place.

Claim.—1. The tube-frame C D D G, consisting of the head-block C, three or more pivoted arms, D, having shoulders E with sloped under edges and hooks H, central spring or springs F, and lower encircling ring G, the several parts being arranged and operating substantially as specified.

2. The tube-box I, in combination with the tube-frame C D D G, said tube-box being attached to said tube-frame, so as to inclose and protect the well-tube during its descent, and to be drawn up with the tube-frame when raised, substantially as specified.

141,234.—*Screw-Cutting Machine.*—JOHN PEACE, Merchantville, and WILLIAM P. COX, Camden, N. J. Application filed July 30, 1872.

The screw for operating the device is held in a bearing swivelled to a projection of the stock A. The nut in which the screw operates is pivoted to the ring which opens and closes the dies. Two jam-nuts are adjustable on the screw, to prevent the ring from being turned too far when screws of uniform size are to be cut.

Claim.—The combination, with the ring B and screw E, of an adjustable stop nut or nuts, for the purpose described.

141,235.—*Thread-Cutter.*—MARY JANE PITEAT, Gallipolis, Ohio, assignor of three-fourths her right to NELSON S. ANGELL, JAMES HANNAN, and DANIEL WILLIAMS, same place. Application filed June 19, 1873.

The thread-cutter is fixed to a spring-band, which slips over and clasps a thimble.

Claim.—1. The detachable thread-cutter for sewing-thimbles, consisting of the spring-band B and spring-cutter C, substantially as shown.

2. The thread-cutter, constructed as herein described, in combination with a sewing-thimble.

141,236.—*Sewing-Machine Caster.*—JAMES ROBERTSON, Northampton, Mass., assignor to himself and LEANDER W. LANGDON, same place. Application filed May 15, 1873.

A caster is arranged within an inverted bowl or cup, which has a seat cast upon it to hold one of the legs of a sewing-machine table. A bent lever is pivoted on top of the bowl, the head of the lever passing over and bearing upon the projecting head of the spindle in such manner that when the lever-head is swung off to one side the weight of the sewing-machine or table forces the roller up into the bowl, thereby locking the caster, while the reverse movement of the lever forces down the spindle, freeing the roller from contact with the bowl and unlocking it. The caster, locked or unlocked, rests directly on the floor and supports the weight of the sewing-machine table.

Claim.—The body A A′, and the roller or wheel C and its shank E operating therewith, so that by means of the lever F the roller may be allowed, by the weight of the table coming upon it or removed from it, to lock against or be freed from the cup or bowl A′, as and for the purpose described and represented.

141,237.—*Letter-Box.*—ANDREAS ROSENSTJERNA, Chicago, Ill., assignor of one-fifth his right to CHARLES BERM, same place. Application filed December 30, 1872.

The letters are temporarily arrested and dropped from a vibrating plate by opening and closing the lid. The act of attaching the receiving-box turns the index and unlocks the bottom of the fixed box A and the cover of A′, thus discharging the letters from one to the other. The removal of the box A′ closes and locks both the doors or covers, preventing access to either box.

Claim.—1. A letter-box made in two separable parts, one to receive the letters and the other to discharge them, when these parts are made to operate together, so as to unlock each other, discharge the contents from one part into the other, and lock each other, by means of a combination and arrangement of parts substantially the same as described.

2. The spring D′ on the bottom B′, and provided with a friction-roller, in combination with the cam V arranged on the bottom C′, substantially as and for the purpose specified.

3. The windows E′ E′, in combination with the slides G′ G′ and the pintle F′, substantially as and for the purposes specified.

4. In a letter-box, an indicator-roller provided with a ratchet engaged by a pawl actuated by the door or bottom of the box, and by a spring, when the said roller, ratchet, pawl, and spring are all arranged upon a removable partition, substantially as and for the purposes set forth.

5. In a letter-box made in two separable parts, A and A′, the lock R′ arranged upon the bottom or door C′ of the part A, in combination with the lock R″ arranged upon the door B′ of the part A′, substantially as and for the purposes specified.

141,238.—*Composition for Burial Caskets.*—WILLIAM H. ROSS, Brooklyn, N. Y. Application filed October 22, 1872.

Claim.—A compound for burial caskets, composed of asphaltum and silica, in variable proportions, and a small quantity of oil-tallow, or other unctuous material, substantially as set forth.

141,239.—*Steam-Generator.*—JOSEPH RYAN, St. Louis, Mo. Application filed August 23, 1872.

By means of the peculiar construction of these devices the circulating-pipe can be connected readily with the boiler or drum.

Claim.—The circulating-pipes B, vertical pipes B′, top discharge-pipe C, saddle-joint b^1, screw-heads b^2, flange-joints c c^1, arranged in combination either directly with boilers or drums, as described and shown.

141,240.—*Treadle for Sewing-Machines.*—FRANK SMILEY, Batavia, N. Y. Application filed March 26, 1873.

Claim.—1. The combination, with two alternately-operated treadles and the shaft or spindle to be rotated, provided with a double smooth-faced wheel or pulley, of the two friction clutches or clamps and supporting-arms, and actuating and reversing straps, substantially as and for the purpose hereinbefore set forth.

2. In a machine constructed substantially as hereinbefore set forth, the radial arms *g g*, adapted to serve as the pivot-bearings for the friction-clutches, and operating as and for the purposes described.

141,241.—*Street-Sweeper.*—WILLIAM SMITH, Barnard Castle, England. Application filed March 18, 1873.

The cylindrical brush is jointed in the middle to permit it to conform to the convexity of the roadway. The brush is also capable of vertical adjustment, is counterbalanced, and may be entirely lifted from the roadway when desired. The whole is set in a diagonal frame having its ends parallel with the line of draft.

Claim.—1. The brushes D D, pivoted or linked together at or near the center of their aggregate length, so that they are free to adapt themselves to any inequalities in the surface being operated upon, whether said brushes be arranged parallel with or at an angle to the axis of the draft-wheels E, substantially as shown and described.

2. The combination of the linked brushes D D with the bars Q Q Q, arranged as described, the bar R, chain S, lever L, weight O, and pawl and ratchet *o n*, so that the brushes are free to adapt themselves to the road-bed by their own weight, or to be counterbalanced or entirely lifted from the road, substantially as herein shown and described.

3. The diagonal frame B, arranged with its ends parallel with the line of draft, as herein shown and described.

141,242.—*Ammoniacal Gas-Engine.*—WILLIAM H. SMITH, deceased, (LUCYNTHA SMITH, administratrix,) and FRANCIS V. DE COPPET, New Orleans, La. Application filed February 5, 1873.

The ammonia is supplied to the vaporizing-chamber from the reservoir by a pump. A pipe conducts the vapor to the engine, the exhaust of which communicates with the condenser, which is supplied with water from reservoirs by a pump. By means of a third pump the charged water is conveyed from the condenser to the reservoirs provided for it. Suitable cocks are provided to regulate the amount of ammonia supplied to the vaporizing-chamber, and also to regulate the degree of heat in the latter.

Claim.—1. The combination of the artificially-heated chamber or vaporizing-vessel I with pipe I^1 and pump L, all constructed substantially as described, and for the purposes set forth.

2. The combination of the artificially-heated chamber or vaporizing-vessel I with pipe I^1, engine D, exhaust-pipe M, and condenser N, all constructed substantially as described, and for the purposes set forth.

3. The combination of the pump P with water-reservoir R R, condenser N, pump O, and storing-tank O^2 O^3, all constructed substantially as described, and for the purposes set forth.

141,243.—*Carpet-Cleaner.*—JOHN SPAULDING, San Francisco, Cal. Application filed March 24, 1873.

A series of rotary brushes are mounted upon a reciprocating carriage and sweep the carpet transversely, and the carpet is raised up for the action of the brushes by means of a series of rollers. An oil-pan is arranged under the carriage to catch the drip. The brushes are held to the rotating arms by adjustable clamps.

Claim.—1. In combination with the rollers R S T, for opening the Brussels, fiber, or nap, and presenting a raised surface or surfaces of the carpet to the action of the brooms, the series of rotary brooms or brushes W W, mounted upon the reciprocating carriage V and acting to sweep the carpet transversely, constructed and operated substantially as herein described and specified.

2. The reciprocating carriage V and its series of pulleys *e e f f* and rotating arms *n n*, carrying and operating the brushes W W, when constructed and connected with the mechanism operating it, in the manner substantially as herein described and specified.

3. The clamping device *r*, for confining and holding the splints composing the brushes, when constructed and applied substantially as described.

4. In combination with the reciprocating carriage V and its truck *c c*, the oil-pan *z*, when applied in the manner and for the purpose described and specified.

141,244.—*Device for Holding Gas-Pipe Nipples.*—LEVI W. STOCKWELL, Ravenna, Ohio. Application filed May 2, 1873.

The end of the nipple that is threaded is screwed into the coupling *g* against a follower, which is backed up by a screw, thus holding the nipple while a thread is being cut upon its outer end. To release the nipple when threaded, the screw is turned back, which permits the nipple to be unscrewed.

Claim.—The combination of the screw *i*, the threaded tube *e*, the follower *d*, and coupling *g*, substantially as and for the purpose herein set forth.

141,245.—*Sewing-Machine.*—SIMON W. WARDWELL, St. Louis, Mo., assignor of one-half of his right to GEORGE W. SHAW, same place. Application filed June 28, 1872.

Claim.—1. The holder R having a hook, *o*, on its periphery, spool-case S having a hinged cover, V, tension-plate W, and hooks *s s′*, for supporting an ordinary wooden spool, the spool and its case S being held stationary by an arm, X, while the holder revolves, in combination with a vertical eye-pointed needle carrying the threads of an ordinary spool and a take-up device, arranged as shown and described on the vibrating and fixed arm, and all arranged in combination with suitable operating mechanism to make stitches, substantially as shown and described.

2. The combination of the holder R having hook *o*, stationary case S having oval cover V, tension-plate W, vertically-vibrating needle, and take-up device, together with operating gearing connections, all said parts being constructed and arranged essentially as described, so that the hook makes two revolutions to each descent of the needle, and so that each stitch is completed before another is commenced, as set forth.

3. The combination of the gears 9 and 11, plate 19, lever 16, dogs 23 24 and their springs, slotted arm 25, diagonal crank-pin 26 arranged on a revolving shaft, and fastening-rod 17, substantially as and for the purpose set forth.

4. The combination of the gears 9 and 11, plate 19, lever 16, dogs 23 24 and their springs, slotted arm 25, diagonal crank-pin 26 arranged on a revolving shaft, fastening-rod 17, lever 14, rack 27, and gear 15, substantially as and for the purpose shown and specified.

5. The combination of the gears 9 and 11, plate 19, lever 16, dogs 23 24 and their springs, slotted arm 25, diagonal crank-pin 26 arranged on a revolving shaft, fastening-rod 17, lever 14, rack 27, gears 15 and 5, the latter communicating an intermittent motion to the feed-wheels *x x′* through the pinion 4, substantially as and for the purpose shown and specified.

6. The take-up device, consisting of the perforated plate *d*, plate K and its eyelets *e e′ e″*, vibrating arm C, and the eyelets *h* *h*, &c., and *y*, all combined and operating substantially as and for the purpose shown and specified.

7. A needle-holder for a sewing-machine, consisting of a cylinder, 29, piston 31 having jaws 35 and a pin, 36, when constructed and operating substantially as set forth.

8. The combination of the needle-holder above described with a hook-headed needle, 32, substantially as shown and specified.

141,246.—*Hoop-Cutting Machine.*—PETER WELCH, St. Louis, Mo., assignor, by mesne assignments, to DAVID T. WELCH, same place. Application filed March 7, 1872.

The material from which the hoops are to be cut is secured upon a reciprocating carriage and carried past a series of cutters which cut off and round the edges of two hoops at each reciprocation.

Claim.—1. In combination with a cutter-stock having knives set thereon at angles, as described, and also throat-pieces, cutters *g* for rounding off the corners of the hoops, substantially as specified.

2. In combination with a cutter-stock, the jointed rod *k*, bumpers *l l*, projection *i*, and set-screw *h*, to allow said stock to adjust itself to inequalities in the timber being cut, substantially as described.

3. The combination of the ratchet *w*, its pawl *o*, finger *r*, and incline *s* with the ratchet *n*, pawl *t*, feed-arm *u*, and incline *v*, for the purpose of operating the timber-feeding carriage, substantially as described.

4. The slatted plates E and F, substantially as described, in combination with the shaft *c*, for the purpose specified.

141,247.—*Apparatus for Hardening Copper Balls.*—ALFRED WELDON, Chicago, Ill. Application filed June 28, 1873.

The hollow balls (or floats) are placed in the closed drum, having a suitable number of steel or other hard-metal heads or protuberances, and the drum rotated for half an hour, after which the balls are removed, filled with water, and replaced in the drum. The force with which the balls come in contact with the steel heads compacts and hardens the metal.

Claim.—1. The drum A B C having hard heads or protuberances *a b c* on the interior, substantially as and for the purpose specified.

2. A float hardened by being rolled in a drum having hard protuberances on the interior, substantially as specified.

141,248.—*Method of Blasting Rock.*—ISRAEL WENTWORTH, Hingham, Mass. Application filed May 21, 1873.

The arrangement of a wooden diaphragm across the blast-hole, whereby, it is alleged, the rock may be cracked or broken in any desired direction.

Claim.—The employment of one or more partitions or pieces of wood, with or in a blast-hole, and with its explosive charge, all substantially in manner as specified.

141,249.—*Steam and Vacuum Water-Elevator.*—JOSEPH C. WIGHTMAN, Newton, assignor, by mesne assignments, to CHARLES HOUGHTON, Boston, Mass. Application filed May 19, 1871.

The pipe which conveys the cold water to condense the steam into the cylinder is made in the form of an inverted siphon. The valve being in its shorter arm the water above and below it forms a packing and also prevents the continued expansion of the steam composing the valve, and thus lessens its liability to wear out.

Claim.—In a water-elevating apparatus, substantially as described, the combination, with the cylinder or chamber A, of the down-condensing pipe, having the form of an inverted siphon, with a valve, K, in the shorter leg thereof, between the lower end of said leg and the point where its upper end communicates with said cylinder or chamber, substantially as and for the purposes set forth.

141,250.—*Sewing-Machine Table.*—FRANCIS R. WOLFINGER, Chicago, Ill. Application filed October 10, 1872.

The top of the table has an opening so that a portion of the machine that is hinged to the top may descend into it. A drawer has a drip cup or trough that catches any of the oil that may fall from the machinery.

Claim.—1. The drawer B, provided with a drip, E C D, and combined with the table X W, as and for the purpose set forth.

2. The combination of the drawer B, provided with a drip, with hinge G, table, and machine, substantially as and for the purpose set forth.

141,251.—*Shade or Globe Holder for Lamps.*—LEWIS J. ATWOOD, Waterbury, Conn., assignor to THE PLUME AND ATWOOD MANUFACTURING COMPANY, same place. Application filed May 20, 1873.

The double wire arms to which the shade-ring is attached are provided with slides for the adjustment of holder to different-sized lamps.

Claim.—The combination of the flanged sheet-metal shade-ring *a b* with the double wire arms *d d* and sliding clamps *e*, as set forth.

141,252.—*Shade-Holder.*—LEWIS J. ATWOOD, Waterbury, Conn., assignor to THE PLUME AND ATWOOD MANUFACTURING COMPANY, same place. Application filed May 20, 1873.

A single piece of wire is bent to form the double arms of the shade holder. The ends are secured by a thin sheet-metal cap secured by indentations.

Claim.—The sheet metal cap *i* receiving the ends of the wires at the end of one of the arms, and confined thereto by indentations, as set forth.

141,253.—*Pessary.*—EDMUND P. BANNING, The Elder, New York, N. Y., assignor to BANNING TRUSS AND BRACE COMPANY, same place. Application filed February 15, 1873.

A supporting-ring is hinged at a single point to an adjustable stem.

Claim.—The adjustable stem, combined with a ring, jointed to the support at one point only, as and for the purpose described.

141,254.—*Window-Sash Ventilator.*—JOHN C. BATES, Cold Spring, N. Y. Application filed May 10, 1873.

An upward opening is formed in the bottom bar of a window-sash, through which the passage of air is regulated by a hinged plate secured on the outside of the bar and operated by a pivoted and swivel screw and nut. Wire-gauze is placed in the opening to prevent the dust from entering the room.

Claim.—1. The combination of the plate and casing or box B C, the hinged plate D, and the pivoted and swiveled screw and nut E F, substantially as herein shown and described.

2. The combination of the wire-gauze G with the plate and box B C, the hinged plate D, and the pivoted and swiveled screw and nut E F, with each other and with the slotted bar of a window-sash, substantially as herein shown and described.

141,255.—*Lasting-Tool.*—JOSEPH H. BEAN, Cincinnati, Ohio. Application filed June 2, 1873.

Adapted for use in the ordinary manner, and also grasps and draws the leather upon each side at the same time.

Claim.—1. The handles A A having the parts a^1 a^2, in combination with the loose jaws B B having the curved faces x x, as described.

2. The combination of the handles A A and loose jaws B B having teeth arranged upon their inner surfaces, the tool as a whole being adapted to grasp the leather between its jaws B B, as shown in Fig. 2, for the purpose set forth.

141,256.—*Camera-Stand.*—NELSON S. BOWDISH, Richfield Springs, N. Y. Application filed March 5, 1873.

To prevent twisting of stand when weight rests unevenly upon the legs.

Claim.—The table or bed *f* and supports *e* attached together, and the latter sliding through the plates *b c*, in combination with the counterpoise or spring and the separate cords or straps to each support *e*, passing over the separate pulleys and connected to such weight, the parts being combined and arranged to operate substantially as set forth.

141,257.—*Manufacture of Boots and Shoes.*—JOHN BOYLE, New York, N. Y. Application filed June 21, 1873.

Claim.—In combination with textile or other similar fabric B, and a grooved or recessed sole, A, the binding-clamp C, for attaching the fabric firmly thereto, substantially as described.

141,258.—*Car-Coupling.*—WINSLOW BRADFORD BARNES, Plymouth, assignor of one-half his right to SAMUEL TALBOT, Jr., Boston, Mass. Application filed September 14, 1871.

The link has reversely-beveled ends to operate in connection with lugs on the bottom of the draw-head, so that while one end is held in the lugs in one draw-head the other end will ride over the lugs in the other draw-head and pass beyond the end of the link-pin.

Claim.—1. The link *i* having reverse inclined faces at the ends, in combination with the recessed lugs *k* and *l* within the bumpers, substantially as and for the purpose specified.

2. In combination with a link pin or catch, arranged for automatic coupling, the link *i* with its inclined reverse faces *k* and *l* at the end, substantially as and for the purpose specified.

141,259.—*Wrench.*—MICHAEL BUMBER, Jersey City, N. J. Application filed April 19, 1873.

A crank-shaft is journaled at one end of the rectangular frame, and the wrench-shaft at the other. Motion is communicated by means of an endless chain. The bearings are movable, facilitating the tightening of the chain. The whole device rests upon a journaled standard, and is capable of angular adjustment.

Claim.—1. The combination of the base A, bearings B, wrench-shaft C, side bars D, endless chain F, chain-wheel G G, bearings I, and extendible crank L M N with each other, substantially as herein shown and described.

2. The bearings I, formed of two parts, one of which is slotted and secured to the bars D, the jam-nuts K, and the screws J, in combination with the shaft C rotating in fixed bearings, the endless chain F, and shaft H, all as shown and described.

3. The combination of the curved and slotted bar O and rod P with the base A and side bars D of the machine, substantially as herein shown and described.

141,260.—*Fire-Proof Floor and Ceiling.*—WILLIAM T. BUTLER, Chicago, Ill. Application filed June 28, 1873.

The joists are made of wood, and are constructed with beveled surfaces at the top and bottom to support the vousoirs of the floor and ceiling arches, the bricks of the bottom arch being formed so as to inclose lower edges of the joists and to be self-sustaining. The floors and ceilings are laid directly on the arches.

Claim.—1. The construction of the joists A, substantially as and for the purpose described.

2. The braces or rods B, more or less in number, in combination with the joists A, for the purpose described.

3. The arch D, in combination with the joists A, substantially as and for the purpose described.

4. The hanging arch G, in combination with the joists A, substantially as and for the purpose described.

5. A fire and water proof floor and ceiling, F and I, supported by joists A and arches D and G, arranged substantially as shown and described.

141,261.—*Rotary Engine.*—GEORGE W. CUMMINGS, Conneaut, Ohio, assignor of one-half his right to DANIEL W. HAZELTINE, same place. Application filed February 8, 1873.

Two sets of ports are provided, either of which can be closed by suitable valves to reverse the movement of the engine. Grooved recesses are formed in the cylinder to permit steam to reach the first piston after the second has passed the induction-port, and thus assist it to complete its stroke. By means of the rings, segmental supports, and springs the piston-arms are properly pressed against inner surface of cylinder.

Claim.—The piston-arms C, with rings *i*, segmental supports *k*, and springs *l*, in connection with the ports *a* a^2, exhausts *b* b^2, and grooved recesses E of cylinder A, as set forth.

141,262.—*Loom.*—HILAS D. DAVIS, North Andover, Mass., assignor to GEORGE L. DAVIS, JOHN A. WILEY, JOSEPH M. STONE, GEORGE G. DAVIS, JOSEPH H. STONE, and JAMES H. DAVIS, same place. Application filed February 21, 1873.

The levers, which are actuated by the pattern-cylinder or chain to control the shuttle-box or shedding motion, have a vibratory movement to and from the cylinder, so arranged that the latter is moved when the levers are not in contact with it, thereby relieving the cylinder of the labor of moving the levers and the mechanism connected with them. To make two picks of the shuttle to one movement of the pattern-chain the cam which actuates the pattern-levers is provided with a removable incline, and the shaft of the cylinder carries a cam which is so arranged as to raise the actuating-pawl out of gear at every other pick. The levers of the shuttle-box mechanism are operated by cranks which receive an intermittent rotation by means of continuously-reciprocating clutches and sliding clutches controlled by the pattern mechanism. In addition to the ordinary cranks of the box mechanism a double crank of peculiar construction is used. The cranks are held in position by means of fixed and adjustable bushings, in combination with the sliding clutches. To prevent the engagement of the clutches, except at certain determined points, they are provided with teeth and corresponding recesses. The device for shipping the sliding clutch is provided with a yielding spring to prevent breakage, and for the same purpose the box-lever is connected to the supporting-rod by a secondary sliding lever and yielding catch. The actuating box mechanism is connected with the boxes on the opposite side of the loom by a chain so attached and led over sheaves that the boxes are moved positively downward as well as upward.

Claim.—1. The combination of the levers, or their equivalent, which work upon the pattern-chain of mechanism for imparting a vibratory motion to said levers toward and from the pattern-chain, by which motion the chain controls the movements of the shuttle-boxes or the heddles, substantially as described.

2. The combination, with the said levers, or their equivalent, and the mechanism for imparting the vibratory motion to them, as described, the mechanism shown, or its equivalent, so arranged as to suspend such vibration for one or more picks, substantially as described.

3. The combination, with the ratchet and pawl for revolving the pattern-chain, of the cam X upon the shaft thereof, to suspend the movements of the pattern-chain for one or more picks, substantially as described.

4. The sliding clutch J, for rotating the cranks, in combination with the reciprocating rotating clutch I, to impart a measured rotation to the cranks, substantially as described.

5. The clutch J, in combination with the fixed stops or bushings M for holding the cranks in a fixed position, substantially as described.

6. The bushings M, provided with means for circular adjustment, in combination with the clutch, substantially as described.

7. The teeth or blocks *j*, and the corresponding recesses *i*, in combination with the toothed clutches, to prevent their engagement except at certain determined points, substantially as described.

8. The combination of the two arms Q and Q^1 of the shipping device with a yielding spring connection to prevent the breaking of the mechanism, substantially as described.

9. The combination of the shipping-lever of the clutch with the vibrating pattern-lever S, substantially as described.

10. The combination of one or more continuously-reciprocating rotating clutches, having a measured circular motion, with one or more clutches which are made to engage with and disengage from the same at or near the limits of said motion, as a device for imparting an intermittent measured rotation to the cranks that move the shuttle-boxes, or to other mechanism, substantially as described.

11. The combination of the secondary sliding lever E^2 with the shuttle-box lever E, by means of the yielding catch *f*, substantially as described.

12. The chain D^2, in combination with the shuttle boxes and rods D^1 and D^3, or rods D^1 D^1, upon opposite sides of the loom, so as to give the boxes a positive motion in both directions, substantially as described.

13. The double crank for moving the shuttle-boxes, consisting, substantially, of the inner crank, the radial bar with its wrist-pin, which revolves upon the wrist pin of the crank, and the slotted disk which revolves said bar, combined and operating substantially as described.

141,263.—*Gas-Meter.*—DANIEL DE CASTRO, Mortlake, Surrey, and RICHARD BURTON, Camden Town, London, assignors to THE IMPERIAL METER COMPANY, London, England. Application filed July 7, 1873.

Gas is allowed to pass through an opening in a pipe into the upper part of the reservoir, and by displacement allows a corresponding quantity of water from the reservoir to enter the drum-case, thereby restoring the water to the desired level when becoming too low from evaporation or other cause.

Claim.—1. The combination, in wet gas-meters, of the water-reservoir *b* with the adjusted waste-water pipe *l*, and the pipe *m* having an adjustable opening for admitting gas into the water-reservoir when required, and the pipe *k* for admitting gas to the drum, arranged substantially as and for the purposes explained.

2. The flexible top and bottom of the chamber *n*, by which the height of the pipe *m* is regulated, substantially as and for the purposes described.

141,264.—*Hub-Boring Machine.*—JAMES DUNCAN and WILLIAM H. ARNOLD, Buchanan, Mich. Application filed May 5, 1873.

A wheel containing the hub which is to be bored is secured to a stationary vertical face-plate. The boring-tool is then adjusted to the center of the wheel and advanced into the hub by the action of a rack and pinion.

Claim.—1. The combination of the adjusting-jaws F and screw G with the wheel A, substantially as specified.

2. The said jaws F and screw G, mounted on a frame, I, adjustable toward and from wheel A, substantially as specified.

3. The mandrel H, reciprocating frame K, driving-belt O, and long drum P, combined and arranged substantially as specified.

141,265.—*Bolt-Cutter.*—EDWARD W. FAWCETT, RICHARD FAWCETT, and WILLIAM E. SEXTON, Salem; said EDWARD W. FAWCETT assignor to EPHRAIM S. HOLLOWAY, Columbiana, Ohio. Application filed December 5, 1872.

Claim.—1. The springs *c*, placed upon each side of the cutter, substantially as specified.

2. The combination of the frame, adjusting-handle, cutter and cutter-frame, and cam-lever, when all are combined to operate substantially as shown and described.

141,266.—*Musical Railway-Signal.*—REED A. FILKINS, Cheshire, assignor to himself and AUGUSTUS R. TYRRELL, Savoy, Mass. Application filed January 11, 1873.

A circular plate, bearing near its edge a series of steam-whistles, is pivoted in front of a series of apertures in a kind of shell or steam-chest. The escape of steam from the apertures is so regulated by valves that the rotation of the plate will produce any desired succession of sounds, or all may sound at once.

Claim.—1. The lever D, arranged in connection with the cylinder C and cap B, as specified.

2. The rotary plate E, carrying a series of steam-whistles, and applied to the shell A, as described.

141,267.—*Shutter-Worker.*—SETH R. FOSTER, St. John, Canada. Application filed June 21, 1873.

The shutters are furnished with wheels and run upon a bar extending along the entire side of the house, and are connected at the tops by a rod. The series of shutters are all operated and controlled by a weight. A single movement closes all the shutters simultaneously.

Claim.—1. The combination of the connecting-bars D, friction-wheels E, and the supporting-rails F, when used for opening and closing two or more window-shutters, substantially as described.

2. The combination of the bars D, shutters C, and the chains H, when used to open and close window-shutters, as shown.

141,268.—*Link of Endless Chains for Horse-Powers.*—ALBERT W. GRAY, Middletown, Vt., assignor to LEONIDAS GRAY, ALBERT Y. GRAY, and ALBERT W. GRAY, same place. Application filed February 26, 1873.

The links have projections attached to them to facilitate fastening them to the tread of the horse-powers.

Claim.—1. The cross-piece *c* in a link in the endless chain of horse-power and other like machines, in combination with the cog-work and cap of such links, for the uses and purposes set forth.

2. The combination of the cogs *a a* with the cap *d*, the cross-piece *c*, and the stud *f*, for the uses and purposes set forth.

141,269.—*Fire Safety-Line.*—CHARLES A. GREGORY, Montreal, Canada, assignor of one-half his right to WALTER MURSON RICE, same place. Application filed May 17, 1873.

A small box containing a windlass and cord with ball attached so as to be thrown out of the window in case of fire in the night, and afford a means for drawing up a substantial rope by which to descend. In order that the device may be readily found in an emergency it is combined with a match-box. A belaying pin accompanies the box, furnished with a strong gimlet-screw, so as to be readily screwed into the wood-work of the apartment and furnish a means of attachment for the fire-escape.

Claim.—The described device, consisting of the box A, having chamber I, windlass E, cord F, and ball K, combined and arranged as described.

141,270.—*Carpet-Lining Machine.*—JOHN R. HARRINGTON, Brooklyn, N. Y. Application filed May 5, 1873.

The cotton-flock or other fibrous material is delivered from a willow or breaker to a revolving wire-screen, thence to an endless wire carrier and between feeding-rollers to a carding-cylinder, then to a second screen and pair of feed-rollers, a finer carding-cylinder and a third screen, at which point it is carried, in the form of a continuous lap, between inclosing sheets of paper or cloth previously pasted by rotating brushes. The fabric is next delivered to pressing-rollers and a heater, then carried over a heated calender-roller and between crimping-rollers to the reciprocating folding device. Rotating clearing-brushes work upon the under side of the rotating screens, and below them is placed an endless carrier to remove the refuse.

Claim.—The combination of willow A, leader C, screens D H I, endless screen E, scratchers G K, and feed-rollers, all arranged and operating substantially as specified.

141,271.—*Folding Chair.*—BENJAMIN J. HARRISON, New York, N. Y. Application filed April 1, 1873.

At the point of intersection of each pair of legs the respective legs are lap-jointed, and secured together by a screw-bolt or by a cross-rail with right-and-left-handed screws. The upper ends of the front legs are connected to the chair-bottom by a cross-bolt or hinge.

Claim.—1. The cross-legs, recessed at the intersections, and secured by right-and-left-handed bolts and nuts, in combination with the cross-rail *c'*, that can be rotated to clamp or release the parts, substantially as set forth.

2. The cross-legs, recessed at the intersections, and secured together by a screw bolt or bolts, in combination with the chair-bottom *a*, connected to the upper ends of the front legs by a cross-bolt or hinge, substantially as set forth.

141,272.—*Combined Brake and Propelling Mechanism for Cars.*—JACOB W. HILL, Jefferson, Iowa. Application filed May 10, 1873.

In running down grades the engines operate as pumps either to retard the train or force air into receivers, from which it is allowed to pass into the ordinary valve-chests upon the throttle-valve being opened, and thence into the cylinders, the induction-valves therein being closed, when it is required as a motive power.

Claim.—The combination of the air-receivers A A, connected by pipe P, the engines B B and their valve mechanisms located at E and I, pistons J connected with axles C, the throttle-valves L, and check-valves H, all constructed and arranged as shown and described, for the purpose specified.

141,273.—*Pruning-Shears.*—HENRY C. HILLS, Pinkney, Mich., assignor to himself and WILLIAM DOLAN, same place, and GEORGE MILLS, Highland, Mich. Application filed March 17, 1873.

A circular rotating-knife is held in any fixed position required, by means of a pivoted link, the bent end of which is passed into holes in the cutter. Thus a new edge may be presented by changing the fastening-hole, and the entire edge of disk can be utilized for cutting.

Claim.—The combination of the rotary cutter C upon the lever B with the arm D, the latter being adapted to adjust the cutter so as to utilize all its surface for cutting, as described.

141,274.—*Disinfectant Compound.*—JONATHAN HILTON, New York, N. Y. Application filed May 31, 1873.

Nitric acid and oil of tar is agitated with carbonate of lime; sulphur is burned in a retort; the sulphurous acid is caused to pass through the mixture of lime, tar, and nitric acid until saturation. After settling, the fluid is separated from the solid parts, the solids are then dried and reduced to a powder.

Claim.—1. The solid disinfecting compound, composed of the ingredients and made by the process substantially as herein described.

2. The liquid disinfecting compound, produced by the ingredients and process substantially as herein described.

141,275.—*Railway-Rail Chair.*—SAMUEL HUBER, Danville, Pa. Application filed June 28, 1873.

The chair is cut away at E in wedge form directly under the ends of the rails, with a view solely to the protection of the rails from battering or splintering, in opposition to the common views of supporting the rails at this point, so as to protect the wheels of the train.

Claim.—A rail-chair having a cavity or recess, substantially as seen at E, as and for the purpose described.

141,276.—*Lathe-Chuck.*—WILLIAM JOHNSON, Lambertville, N. J. Application filed March 22, 1873.

The case A contains three worm-wheels, B, placed triangularly and at equal distances apart, and a single screw, I, to turn them; and the jaws F, pivoted to arms projected from the wheels and free to turn on their pivots, are prevented from rising by interlocking flanges, as shown.

Claim.—1. A worm-wheel, B, having a perforated arm, E, clamped to and combined with a chuck-jaw to turn therewith, in the manner described.

2. The holder E having lip and groove H extending only partially around it, in combination with a correspondingly-constructed chuck-jaw, F, to allow the jaw to be removed or attached, in the manner set forth.

3. A wheel, B, plate C, and screw-bolt D, combined with and turning on bearings in the case A, as and for the purpose described.

141,277.—*Smoke and Steam Burner.*—JOHN W. KINSMAN and ADOLPHUS EUGENE, Laramie City, Wyoming Ter. Application filed April 12, 1873.

A trough or box swinging on pivots placed longitudinally in the fire-box, having a perforated pipe at the bottom running its entire length, and a steam-pipe running on top of the grate along the walls of the furnace, in which the steam is superheated and conveyed to this perforated pipe, is filled with coal. The gases arising therefrom and the superheated steam commingle and are consumed.

Claim.—1. A pivoted fuel-holder, C, in combination with the grate B and furnace A, as and for the purpose described.

2. The steam-exhaust pipe D, arranged in relation to the pivoted drying-trough C, to discharge thereinto, as and for the purpose set forth.

3. The combination of a pivoted box or trough, C, superheating-pipe D, and distributing-pipe E, with the fire-box of a steam-boiler or a smelting-furnace, substantially as described.

141,278.—*Car-Coupling.*—GERHARD KOEB, Springfield, Ohio, assignor to himself and JACOB B. KOEB, same place. Application filed February 1, 1873.

The link is guided by the rack on the rear side of the pin.

Claim.—The bumper A having ribs a^1 and cavity C, combined with pin E having rack F and the coupling-link D, as and for the purpose described.

141,279.—*Lathe for Turning Tobacco-Pipes.*—CHARLES KRAFF, Philadelphia, Pa. Application filed May 13, 1873.

The cutting-tools are so arranged as to bore out the bowl and stem and form a portion of their outer surfaces simultaneously.

Claim.—1. The adjustably-inclined rotary shaft C and the adjustable block carrier or holder G H, when constructed and arranged in relation to each other for the purpose of enabling the attendant to adjust the two said devices to suit the required inclination to be given to the stem and of the pipe, without changing the fixed position of the block of wood in the jaws H of the said block-holder, substantially as hereinbefore set forth and described.

2. The arrangement of the inclined shaft C and its carrying-frame K 5, the weighted lever E with its slot 8, and its fulcrum-pin 15 in the adjustable supporting-slide b', the said parts being constructed and secured to the main supporting-frame of the machine, so as to operate substantially as and for the purposes hereinbefore set forth and described.

3. The arrangement of the vertical rotary shaft D and its carrying-frame L, the lever F with its adjustable supports M and 11, and the slots 10 10 in the main frame of the machine, the said parts being constructed and attached to the said main frame of the machine, substantially as and for the purposes hereinbefore set forth and described.

4. The tool or cutter-head, with its respective, distinct, and separable cutters, constructed and secured adjustably together, substantially as shown in Figs. 3 and 4 and described, for the purpose specified.

141,280.—*Steam-Whistle.*—OTTO KROMER, Sandusky, Ohio. Application filed April 8, 1873.

The column of air in the body of the pipe being caused to vibrate by steam-jet, spring-gates, within the control of the engineer, divide the pipe-body into different lengths, and thus produce various tones successively.

Claim.—In combination with the bell D the valves E, constructed and arranged to operate substantially as and for the purpose set forth.

141,281.—*Sign.*—WILLIAM LAMBERT, Geneseo, Ill. Application filed March 29, 1873.

The back of each letter or character is provided with downward-projecting lugs and a spring-jaw, to support and hold the letter in position when placed upon the rod.

Claim.—In a sectional sign, the spring jaws or arms *c*, secured to the letters D for attaching the same to a plain or notched supporting-rod, C, in combination with the hooks or clips *d*, substantially as and for the purpose set forth.

141,282.—*Reed-Organ Swell.*—JOHN R. LOMAS, New Haven, Conn., assignor to BERNARD SHOBINGER, same place. Application filed March 15, 1873.

A hinged panel, in the front of the case and right against the ordinary swell-valve, is operated by the swell-action, knee, foot or otherwise, to let the sound out at pleasure.

Claim.—1. An outside swell, C, and an ordinary swell, A, combined to operate simultaneously, in the manner and for the purpose described.

2. The swell A, having piece D, the swell C, and the lever B, combined in the particular manner and for the purpose specified.

141,283.—*Submarine Foundation.*—EDWARD MANICO, London, England, assignor to EMILE VERGNES, New Orleans, La. Application filed August 2, 1872.

A new mode of placing the cradles for submarine foundations. The cradles are wrought-iron cages of cubical form, partially filled with stones, to afford a lodgment for sand by the action of the tide. Instead of being placed side by side, as heretofore, they are placed diagonally, and secured at the corners by clamps, and the alternate recesses on the shore side are filled with additional cradles.

Claim.—1. The combination of the cradles edge to edge diagonally, substantially as and for the purpose herein before set forth.

2. The combination, with the rows of diagonally-placed cradles, of an additional cradle placed on the shore side of the row in each alternate recess, substantially as and for the purpose hereinbefore set forth.

141,284.—*Farm-Fence.*—WINFIELD S. MCKENZIE, Rockwell, Tex. Application filed April 12, 1873.

The fence is supported upon short posts, which are pivoted at their tops to the middle of the end bars of the panel so that the fence may be tilted over either way, a portable brace serving as an additional support.

Claim.—1. The short posts A and pivoted or tilting bars B for supporting a fence, whether said fence be formed of wires or other material, substantially as herein shown and described.

2. The combination of the loops L and bars K with the bars or posts that support the fence, substantially as herein shown and described.

3. The portable brace M N O P Q for strengthening the inclined fence against pressure, substantially as herein shown and described.

141,285.—*Attaching Knob to Spindle.*—FRANKLIN M. MERRIAM and JOSEPH B. MERRIAM, West Meriden, Conn. Application filed April 19, 1873.

A socket-nut is screwed upon a square spindle, and the end of the knob-shank placed in the socket of the nut and held there by a set-screw. A sleeve is placed over the nut and screw for the purpose of holding the latter in place. The rose is constructed so as to cover the sleeve and nut.

Claim.—The rose G, constructed substantially as herein shown and described, in combination with the spindle A, neck B, socket-nut E, sleeve F, and washer H, as set forth.

141,286.—*Inside Blind.*—ELLIOTT METCALF, Rome, N. Y. Application filed May 10, 1873.

The ribbons that are attached to the front and rear of the slats are attached at their upper ends to a roller that is suspended by cords to screws, rings, or eyes on the window-frame. The whole device can be lowered, or the slats can be drawn up to the roller, or the slats can be opened or closed without being drawn up, all by means of the several cords and screw-eyes or pulleys. The ribbons are fastened to the slats by being passed through two slots near each edge of each slat.

Claim.—1. A Venetian window-blind, composed of the roller B, lowering-cords *a*, adjusting-cords *c*, shifting-ribbons C attached to the roller, and to the front and rear edges of the slats D, and combined with the elevating-cords E, when the various parts are constructed and arranged as shown, to permit the blind to be lowered from the top, to be raised from the bottom, and to enable the slats to be opened or closed, as and for the purpose set forth.

2. In a Venetian blind, the shifting-ribbons C, combined with the slats D, when the ribbons pass through slots A A near the edges of the slats, as and for the purpose set forth.

141,287.—*Pen-Holder.*—JOHN S. OBENDORFF, Virginia City, Nev. Application filed June 21, 1873.

A hollow elastic sleeve or bulb is attached to the stem of a pen-holder, and, by confining a quantity of air, forms an air-cushion.

Claim.—The combination of the bulb-shaped rubber sleeve B and air-cushion *a* with the holder A, as shown and described.

141,288.—*Machine for Dressing Millstones.*—JOEL W. PARISH, McFarland's, Va. Application filed February 21, 1873.
